The hut gave place to a stone building, but, when additional rooms were built round the central 'house of the god,' and when the whole structure of the temple, with its spacious sphinx-guarded approach, pylons, courts for the worshippers, pillared halls for processions of priests, etc., was elaborated, the dark central chamber of the god, accessible to the higher priesthood only, remained as a constant factor, and contained the divine image or the sacred animal. The door was solemnly sealed with papyrus and clay at night, and as solemnly opened in the morning, before the day's ceremonial began. Thus what had once been the temple itself was now the inner sanctuary of a wide-spread temple, with all its multifarious buildings and chambers for purposes connected with the cult. The height of the Egyptian temple diminished from front to back.¹

(b) The great temples of Babylon had probably originated in a structure of simple kind, oblong in shape, with a recess for an image. Excavations show that the great temples stood in a court with a vestibule, flanked by chambers.

The temple building consisted of a long outer hall, opening into a smaller one with the holy place, or *parakhu*, where stood the image of the divinity and an altar. The holy place was open to the priests alone, or to a worshipper accompanied by a priest for special religious purposes. An altar stood in the court and perhaps in the outer hall also. The names of temples are many, and some of them show their great sanctity, others are suggestive of height—'the house of the shining mountain,' 'the lofty house.' This points to the high tower-like structure, the *ziggurat*, which stood beyond the important temples, or towered within the sacred enclosure where stood many temples dedicated to various gods, as well as the houses of priests—a grouping of religious buildings found in the larger cities. The *ziggurat* was a storeyed tower or pyramid, consisting of a series of diminishing and superimposed cubes. These varied in number, and symbolized the mythical mountain of the world. Where it consisted of seven storeys, these represented the planetary zones, or the seven zones of the earth. Each storey was approached by an inclined pathway or a flight of steps, either directly up the face or diagonally across it, until the top, which formed a broad platform, was reached. On the platform stood a chamber for the god, containing a couch and throne, and perhaps an image. As with the Mexican *teocalli*, processions winding up the tower could be plainly seen below, and, while the Egyptian temple in its grandest development was spread over a large area, the Babylonian, as far as the *ziggurat* was concerned, aimed at reaching a lofty elevation, and represented in miniature the structure of the universe. It seems to have been regarded also as the grave of the god to whom it was dedicated, and persons of importance were sometimes buried round it.²

Both Egyptian and Babylonian temples were endowed with lands which yielded large revenues. Hence, outside their religious purpose, they had great influence on the economic life of the nation. In the Babylonian temple area also, as the priests were administrators of the law, there were courts of justice, chambers where national archives were stored, and even banks.

(c) The Greek temple was preceded by the *πέμενος*, the open sacred place with its *ἀγαλμα* of the deity, altar, and other *sacra*. In the Aegean religion the sacred cave served as a temple where the Mother-goddess was worshipped, as in the double cave (upper and lower) of *Dieta* in Crete, where a rich store of cult objects has been found in recent years.³ Palaces had their domestic chapel or shrine, plain and of small size, with a ledge at one end for images and sacred objects. The ruler was a priest-king, and in one instance, that of the palace of Knossos, 'the Place of the Double Axe' (*λάβρος*), the whole building has the character of a temple.⁴ Free-standing shrines or temples

also existed, like that discovered at Gournia, a small enclosure 12 ft. square, in the heart of the town, in which were found many images and cult objects.¹ With the perfecting of the divine image, a house to shelter it became necessary, and the earliest type was no more than a rectangular oblong *cella*, or *σηκός*. To this was soon added an additional chamber, with open front and a couple of columns supporting an architrave, the corners of which rested on flattened columns attached to the ends of the side walls. These columns were at first of wood; the earliest stone columns date from the 6th cent. B.C. Throughout the whole period of Greek religion the rectangular *cella* remained as the central part of all Greek temples, though it was sometimes prolonged back and front with additional chambers, or surrounded by single or double rows of columns, while these were sometimes also introduced within the *cella*. Vitruvius, indeed, classifies temples according to the arrangement of the columns in relation to the *cella*.² The temples of the gods faced eastwards, and opposite the entrance stood the image of the god. The *cella* also contained an altar or altars, votive offerings, and treasure, the last being also stored in the chamber behind the *cella*. The temples were never large; they were merely houses for the image, and hence were often kept closed. They were decorated with sculpture and painting both within and without. The temple stood within a *πέμενος*, where the great altar was placed, and where the worship was carried on.³

(d) The Roman *templum*, as already shown, was originally a rectangular space of ground marked off by the augur, in which a tent was pitched for augural purposes, like the 'medicine-hut' of the shaman. Strictly speaking, the house of a god was the *ædes*, but the word *templum* was now applied to such a structure, inaugurated by the augurs, and usually of larger and more complicated structure than the *ædes*. In the earliest times divine dwellings were unknown. The grove, the cave, the hearth, were the earlier sacred places, or the *sacellum*, a small place consecrated to a god, enclosed by a fence or wall, but roofless, with an altar and possibly an image. The Romans, in erecting houses for the gods, were influenced by the Etruscans and the Greeks. The Etruscan temples were of wood, oblong, with one or more chambers and an open portico. The Roman temple had also a central *cella*, but of much greater breadth than the Greek, this feature being probably a result of Etruscan influence. The structure of temples, whether simple or elaborate, was generally determined by Greek architecture, though there were differences in detail—e.g., the absence of columns at the back. Circular temples were also built; these had become common in Greece from the 4th cent. B.C., though it is not impossible that the form may be copied from the early Italian house.

Before building a temple, a space of ground was *liberatus et effatus* by the augurs, and consecrated by the *pontifex*. When the building was erected, it was dedicated to a god. In some instances, however, a building might be consecrated to religious use without the preliminary augural ceremony. Such buildings were *sacra*, or *ædes sacra*, like the temple of Vesta.⁴ Outside the temple stood the altar, and within burned the sacred fire. In the temples were stored votive offerings, gifts, treasure of all lands, as well as the images of the gods.

(e) During the Vedic period in India, as has been seen, there were no temples. No trace of temples in the pre-Buddhist period is known, but, if any existed, they must have been of wood, as they still are in Burma, the use of stone in

architecture not having been introduced until Āśoka's reign, as a result of contact with the West. Religious edifices are certainly known for the first time in Buddhism. The primitive sacred object in Buddhism was not an image, but a relic. This at first was not set in a temple, but enclosed in a *stūpa*, or *tope* (Sinhalese *dāgaba*)—an elongated hemispherical structure standing on a base, the exterior often richly carved or ornamented, and crowned with a square capital and the *chhatra*, or umbrella. Many *stūpas* contained no relic, but were erected as commemorative objects. A path fenced by a railing surrounded the *stūpa*, for circumambulation. The *stūpa* was decorated with flags, streamers, and flowers; and it was the chief religious edifice of early Buddhism.¹ Another religious edifice was the *chaitya*, a name applied to any religious monument—e.g., a *stūpa* with relics—but also restricted to a building corresponding to a temple or church, the 'chaitya hall,' with pillared aisles and an apse containing a *stūpa* and an altar.

The earliest known structural building of this type—e.g., at Ter, Haidarābād—consists of an apsidal chamber with high barrel-vaulted roof. In front is a square hall, or *mandapa*—perhaps a later addition, lower in height, with a flat roof supported by pillars. The façade above the roof of the hall has a niche containing now a Hindu image, which was probably at one time a window. Within the apse stood a *dāgaba*, now replaced by a Vaiṣṇava image. *Chaityas* of this type must have been common in India. Buddhism made use of rock excavations at an early time for *chaitya* halls, which sometimes had aisles.²

A third structure was the *vihāra*—a hall where the monks assembled, with cells at the sides for sleeping. The *vihāras* were later used as temples and became the centre of monastic buildings grouped around them. They usually stood beside *chaityas*, though they came to be furnished with chapels in which religious services could be performed as well as in the *chaitya*.

During ten centuries from Āśoka's time onwards cave *chaitya* halls and *vihāras* were excavated all over India.

In early examples at Biḥār the *chaitya* halls are merely oblong chambers, sometimes with a cell or apse at the farther end for the *dāgaba* with its relic. Others are more elaborate. The façade of the cave represents the exterior of a wooden *chaitya* in all its details. The interior is apsidal. Pillars are cut in the sides, and in the apse is the *dāgaba*, which now has the image of Buddha in front of it. Some of these caves are highly elaborate in their carving both within and without, and are also pillared structures with aisles. The cave *vihāras* have a central pillared hall with cells at the sides for monks. Beyond the hall are one or more inner sanctuaries for images of Buddha. These are later additions. Here again the architecture and adornment varies from simple to highly elaborate. The earliest free-standing *vihāras* were probably simple halls with cells attached, and were sometimes of a storeyed pyramidal form, each successive storey decreasing in size, and giving a series of pillared halls one above the other, with cells for the monks on the terraces. This architectural structure supplied a form for all the later temples of southern Hinduism.³ Attached to great monasteries, as at Peshawār, was a court, or *vihāra*, with cells for images, and beyond that, opening from it, a circular or square court surrounded by similar cells, and with a *stūpa* in the centre. These belong to the period of Mahāyāna Buddhism.

One of the earliest known temples, or *chaityas*, is at Bodhi Gayā, in front of the Bo-tree of Buddha's enlightenment. Frequently restored, it was probably erected in the 6th cent., and is 160 ft. high by 60 ft. wide. It is rectangular with an elongated pyramidal form of nine storeys, each with exterior niches for images, and the interior *cella* contained originally an image of Buddha. Such a nine-storeyed tower-temple is unique in India, but is found frequently north of the Himālaya.⁴

Hindu temples doubtless owe much in their inception to Buddhism, and are of great variety in structure, size, and ornamentation. But there are two principal groups, one in Southern India of the so-called Dravidian style, and one in Northern India, each of which shows great uniformity in general plan. In S. India the structure consists

of the temple proper, or *vimāna*, 'the vehicle of the gods'—a square building with a pyramidal roof which may have one or several storeys, like the storeyed *vihāra* of Buddhism. In this is the square cell containing the chief image of the god, and lit only from the doorway. Between the wall of the inner cell and the outer wall is the procession path, or *pradakṣiṇa*. Pillared porches or halls called *mantapams* (Skr. *mandapa*) precede the entrance, and are usually larger than the *vimāna*. *Vimāna* and *mantapam* stand in a walled enclosure with gate-pyramids, or *gopurams*, corresponding to the Egyptian pylons and often very imposing. Within the enclosure stand a pillared hall, priests' dwellings, tanks, and other structures. These temples are devoted to the Vaiṣṇava and Saiva cults, and are not otherwise distinguishable apart from the sculptures and images. The earliest examples of the *vimāna* show its derivation from the Buddhist apsidal *chaitya* hall. The apse for the relic-shrine has become a cell for an image and is entered by a door. In another early example the circular apse has given place to a cell with altar and image, surmounted by a tower, and the hall in front, distinct from the cell, is pillared. Cell and pillared nave or *mantapam* are reproduced in all Jain and Hindu temples of later date, together with the storeyed tower. The enormous size and elaborate architectural and sculptural design of these buildings make them still marvellous rivals of the cathedrals of Europe. Some, besides the original enclosure with its gate-pyramids, have a second or even third exterior enclosure, with *gopurams*, shrines, porches, cells, etc. The *vimāna* in itself corresponds to the ordinary Hindu village temple, and in some examples has either been such a temple or is little more imposing than one of these. Sometimes two *vimānas* dedicated to different divinities stand within the central enclosure. In S. India the largest group or congeries of temple buildings is at Srīraṅgam. There are seven enclosures, leading gradually to the central shrine, and the three surrounding the central enclosure are crowded with temples, porches, halls, etc., while in each wall there are two or three *gopurams* of great height. 'The idea is that each investing square of walls . . . shall conduct the worshipper by regular gradations to a central holy of holies.'¹ While the temples of this kind are of comparatively late date, others of earlier date, but presenting the same general features, have been carved out of the solid rock and excavated internally, so that they are monolithic temples. The chief examples are the raths (*ratha*=*vimāna*) at Mamallapuram and the beautiful *kūlāsa* at Ellora.²

The Northern temples (Fergusson's 'Indo-Aryan style')—e.g., in Orissa—are characterized by a pyramidal curvilinear tower on a polygonal base in which is the central shrine, often quite small. The interior plan is square, and in the Orissan examples there are no pillars, or these are found only in modern additions. In front is a square porch with pyramidal roof, and sometimes in front of this again additional porches. The enclosing wall is always insignificant, if it is present at all, and has no *gopurams*. Other shrines are always subordinate to the towering temple proper with its porch. Even the more elaborate temples preserve these essential features—e.g., the Kandarya Mahadeva, or temple of Śiva, at Khajurāho.

In all Hindu temples the inner cell or shrine with its image is the central feature round which all the other parts are grouped, and to which, however elaborate, they are all subordinate. The cell is cubical, of small dimensions, unornamented,

and unlit save by the doorway, and is too sacred to be entered by any but the priests. The exterior building surrounding the cell is of the most elaborate workmanship, often of a kind which offers little clue to the method of producing it. In some districts enormous numbers of temples exist, ancient and modern, and at Benares, the sacred city, there are 1500, though none are older than the 18th century.

(f) In Nepal the *stūpas* do not contain relics. Some are of flattened hemispherical shape with a square capital, 'umbrella,' and lofty finial or spire, like those in Tibet and China, and stand on a plinth on which are built shrines of the five Dhyani-buddhas. Others are lower and flatter; and others again stand on a structure with successive roofs. Buddhism in Nepal is mingled with Saivism, and the characteristic temple is a square structure of several decreasing storeys divided by sloping roofs. Some are mounted on a pyramidal-stepped platform. These buildings are of wood and stone.¹

(g) In Burma the *stūpa* (*tsedi*) is bell-shaped and stands on a series of platforms, and is crowned with a conical finial. The temples are of square form with projecting porches. In the thickness of the walls are narrow corridors with niches in which are images. A series of storeys arranged pyramidally and crowned with a slender steeple forms the roof. Ancient Buddhist temples in Siam have a rectangular outer enclosing wall, within which is the *bot*, also rectangular, with a porch. The interior is divided by pillars into a nave and single or double side aisles. Within are the high altar and image of Buddha. Behind the *bot* stands a *stūpa*, or *phra*. *Vihāras*, or *vihāns*, and *kamburiens* are buildings similar to the *bot*, but smaller, where the laity come to pray or hear sermons. The *bot* is accessible only to the priests. The *mondob* is a rectangular building enclosing a huge image of Buddha. One enclosure sometimes contains several of these structures, erected from time to time by devout Buddhists.²

(h) The earliest Chinese religion had no temples, and apparently the general use of these is due to Buddhism. With few exceptions the temples of the three religions, Confucianism, Buddhism, and Taoism, are mainly of one type, though they differ in size. The religion to which each is dedicated can be discovered only from their interior decorations and the images which they enshrine.

Buddhist temples are enclosed by a wall with an ornamental gateway. The temple has a series of porches or halls, opening from each other. Two of these form antechapels to the main structure with its altar and images of the three Buddhas, facing the entrance, and stalls for the monks. Before the images stands the table for offerings, with lamps and flower-vases. Beyond this another hall contains a *dāyabā*, and a final one enshrines the image of Kwan-yin. Within the enclosure are the various buildings for monks, pagodas, drum-tower, bell-tower, and other structures. The roof has the characteristic form of all Chinese buildings, concave, with projecting eaves, but more elaborately decorated than in secular buildings. Confucian temples are of the same general plan, the central 'Hall of Great Perfection' containing the tablets of Confucius, his disciples, and the twelve sages. Tables for offerings stand before these. Taoist temples contain the images of the Three Precious Ones, in imitation of the three images of Buddhist temples.

(i) In Japan, as in China, the earlier worship was in a consecrated enclosure open to the sky. Tradition assigns the first temples to a period near the beginning of the Christian era. Shintō temples are not large and conform in structure to the architecture of an age when tools were few and primitive. The quality of the wood used in the structure is of more importance than ornamentation and carving, whereas the carvings on Buddh-

ist temples are highly elaborate, and have much gilding, lacquer-work, and painting. The oldest Shintō temples and many of the smaller ones are thatched. The type is similar to that of China, showing that Chinese influences prevailed.

The temple area, at least in the case of the greater temples, has several enclosures, with fences and gateways preceded by flights of steps. The grouping of the various structures differs according to the nature of the ground, usually on a slope, giving the chief eminence to the main shrine. Shintō temples, but rarely Buddhist, are preceded by the characteristic *tori-ii*, of two wooden uprights with cross-bars, the upper one projecting and curving upwards at the ends; they correspond to the gateways of *stūpas* and temples in India, like that of the *tope* at Sanchi, and to similar structures in religious architecture elsewhere.¹ The temple consists of two or three halls, one an oratory or prayer-hall for worshippers, an intervening hall, and the sanctuary open only to the priests. Shintō temples have no images, a mirror usually constituting the symbol of deity. Some temples are dedicated to more than one divinity. An altar stands in the shrine. The lay-worshipper, entering the prayer-hall, pulls a rope attached to a gong and so announces his presence to the deity before beginning his devotions. Within the temple enclosure, as in China, the grounds often being laid out artistically, stand a pagoda, drum-tower, belfry, stage for religious dances, library, votive-offering hall, store-houses, kitchen, priests' rooms, etc. This general description applies to both Shintō and Buddhist temples, though the latter are generally more gorgeous and imposing, and contain images, lights, votive offerings, lotus-flowers of silver-gilt, while the priestly ritual is elaborate. They are usually built of wood, with gilding and porcelain casing, and metal work; the roofs are of tiles.

(j) In Tibet the Buddhist monasteries are the chief architectural structures, occupying large areas and containing a square for assemblies, in which stands the temple.

This is a stone rectangular building, on the top of which is a pavilion with a roof of Chinese type. The interior is divided into a nave and side aisles by pillars, which are painted in yellow and red. The three great Buddhist images with their altar stand at one end. Other images stand along the side walls. There are no windows, and the interior, which is richly coloured or decorated with frescoes and hung with banners, is lit by lamps. Seats for the various officials and Lāmaist congregation are arranged according to a definite order. The temple is approached by a flight of steps and a gateway guarded by demoniac figures. In the vestibule are images of the kings of the four quarters, and also prayer-wheels. These, in larger temples, are placed in detached chapels, in which are images of lower divinities. Occasionally, as at Gyan-tse, a temple is built in stepped terraces, like a *vimāna*, crowned by a drum-like structure, on which are a square and a *chhattra* canopy. Shrines to the different Buddhas occupy the various storeys.² The great 'cathedral' at Lhasa faces eastward, and is three-storeyed, the roof being of gold. The approach is through a pillared hall, adorned with pictures. Beyond this is an antecourt, leading to a pillared hall, shaped like a basilica and divided into aisles by a series of colonnades. It is lit from above, as there are no side windows. On the side walls are chapels. Lattice-work separates the cross aisles from the longer aisles, and on the west the sacred place is approached by a staircase. This is in form of a square, with six side chapels, three on each side. An altar stands in the centre, and on the west is a recess with an image of Buddha. Here too are the seats of the Dalai and Tashi Lāmas, and of abbots and lesser officials, as well as images, relics, prayer-wheels, etc.³

(k) The Hebrews had different kinds of sanctuaries before the Temple was built at Jerusalem. The 'tent of meeting' referred to in E was pitched outside the camp in the wilderness. There Moses communed with God, who appeared in a pillar of cloud (Ex 33^{7c}, Nu 11^{24c}, 12⁵ 14¹⁰). It is not described, and was obviously of a simple character. Its one guardian was Joshua, who 'departed not out of the tent' (Ex 33¹¹). The tent may have contained the sacred Ark, a kind of abode of deity, as Nu 7⁸⁹ shows (cf. 2 S 15²⁵), though tent and Ark are never mentioned together. Such portable sanctuaries were used by the Semites, either in nomadic or in more settled times, in the latter case certainly in connexion with war, when the images were carried with the army. The Hebrew 'tent' was used for sacred divination like the Semitic portable sanctuary, and it may be compared with the sacred tents of the Omaha.⁴ The Tabernacle, elaborately

⁴ See § 2 (f) above.

described by P, and containing the Ark, was probably never more than an ideal priestly construction projected upon the past. The Ark was later kept in a 'house' or temple at Shiloh (1 S 1⁹ 33-15), which may have been destroyed by the Philistines, who carried off the Ark. On its recovery, it was kept from time to time in private houses, and possibly in a tent (2 S 7⁶), as it was so kept later by David at Jerusalem (2 S 6¹⁷; cf. 11¹¹). Tents were also used after the settlement in Canaan on the 'high places' (2 K 23⁷, Ezk 16¹⁶, 'sewn high places').

What the 'house' at Shiloh was like we have no means of knowing, but probably it was not elaborate. Micah's image and other religious objects were kept in an apartment of his house (Jg 17⁵ 18¹³). When captured by the Danites, these were placed in a sanctuary at Laish. At Nob there was a sanctuary with its priesthood, containing an ephod and a table of holy bread (1 S 21).

Tent and high place were succeeded by the Temple built by Solomon. It stood within a great court as one of a series of buildings, including the palace, and was thus dominated by the latter, to some extent, though it was itself the chief building. It had its own 'court of the temple,' surrounded by a wall of stone and cedar.

The Temple was an oblong structure of stone, faced by a porch, in front of which stood two bronze pillars called Jaehin and Boaz, like those in front of other Semitic temples. The structure, exclusive of the porch, which was of equal breadth with the Temple, was 60 cubits long, 20 broad, and 30 high. It was divided by a partition with doors into a Holy Place (*hēkāl*) and an Oracle, or Most Holy Place (*debir*)—a square dark chamber 20 cubits in each direction, leaving a space of 10 cubits above it. The interior walls were lined with cedar, carved, and ornamented with gold, and the floor was of cypress. Between the walls of the structure and an outer wall, running round the sides and back to the height of 20 cubits, were three storeys of rooms for treasure and Temple ornaments. In the Temple wall, above these, there were latticed windows. The Oracle, or Most Holy Place, the *adytum*, was the dwelling of Jahweh, and contained the Ark with the cherubim. In the Holy Place stood the altar of shewbread, the altar of incense,¹ and ten candlesticks, five on each side. Outside the porch, which faced east, was the altar of burnt-offering, and near it a brazen sea supported by metal oxen, as well as ten smaller lavers on wheels. The people gathered for worship in the court, though it is called 'the priests' court.' The Holy Place was for the priests alone—a suggestive difference, appearing now for the first time.²

Thus the main features of the Temple were common with those of Syrian and Phœnician temples of the period—porch, outer chamber, and *adytum*—though some have suggested Egyptian influences in its construction.³

Ezekiel's ideal Temple has the same division of inner and outer sanctuaries and porch, but there are two courts, an inner one for the priests, an outer for the laity; and the sacred building was to be entirely dissociated from all secular buildings, and was also to be shut out from Jerusalem by the lands of the Zadokites.⁴

Zerubbabel's Temple of the restoration period had an outer court with walls and gates, and an inner court in which stood the altar of unhewn stones, and perhaps a laver. Into the inner court the laity appear to have had access for a time at least. The Temple itself had a Holy of Holies, but was unique among temples in possessing no representation or symbol of deity, the Ark having been lost. The presence of deity, however, was marked by the ritual of the Day of Atonement. The Holy of Holies was separated from the Holy Place by a curtain, and this chamber contained the table of shewbread, altar of incense, and the seven-branched candlestick. The Holy Place was entered by a curtain.

Herod's Temple, built about 20 B.C., was on a larger scale than any of its predecessors, but the general plan was the same.

A large outer court—'the court of the Gentiles'—was surrounded by porticoes or cloisters with marble pillars, built against the enclosing battlemented wall. Within the area, on a raised platform, was a second court surrounded by a terrace and an enclosing wall with nine gates, and with chambers and porticoes on its inner side. Within this none but Jews might enter. A wall across the breadth of this inner court divided it into two parts, the smaller of which was 'the court of the women.' The other part was open to male worshippers, and within its area stood the temple building, surrounded by a breastwork of stone enclosing the court of the priests. Within this court priests only could enter, except when a layman offered a sacrifice which required his presence. The Temple within this inner area was preceded by a lofty porch and gateway. This gave access to the *hēkāl*, or Holy Place, across the great door of which hung a curtain, and this again to the *debir*, the Holy of Holies, across the entrance to which hung two curtains. Above these was an upper storey, and a side building of three storeys surrounded the Temple on three sides. In the *hēkāl*, which was open only to the priests, stood the table of shewbread, altar of incense, and seven-branched candlestick. The *debir* was empty and quite dark, and was entered by the high-priest alone on the Day of Atonement. In front of the porch outside stood the altar of burnt-offering and the laver. The building was of white marble, and the eastern front and part of the walls were covered with gold.¹ The *debir* was 20 cubits square; the *hēkāl* 40 cubits long, 20 broad, and 40 high. The porch was 100 cubits high, 100 broad, and 20 in depth, and extended on both sides beyond the Temple, with its side buildings, by some 15 cubits. Herod had raised many pagan temples throughout his dominions, and he erected this for the Jews in his capital partly as a matter of policy.

5. Conclusion.—A general survey of temples shows that the essential part is the *cella*, or chamber, for the image of the god, and that, whatever additions are made by way of increasing the splendour of the temple or as adjuncts to it, this remains constant, and is indeed its most important feature. It is the holy place, and is seldom if ever entered save by the priests. The temple at Eleusis forms an exception, for apparently there all was open to the worshippers. But generally worship takes place in the temple area or within the hall preceding the *cella*, which is very often dark and unlit by windows. The Jewish synagogue, the Muhammadan mosque, and the Christian church are not strictly temples, for they are not houses enclosing a divine image, but places of public prayer. Yet even in the mosque the recess, or *mihrab*, indicating the direction of the *ka'bah*, towards which the worshipper prays, has a certain parallel to the *cella* with its image which the worshipper also faces. The great mosque at Mecca also contains the *ka'bah* with the sacred black stone, and the *ka'bah* is an old but reconstructed sanctuary within the mosque. In the Christian church the chancel and the sanctuary with the altar are not ordinarily open to the laity assembled in the nave, but yet they approach the altar at the Holy Communion.

Certain temples are national holy places, like the Pantheon at Rome, the *ka'bah* at Mecca, and similar great temples in important centres. Pilgrimages are often made to temples, and temples form asylums whither criminals flee for safety. Frequently there is much symbolism connected with the temple, and attention is paid to the direction in which it faces, most temples facing the east or the place of the rising sun. Very often in connexion with one great temple there will be a series of lesser shrines for other divinities, all forming a group of sacred buildings within the area. The area is usually enclosed by a wall with gates, which are often most elaborate, and avenues, while pillars and poles stand about it, and it is often decorated with flags and streamers. It is interesting also to notice how frequently with the change of a religion the old sacred places are retained, and successive buildings occupy the old site, or the same temple serves for new deities.

TEUTONIC RELIGION.—I. **INTRODUCTION.**—I. **Position of the Teutonic peoples.**—We have no detailed information (and indeed little historic evidence of any kind) relating to the Teutonic peoples before the time of Julius Cæsar (58 B.C.). For the first one and a half centuries A.D., however, a comparatively large amount of evidence is obtainable. During this time the area occupied extended from the Rhine to the basin of the Vistula. From the Roman empire it was separated by the rivers Rhine and Danube and by a fortified line connecting these two rivers. On the east and south-east the boundaries of the Teutonic area cannot be determined with any precision—the plain of Hungary was occupied largely by Sarmatian peoples, but it seems probable that the Teutonic peoples extended into the basin of the river Dneister. In the north they undoubtedly occupied the kingdom of Denmark and considerable portions of the Scandinavian peninsula.

From the 3rd to the 6th cent. the Teutonic peoples extended their dominions considerably to the south-east, south, and west. The Goths conquered a large portion of S. Russia, and from about 260 to 270 the Romans had to give up to them their territory of Dacia (north of the Lower Danube); moreover, about the same time the Alamanni occupied the Black Forest region. During the 4th cent. bands of warriors, in ever-increasing numbers, began to enter the Roman service, and towards the close of the century a large section of the Goths was admitted *en bloc* within the Roman territories in the Balkan Peninsula. Between 406 and 486 all the western territories of the empire were conquered by the Teutonic peoples, of which the most important were: (1) Visigoths, who occupied S. France and Spain after 412; (2) Ostrogoths, who occupied Italy, 489-553; (3) Vandals, who crossed the Rhine in 406, and in 429 passed over into Africa, which they held for over 100 years; (4) Burgundians, who crossed the Rhine shortly after the Vandals and in 443 occupied S.E. France; (5) Alamanni, who went into Alsace and Switzerland about the same time; (6) Bavarians, who occupied the Alpine regions farther east probably about the same date; (7) Franks, who conquered and occupied successively one part after another of Gaul from 428 onwards, becoming supreme by their victory over the Visigoths in 507; (8) Langobardi, who, after occupying for some time the province of Austria and the Alpine regions to the south, passed into Italy about 568 and brought the greater part of the peninsula under their dominion; (9) English, who conquered and occupied most of the southern half of Britain from about the middle of the 5th cent. onwards.

Before the end of the 8th cent. a new series of movements began among the Northern peoples, an activity almost entirely maritime and lasting throughout the 9th and 10th centuries; this period was commonly known as the Viking Age. While it lasted, large numbers of piratical adventurers

settled on the coasts of the Scottish islands, of Ireland, of the Netherlands, and of N. France. The last named, occupied by the vikings under the leadership of Hrólfir, son of Rögnvald, officer of Harold the Fair-haired, king of Norway, became after 911 the earldom of Normandy. From 866 onwards a large part of England too came under Scandinavian rule, though this domination was only temporary. In 870, however, those Norwegian chieftains who were unwilling to accept the sovereignty of Harold the Fair-haired began permanently to settle in Iceland, and more than 100 years later, in 985, Greenland was colonized from Iceland. Contemporaneous with these events were similar movements across the Baltic, which probably emanated mainly from Sweden. The establishment of the Russian kingdom (traditional date 859) was due to such bands of adventurers. In the East we hear of raids by parties of Scandinavians as far as the Caspian.

2. **The conversion of the Teutonic peoples.**—As conversion was in general due to direct contact with the Romans, we find those Teutonic peoples first converted who were settled within the territories of the empire. Before the middle of the 4th cent. the conversion of the Goths by Wulfilas to the Arian form of the Christian religion had begun and was practically complete within a generation. From them this religion must have spread very rapidly to the Gepidæ in E. Hungary and to other neighbouring peoples, since the Vandals appear to have been converted before the great movement to the West began. The Rugii in the province of Austria, the Langobardi, and some of the Burgundians also adopted the Arian form of Christianity, while the Franks before the close of the 5th cent. and the English in the 7th were converted to Catholicism. It was due largely to the efforts of Irish and English missionaries that between the 6th and 8th centuries the remaining peoples on the Continent (except the Danes), viz. Alamanni, Bavarians, Old Saxons, and Frisians, were converted. In the 8th cent. after great difficulty Charlemagne enforced the adoption of Christianity throughout the territory of the Old Saxons who had been conquered by him. Among the Danes and the Swedes missionary enterprises met with some temporary success, especially in the 9th cent. during the time of the missionary bishop Ansgar (826 to his death in 865). But Christianity was not permanently established in Denmark till after the defeat of Harold Gormsson by Otto II. in 973. In Norway Hákon I. (934-960) and his successors Harald II. and his brothers (960-975) were Christians, but the country was very little affected till the time of Olaf Tryggvason (995-1000), to whom conversion was really due. Many of the Scandinavians settled in the British Isles were converted before the close of the 9th cent., and these countries had become entirely Christian in the course of the 10th century. Some of the early settlers of Iceland had been converted to Christianity in the British Isles, but it was abandoned by their descendants and not established in the island till 1000. The traditional date of the establishment of Christianity in Sweden was 1008, but it was only towards the close of the 11th cent. that the heathen religion was entirely abolished. The adoption of Christianity by the Russians dates from 988.

3. **Authorities.**—(1) The little information which we possess relating to the religion of the Teutonic peoples during the period before their invasion of Roman territories in the 5th cent. is derived from the writings of Cæsar, Strabo, and Tacitus—especially from Tacitus' *Germania*, written in the 1st century. Some little evidence is also furnished by Roman inscriptions. Still less information is to be obtained from the period during which the Teutonic peoples living on the Continent were converted, though a few scattered notices are preserved in the writings of Ammianus Marcellinus (late 4th cent.), of Jordanes (c. 550), and especially of Procopius (about the same

date). In the 8th and 9th centuries a little evidence is to be derived from laws and capitularies in which heathen practices are prohibited, and survivals of heathen practices are occasionally noticed in writings of a much later date. The authorities until the 6th cent. are entirely Greek and Latin, in the 7th Latin alone, and with the exception of Jordanes, a monk of Gothic family, we have no records of Teutonic nationality.

As to actual beliefs we learn very little. The only myth which has come down to us is of Langobardic origin and connected obviously with an attempt to explain the name of that people. It occurs for the first time in the *Origo gentis Langobardarum*, an anonymous work dating probably from the 7th century. There are also two German metrical charms from Merseburg which deal with mythological subjects (10th cent. MSS). Beyond this we have scarcely more than a few names, particularly those of the days of the week, which are translations from Latin and date probably from the 4th century.

(2) *English*.—In England most of the evidence available, which is but little, is contained in the writings of Bede († 735), who in the *Chronicle* attached to the *de Ratione Temporum* has left an account of the calendar used by the English in heathen times. A few references to their religion before conversion are preserved also in the *Ecclesiastical History*. No Anglo-Saxon poems have come down to us in a purely heathen form, but a certain amount of information relating to heathen practices and beliefs may be obtained from *Beowulf* and also from certain shorter poems, especially from charms. We may also learn something of the mythological conceptions of the English from glossaries, letters, and other writings.

(3) *Danes and Swedes*.—Certain foreign Latin works throw light on the religion of the Danes and Swedes. Particular mention may be made (for the Swedes) of the *Life of St. Ansgar* written by his disciple Rimbertus, and of the work of Adam of Bremen, who in the 4th book of his *History of the Church of Hamburg* gives an important description of the sanctuary at Upsala. Later Danish historians add considerably to our knowledge both of religion and of mythology for Danes and Swedes. In particular we have the *Danish History* of Saxo Grammaticus (c. 1200), much of the information in which is obtained from Icelandic sources. He himself acknowledges this in his reference to the men of Thule:

“Their stores, which are stocked with attestations of historical events, I have examined somewhat closely, and have woven together no small portion of the present work by following their narrative.”¹

Some important evidence from earlier times is also to be obtained from inscriptions and sculptured monuments of the heathen period.

(4) *Norway and Iceland*.—(a) For the religion of Norway and Iceland far more abundant information is available from the Icelandic sagas, the evidence of which varies greatly in value. First in importance are the *Íslendinga Sögur* (‘Stories of the People of Iceland’), anonymous works written chiefly in the 13th cent., though a few may be slightly older. These are based on oral sagas—stories preserved by oral tradition in a more or less fixed form of words—from the latter part of the 10th and early 11th centuries. Among these special mention may be made of *Eyrbyggja Saga*, which in its early chapters gives an account of the religious practices of a certain Thórólfr of Mostr, who emigrated to Iceland c. 884 to escape from Harold the Fair-haired. Much information relating to religion is also given in *Egils Saga*, *Njáls Saga*, *Viga-Glúns Saga*. These sagas tell us not only of the religion of Iceland itself, but also of the homeland Norway both before and after the settlement. For throughout the period covered by the *Íslendinga Sögur* (till c. 1030) it was customary for Icelanders to visit the home country, and consequently the scene of the sagas is often laid in Norway.

Next in order to these come the *Stories of the Kings of Norway*, contained in the important collection known as the *Heimskringla* by Snorri Sturluson († 1241). As an authority for the period of Harold the Fair-haired, he is not inferior to the writers of the *Íslendinga Sögur*, but his account of earlier periods, contained in the first saga, *Ynglinga Saga*, is legendary. The longer sagas of *Olaf Tryggvason* and of *St. Olaf*, in the *Floresjarbók* and in the *Fornmanna Sögur*, offer a large amount of additional information, which in general is of a more legendary character than Snorri’s sagas of the same kings, but all these sagas deal primarily with Norway. Much information too about religious practices and beliefs is contained in various stories of ancient time—the *Fornaldar Sögur*—which, like the *Íslendinga Sögur*, are for the most part anonymous, but of which the authority is much inferior to that of the latter. In part they are derived from earlier poems, some of which are inserted in the text. But there is no doubt that much fiction is embodied in these stories. The most important are *Hervarar Saga ok Heidreks Konungs* and *Gautreks Saga*.

(b) For Norse mythology the chief sources of information are the poems commonly known as the Older Edda, the MSS of which date only from the 13th century. The poems themselves, on the other hand, are for the most part considerably older, most of those on mythological subjects dating probably from the 10th cent. and even in some cases from the 9th, and belonging consequently to the heathen period. The poems which give us most information are *Völuspá*, *Vafthrútnismál*, and *Grímnismál*. The first deals with the cosmogony and fate of the gods. The second is in the form of a dialogue on mythological lore between Óðinn and the giant Vafthrúthinn. The third is a monologue by the disguised Óðinn, who gradually reveals himself by his mythological knowledge. Next in order of importance

are *Lokasenna*, another dialogue poem in which Loki attacks various gods and goddesses with scandalous charges; *Skirnismál*, which tells of the wooing of Gerthir for the god Freyr; *Hymiskviða* and *Thrymskviða*, descriptions of the adventures of the god Thor; *Vegtanskvíða* (‘Balder’s Dreams’), a dialogue between Thor and a ferryman supposed to be Óðinn; *Álvissmál*, a dialogue between Thor and a dwarf; *Hymálujóth*, a dialogue between the goddess Freyja and a giantess Hyndla. Much mythology is also contained in the philosophical poem *Hávamál*, and incidentally in some of the heroic poems in the same collection.

In addition to the Edda-poems there have been preserved the so-called ‘skaldic’ poems dating from the 9th and 10th centuries by known authors. The earliest of these (early 9th cent.) are fragments of poetry by Bragi Boddason, some of which are preserved, and which we know come from *Ragnarsdrápa*. To the late 9th cent. belong the *Ynglingatöl* and *Harustlög* by Thjóðholf of Hvin, a genealogical poem describing the ancestors of the Norwegian royal family. To the same century belongs the poet, Thórbjörn Hornklofi. The *Eiríksmál*, an incomplete poem whose authorship is unknown, describes the death of Eric Blood-axe shortly after 954.

There are also extant two poems by Eyvindr Skaldaspillir, the *Hákonarmál* recounting the death of Hákon 1. in 960, a copy of the *Eiríksmál*, and the *Háleygjatöl*, a genealogical poem dealing with the ancestors of the earls of Lathir, and modelled on *Ynglingatöl*. References to mythology are also contained in many other poems.

It is to be noted that our knowledge of mythology comes almost entirely from Icelandic sources, for even the Norwegian poems—including the poems of the Edda, many of which were doubtless composed in Norway—are preserved only in Icelandic MSS. The chief reason for this phenomenon is doubtless to be found in the peculiar faculty for oral tradition developed in Iceland during the 11th cent. or slightly earlier, for which it would be difficult to find a parallel in Europe, except in Ireland. The unusual conditions under which Iceland was converted afford another reason, for there Christianity was not forced from above, as in countries with monarchical government. Indeed in Iceland there existed no strong central power which could effectively stamp out the observances and eradicate the remembrance of the old faith. The traditions of the heathen age survived the hostility of the Church in the 11th cent. and formed evidently a leading source of literary and antiquarian interest to subsequent generations.

A systematic account of Norse mythology is given in Snorri’s Edda (commonly called the Prose Edda), the first part of which, *Gylfaginning* (‘the Befooling of Gylfi’), is entirely devoted to the subject. Much mythology too is also introduced incidentally into the second part, *Skáldskaparmál* (‘the Language of Poetry’). The chief authorities used by Snorri here are the poems of the Edda (*Völuspá*, *Vafthrútnismál*, and *Grímnismál*). He makes use also of some lost poems and also no doubt of oral tradition.

Another account, which, however, has very little in common with the Edda, is given by the same author in the opening chapters of *Ynglinga Saga*. In it the gods are represented as having lived on earth as the rulers of the Swedes in ancient times—an account in which the euhemeristic element is prominent. A certain amount of mythological information also is afforded by the *Fornaldar Sögur*.

(c) The chief authority for the ethics of heathen times is the Edda poem called *Hávamál*, which, properly speaking, appears to be a composite work, made up of five different poems. In substance it may be compared with Hesiod’s *Works and Days* or with the early Egyptian *Wisdom of Ptah-hotep*.¹ Such maxims occur in several other Edda poems, particularly in *Fáfnismál* and *Sigrdrífumál*. They are also common in the earliest Anglo-Saxon poems, though these do not often contain distinctively heathen precepts. The ethical standards of heathen times are no doubt faithfully portrayed in early Norse poetry and in sagas relating to the same period. With certain reservations the same may be said of *Beowulf* and other Anglo-Saxon poems.

4. *Difficulties*.—One of the greatest difficulties which the student of Teutonic mythology has to face is the question of how far the mythology and religious practices found in Iceland alone or in Iceland and Norway were shared also by the Danes and Swedes or by the Teutonic peoples in general. Indeed so little evidence is available, except for Iceland and Norway, that neither positive nor negative conclusions can be drawn with any confidence. Thus we have no information except from Norwegian-Icelandic sources of some of the more important deities, such as Freyja and Heimdallr; yet are we justified in assuming that these deities were unknown except in Norway and Iceland? One is forced to hesitate; for occasionally evidence is forthcoming for characters or conceptions which one might justifiably have assumed to be the creation of Norse literature. Óðinn’s horse, Sleipnir—to quote one instance—is

¹ Tr. O. Elton, p. 5.

¹ Tr. by E. A. W. Budge (‘Egyptian Library’).

represented as having eight legs in Norse mythology, and we find a clear representation of such a horse on an engraved monument at Tjängvide, Götland.¹ The riding *valkyrjur* too (one of the most picturesque conceptions of Norse mythology) might well have been regarded as the creation of Norwegian poetry, had we not met with the same conception on a Swedish inscription at Rök; indeed with great probability it may be traced also in an Anglo-Saxon charm.

Another difficulty which confronts the student is that at first sight there appears to be an irreconcilable discrepancy between the account of Norse mythology given by Snorri and the references to religious beliefs and observances recorded in the *Íslendinga Sögur*. The former represents Othin as the chief and most important god of the Norse pantheon; and the early poems of the Edda and of the skalds agree with this representation. The *Íslendinga Sögur*, on the other hand, scarcely records a single instance of worship of Othin. In them Thor is by far the most prominent deity, and after him Freyr. It is only in the *Fornaldar Sögur* and in the other sagas relating to the legendary period² that we find Othin prominent. The explanation of this fact is probably that the worship of Othin and that of Thor belong to different classes of the population; the former was the god of the royal families and of their military followers, while the latter was the god of the free population in general. Kingship never existed in Iceland, and very few settlers appear to have been of royal blood, and consequently the god of this class of society, though still celebrated in poetry, does not seem to have received any actual worship.

Lastly, one characteristic of Norse mythology may doubtless be accounted for by the fact that so much of our information is drawn from Iceland. In peculiar contrast to the mythologies of other peoples, the Norse deities are not associated with particular localities, and herein no student can fail to contrast Norse and Greek mythologies. Freyr indeed is traditionally associated with Upsala, and there are indications which connect Gifjón with Sjaelland; but these instances are rare. The homes of the gods mentioned in the Edda poems—Breithablik, the home of Balder, Himinbjörg, the home of Heimdallr, etc.—seem to be purely mythical. Some evidence is to be found in place-names, however, that various deities were connected with localities in Norway, Sweden, and Iceland as well as with districts in other Teutonic lands. The reason for this comparative absence of local association is obviously to be found in the fact that by their emigration the colonists were cut off from the ancient sanctuaries of their race.

II. GODS, SPIRITS, AND MYTHICAL BEINGS.—Since Norse literature offers an abundance of material for the study of its mythology and religion, it seems almost necessary to make it the basis of any description of Teutonic mythology and religion. In the following account under each heading an attempt will be made to show also how far the testimony available for the mythology of the other Teutonic peoples is corroborative or discordant. In the first place, it is convenient to distinguish between (1) beings essentially mythical and (2) beings or phenomena in themselves natural but treated mythologically.

i. BEINGS ESSENTIALLY MYTHICAL.—This class consists of the following: (1) *æsir* (sing. *áss*) and *vanir*, (2) *jötnar* (sing. *jötunn*), (3) *dvergar* (sing. *dvergr*), (4) *álfar* (sing. *álfr*), (5) *nornir* (sing. *norn*), (6) *valkyrjur* (sing. *valkyrja*), (7) *fylogjur* (sing. *fylogja*), (8) *landvaettir*, (9) such impersonal conceptions as Yggdrasil's ash.

¹ Cf. Du Chailly, *The Viking Age*, i. 58.

² Cf. *Ynglinga Saga*.

i. *Æsir and vanir*.—(a) *Norse*.—It is a peculiar characteristic of Norse mythology that it possesses two classes of gods. To the *æsir* belong Othin, his sons Thor, Balder, Vali, Vitharr,¹ his brothers Vili and Ve,² and others. To the *vanir* belong Njörthr and his children Freyr and Freyja. Possibly also to the same class belongs Heimdallr, for, though this is not altogether proved by *Thrymskviða*, 14, yet the fact that he is often associated with Freyja, apparently as her guardian, points in this direction.³

The story of the relationship of the two sets of gods is told most fully in *Ynglinga Saga*, 4. There had been a war between them, which was eventually settled by an exchange of hostages. Njörthr and his children were given as hostages to the *æsir*, and Hoenir accompanied by Minir was sent as a pledge to the *vanir*. This story, in part at least, is known to early poetry. In *Völuspá*, 24, it is suggested that the *vanir* were successful, while in *Vafthrúthnismál*, 39, we are told that Njörthr had been given as a hostage to the *æsir*, and that he would return home to the *vanir* at the 'Ragnar Rök.'

Apart from the *vanir* the divine mythology is confined to the *æsir*, in which term all the gods collectively are included. With them there are goddesses, known comprehensively as *ásynjur*, the chief of whom is Frigg, wife of Othin. Often Freyja of the *vanir* is included with this group.⁴

Besides the *æsir* and the *vanir*, we find two deities who belong to neither class and who indeed are never brought into connexion with the Norse pantheon, viz. Thorgerthr Hölgabrúthr and her sister Irpa. Their worship was very prominent in Norway during the last years of the heathen age, especially under Earl Hákon of Lathir, who ruled Norway from 975 to 995 and who was specially devoted to their cult. Of myths connected with them we have no mention in Norse literature except what is apparently a confused reminiscence in *Skáldskaparmál*, 45. Their story is told only by Saxo,⁵ who says that Thora (Thorgerthr) is the daughter of Cuse (*i.e.* Gusi), king of the Lapps, and wife of Helgi, the eponymous hero of Halogaland. It is generally believed that these deities hail from the north of Norway, and their character is Finnish (Lappish) rather than Norse.

Under the lordship of Othin the gods form an organized community, which is evidently modelled after the fashion of the ancient Scandinavian community. They have a council of twelve, whose duty it is to keep up the sacrifices, to deliberate on the government of the country, and to judge between man and man.⁶ Councils of this type are found in many early Scandinavian countries, and there can be little doubt that in heathen times they had religious as well as judicial functions. In *Grímnismál* the gods are said to meet daily at Yggdrasil's ash. From the same poem we learn that each of the gods had a home of his own, the names of which are apparently mythical and generally adapted to the character of the god, Breithablik for Balder, Alfheimr granted as a tooth gift (*at tannfé*) to Freyr, etc. The most frequently mentioned is Othin's home of Valhöll ('the hall of the slain'), where he, together with the valkyries, entertains hosts of slain warriors, who pass their days in combat and their nights in feasting. In *Gylfaginning*, 23, some verses are quoted indicating that Njörthr loves living by the sea-shore, while his wife Skathi, daughter of Thjazi, a *jötunn*, prefers to dwell in her father's home, the mountains. Wherefore a compact is made by which they divide their time between the two places—Njörthr's home is called here

¹ Cf. *Gylfaginning*, 30, 51; *Grímnismál*, 17.

² Cf. *Gylfaginning*, 6.

³ Heimdallr's father is not mentioned, but he is said to be the son of nine mothers, whose names are enumerated in the closing stanzas of *Hymdaluðóth*.

⁴ See art. God (Teutonic).

⁵ Tr. O. Elton, p. 87 ff.

⁶ Cf. *Gylf*, 20.

Nóatún. The association of Freyr with Upsala does not belong to this category.

Besides their individual homes, the gods collectively are said to inhabit Asgarth. Their meeting-place is called Ytha-völlr.¹ In *Gautreks Saga*, 7, the hero Starkathr is represented as attending a conference of them held in a forest clearing. The significance of this (together with Yggdrasil's ash and the fact that *völlr* originally meant 'wood') is seen below, § IV.

A totally different account of the gods is given by Snorri, curiously enough, in the early chapters of *Ynglinga Saga*. Here they are represented as men who had once lived on the earth and come to Sweden from S.E. Europe. Othin is represented as dying and being succeeded in the leadership of the gods by Njörth, whose reign was marked by prosperity and peace. The latter on his death was succeeded by his son Freyr, whose reign was of the same character. Freyr was succeeded by his sister Freyja, and she in turn by Freyr's sons, grandsons, etc., who are no longer represented as gods.² This story is no doubt of euhemeristic origin, but the association of Freyr with Upsala is ancient and traditional. In Saxo he is represented as instituting the Upsala sacrifices and is said to be the ancestor of certain Swedish warriors. *Ynglinga Saga* itself is largely based on an early poem *Yngtingatöl*, which traces the ancestry of the ancient Norwegian royal family through the Swedes to Freyr, who is no doubt to be identified with Fricco of Adam of Bremen's account.³

There are many stories relating the appearances of the gods to men. These occur most frequently in the *Fornaldar Sögur*, and the deity most mentioned is Othin.⁴

(b) *Danish and Swedish*.—On examining non-Norse sources, we find a number of the Norse gods mentioned by Saxo, including Woden (Othin), Thor, Freyr, Frigg, and Oller (Ullr), as well as Balder and Hoder (Höthr), who, however, are by him represented as demi-god and human being respectively. It is not always clear how far Saxo draws from Icelandic sources, but there can be little doubt that these deities were known to him from Danish tradition. Freyr is constantly associated with Upsala and Sweden, and Saxo is also the only authority who gives the story of Oller (Ullr).⁵ With Saxo the home of the gods is sometimes called Byzantium, which apparently is used to translate Asgarth.

With regard to Swedish beliefs, we have important earlier evidence in Adam of Bremen's description of the sanctuary at Upsala. This contained the images of three gods, Thor, Woden (*i.e.* Othin), and a deity Fricco, who is in all probability to be identified with Freyr. No stories of the gods are, however, recorded from Sweden. In much earlier times we have a short account of the religion of the people of Thule (*i.e.* Scandinavia) written by Procopius.⁶ The only deity specially mentioned by him is Ares, and it is not clear whether by this name we are to understand Othin or Tyr. An early trace of worship of Freyr may be preserved in the name Prove(n)—the god among the Wagri of N.E. Holstein.⁷

(c) *English*.—For the mythology of the heathen English we have little or no information except that to be obtained from names. The A.S. word *os*, corresponding to the O.N. *áss*, occurs as the name of one of the letters of the Runic alphabet (though here apparently its meaning is forgotten).⁸ It also is to be found very frequently in personal names, as in Oswald, and the plural form occurs only in the genitive *essa* in an A.S. charm.⁹ The form *van-* does not occur, except rarely in personal names—*e.g.*, Wanraed—unless this is possibly the origin of the prefix *wan-* in *wanseoec* ('epileptic'),

in which case we might compare *elf-ald* in Saxon *Leechdoms*,¹ ii. 344. 20.

Othin's name also is preserved—A. S. Woden—as the ancestor of all the royal families except that of Essex, which traced its genealogy to a certain Seaxneat. His name is also preserved in 'Wednesday' (as a translation of 'Mercurius'). Thunor (O.N. Thor) is known only from 'Thursday' (where his name is used to translate 'Juppiter') and from certain place-names, *e.g.*, Thunresleah and Thunresfeld.²

The name of Fri (*i.e.* Frigg) is preserved only in 'Friday' (as translation of 'Venus'), and Ti (Tiüg) (O.N. Týr) occurs in glossaries as translation of 'Mars,' and, like *os*, is the name of one of the letters of the Runic alphabet. His name is preserved also in 'Tuesday.' In Bede's account of the heathen English calendar two months (corresponding to March and April) are said to derive their names from goddesses called Rheda (Hrei?) and Eostre (Eastre). The existence of these deities has been doubted by some modern writers. We also find a reference, in a charm which appears to be a mixture of Christian and heathen beliefs, to Erece ('Mother of Earth'), with which we may compare Semnes Mate (Lettish).

Lastly, mention may be made of Ing, the name of one of the letters in the Runic alphabet. In the verses dealing with Ing he is said to have been seen first among the East Danes, but afterwards he went east over the sea, his car speeding after him.

(d) *German*.—With regard to German mythology, a fragment relating to gods is preserved in one of the Merseburg charms, in which we are told that Wodan and 'Phol' were riding to the forest when the pastern joint of the latter's horse was dislocated. Various deities tried by their incantations to put it right. The names mentioned are Frija and her sister Volla,³ and Sinthgund and her sister Sunna. The only other myth recorded occurs in certain Langobardic writings and is rather striking.

'The two tribes of Vandals and Langobardi (then called Winniles) appealed to the gods for victory in their war with each other. The Vandals approached Woden, who replied: "Whatsoever I shall first look upon when the sun rises, to them will I give victory." The Winniles appealed to Frija, wife of Woden, who gave counsel that at sunrise the women of the Winniles should come with their husbands and let down their hair about their faces, like beards. And when Woden saw the Winniles women, he said: "Who are these Longbeards?" And Frija replied: "As thou hast given them a name give them also victory." And he gave them victory.'⁴

Apart from these references, the gods are known from the names of the week: Donar (O.N. Thor); A.S. Thunor) throughout the German area; Fria (Frigg, Fri) at least in the greater part of German area; Wodan (Othin, Woden) only in the north-west and in Holland; Tiu (Ti, Tir) only in the south-west. Occasional references to the gods are also found in lives of missionary saints. Thus the worship of Wodan among the Alamanni is mentioned in Jona's *Life of Columbanus*, while in other cases German deities are no doubt intended by old names such as Juppiter. In a formula used after baptism and commonly supposed to have come from the region of the Old Saxons (though the language is rather peculiar) the convert is required to abjure Wodan and Thunor and Saxnot together with other monsters (*Unholden*) associated with them. This Saxnot is doubtless to be identified with the name that stands at the head of the genealogy of Essex. Lastly, in Alcuin's *Life of St. Willibrord* we hear of a god called Fosite. He was worshipped on a certain island, called after him and identified

by Adam of Bremen with Halogaland.¹ Grimm and others have identified this deity with Forsete, the son of Balder,² but discrepancies in the spelling of the two names offer difficulty.

In Gothic no names of deities have been preserved, unless we place in this category the name of the Runic letter Enguz (A.S. Ing). The word *ansis*, however (O.N. *aesir*), is mentioned by Jordanes in a curiously interesting connexion. He states that the Goths called their chiefs to whose good fortune they thought they owed their victory, 'non purus homines sed senideos id est anses.'³ In earlier times Tacitus,⁴ though unfortunately he seldom mentions Teutonic gods by their native names, twice mentions Mars and Mercurius among the deities of the Germans, and in the *Germania* specially mentions Mercurius as the deity most worshipped by them. There can be no doubt that the deities meant are the later Ziu and Wodan (N. Tir and Othin). In ch. 9 too he mentions Hercules and in *Annals*, ii. 12, a grove sacred to him. It is not so easy to ascertain the identity of this deity. Some modern writers believe Donar (O.N. Thor; A.S. Thunor) to be intended; others think the reference is to a tribal deity.⁵ In the same chapter Tacitus states that some of the Suevoi worship with the symbol of a ship. Here again we are left in doubt as to the identity of the deity. Perhaps we may include the 'templum Tamfanæ' mentioned in *Annals*, i. 51, and 'lucum quem Baduhennæ vocant' in iv. 73, if these be the names of deities. In *Germ.* 43 he speaks of a grove in which Castor and Pollux are worshipped under the name of deities. The fullest account, however, of a Teutonic deity is that of Nerthus,⁶ who was worshipped by certain maritime peoples including the English, and whose sanctuary was situated on an island, the position of which is not clearly stated by Tacitus but is probably to be placed in the S.W. Baltic. It is to be observed that the name Nerthus is identical with the O.N. Njörth, and, in spite of the difference in sex, we need scarcely doubt their original identity. Rites similar to those which Tacitus describes in connexion with Nerthus are associated with Freyr, son of Njörth.

Apart from Tacitus, practically the only references to Teutonic deities occur in inscriptions upon altars raised by soldiers in the Roman service. Besides Mars, these inscriptions sometimes record a deity Nehalennia with the prow of a ship, and this may point to the identification with the Isis of Tacitus. In the introduction to *Germ.* 2 Tacitus states that in their ancient poems the Germans trace the origin of their race to a god called Tuisto ('son of earth'). His son was Mannus (?' man'), and he again had three sons from whom three groups of peoples were named and descended—the Ingaevones (or Inguæones), Ermiŋones, Istaevones. These group-names are mentioned also by Pliny the Elder, and a genealogy of the kind classifying Teutonic and other peoples is found in Merovingian times. We have no trace elsewhere of any god or hero called Istio, but there is some slight evidence for an Irmen. The name Ingaevones (or Inguæones) is undoubtedly to be connected with A.S. Ing, who is associated in tradition with the Danes and with the titles Inguina Eodor and Frea Inguina, used in *Beowulf* of the king of the Danes. It is further to be noticed that in Norse the god Freyr and his descendants sometimes bear the title Yngvi, the full title of the god being Yngvi-Freyr or Ingunar-Freyr. His descendants—the ancient kings of Sweden—are known collectively as Ynglingar. It will be seen that there is some discrepancy between Norse and English tradition, the former connecting the name with Sweden, the latter with Denmark. Whatever may be the explanation of this, the association of the word with Freyr, the son of Njörth, seems to point to some connexion with the worship of Nerthus—a conclusion which is confirmed by the fact that Tacitus, with whom Pliny is substantially in agreement, describes the Ingaevones as 'proximi oceano.'

2. *Jöttnar*.—(a) *Norse*.—Giants or monsters play an important part in the stories of Norse mythology. When viewed collectively, they are called *jöttnar* or *thursar*. Sometimes also we hear of the *hrimthursar* ('frost-giants') and *bergrisar* ('cliff-

giants'). Most often, however, they appear singly, and the corresponding feminine form of the word *jötunn* is *gygr*. Unlike the *aesir*, they do not appear to form an organized community as a whole, though sometimes individual *jöttnar* (like Thrymr, 'Lord of the Thursar') seem to have communities under their dominion. The home of the giants is known as Jötunheimar, lying, according to early story, far to the north-east, remote from Asgarth, the home of the *aesir*. The general characteristics of the giants were huge form and superhuman strength.

The story of Skrymnir¹ tells dramatically how huge and strong a giant was conceived to be in Norse literature. For the god Thor took refuge one night in the thumb of one of his gloves, and, when he attempted to kill the giant with a blow of his hammer, Skrymnir only asked whether a leaf had fluttered down into his face.

Although the giants may have had monster shapes, it seems clear that sometimes the giantesses were deemed very beautiful, as in the case of Gerthr, to whose radiant beauty Freyr lost his heart.

It is necessary to distinguish between anthropomorphic and theriomorphic giants, though it is difficult to draw a definite line between them; e.g., Loki has theriomorphic children. Many of the former class are mentioned in myth, the best known being Thrymr, Hymir, Hrungrnir, Geirröth, and Thjazi, all of whom fight with Thor, and are slain by him.

Sometimes the *jöttnar* are on friendly terms with the *aesir*: Hyrökin, a giantess, attended Balder's funeral, and it was through an appeal to her strength that the funeral ship was able to be launched. Further, we find a number of marriages between gods and giants; Njörth married Skathi, the daughter of Thjazi.² Freyr married Gerthr, daughter of Gynir; and even Thor, despite his general hostility, had a son Magni by a giantess Jarn-Saxa. This giantess, with others, including the daughter of Geirröth, appears as the mother of Heimdalr in *Hynduhjóth*, but this part of the poem (the short *Völuspá*) is commonly believed to be a late composition. The giants too are often represented as wanting to marry *ásmjúg*; Thjazi carries off Ithunn, and Freya was sued for by Thrymr. It may here be mentioned that anthropomorphic giants often had the power to assume the form of animals. In the incident referred to above Thjazi assumes the form of an eagle, and in *Vafthrúthnismál*, 37, the wind-demon Hraesvelgr is described as a *jötunn* in the shape of an eagle.

Although the giants are presumably gifted with tremendous physical strength, they are not always lacking in intelligence, for we have the incident of Othin's visit to the giant Vafthrúthnir in order to learn of his store of wisdom.

The chief theriomorphic *jöttnar* are the Mithgarthsormr, or Jörmungandr, and the Fenrisulfr, both of whom together with Hel are said to be the offspring of Loki and the giantess Angrbotha ('she who bodes distress'). Mithgarthsormr is represented in *Gylfaginning*, 34, as a kind of vast sea-serpent stretching round the earth. In *Hymiskvitha*, 23, Thor goes fishing and catches it on his hook. Fenrisulfr is a wolf which the gods succeed after great difficulty in fettering, though not until he has bitten off Tyr's hand, which has been placed in his mouth as a pledge of the good faith of the gods.³ At the end of the world he will burst his bonds and attack the gods in conjunction with Mithgarthsormr, Loki, Surtr (a fire-demon), and other monsters. Although usually found in the company of the *aesir*, it would seem that Loki belonged to the *jöttnar*. Here also we should perhaps mention Ægir, also called Hlér, a sea being, who is on friendly terms with the gods and visits them.⁴ From *Fornaldar Sögur*, ii. 17, it seems clear that he was the son of Fornjotr, and in *Hymiskvitha*, 1, 2, he is described as a *berg-búi* ('cliff-dweller'), an epithet which is elsewhere synonymous with *jötunn*. His wife is called Ran,

and is said to have a net in which she catches all who perish in the sea. There is a suggestion too from the story in *Frithjofs Saga*, 6, that a man fearing death by drowning would do well to carry gold on his person in order to be received well in the halls of Ran.¹

Apart from mythological works monsters are not infrequently mentioned both in the *Islendinga Sögur* and in sagas of the kings, as well as in the *Fornaldar Sögur*, though they are more usually called *tröll* than *jötnar*.

As examples we may refer to the two demons (male and female) at Sand Haugar in the north of Iceland encountered by Grettir;² the female demon who ate eleven merchants in a rest house in the Norwegian mountains;³ and the monster Brusi and his mother in the form of a black cat encountered by Ormr Stórolfsson in the *Saga of Olaf Trygvason*.

In those *Fornaldar Sögur* which deal with the north of Norway, viz. *Ketil Saga Haengs* and *Grim's Saga Lotlinkinna*, monsters are frequently mentioned. It may be noticed that Thorgerth Hölgabrúthr once appears among them,⁴ and Saxo's *Danish History* abounds with such stories. Tales like these recall Procopius's remark: 'The rest of the inhabitants of Thule . . . worship many gods and demons in heaven and in air and in sea and certain other daemones which are said to be in the waters of springs and rivers.'⁵

A spring was the home of Mimir. His story is given in *Ynglinga Saga*, 4, where the *æsir* send him with Hoenir as pledges to the *vanir*, who cut off his head and return it to the *æsir*. Othin then smears the head with worts to preserve it and keeps it for divining purposes. In *Völuspá*, 45, Othin is said to converse with Mimir's head. We are told further⁶ that under one of the roots of Yggdrasil's ash is Mimirbrunnr ('Mimir's spring'), in which are hidden cunning and wisdom. Othin came to the brook asking a drink and was refused until he left his eye as a pledge. This he granted, and in *Völuspá*, 28, the sybil says: 'Mimir drinks mead every morning from the pledge of Othin.'

A reference to a Miming is made by Saxo⁶ in his story of Balder and Höthir. Here Miming is called the 'silvarum satyrus,' and is said to have in his possession a sword and magic bracelets, the former of which alone of all swords will prevail against the charmed life of Balder. At the beginning of *Thithreks Saga* too Mimir is the name of the smith, teacher of both Sigfrid and Velint. It is to be noted also that Miming was the name of Weland's famous sword in the poem of *Waldhere*.

Perhaps originally Mimir was famed for his wisdom, but later tradition laid stress on his skill in smith's work. His name is preserved in modern Swedish folk-lore—Mimis-sjö and Mimis-ä ('sea of Mimir' and 'river of Mimir'), both of which preserve his connexion with water. His name is also mentioned in the mediæval German poem *Biterölf* as 'Mime the old.'

(b) *Anglo-Saxon*.—The A.S. forms corresponding to the Norse *jötunn* and *thurs* are *ecoten* and *thyrs*, and both terms are applied in *Beowulf* to the monster Grendel, who with his mother dwells under a pool in the fens and makes attacks on the hall of the Danish king whose knights he devours. As far as we can gather, these beings are anthropomorphic. The story of *Beowulf's* encounters is clearly to be connected with those of Grettir and of Ormr Stórolfsson and presumably has its origin in a folk-tale. In A.S. literature ancient weapons are sometimes described as being made by the giants.⁷ In the *Gnomic Verses*, which form the introduction to the Abingdon text of the *Anglo-Saxon Chronicle*, the *thyrs* is said to have his home in the fens.

⁵ *Gylf*, 15 (drawn from *Völuspá*, 29).

⁶ P. 85.

⁷ 'Eald sword ecotensc' (*Beowulf*, l. 155S). The same expression is used for buildings of the past: 'Visible from afar are the (cities) skilfully built by the giants.'

(c) *German*.—There is no doubt that these monsters were known also in Germany, where we find for them the words *duris* (i.e. *thurs*) and *risi*. No stories dating from very early times happen to have been preserved, but mediæval German poetry and legend abound with references to such beings.¹

3. *Dvergar*.—(a) *Norse*.—*Dvergar* is the name given collectively to the dwarfs in Old Norse literature, and to many of them are assigned individual names in *Völuspá*, 15 ff., where also their creation is mentioned. In *Gylfaginning*, 14, Snorri tells us that they first received life as maggots in the flesh of Ymir, but were endowed with intelligence by the gods, and given human shape. The *dvergar* were said to live either down in the earth or more frequently in stones (rocks), in front of which they were sometimes seen in the evening.

Svegdír one evening at sunset saw a dwarf sitting under a stone, and when the dwarf called him to go into the stone, he assented, whereupon it shut behind him and naught has been heard of him since.²

It is perhaps to their connexion with rocks that the word for echo—*dvergmál* ('dwarf-speech')—owes its origin. In Norse literature they were renowned particularly for their skill in metal-work, and many were the wonderful things fashioned by their hands—so much so that a compound word has been formed to denote great skill, viz. *dverg-hagr*.³

On most occasions the dwarfs appear in human form, though small, but in *Reginmál* Andvari lives in a water-fall in the shape of a pike and is caught in that form by Loki, who borrows Ran's net for the purpose. It is from him that Loki gets the gold required to ransom himself and his companions, Othin and Hoenir, from Hraethmarr, and this incident afterwards plays an important part in the *Völsunga Saga*. After this episode Andvari withdraws into the stone and curses all who shall possess the gold.

Possibly, too, 'Mimingus, sylvarum satyrus' mentioned by Saxo is associated with dwarfs, and possibly this Miming is identical with *Völundr* or *Weland*, the most famous of all smiths.

(b) The word corresponding to O.N. *dvergr* is to be found in all languages of the Teutonic peoples extant—O.H.G. *twerg*, A.S. *dweorh*. In A.S. literature we find a charm against a dwarf. Dwarfs also figure in German folk-lore. Thus in the *Seyfriedslied* the treasure which the hero won again after killing the dragon belonged in reality to some dwarfs, sons of Nybling.

4. *Alfar*.—For these see art. DEMONS AND SPIRITS (Teutonic), vol. iv. p. 633.

5. *Nornir*.—For these see art. DOOM, DOOM MYTHS (Teutonic).

6. *Valkyrjur*.—(a) *Norse*.—Valkyries, or 'choosers of the slain,' were supernatural maidens sent by Othin to determine the course of battles and to choose warriors for Valhöll. They are also known as *valmeyjar*, *skjoldmeyjar*, and *óskmeyjar*, and in *Völuspá*, 31—if the phrase is not an interpolation—they are called *nönnur herjans*. By the Edda poems, *Grimnismál*, 36, and *Völuspá*, 31, we are given certain information about them, and of the former poem Snorri has made use in *Gylf*, 36. In *Grimnismál* our attention is drawn mainly to one aspect of the valkyries—their duties in Valhöll; for Othin is represented in the poem as crying to his maidens to bear him the ale as they do to the *einherjar*, when they are feasting in the evening in the hall. Here we have the names of thirteen valkyries given.

Snorri inserts this stanza from *Grimnismál* in his elaborate account of Valhöll in *Gylf*, 38, expanding it in prose and adding that Othin sends these maidens to battle. He specially mentions

¹ Cf. art. DEMONS AND SPIRITS (Teutonic), vol. iv. p. 634.

² *Ynglinga Saga*, 15; also *Hervarar Saga*, 2.

³ See art. DEMONS AND SPIRITS (Teutonic), vol. iv. p. 633^b.

Guthr, Rosta, and Skuld, the youngest norn, as undertaking this work. It is this function of the valkyries that the poet of *Völuspá* deals with in str. 31 of the poem. He gives us a picture of a band of valkyries, six in number and named, equipped and ready to ride into battle. From other references in Norse literature we learn that they were seen riding through the air and over the sea ('*lopt ok lög*'), white and shining with their helmets, shields, and spears—a splendid company of maiden warriors.¹

With the valkyries may perhaps be compared the Slavic conception of the *vila*, who was thought to ride a seven-year-old stag and bridle him with snakes. The characteristic, attributed to her by the Slavs, of discharging fatal darts at men while in the air is especially interesting when compared with a similar reference in an A.S. charm.²

Other valkyries, who became the wives and lovers of heroes, and are represented as human in origin, although included by Othin among his battle-maidens, are mentioned below.³ From a story in Saxo⁴ we hear of maidens called 'nymphæ sylvestres,' who seem to be valkyries.

Hotherus (O.N. Hóthr), the enemy of Balder, was hunting in a wood when he came to a lodge where he was greeted by certain wood-maidens. They told him that it was their lot to determine the fortunes of war and that often they secretly assisted their friends in battle, and gained for them the victory.

Since the valkyries were so closely bound up with the fate of warriors and the issue of battles, it is clear that they cannot be entirely dissociated from the norns. The close relationship between the two conceptions is clearly seen in the poem given in *Njáls Saga*, 156.

There in the accompanying prose account a certain Darruthr saw women riding twelve together to a bower, and, looking within, he saw that they had set up a loom of which 'men's heads served for weights, men's entrails for the weft and warp, a sword for the *skeith*, and an arrow for the *hræll*.' They sang at their work and in their song seemed to describe themselves as valkyries, and finally they rode away, six to the south and six to the north.

Moreover, in *Gylf*. 36 Skuld, the 'youngest norn,' is included among the valkyries. In contrast with the norns, however, the valkyries are in Norse mythology associated chiefly with Othin, whose messengers they are, though in one passage quoted from Saxo they seem to assist Hother, who is an enemy of the gods.

(b) *Anglo-Saxon*.—In A.S. literature we find on several occasions the word *wælcyrge* (O.N. *valkyrjur*). In glossaries⁵ it is glossed 'Erinyes,' 'Belona,' 'Tisiphone.' In Wulfstan's *Sermo ad Anglos* the *wælcyrge* are classed together with other undesirable people, and in a charm mention is made of certain women who ride over the land and array their forces. They hurl darts at human beings, who are thereupon seized with sudden pain. The word *wælcyrge* is not mentioned in the latter example, but there can be little doubt that the lines refer to them.

(c) *German*.—In German the word does not occur, though the idea does in the Merseburg charm, where they are called *idisi*. They are represented as fastening bonds, holding back the host, and tugging at the fetters.

7. *Fylgjur*.—For these see art. SOUL (Teutonic).

8. *Landvaettir*.—Just as the *fylgja* presided over the individual, so the *landvaettir* presided over the country as its tutelary spirits. A certain number of references are to be found to them in Norse literature, not the least interesting being the heathen law mentioned in the *Landnámabók*, iv. 7, which ordered that figure-heads of ships were to be removed on approaching the island, lest they should frighten the *landvaettir* with their 'yawn-

ing heads and gaping snouts.' In *Egils Saga*, 57, Egill turns a curse against the *landvaettir* of Norway in order to force them to drive away King Eric and Queen Gunnhildr, from whom he was fleeing. Sometimes *landvaettir* seemed to favour certain individuals, as was the case with Björn, the lie-goat whom they accompanied to the assembly, while his brothers were accompanied by them when hunting and fishing.¹

The *landvaettir* seem not always to be very clearly distinguished from the *fylgjur* of individuals; e.g., in the *Saga of Ólaf Tryggvason* (*Heimskringla*), 36, it seems to be suggested that the *landvaettir* of Iceland seen by the wizard are connected in some way with the great chiefs of the land. The word *vaettir* (pl. *vaettir*) is identical with A.S. *wiht*, 'creature,' etc., although the latter has not the specialized meaning of Old Norse. For the idea itself we may refer to the *genius loci* of the Romans.

9. *Yggdrasil's ash*.—Our information for Yggdrasil's ash is mainly derived from *Völuspá*, 19, 20, 27, and *Grímnismál*, 29-35. References also occur in *Fjölsvinnsmál*, 13-18. From *Völuspá* we learn that the ash Yggdrasil stands ever green over the well of Urthir ('Fate'), and from it falls dew into the vales beneath. Under this tree dwell the three norns. In *Grímnismál* not only do we learn that the *æsir* go daily to the judgment-seat under the ash, but we are given many details about its appearance.

It has three roots stretching in three directions. Hel dwells under one, the frost-giants under a second, and under the third the children of men. Its branches are the home of an eagle, a hawk, and a squirrel Ratatöskr, who bears messages to Nithöggr dwelling below. Four harts gnaw the topmost branches, and many are the serpents which lie under its boughs.

In *Gylf*. 15f. Snorri adds that in the spring of Fate dwell two swans, from whom are sprung all birds of that race, and also from the branches of the ash drops dew called 'honey-dew,' on which bees feed. The ash is sometimes called Yggdrasil, Askr Yggdrasil. Laéráthr, Mjotvithr, and Míma-meithr seem to be names for the same tree. In both *Grímnismál* and *Fjölsvinnsmál* we have indications that the ash is being gradually destroyed; a hart bites it from above, it rots in its side, and Nithöggr gnaws it from beneath. And, according to *Völuspá*, 47f., when the last days come, it will shiver and groan. The golden foliaged Glasir which stands by 'Sigtyr's halls'² is perhaps to be identified with it. One other striking passage must be mentioned—*Hávamál*, 138, in which Othin is described as hanging on that tree of which no one knows from whose roots it proceeds.

A similar conception to that of a world-tree is certainly to be found among other Teutonic peoples—e.g., among the Old Saxons, who worshipped the Irmsensul. Several features in Adam of Bremen's description of the tree beside the temple of Upsala also recall Yggdrasil's ash.³

ii. NATURAL THINGS VIEWED MYTHOLOGICALLY.—1. *Day and night*.—From references in *Vafthrúthnismál*, 13, 25, Night, the daughter of Nörr, is depicted as driving across the sky her chariot and horse Hrimfaxi, from whose bit falls the spume which makes the dew in the valleys. Of Day we are only told that he is born of Dellingr. In *Gylf*. 10 Snorri gives further genealogical details.⁴ In *Alvissmál*, 30, is given a list of names by which Night is known among the *jötvar*, elves, and gods. In the document *Hversu Noregr Bygðist* we find a genealogy traced back to Swan the Red, son of Dagr, son of Dellingr, and of Sól, daughter of Mundilfari. For the personification of Night and Day, we may compare

⁴ See art. SUN, MOON, AND STARS (Teutonic and Balto-Slavic).

Greek mythology, especially the allusions to the chariots of the Sun and the Moon.¹

2. Sun and moon.—For these see art. SUN, MOON, AND STARS (Teutonic and Balto-Slavic).

3. Rainbow.—To the old Norse people the rainbow was the bridge built by the gods to span the space between earth and heaven. Bifröst or Ásbru was its name, and it was triple-hued. Though it is made with cunning and of great strength, Snorri tells² that the day will come when it shall be broken. This bridge is referred to as Bifröst in the Older Edda, though it is not explicitly identified with the rainbow. In *Gylf.* 27 Heimdallr is named as guarding it against the frost and cliff giants.³

4. Winds and seasons.—In *Vafthrúthnismál*, 27, 37, references are made to the winds and seasons. The winds, according to the poet, arise from beneath the wings of the giant Hraesvelgr, who sits at the end of heaven in the likeness of an eagle. In *Vafth.* 27 Vindsvallr is said to be the father of Winter and Svasudhr of Summer. In *Gylf.* 18 f. Snorri gives further details, explaining that the difference between Summer and Winter is to be accounted for by the difference of parentage, for each has inherited the disposition of his father.

5. Thor.—In the preceding paragraphs we have been dealing with mythological conceptions which are scarcely distinguished from the natural bodies or phenomena which have given rise to them. There can be no doubt, however, that other mythological conceptions originated from similar phenomena in early times, though their identity with these was subsequently forgotten. Thus the name of the god Thor is identical with the word for 'thunder' preserved in English and German. The identity was practically forgotten in Norse owing largely to the fact that the word had gone out of use, but it is clearly preserved in Adam of Bremen's account of the Upsala sanctuary, where he speaks of Thor, 'qui tonitrus et fulmina . . . gubernat.'⁴ We may refer also to the 'malleo joviales' which were carried off by the Danish prince Magnus on one of his raids among the Swedish islands, and which, according to Saxo,⁵ had been venerated as symbols of thunder.

In English and German the name of the god is not distinguished, and consequently with the small evidence at our disposal it is not always clear which of the two was meant. The thunder-god (especially personifications of thunder) is of course wide-spread among the people of Europe. It is sufficient here to refer to the Taranis of the Celts (whose name appears to be identical with that of the Scandinavian Thorr), Juppiter Tonans of the Romans, Zeus Keraunios of the Greeks.

6. Othin.—Many writers hold that Othin originated in a personification of the wind. This view is largely bound up with the association of the god with the raging host, the antiquity of which is not very clear. The name Woden itself, which seems originally to have meant 'inspired or frenzied,' hardly furnishes a parallel to the case of Thor.

7. Jötnar.—It has been supposed by many writers that not only gods but also *jötnar* largely owe their origin to personification of natural phenomena. The *hrimthursar* ('frost-giants') indeed, of whom we often hear collectively, can hardly be of other origin. The friendly *jötunn* Aegir is very closely associated with the sea, for

¹ E.g., Homeric *Hymns*, xxxi. 15 f., xxxii. 9 f., and, in particular, *Od.* xxiii. 244 ff. Cf. also 2 K 23¹¹.

² *Gylf.* 13.

³ For reference to the rainbow in other mythologies we may compare *PC*³ i. 298.

⁴ iv. 26.

⁵ *Gesta Danorum*, ed. A. Holder, Strassburg, 1886, p. 421.

which his name is often used in poetry. There is some reason also for suspecting that Thrymr, the *jötunn* who steals Thor's hammer, may originally have been a counterpart of Thor, a rival thunder-god. It has been proposed by some that the *coten* Grendel in *Beowulf* arose from a personification of storm-floods, but this explanation is open to the objection that the story is clearly based on an early folk-tale, the original locality of which has not yet been determined. If the *jötnar* in general had been derived from the personification of natural phenomena, one would expect to find an obvious meaning for their names, as in the case of Thor and perhaps of Thrymr, but as a matter of fact the etymology of the majority of their names is quite obscure.

According to another view, which has obtained more currency in recent times, the *jötnar* largely represent the communities of a more primitive race or civilization. This view also can be justified in some cases by the records. The giant Hrungrnir fights against Thor with a hone, which may perhaps represent a stone hammer, and the word *berg-búi* ('cliff-dweller') points in the same direction. In some stories, as in the case of Grendel, the *jötnar* have cannibal propensities, and for this practice there is thought to be evidence in the way human bones are found mixed with those of animals in some caves. We may note also that the name Heithr is sometimes applied to witches of 'Finnish' (Lappish) origin, while in *Hynndluljóth* Heithr is said to be the daughter of the *jötunn* Hrungrnir.

Occasionally also the word *jötunn* is applied in some MSS to persons also described as *Finnar*, as in the case of Swasi, father-in-law of Harold the Fair-haired. In the genealogies given in a document *Hversu Noregr Bygðist* some connexion is hinted at between *Finn* and *jötunn*. With the evidence at our disposal we are not yet in a position to determine their origin. It has been suggested also that the *dvergar* may be derived from communities of more primitive inhabitants.

8. Nornir.—The *nornir* bear so close a resemblance to the *völur*¹ ('wise women'), not infrequently mentioned in the sagas, that there can be little doubt that they are at least partly derived from them. Sometimes indeed the words *norn* and *völva* are used interchangeably.

9. Valkyrjur.—It is not unlikely that the *valkyrjur* have a similar origin. Sometimes the name is applied to human beings endowed with supernatural powers, as, e.g., to Svava, the heroine of *Helgakvitha Hjörvarthssonar*, and to Sigrun in *Helgakvitha Hunding-bana II.*, and to Sigdrifa, a valkyrie who was punished by Othin for not carrying out his commands. And, as most authorities identify her with Brynhildr, the term is applied to the latter also. This conception of human valkyries is not confined to the North. For, in Wulfstan's *Sermo ad Anglos*, *wælcyrgean* are mentioned beside *wiccean*, among a list of bad characters, from which the country is said to be suffering.² It is more difficult, however, to explain how the conception arose. We hear of fighting women more than once in Saxo, and the human *skjaldmeyjar* in the *Atlakvitha* point perhaps in the same direction.

10. Kings.—Among other human beings we may notice especially kings who were credited with supernatural powers both during their lives and after death. Two of the legendary kings of Sweden, Dómaldi and Olaf Trételgja, are said to have been put to death owing to bad harvests for which they were held responsible.³ This belief lasted down to late times, since Gustavus Vasa is

¹ See art. DEMONS AND SPIRITS (Teutonic), vol. iv. p. 632^a.

² Cf. II. i. 6 (b).

³ *Ynglinga Saga*, 18.

said to have complained that the Swedes blamed him for bad weather. Nor was it peculiar to the North. According to Ammianus Marcellinus, xxviii. 5. 14, it was customary among the Burgundians to depose their kings in time of famine as well as after military disaster.

ii. **The dead.**—Norse literature shows by constant reference that to the dead were attributed supernatural powers. Among those most commonly referred to is that of bringing prosperity and abundant harvest.

In *Ynglinga Saga*, 12, the god Freyr is said to die, but his death is not announced to his subjects the Swedes. His dead body was preserved that prosperity might abound in the land. A similar story is told about Halfdan the Black, for his body after death was cut in four pieces, which were buried in different parts of the kingdom, so that all sections of the land might have plentiful years.¹ A similar belief underlies the story of Olaf Geirstatha-alf,² and that of Guthmundr,³ who after death was thought by his people to be a god, and was therefore worshipped. Yet another example is to be found in *Landnámabók*, i. 14, where Thóroflr Smjör is mentioned as being worshipped after death. A curious instance of worship of the dead occurs in *Kristni Saga*, 2, where the missionary Thorvaldr is taken by a heathen Kodran to see a stone in which the ancestor (*ár-maðhr* or *spá-maðhr*) of the latter is said to have dwelt for a long time. Kodran avowed that, when the missionary had sprinkled the stone with holy water, his ancestor had come out and complained that the water had scalded his little children.

12. **Yggdrasil's ash.**—This is a very complex conception, as may be seen from the variety of phenomena attached to it.⁴ The descriptions indeed are hard to visualize and are apparently inconsistent. Sometimes the ash seems to spread out over the whole world; sometimes again it is represented as a definite locality to which the gods ride or walk to hold their court. If the tree called *Læráth* in *Grímnismál*, 25 f., is to be identified with the ash, as seems probable, it must be regarded as standing very near to Othin's hall. Now it was, and indeed still is, the custom for country houses in the North, especially in Sweden, to have standing by them a tree known as *várdráð* ('protecting tree'), on which the welfare of the house is supposed to depend. Such trees were doubtless regarded as especially sacred in heathen times, and it is not unreasonable to suppose that the original conception of Yggdrasil's ash may have been that of a *várdráð* of the divine community. In *Völuspá* the reference to the ash seems to point to a tree on which the destiny of the gods depends rather than to an all-comprehending world-tree. That its origin is to be found in actual trees is rendered probable by the *Irmensul*, which likewise was all-comprehending ('universalis columna . . . quasi sustinens omnia'),⁵ for this was a real tree, or rather a tree-trunk, in spite of the property assigned to it. Further, the adjuncts mentioned in *Grímnismál* and *Gylfaginning*—the harts, snakes, etc.—link it with grove sanctuaries. We may refer particularly to those of the Lithuanians and Prussians, especially to the sacred one at Romove. It was forbidden to injure any birds or animals in such groves. The description indeed of the sacred oak at Romove furnishes an interesting parallel to Yggdrasil's ash from real life. In the North itself we can find parallels for all the features involved; e.g., snakes seem to have disappeared from the Northern sanctuaries before the date of our records, yet a very interesting analogy in some respects is furnished by the description of the sacred tree at Upsala in scholium 134 to Adam of Bremen's *History*.

⁵ Rudolph of Fulda, *MGH Inscript.* ii. 676.

III. **WORSHIP.**—The Teutonic festivals are treated separately under the heading FESTIVALS AND FASTS (Teutonic). There are also separate articles on SACRIFICE (Teutonic) and HUMAN SACRIFICE (Teutonic). The various superstitions are covered under the headings DIVINATION (Teutonic), MAGIC (Teutonic), and ORDEAL (Teutonic). It remains in this section to speak of prophecy and the priesthood.

i. **Prophecy.**—According to Tacitus, *Hist.* iv. 61, numbers of women among the Germans were considered to possess the gift of prophecy 'in consequence of which many were revered as goddesses,' though he denies elsewhere¹ that the veneration paid to them was so great as this. One of the chief of these prophetic women was known as *Veleda*, a prophetess of the Bructeri, who ruled over considerable territory. To increase the honour in which she was held, she lived at the top of a high tower, and questions and oracular responses were conveyed between her and the public by a near relative 'like a messenger who had converse with the gods.'² The name *Veleda*, strictly speaking, does not appear to be a proper name but a Gaulish word for 'prophetess.'³ We may here mention the story of the older Drusus, who in his last campaign was met on the banks of the Elbe by a woman taller than human who prophesied to him the manner of his death even as it afterwards came about.⁴ According to Strabo,⁵ the Cymbri had prophetesses who practised divination with slaughtered prisoners.⁶

2. **Priesthood.**—(a) *Priest.*—(i.) In Norway, and especially in Iceland, the duties of the priest were performed by the political leader of the people. During the colonization of Iceland the more important of the chiefs who went out from Norway built their own temples, not infrequently of the wood of which their temples had been made in Norway.

Thus we read in *Eyrbyggja Saga*, 4, that Thóroflr of Mostr built a temple to Thor of such wood. To this temple all the men in his own district had to pay a tax called 'temple-toll'; but the chief himself paid for the upkeep of the building and performed all the necessary duties in connexion with the temple and the temple services, while at the same time exercising judicial authority over the people of the neighbourhood. Again in *Hrafnkel's Saga Freysgötha*, 2, we are told that Hrafnkel raised a great temple in Athalþó, where he 'made offerings to Freyr of the half of all the best things that he had.' Hrafnkel settled the whole of the valley and gave land to people on condition that he should be regarded as their chief and exercise the authority of priest over them.⁷

The priest was called *góthi*, and his office *gothorth*. In each *gothorth* was a consecrated place set apart for the *thing* (gathering of the people). Small settlers who were not of sufficient substance and authority to build temples of their own joined one or other of the *gothorth* so as to have the benefit of the temple services and the temporal protection of the *góthi*. So inseparable was the political function from that of the priest in Iceland that the *gothorth* formed the starting-point for the foundation of the constitution of Iceland. The title of *góthi* continued in existence after the adoption of Christianity, although now it had lost all religious significance and meant no more than magistrate (*lögsögumathr*). It is interesting to observe that the *gothorth* was a hereditary office and could even be bought and sold like any other property.⁸

This combination of priestly with secular authority existed also no doubt in Norway, whence the original priests of Iceland came, though—and here is a difference from Iceland—the power of the

⁹ Cf. *Vatnsdæla Saga*, 41 f.; *Bandamanna Saga*, 3.

local chiefs in Norway was subordinate to that of kings. The word *góthi* is occasionally applied to local chiefs—*e.g.*, to Thorhaddr the Old, who was *hof-góthi* at Maeren in Trondhjem¹—and on several occasions we hear of priests in Iceland who had formerly possessed temples in Norway. The *Saga of Hákon the Good* (*Heimskringla*), 16, gives an account of a great sacrificial feast at Hlathir of which Earl Sigurth sustained the whole cost himself; and from the *Saga of Olaf Tryggvason* (*Heimskringla*), 75, we learn that it had been the custom of Olaf's predecessors to offer sacrifice in Trondhjem. In poetry we sometimes meet with such expressions as *vörthr véstalls* ('guardian of the altar') applied to kings of the past. In all cases, here as in Iceland, it is clear that no exclusively priestly class existed, and that priestly duties were in all cases combined with temporal power.

For Denmark very little evidence is available. On three Runic inscriptions found in Fyn, and dating approximately from the 9th cent., the word *kuthi* (*i.e.* *góthi*) is found in combination with some proper name to form a compound word. Hrólfr and Ali are said to have been *nuRakuthi* (*Nora-góthi*) and *sarluakutha* (*Sölva-góthi*) respectively. It has been suggested that Nori and Sölvi are the names of men; but it seems at least equally probable that they are place-names.² If this is so, Hrólfr and Ali may have been local chieftains, like those on the west coast of Norway. It is significant that Saxo, who frequently refers to the laws and customs of heathen times, makes no references to a priestly class in Denmark.

For Sweden the evidence is more abundant. Adam of Bremen states in connexion with the great temple at Upsala:

'Assigned to all the gods they have priests to present the sacrifices of the people.'³

It does not necessarily follow perhaps from this statement that the duties of these persons were of an exclusively priestly nature. Elsewhere the evidence seems rather to point to a union in Sweden, like that in Norway and Iceland, of priestly duties with secular authority.

Thus we read in *Ynglinga Saga*, 47, that a famine which arose in the days of the legendary king Olaf Trételja was attributed by the people to the king's remissness in offering sacrifices; and even towards the end of the 11th cent. we read in *Hervarar Saga, ad fin.*, of one Blótsveinn ('sacrificing-Sveinn') obtaining the throne in virtue of his promise to offer sacrifice on behalf of the people, which he actually carried out. Rimbertus⁴ describes the formal dedication of the Swedish king Ericus; and it will be remembered that the native dynasty, the Ynglingar, traced their descent from the god Freyr.

Thus, while the evidence is perhaps less direct and convincing for Sweden than for Norway, it seems on the whole to indicate a close union from the earliest times between secular and religious power.

(ii.) Except in Tacitus references to priests among the Teutonic peoples are of rare occurrence. In later times we read in the *History* of Ammianus MerceLLinus⁵ that the priests of the Burgundians were presided over by a chief priest who held his office for life. Jordanes⁶ states that the priests of the Goths were of noble extraction.

(iii.) We learn from Bede⁷ that the priests of the ancient English were forbidden to bear arms and to ride except on mares. Heathen priests are also referred to,⁸ perhaps the most interesting instance being that of Coifi.

Eddius,⁹ in his description of the shipwreck of Wilfrid off the Sussex coast, refers to the 'princeps sacerdotum idolatriæ' standing before the country-people on a high mound and by his magic arts seeming to cast fetters on the hands of the people of God.

⁸ *Ib.* ii. 6, and elsewhere.

(iv.) Among the Teutonic peoples of the Continent in ancient times the priest seems to have combined to a great extent spiritual with temporal powers. According to Tacitus, his duties were threefold: (1) the consultation of omens on public occasions, together with divination, the casting of lots, and the observation of the sacred horses;¹ (2) duties in connexion with the tribal assembly such as the proclamation of silence at the opening of the meeting, and the administration of punishment at the assembly and in time of war;² (3) the guardianship of the sacred groves, symbols, and other holy objects,³ which they also carried with the host to battle.⁴ They no doubt had duties also in connexion with the public sacrifices. Indeed it may be said that their functions as a whole were essentially of a public character. There is little or no trace of any mystical relationship existing between the priest and the god, or of any peculiarly spiritual qualification in the priest such as we find noted, *e.g.*, in the case of prophetesses like Veleda, or in the account of the Druids given by Diodorus Siculus.⁵

(b) *Priestess*.—(i.) In Iceland the word *gythja* ('priestess') occasionally occurs,⁶ and seems to be applied to women belonging to the ruling families of Iceland (*i.e.* those who held *gothorth*).

In *Kristni Saga*, 2, we are told of a woman Frithgerth who was 'in the temple offering sacrifices' while Thorvaldr was preaching the Christian faith hard by. The term *gythja*, however, is not applied to her, and it is possible that she was only acting as deputy for her husband, who was absent at the *althingi* ('general assembly'). Mention is made in *Vápnfirthinga Saga*, 10, of a woman called Steinvör, who is described as a *hof-gythja* ('temple-priestess') and who owned a *hofuth-hof* ('public temple') and claimed temple-toll. When she wished to enforce the civil authority of the *gothorth*, she was obliged to apply to her kinsman Brodd-Helgi for help. But that she was conscious of her full religious responsibilities seems to be borne out by the amusing account given in *Kristni Saga*, 5, of a 'flying' between Thangbrandr the priest and one Steinvör, the mother of the poet Ref, who is without doubt to be identified with the *hof-gythja* of *Vápnfirthinga Saga*. Here we are told that, after she had preached heathenism to Thangbrandr at some length, she made the startling announcement that 'Thor challenged Christ to fight in single combat; but he dared not fight against Thor!'

Beyond this, references to priestesses in the old Scandinavian countries seem to point to persons of a different character, though these references are not very satisfactory.

In *Sturlaugs Saga Starfsama*, 18, we are told of 60 *hof-gythjar* in a temple, which, however, was Finnish. Again in *Ynglinga Saga*, 4, we are told that the goddess Freyja was a *blót-gythja* ('sacrificial priestess'), and that after Frey's death she kept up the temple and sacrifices at Upsala.

Here also we may mention the story of Gunnarr Helmingr, who is related in ch. 278 of the *Saga of Olaf Tryggvason* (*Flateyjarbók*) to have personated the god Freyr after destroying his idol. Frey's image was kept in a temple in Sweden, and his shrine is said to have been attended to by a young and beautiful woman who was known as his wife, and with whom he used to make an annual progress through the land, driven in a chariot. This person is not actually called a priestess (*gythja*), but at all events she apparently had charge of the sanctuary and interpreted the answers of the god. We may here compare the account of Freyja, who in *Ynglinga Saga*, 13, is said to have upheld the sacrifices at Upsala after the death of Freyr.

(ii.) We have no definite evidence for the existence of priestesses in the strict sense of the term among the other Teutonic peoples. Tacitus speaks of 'numbers of women of prophetic power,'⁷ but these recall the *völur* rather than the priestesses of the North. The former existence of a priestess may, however, perhaps be inferred from the account of the sacred grove of the Nahanarvali, which is said⁸ to have been under the charge of a priest 'muliebri ornatu.'

IV. *TEMPLES AND SANCTUARIES*.—(a) *Iceland*.—(i.) In Iceland the temples formed centres of jurisdiction, one belonging to each of the 39

¹ In the last duty he was accompanied by the king; cf. *Germ.* 10.

⁷ *Hist.* iv. 61, 65.

gothorth. One of the fullest descriptions of such temples which we possess occurs in *Eyrbyggja Saga*, 4.

Here we are told that Thórólfr of Mostr set up a great temple to Thor by Thor's river. There was a door in the wall near one end. Inside stood the high-seat pillars containing the pegs which were called *reginnaglar* ('holy pegs'). On one of these pillars the image of Thor was carved.

The interior of this temple was a very holy place. At the end of the temple farthest from the door there was an annex like the choir of a church at the present time, and there in the midst of the floor stood a *stalli* which served as an altar, and thereon lay a jointless ring weighing twenty ounces on which all oaths are said to have been sworn. The priest wore this ring upon his arm at all assemblies. On the *stalli* stood also the sacrificial bowl wherein was a *hletteinn* which served as a sprinkler, wherewith was sprinkled the blood from the bowl which was called *hlaut*. That was the blood which was shed by such creatures as were sacrificed to the gods. In the annex round about the *stalli* were the gods ranged. To this temple all men had to pay tribute, and they were under an obligation to accompany the temple priests on all such journeys as *thingmen* now take with their chiefs, and the *góthi* kept up the temple at his own cost so that it should not fall out of repair, and in it he upheld the sacrificial feasts.¹

Some additional details are furnished by the descriptions of the temple at Kjalarnes in *Kjalnesinga Saga*, 2, 4.

This temple was 60 ft. in breadth, and, like the one built by Ingimundr in Vatsdaela,¹ 100 ft. in length. Thor was the god most honoured in this temple. The inner sanctuary was circular like the hull of a ship. Thor stood in the midst of it, and other gods on both sides. In front of them stood a *stalli* made with great skill and covered with iron. On it there was a fire which was never allowed to die down. They called it the 'consecrated fire.' On that *stalli* there lay also a great 'ring' of silver. The temple priest wore it on his arm at all assemblies. Men took their oaths on it in all law-suits. On that altar there lay also a great bowl of copper into which was poured the blood which came from the cattle which were sacrificed to Thor or from the men. This blood they called *hlaut*, and (the bowl they called) *hlaut-bolli*. Men and cattle were sprinkled with the *hlaut*, but the cattle which were sacrificed there were used for entertaining the company when sacrificial feasts were held. And the men who were sacrificed were sunk in the pool which was outside by the door, and which was called *blótvíða* ('sacrificial spring'). The temple was surrounded by a wooden fence too high to climb, and both the temple and the fence contained doors that locked. Finally we are told that the beams of the temple were very excellent.²

Thorhaddr the Old, like many another, took the temple-mould and the high-seat pillars from his Norwegian temple and used them for his temple in Iceland.³ We are also told that Jörundr *góthi* raised a temple in Svertingsstathir.⁴ Numerous other instances might be cited.

In *Kristni Saga*, 2, heathen sacrifices are mentioned as being offered in a temple at Hvamm. In *Hrafnkels Saga Freysgótha*, 3, we are told that Hrafnkel raised a great temple to Freyr in Athalól. This temple stood on a rock above a deep pool in the river and contained images of the gods which had some kind of robes or ornaments upon them. A temple dedicated to Freyr is also mentioned in *Víga Glúms Saga*, 5, as being 'on the south of the river at Hripkelsstathir.'⁵ In ch. 24 of the same saga we read that there were three temples on Eyjafirðr. In ch. 25 we have an interesting confirmation of the accounts of the oathing mentioned above. In the temple in Diupadale on Eyjafirðr 'whoever took the temple-oath took in his hand the silver ring which was reddened in the blood of the cattle sacrificed and which weighed fully three ounces.' Possibly the ring of Tomar (Thunor) which was carried off from Dublin by King Charles Malachy II. in 994 was one of the sacred rings upon which oaths were sworn.⁶ Here we may compare the *Anglo-Saxon Chronicle*,⁷ where the oath-ring is represented as the most binding form of engagement known to the Danes.

(ii.) Not only the temple itself, but also the land round about, was regarded as sanctuary.

Thus in *Eyrbyggja Saga*, 4, we are told that Thórólfr of Mostr held as sacred a hill in the precincts of his temple on Thornes. Here the *thing* of the men of the Western Firths was held. No one was allowed to turn his eyes thither unwashed, and no blood was to be shed there. Thórólfr's sons preserved the sanctuary inviolate as long as they could; and, when it had been defiled with bloodshed by the Kjalalekings,⁸ the place was declared unhallowed and the *thing* removed to another part of

the promontory, where the *dómhringr* is still pointed out to travellers—'That was one of the holiest of places.'

A curious tradition of sanctity is found in *Landnámabók*, ii. 16.

Authr the Deep-Minded was a Christian. 'She was accustomed to say her prayers at Cress-hills. She had crosses raised there, for she was baptized and a good Christian. Members of her family afterwards showed great reverence for that hill. A *hörgr* was made there when they began to offer sacrifices. They believed that they would pass into the hill when they died.'

(b) *Norway*.—(i.) From *Eyrbyggja Saga*, 3, we learn that, before Thórólfr of Mostr left Norway for Iceland, he had charge of Thor's temple on the island of Mostr, and was a great friend of Thor. The framework of this temple was transferred bodily to Iceland. Another island is mentioned in the *Saga of Olaf Tryggvason*¹ as containing a large temple dedicated to Thor. Guthbrandr of the Dales also possessed a temple dedicated to Thor.² His predecessor was a great friend of Earl Hákon of Hlathir. They had a temple in common in Guthbrandsdale, which contained figures of Thor and of Hákon's patron goddesses, Thorgerthr and Irpa. Thorgerthr is described as being as tall as a full-grown man and having a hood on her head. Thor was seated in his car, and all were adorned with clothes or ornaments and had gold rings on their arms. This temple and Earl Hákon's temple at Hlathir are said to have been the two chief temples in Norway.³ When Earl Hákon first took possession of Norway, 'he commanded throughout his whole kingdom that the temples should be maintained,'⁴ and later, when the emissaries of the emperor Otto had overthrown the temples of S. Norway, Earl Hákon caused them to be rebuilt and the heathen sacrifices to be re-established.⁵

Some interesting details of one of his temples (in Arkadale) are given in *Faereyinga Saga*, 23.

It stood in the midst of a wood and was surrounded by a paling and adorned with gold and silver, while the roof was lighted with several glass windows. Inside near the door was a figure of Thorgerthr Högabrúthr, beautifully adorned. The same story occurs in the *Saga of Olaf Tryggvason* (*Flateyjarbók*), 326, where we are told that Olaf stripped Thorgerthr of all her 'gold and silver and fine clothes' and dragged the idol at his horse's tail, finally beating it to pieces with a club and burning it along with the image of Freyr.

Olaf Tryggvason systematically destroyed Hákon's temples and despoiled the idols. He took from the door of the temple at Hlathir the large gold ring that Hákon had had made, and burnt the image of Thor which it contained.⁶ In his missionary expedition to Inner Trondhjem he despoiled the temple at Maer, which contained many idols fixed on *stallar*, in the midst of whom sat Thor, 'an image of great size, all adorned with gold and silver.'⁷ A curious and interesting account of a temple and image dedicated to Balder in the district of Sogn is mentioned in the *Saga of Frithjof the Bold*.⁸ It has been the custom to cast doubt on this evidence, but the details are not obviously fictitious, and it is difficult to imagine why they should have been invented. The account is at least as reliable as that of *Kjalnesinga Saga*,⁹ which is usually accepted as probable.

(ii.) The word *hof* ('temple') frequently occurs in association with the word *hörgr*.¹⁰ What exactly the *hörgr* was we do not know. From *Hyndluljóth*, 10, the *hörgr* seems to have been made of stones:

'He made me a *hörgr* built of stones. Now, this heap of stones is turned to glass.'

But in *Grímnismál*, 16, Njörthr is said to rule over *hótimbruthum hörgi* ('high-timbered *hörgrs*').

¹ Cf. *Vatsdaela Saga*, 15.

² Here we may compare the story given in *Landn.* v. 12 of Ketilbjörn, who was so rich that he ordered his sons to make a cross-beam of silver in the temple which they were building on Mossfell. His sons, however, did not carry out his orders.

¹⁰ Cf., e.g., *Helgakvitha Hjörvarthssonar*, 4.

The phrase 'hörgr and hof high-timbered' occurs also in *Völuspá*, 7. It has been suggested that the word 'high-timbered' is merely conventional and that the hörgr was a stone structure as opposed to the wooden temples so common in Norway and Iceland. In *Urvar Odds Saga*, 29, we are told that Oddr 'burnt a hof and broke a hörgr'; but in the preceding verse both hof and hörgr are spoken of as being 'burnt.' Hof and hörgr are spoken of as burnt in ch. 165 of the *Saga of Olaf Tryggvason* (*Formanna Sögur*). But in ch. 141 of the same saga we are told that the king commanded 'hof and hörgr to be broken and burnt.' The hörgr is frequently mentioned in connexion with women.

Thus in *Gylf*, 14 the goddesses are said to inhabit 'a hörgr which was a very fair house. It was called Vingólf.' In *Hervarar Saga*, 1, Starkathr is said to have carried off Alfhildr as she was in the act of reddening the hörgr by night after the great ásarblót. After the death of Authr the Christian, her relatives made a hörgr on the hill where she had set up her crosses.

The word is still traditionally connected with high places in popular speech. Thus, when the land lies deep in snow, the Icelanders say that 'only the highest hörgar jut out.' And in the Norwegian patois a dome-shaped mountain is called a hörgr. Perhaps the word is a survival of an older form of religion when places of worship were more primitive than the carefully constructed hof. It is obviously connected ultimately with the O.H.G. *haruc*.

(iii.) It will be seen that there are certain obvious discrepancies in regard to the use of the term hörgr. It appears in some cases to have been a cairn, but in others a building capable of habitation. Sometimes it is made of stone, in other cases perhaps of wood. The difficulty is increased by the fact that the word is obviously identical with the early German word *haruc*, which is used to gloss the words *nemus*, *lucus*, while the corresponding A.S. *hearg* is also perhaps used for 'grove.' Such sacred woods or groves were probably common in early times, since many place-names are compounded with the word *lundr* ('sacred grove'). Moreover, the usual name for the place of assembly in the North is *thingvöllr*, which must originally have meant 'wood of the assembly,' *völlr* being cognate with O.S. *wald* and O.H.G. *wald* ('forest').

The legendary sanctuary at Glasivellir¹ was probably connected with a holy grove, and is no doubt identical with Glasir, the name of the tree by Valhöll, Óthin's dwelling-place, mentioned in *Skaldskaparmál*, 34. It is in a forest clearing that the gods meet to decide the fate of Starkathr.² According to a mythological poem,³ the gods meet every day to dispense justice under Yggdrasil's ash. Perhaps we may also instance Tomar's wood,⁴ which was situated near Dublin. It has been suggested that this means 'grove of Thor.'

It is noteworthy that the two great assembly places, Frosta and Gaula, are both on peninsulas. Sacred islands may also have been known, as can perhaps be inferred from the recurrence of such names as Njardhrey, Vê-ey, Thorsey, and possibly Halogaland.

(c) *Sweden*.—(i.) The great temple of the Swedes was at Upsala.

'The Swedes have a most magnificent temple which is called Ubsola [Upsala] not far distant from the city of Sictona [Sigtuna]. In this temple, which is fitted [?] entirely with gold, they worship the statues of three gods. Thor, the most powerful of them, has his seat in the midst of the couch [?], while Wodan and Fricco occupy places on either side of him. . . . Wodan they represent as armed, just as our people represent Mars, while Thor with his sceptre seems to copy Jupiter.'⁵

'That temple is surrounded by a golden chain which hangs over the roof [?] of the building, and the gleam of which is visible to visitors at a distance; for the shrine itself stands on level ground with hills round it like a theatre.'⁶

(ii.) In the (contemporary) scholium 134 we have an interesting account of a holy grove which stood

¹ Cf. the *Tháttur af Nornagesti*, 1; *Hervarar Saga*, 1.

² Cf. *Gautreks Saga*, 7. ³ *Grimmsmál*, 30.

⁴ Mentioned in the *War of the Gaethil with the Gaill*, 113.

⁵ Adam of Bremen, iv. 26.

⁶ *Ib.* scholium 135.

beside the temple, and which contained an evergreen tree of great sanctity.

'Near that temple there is a very large tree stretching out its branches afar and always green both in winter and summer. No one knows what kind of tree it is. There also is a spring in which it is the practice of the heathen to do sacrifice by sinking a living man in it. If he does not reappear, the prayers of the people will be fulfilled.'

The description of Yggdrasil's ash, which is said to overshadow Asgarth,¹ is no doubt derived from the Upsala evergreen, as the description of the home of the gods is surely derived from some Northern sanctuary, in all probability the identical sanctuary at Upsala.²

There are many other references to this sanctuary in both Norse and Danish authorities, and it was in fact the most famous one in the North. In *Ynglinga Saga*, 12, and in Saxo, iii. 90, its establishment is attributed to the god Freyr, who in the former is represented as having lived and died at Upsala. This is no doubt also the scene of the story of Gunnar Helmingr, although in this story the place is not actually mentioned.

In *Jónsvikinga Saga*, 12, we are told of a temple in Götland which contained 100 gods and also temple treasure and temple servants to offer the sacrifices, but, apart from the great temple at Upsala, we know little of the heathen temples of Sweden.

(d) *Denmark*.—No records of Danish temples appear to have been preserved. The chief sanctuary of the Danes was at Leire. This was no doubt a sanctuary of great antiquity. It is the home of the famous kings of the 6th cent., Hróarr and Hrólfir Kraki (the Hrothgar and Hrothwulf of *Beowulf*). In *Ynglinga Saga*, 5, it is said to have been the home of the goddess Gifjón and her husband Skjöldr, the eponymous ancestor of the Skjöldungar (A.S. Scyldingas), the Danish royal family. Like Upsala, the locality is remarkable for its barrows, some of which date from the earliest times.

The existence of ancient sanctuaries in the old Danish kingdom is also implied by some of the place-names; e.g., *Lundr*, the name of the old ecclesiastical capital in Skåney, meant originally a 'sacred grove.' Cf. also Vêborg (mod. Viborg; 'sanctuary town') and Helganes ('holy promontory') in Jutland; Óthinsé or Óthinsvé ('Óthin's Sanctuary') on the island of Fyen, and Hlésey, besides many other Danish (and Norwegian and Swedish) place-names.

(e) *England*.—In England the worship of idols and the existence of heathen temples were well known to Bede. In A.D. 601 Pope Gregory sent a letter to the abbot Mellitus urging that, while he is to destroy the idols in England, he is to leave the heathen temples standing that they may be consecrated for purposes of Christian worship. He says expressly, 'It is their custom to slay many oxen in sacrifice to devils.'³ The East Anglian king Redwald, who had been converted to Christianity on a visit to Kent, is said to have had in the same temple an altar for Christian worship and an *arula* at which to offer victims to devils;⁴ and his son Earconbert is said to have been the first of the English kings who commanded the idols throughout his country to be destroyed.⁵ When the Northumbrian Council decided to adopt Christianity, the high priest of the heathen, Coefi, rode to the sanctuary of Gudmanum on the Derwent, cast a spear into it, and commanded his companions to destroy and set fire to it with all its precincts.⁶ References of a historical character to sanctuaries in this country are rare, however. But such place-names as Thuresleah, which must originally have

¹ *Gylf*, 15.

² *HE* i. 30.

³ *Ib.* iii. 8.

⁴ Cf. also *Skaldskaparmál*, 34.

⁵ *Ib.* ii. 15.

⁶ *Ib.* ii. 13.

meant 'grove of thunder,' perhaps indicate the existence of groves sacred to the thunder-god among the ancient English, and there are other reminiscences of heathen worship no doubt preserved in such place-names as Thunresfeld and Wednesbury.

In *Beowulf*, 175, we hear of offerings made *aet haergtrafum*, which perhaps means 'shrines' covered with canopies. The word *haerg*, identical with Norse *hörgr*, is of frequent occurrence standing alone, and is used to translate various Latin terms such as *fanum*¹ and *idolum*. There are other passages in which the word seems to mean a 'grove,' as in German, and it is not uncommon in place-names—e.g., Harrow. A number of other words which appear in Christian usage were presumably applied at first to heathen sanctuaries—e.g., *weofod* ('altar').²

(f) *The Continent*.—(i.) References to temples on the Continent are rare. In the 6th cent. a Frankish temple was destroyed by Radegund, wife of Chlotar. Gregory of Tours describes a temple at Cologne which contained figures of the gods and in which sacrificial feasts were held. The Frisians seem to have had temples, but the notices are not always clear.

(ii.) The word *fanum*, by which these sanctuaries are usually denoted, is also used of the *Irmensul*, which, according to Thietmar of Merseburg,³ was an immense wooden shaft or pillar worshipped by the Old Saxons in a place called Eresburg. According to the *Vita S. Alex.* 3, this pillar was 'set up aloft in the open.' In their own language they call it 'Irmensul, quod latine dicitur universalis columna, quasi sustinens omnia.' It was cut down in the year 772 by Charlemagne, who spent three days destroying the sanctuary and carried off much gold and silver.

Among the heathen practices of the Old Saxons condemned in the *Indiculus Superstitionum* and elsewhere we hear of sanctuaries connected with woods, of springs connected with sacrifices, and of various places which are venerated as holy.

The chief sanctuary of the Frisians was that of 'Fosite's Land.' According to Alcuin's *Vita S. Willibrordi*, 10, it took its name from the god Fosite.

¹ For *fana* of this god were "constructed" (*constructa*) on it.' This place was held so sacred by the country folk that no one dared to touch the cattle or anything else that fed there. He also mentions a sacred spring on the island.⁴

Adam of Bremen⁵ identifies this land with the island of Heilgiland (Halogaland). In the *Vita S. Bonifatii*, 23, we read of a sacred oak of gigantic size, the *robor Jovis*, which was cut down by the saint amid the clamorous protests of the heathen.

There is no doubt that sacred trees and groves were of frequent occurrence among all the Teutonic peoples of the Continent. In the *Translatio S. Alexandri*, 3, we are told that the Saxons worshipped trees and streams. Claudian speaks of 'groves grim with ancient religious rites and oaks resembling barbaric divinity.'⁶

The O.H.G. word *haruc*, like the O.N. *hörgr* and A.S. *haerg*, presents some difficulty, being used sometimes to gloss *nemus*, *lucus*, sometimes *fanum*, *delubrum*. It has been suggested by Mogk that the lack of clear distinction between the terms for the natural and the artificially constructed sanctuary is due to the utilization of old sanctuaries as sites for later temples.

(iii.) References to Teutonic temples in earlier times, in the works of Tacitus, are rare and doubtful. In *Ann.* i. 51 it is stated that Germanicus razed to the ground the temple which they called

the temple of Tamfana and which was most frequented by those tribes. Again, in *Germ.* 40 mention is made of the *templum* of Nerthus, but it is not unlikely that the word is used loosely for 'sanctuary'—'the holy grove on an island in the ocean,' the home of the goddess Nerthus, who visits the nations in a consecrated car covered with a garment.

'One priest alone is permitted to touch it. He is able to perceive when the goddess is present in her sanctuary and accompanies her with the utmost reverence as she is drawn along by cows. It is a season of rejoicing, and festivity reigns wherever she deigns to go and be received. They do not undertake hostilities or take up arms; every weapon is put away; peace and quiet are then only known and welcomed, until the goddess, weary of human intercourse, is at length restored by the same priest to her temple. Afterwards the car, the garments, and, if you are willing to believe it, the deity herself, are cleansed in a secret lake. This rite is performed by slaves who are instantly swallowed up by its waters.'

The indications given by Tacitus are too vague to enable the site of this sanctuary to be fixed with any certainty, but it is not impossible that it was the Danish sanctuary of Leire. In that case Nerthus may have lived on as Gifjón. Her name, however, is identical with that of the Norse god Njörthr.

According to *Germ.* 9, 'the Germani deem it to be inconsistent with the majesty of the gods to confine them within walls or to represent them after any similitude of a human face; they dedicate groves and woods and call by the names of gods that invisible thing which they see only with the eye of faith.'

Sacred groves are mentioned by Tacitus in several other places. Arminius's forces assemble in a wood sacred to Hercules.² Civilis brings his army together in a sacred wood.³ According to *Germ.* 43, the Naharvali had a grove of ancient sanctity. It was in these groves that they kept the sacred symbols.⁴ Here also were reared the sacred white horses which were never allowed to do work for mankind, but were employed to draw the sacred cars, when their neighing was carefully observed by the priest and king of the state.

According to *ib.* 39, the Semnonnes had a wood of immemorial antiquity and holiness. Here on certain occasions there met embassies from all the kindred peoples (the various branches of the Suevi) to celebrate their barbaric rites by the slaying of a man. The grove was held in reverence, and no one was allowed to enter unless he was bound with chains to signify his own humility and the power of the grove.

N. KERSHAW.

THAGS.—A secret organization of robber-stranglers called Thags existed for centuries in India, but it was put down by Lord William Bentinck's Government in the second quarter of the 19th century. Their history is full of incident and varied interest; here the religious and ethical aspects of the subject must be dominant.

1. Introduction.—The word *thag*, usually written *thug*, comes from a Sanskrit root *sthaga* meaning 'conceal,' which in the modern vernaculars becomes *thag* and means 'deceive.' The earliest reference to Thags comes from the middle of the 12th cent., and the first historical information about them from the end of the 13th cent.; but clear and full knowledge did not become available until the time when the organization was put down, about 1830. At that time there were thousands of Thags, well organized and extremely successful. They were all men of intelligence and capacity, most of them Hindus of good caste or respectable Muhammadans. Religion controlled their operations down to the last detail. How far back the fully organized confederacy reaches we cannot tell; but scattered fragments of information make it probable that in all essentials the conspiracy had been the same for several centuries.

2. Description.—Thags were ostensibly most respectable men, engaged in business, farming, or something else equally harmless. Their method was to start out in bands of from ten to two hundred in the month of October. They usually posed as merchants, but on occasion adopted other disguises, especially the dress and marks of ascetics. They possessed a secret vocabulary and a number of secret signs, which could be used without danger in the presence of outsiders. They travelled along or near the great roads used by merchants and money-porters, discovered which individuals

or companies carried valuable goods or large amounts of gold and silver, and then with much skill and cunning contrived to win their confidence. They would then travel with them, it might be for days or even weeks, until time, place, and all else were favourable to their purpose, when, at a signal, they suddenly set upon the unsuspecting party, strangled them all in a few minutes, buried their bodies, distributed the booty, and decamped. They used a cloth in strangling their victims. Similar methods were practised on the rivers. One of the most extraordinary features of their history is the almost unbroken immunity which they enjoyed: it was only very rarely that a Thag was caught and punished for his crimes.

Thags believed their profession to be a religious duty, and all that they did was done under the sanction of religion. They were fully convinced that the goddess Kālī, the wife of Śiva, called also Durgā and Bhawānī, had commanded them to strangle and to rob, and had laid down all the rules which they followed in the course of their operations. Many Brāhmins were Thags; and, when there was a Brāhmin member in a gang, he conducted the ceremonies. The neophyte, whether the son of a Thag or a new accession, was initiated in an impressive religious ceremony, and took a dread oath of absolute fidelity to the brotherhood. Before starting on the season's operations each gang met in a suitable place, and took part in a solemn act of worship. As soon as possible after every successful operation another religious ceremony was carried out. Once in seven days at least the goddess was worshipped, and on the greater occasions animals were sacrificed in her honour. They would not start on a journey, admit a new member, or decide upon an act of murder, unless the goddess granted them favourable omens. In every ceremony she was worshipped, and to her their prayers were offered. No image was used; but the pickaxe for digging the graves of their victims, solemnly consecrated, stood for the goddess, and was believed to be filled with her power and inspired by her to guide them. In every ceremony the offerings of *gur* (i.e. coarse sugar) and water were made to the pickaxe; over it every oath was taken; and at all times it was regarded with extreme reverence, confidence, and fear. On every occasion when *gur* and water were offered to the pickaxe, every fully qualified Thag also ate of the *gur* and drank of the water. At the close of each period of operations a percentage of the gains was solemnly presented to the goddess in one of her temples.

Among the rules which guided the Thags perhaps the most noticeable was the law that they must never strangle a woman.

3. Sources of the system.—The religious and political conditions of mediæval India provided the soil and the seed from which this extraordinary organization grew. The following facts require to be realized.

(a) In all parts of India to-day there exist criminal tribes,¹ i.e. tribes whose regular caste-occupation is some form of crime. In each case there is a belief that some divinity has imposed on the tribe the particular type of crime which it practises and has also laid down the rules under which it is followed. It is therefore the duty of every member of the tribe to make the practice of the crime his regular occupation, and to obey all the religious rules which are laid down for his guidance in it. So long as he does so, he regards himself as a religious man. A percentage of the gains is regularly dedicated to the god or goddess who gave the tribe its criminal profession. A few of these tribes profess Muhammadanism, and dedicate their gains to some *pir* (Muhammadan saint); but they are probably old criminal tribes which have undergone a shallow conversion to Muhammadanism. Criminal tribes are primitive people of very low social standing.

(b) All the chief forms of Hindu theology declare that the Supreme is exalted far above the petty distinctions of human

¹ J. N. Farquhar, *Modern Religious Movements in India*, New York, 1915, p. 424.

morality. The idea is to make Him truly absolute, to sever Him in the most decisive way, not only from the earthly and the sensual, but from all human conditions as well. Thus, from the very fact that in Himself He is completely separated from both good and evil, it becomes possible to acknowledge that He is indifferent to them and is equally the cause of both. Hence to suggest that God should bid men do what we call wrong seems to the Hindu to be not only quite natural but also inevitable.

(c) The Śākta sect of Hinduism, which worships the wife of Śiva, called Durgā, Kālī, Bhawānī, or simply 'the goddess' (Devī), and possesses a philosophical theology, falls into two sub-sects—the Right-hand and the Left-hand. The Left-hand sect has a cult which contains several extraordinary features. Only one need be mentioned here, viz. that for many centuries not only animal but also human sacrifice was offered. In 1835 the British Government prohibited human sacrifice, but until then it was common in the chief shrines of the goddess in North and Central India. According to the ritual law, only males can be sacrificed to her.

(d) In the worship of the goddess in the homes of the people, pots, pieces of metal, and diagrams are more often used than images; and both images and symbols, when duly consecrated, are believed to be filled with the presence and power of the goddess.

(e) In modern India there are many groups of ignorant Muhammadans who take part in Hindu worship. They not only join in the great festivals, but also visit Hindu temples and make offerings to the gods, in order to secure immunity from disease and to obtain other boons. Muhammadans of a low type thus readily adopt elements of the Hindu cult.

These facts enable one to realize that, in mediæval India, there might readily appear a community organized on the basis of the worship of the goddess and the practice of murder and robbery. At first it would differ but little, if at all, from an ordinary criminal tribe; and the first Thags would be ignorant Hindus who had been worshippers of the goddess before they formed the society to strangle and rob unwary travellers. To pass from participation in human sacrifice before the altar of the goddess to the search for victims for her on the high roads would be no violent change. Nor would even the thoughtful Hindu be shocked by the doctrine that the goddess had ordered the programme of murder. Hindu theology provides a substantial basis for the idea. Further, the fundamental document on which the worship of the Devī rests¹ is full of blood and horror. The story in that document of her struggle with a demon named Raktabija and her final triumph over him was made by Thags the starting-point of the tale in which she commands the original Thags to strangle men.² The ritual law that only males should be sacrificed to her is clearly the source of the rule that Thags must not kill women. It would also seem quite natural to devotees of the goddess to use the pickaxe as a symbol instead of an image, and they would instinctively believe that the power and the will of the goddess were present in it.

Nor need we wonder that Muhammadans, in order to become Thags, were willing to participate in Hindu worship, since so many are to-day accustomed to supplement Muslim rites with the cult of Hindu divinities.

(f) India has usually been ruled, not by one Imperial Government, but by a multitude of petty states, each of which sought only to secure peace and order within its own narrow territory, and cared little or nothing for what happened outside. Nor has the individual Indian ever felt it to be his duty to go out of his way to secure the well-being of the Indian people as a whole. If, therefore, some of the subjects of one of these small states pursued a certain type of crime outside the limits of the state and brought back large gains, whereof they gave considerable percentages to the Government, on the one hand, and to the temples, on the other, both Government and people were usually only too willing to acquiesce in the arrangement, and to do all that was possible to protect the men who brought them so much prosperity.

These and similar facts account for the almost universal immunity which the Thags enjoyed. They were found all over India, were closely bound to one another by oath and interest, and were usually only too well able to take prompt vengeance on any who molested the brotherhood.

¹ *I.e.* the Chaṇḍī episode in the *Mārkaṇḍeya Purāna*.

² Sleeman, *Ramaseena*, p. 127.

Thus only an Imperial Government using wide powers could successfully grapple with them.

4. The rise and fall of Thagi.—It seems clear that the Thag conspiracy was originally a Hindu organization, as we have already suggested, and that it came into being before the Muhammadan conquest of North India (1193–1293). In his *Srikanṭhacharita* the Hindu poet Maṅkha or Maṅkaka (fl. c. A.D. 1150) compares the thievish spring to a Thag.¹ Clearly by his time the community was already well known.

If the community was very successful, it would soon attract indigent Hindus of high caste, and there would be plenty of poor Brāhmins who would be eager to enter. It seems probable that, after the Muhammadan conquest, during one of the many periods when anarchy was wide-spread, the stranglers found unusual opportunities for their depredations, and waxed so rapidly rich that many Muhammadans became Thags and readily acquiesced in the established cult of the goddess. The great success and the wonderful immunity from punishment which the movement enjoyed would be to them clear proof of its divine origin. There is conclusive evidence that Muhammadan Thags looked back with great veneration to Nizām al-Din Awliya, a famous Muslim saint, who lived at Delhi in the first quarter of the 14th cent., and that they regarded him as one of the founders of the system.² This fits in perfectly with our theory that, at some time after the conquest, numerous Muhammadans joined the community. It is probable that the event occurred about A.D. 1300. The story that Muhammadan Thags were all descended from seven famous tribes³ may also have a historical root.

The confederacy lived and flourished for many centuries, and was still extremely prosperous at the moment when it had the ill fortune to attract the attention of the British Government in India. In 1829 special officers were appointed to investigate the system, and a serious campaign was started for the destruction of the whole organization. Within seven years the work was done. The success of this great effort is mainly due to the devotion and genius of Captain, later Major-General, Sir W. H. Sleeman.

5. Religious and ethical character of the Thags.—Those Europeans who had extended intercourse with Thags, during the period when the British Government were endeavouring to put the system down, gave very vivid descriptions of the kind of men they were.

(a) Every Thag was fully convinced that the goddess had created the system, and that she invariably saved Thags from punishment or disaster, so long as they obeyed the rules she had laid down for their operations. They were also immovably convinced that the consecrated pickaxe was so filled with the presence of the goddess as to be able to guide the Thags in their wanderings and to bring dire disaster on every one who disobeyed.⁴

(b) No Thag ever showed the slightest compunctions of conscience for his crimes. Sleeman writes:

'A Thug considers the persons murdered precisely' in the light of victims offered up to the Goddess; and he remembers them, as a Priest of Jupiter remembered the oxen, and a Priest of Saturn the children sacrificed upon their altars. He meditates his murders without any misgivings, he perpetrates them without any emotions of pity, and he remembers them without any feelings of remorse. They trouble not his dreams, nor does their recollection ever cause him inquietude in darkness, in solitude, or in the hour of death.'⁵

Never did the strength of religious faith or the extraordinary domination which religion exercises over man's moral nature find clearer illustration.

THĀNESAR.—Thānesar (Skr. *sthānviśvara*, *sthānu*, a local name of Śiva, *iśvara*, 'lord'; also *sthāneśvara*, *sthāna*, 'shrine,' and *iśvara*) is a sacred town in the Karnāl District of the Panjāb, lat. 29° 59' N.; long. 76° 50' E., on the banks of the river Sarasvatī (*q.v.*). The Chinese pilgrim, Hiuen-Tsiang, describes it under the name of Sa-t'a-ni-shi-fa-lo, as the centre of the Hindu Holy Land (Dharmakshetra, Kurukshetra) and gives the local legends.¹ It has been identified with the Ostobalasara or Batangkaisara of Ptolemy.² In A.D. 1014 it was sacked by Mahmūd of Ghazni.³ The most famous shrine was that dedicated to Chakrasvāmi, Viṣṇu, 'lord of the discus.' The statue is said to have been taken to Ghazni to be broken up and trodden under foot. It was finally desecrated by Aurangzib. Enormous crowds of pilgrims visit the place to bathe at eclipses of the sun.

THEISM.—**1. Definition.**—The word 'theism' (Fr. *théisme*, Germ. *Theismus*) is a purely modern formation, implying a non-existent Greek *θεισμός* and an equally non-existent verb *θειζω* (on the analogy of *μηθίζω*, *φλυππίζω*, and the like). As there is a certain vagueness about the meaning of the word in current English, it is necessary to begin this article with a convention as to the sense in which 'theism' will be employed in what follows. The word will be used throughout as a name for a philosophical theory as distinct from a practical religious faith. Perhaps the faith and the theory are never absolutely disjoined, but they are at least logically distinguishable. It may be doubted whether any man wholly untouched by the spirit of adoration and wholly devoid of love to God has ever been a genuine theist in philosophy, and again whether one can be in earnest with a philosophical belief in God without being led on to regulate his life by that belief. But it is at least possible to practise love of God and trust in God without making any conscious attempt to find a speculative explanation of the world. There are many who, in George Tyrrell's phrase, share the faith of Simon Peter without concerning themselves about his theology. The present article will be exclusively concerned with the philosophical conception of God as the ultimate ground of things. Current usage seems to require a further distinction. It seems necessary to discriminate theism not only from atheism (*q.v.*), the denial that God exists, and scepticism or agnosticism (*q.v.*), the refusal to answer any question about the ultimate ground of things, but also from deism (*q.v.*), which, in its way, also treats God as an ultimate ground. We shall probably not depart far from the implications of current language if we agree to define theism as the doctrine that the ultimate ground of things is a single supreme

reality which is the source of everything other than itself and has the characters of being (a) intrinsically complete or perfect and (b), as a consequence, an adequate object of unqualified adoration or worship. Belief in a ground of things which is not intrinsically complete and perfect, and consequently no adequate object of adoration, but at best of respect and admiration, would at the present day probably be described by every one as deism rather than as theism. Thus the suggested definition in fact coincides with the famous formula of St. Anselm, that God is *id quo maius cogitari non potest*, 'the being than which none greater can be thought.'¹

It is evident that theism, thus understood, is incompatible with polytheism (*q.v.*) and also with any doctrine, theological or metaphysical, which asserts a plurality of independent and equally ultimate 'reals,' whether in the form of a dualism between God, the good principle, and an immaterial evil principle (Zoroastrianism, Manichæism [*q.v.*]), or between God and matter, or in that of an ultimate plurality of unoriginated 'souls' or 'persons,' or in any other shape. All such doctrines involve the denial that there is any object which answers to the definition *id quo maius cogitari non potest*. For this reason the various modern theories of a finite or limited deity are inconsistent with strict theism. For a deity limited by restrictions arising outside his own nature is manifestly not the source of all reality other than himself, and thus not God in the sense in which we are using that word. And, if the 'limitations' are asserted to be self-limitations, due to the nature of God Himself (as in the philosophy of Hastings Rashdall), we have to face a dilemma. Either the presence of these limitations in the deity is a defect, and the deity is therefore not God in our sense at all, or their presence is not a defect, and there is then no sense in calling them restrictions or limitations, as it is their absence which would, in this case, be the defect.

It is mainly on the ground of alleged difficulties in the notion of the divine Omnipotence that these theories are recommended. But the difficulties seem due to misunderstanding. Omnipotence means only power to do whatever is consistent with God's own perfection. It is no real limitation of the divine power to hold, as most theologians and philosophers have done, that God cannot do what is in itself absurd—e.g., cannot make a false proposition true, or make virtue vice, or annihilate Himself. The old Stoic boast that the sage is in one respect more powerful than God, because he can put an end to his existence if he grows tired of it, is a mere false paradox.

It is, perhaps, more important to be clear on the point that theism, as defined, is equally inconsistent with the type of philosophic monism called by James Ward 'singularism'—the theory that there is only one existent, the Absolute, and that this single existent is the true subject of all significant propositions. If we mean by God a being from whom all else that exists derives its being and who can be worshipped, then the belief in God necessarily implies belief in the real existence of beings who can worship God. To say that God is the source of existence implies that God is not all that exists. From a theistic point of view it is, no doubt, proper to call God, the being from whom all others are derived, the Absolute or unconditioned being, but only on the condition that the Absolute is not equated with all that really exists. The underived source of existence may, in virtue of its unique intrinsic completeness or perfection, be called the *ens realissimum*, but the very use of such a phrase implies that there are other *entia realia*.

It will probably be readily admitted that the *ἐν καὶ πᾶν* doctrine of Spinoza cannot be reasonably called theism, nor have the most distinguished representatives of singularism in

¹ *Prosligion*, ch. 2.

our own times shown any desire to claim the name of theists. It should be recognized that the popular language about a purely 'immanent God,' as opposed to the 'transcendent God' of orthodox Christian theology, is equally incompatible with genuine theism, inasmuch as it conflicts with the recognition of a real distinction between the supreme source of existence and the dependent existents. It is just this distinction which is vital in a theistic philosophy, and, for this reason, it may be taken as a fair test of the theism of a philosophy whether its way of conceiving the relation of its God to the world is compatible with a real recognition of the divine transcendence.

2. *Philosophy and theism.*—If we look at the history of European philosophy, it may be said that in the main the general trend of philosophic thought, even independently of the influence of positive religions, has been theistic, at least from the time of Plato to our own day. Even the agnosticism of Herbert Spencer, when all the qualifications with which it is enunciated by its author are taken fully into account, has a recognizable theistic tendency and might be said, apart from its blunders about dynamics, to be little more than a very crude reproduction of the 'negative theology' which is really one-half of the orthodox Christian doctrine of God. As will be shown directly, this tendency to theism is a direct consequence of the permanent influence of Plato on all subsequent developments in philosophy. Apart from materialism (*q.v.*), which has never produced a philosopher of the first rank, the main antitheistic influence in modern European philosophy has been that of Spinoza (*q.v.*), which has steadily affected metaphysical thought, perhaps even more outside than within the professionally philosophical schools, from the time of Jacobi and Lessing down to the end of the 19th century. This is partly accounted for by the powerful attraction exercised by the naturalistic strain in Spinoza's doctrine on the devotees of physical science, partly by the tendency of many of the most prominent 19th cent. representatives of the Hegelian line of thought to interpret Hegel (*q.v.*) in a Spinozistic sense.

Whether the Spinozistic interpretation of Hegel is the true one might admit of question, and it has been rejected by such eminent Hegelian students as Hutchison Stirling and J. M. E. McTaggart, in the one case for a definitely theistic interpretation, in the other for a version which has more affinity with the monadism of Leibniz (*q.v.*) than with Spinoza's singularism. But in the main Hegel has become known, at least in the English-speaking world, through the work of philosophers with strong Spinozistic prepossessions, with the consequence that the influence of Hegelian ways of thinking has been definitely hostile to theism. Even among professedly Christian theologians allegiance to Hegel in philosophy has usually led to an extreme 'immanence' doctrine of God which at least compromised the theistic position.

More ephemeral has been the influence excited in the last half of the 19th cent. by the pessimistic atheism of Schopenhauer (*q.v.*), and in the last twenty or twenty-five years by the brilliant, if incoherent, anti-Christian polemics of Nietzsche (*q.v.*). Both the pessimism of Schopenhauer and the atheism of Nietzsche are, however, too little reasoned and too obviously matters of personal temperament to be regarded as of permanent philosophical importance. The influence of Hegel, also, and still more that of Spinoza, would seem to be for the present a spent force. In the present state of philosophy the most formidable rival to theism as an explanation of the world appears to be the thoroughgoing rationalist pluralism of the 'new realism,' represented at its best by the writings of Bertrand Russell and G. E. Moore. Of this doctrine, as well as of the supposed objection to theism arising from the evolutionist's alleged vision of Nature as 'red in tooth and claw,' something is said below (§ 17).

3. *Plato.*—The importance of Plato as the creator of philosophical theology makes it necessary to begin any serious account of theism as a philosophical theory with a clear statement of the Platonic position, so far as that position was

expressed by Plato in his writings. To call Plato the creator of philosophic theology does not, of course, mean that the belief in God is an invention of Plato. As has often been remarked, the general trend of the best Greek thought on the problems of human conduct and destiny—as represented, *e.g.*, by such poets as Aeschylus and Euripides—is in the direction of a vague monotheism. And it cannot be seriously doubted that an earnest practical faith in God was characteristic of Pythagoras and of Socrates. Even the most unreasonable scepticism about the historical good faith of Plato's accounts of his master cannot obscure the fact that Socrates gave up the whole of his mature life to the execution of a mission to which he believed himself to have been called by God and died as a martyr to his calling. But this, so far as we know, was a matter of personal religious conviction rather than of speculative theory. Even Plato himself does not attempt a formal philosophical statement and justification of the belief in God until we come to the *magnum opus* of his old age, the *Laws*. In his best known earlier writings—*e.g.*, the *Republic*—great stress is laid upon the importance for the formation of moral character of an ethically adequate conception of the divine nature. God must be thought of as perfectly good, and current religion must be purged of everything which suggests that there is anything unethical in His character or that His dealings with men have any other purpose than their true good. It is just because God is perfectly good that (*Republic*, *Theaetetus*) the end of life may be said to be to 'become like God.' God fashioned the world and made it the best possible world because it would be unworthy of His goodness to make it otherwise (*Timaeus*). True piety is to be a 'fellow-worker' with God (*Euthyphro*). We are God's sheep and He is our shepherd (*Politicus*). The souls of the righteous are in the hand of God, and when they depart from us it is to be with Him (*Phaedo*). But this is, of course, the language of religion, not of science, and we are made to understand the difference by the simple fact that nearly all that is said of God, outside the *Laws*, beyond the one emphatic statement about His perfect goodness, is conveyed in 'myths,' *i.e.* in imaginative stories, as to which we are cautioned that we cannot undertake to pronounce on their strict truth. Nor is any attempt made to *prove* either the existence or the perfect goodness of God. In particular the story of creation in the *Timaeus* is, as we are explicitly warned, not to be taken as scientific truth, but as a tale which is the most probable that can be told about matters which lie outside the region within which scientific knowledge is possible. If we did not possess the *Laws*, it would be legitimate, as in fact it is not, to doubt whether Plato did not agree with Kant that reasoned scientific knowledge of God is impossible, though on grounds which are not identical with Kant's. In the tenth book of the *Laws*, however,¹ we have a formal proof of God's existence, wholly devoid of any features of mythical colouring, which is expressly declared to be conclusive. The argument, the main principle of which had been already anticipated in the *Phaedrus*,² is as follows. The most universal characteristic of things is motion and change. Now, motions are of two kinds, (*a*) impressed, and (*b*) original or spontaneous. Or, to use Plato's own phraseology, there are motions which are able only to move something else (impressed or communicated movements), and there are motions which 'move themselves as well as other things.' And native or spontaneous movement is logically prior to impressed or communicated movement. We cannot

¹ 887 A-899 E.

² *Phaedrus*, 245 C-E.

regard all movements as impressed or communicated without falling into an impossible logical *regressus in indefinitum*. Further, 'motion which moves itself' is precisely what we mean when we talk of *ψυχή*, 'soul.' 'Soul' is simply a shorter name for the *κίνησις ἐαυτῆρ κινεῖν δυναμένη*. It is just when we see a thing manifestly capable of internally initiated movement or change that we feel bound to say that the thing in question is 'animated' or has a 'soul.' It follows, then, that souls and their various 'motions' (judgment, volition, hope, desire, and the like) are prior to bodies and their motions or changes. All bodily processes are derivative from and dependent on 'motions' of the soul, and it is just for this reason that Plato explicitly denies the doctrine, often imputed to him by the uncritical, that 'matter' can be the principle of evil. Further, good souls, in the degree of their goodness, are sources of orderly and beneficent motions; evil souls, of disorderly and evil motions. Now, the great recurrent motions which science discovers in the universe (the periodic motions of the heavenly bodies) are all regular and orderly and belong to the class of the 'good' motions. Hence they must be due to good souls. (It had been carefully laid down in an earlier passage that all apparent irregularities and anomalies in these motions are only apparent and disappear as our science becomes more adequate.) If, then, we define God as a perfectly good soul, we may say that, since the great motions of the universe are all perfectly orderly, they must be caused by God. God, however, cannot be the only soul, or 'movement that moves itself.' For, though the *magnalia naturae* exhibit perfect regularity, there are also irregular and destructive motions, such as those, *e.g.*, of disease or those due to a wicked will; and these are just as actual as facts as anything else. Thus the facts of the universe bear witness to the existence of souls which are not wholly good. There must be at least one 'bad' soul, which is not God, and there may, of course, be as many more as are required to account for the observed facts. The transcendence of God is thus safeguarded.

Plato's language about the 'bad' souls has been misunderstood both in ancient and in modern times. Plutarch¹ thought that he had discovered in Plato's words the doctrine of an ultimate dualism between a good and an evil world-soul. This view did not find favour with the Platonists of antiquity, but has been revived in modern times by Zeller, from the weight of whose name it has obtained a wholly undeserved consideration. Plato says nothing about an evil principle, in the *Laws* or anywhere else. What he does say² is merely that all motions cannot be due to a single soul; there must be at least two, the 'beneficent' and 'that which has power to effect the contrary results.' The whole context suggests that the bad souls of which he is thinking are chiefly those of passionate and ignorant men, which, of course, are numerous. It should further be noted that, in the passage of the *Laws* containing the theistic argument, Plato speaks throughout in the plural of 'gods,' giving the soul which moves the sun as an example of his meaning. This is, however, a mere consequence of the fact that the legislation of the *Laws* is designed for an ordinary Greek community. It is assumed that the State religion of the colony will recognize 'gods many,' and Plato's object is to substitute the heavenly bodies, or rather the souls which move them, as types of regularity and beneficence, for the morally frail and passionate anthropomorphic deities of actual Greek cults. Of Plato's personal conviction of the unity of God there can be no real doubt. The unity of God, 'the best-soul,' follows in fact, as we may see from the *Timaeus*, from the unity of the universe. The universe is one and is a rational system; therefore it is the product of one intelligence.³ That a Greek writing for Greeks should allow himself to speak of *θεοὶ* explains itself; what is really significant is that Plato speaks so frequently, and just when he wishes to be most impressive, of *θεός*.⁴

From the goodness of God, since God is a soul (*ψυχή*), it follows that everything in the world is

¹ *De animae procreat. in Timaeo*, 1014 E.

² *Laws*, 896 E.

³ *Timaeus*, 30 D-31 B.

⁴ In *Ep.* 13 he writes to Dionysius II. that he will distinguish letters of real importance from those which he is obliged to write as a matter of formal politeness by mentioning *θεός* and not *θεοὶ* in the opening sentences.

governed by a wise and beneficent Providence, and that God's dealings with man are perfectly and inexorably just. Thus the tenth book of the *Laws* definitely creates 'natural theology' as a branch of philosophy for the first time and indicates once for all its main doctrines—the existence and goodness of God, the reality of God's providential government of the universe, the immortality of the soul, and the correspondence between man's destiny and his works. These doctrines together make up what was known as 'natural' or 'philosophical' theology, as distinct from both 'poetic' theology—the stories told of the gods by the poets—and 'civil' theology, which consists in knowledge of the cultus prescribed by the State.¹

The question whether Plato's theology amounts to a complete theism is not without its difficulties. On the one hand, there is no doubt that, as Burnet has said,² Plato regarded his doctrine of God as the central thing in his whole system. It is precisely the activity of God, the perfectly good soul, that connects the world of 'becoming,' *i.e.* 'Nature,' the world of all that we call empirical existence, with the system of *εἶδη*. The reason why there is a world of 'things' at all is just that God, the perfectly good soul, exists and is eternally active. The perfectly good soul, of course, has a perfect knowledge of 'the Good,' and its activity consists in reproduction or 'imitation' of the Good. Thus all existents other than God owe the very fact of their existence to God, as they owe it also to Him that they are what they are. Still it does not appear that the Platonic God is *all* that later theists have meant by the Supreme. He is an existent, though a perfect one, and beyond all existents there is the system of 'form' or 'numbers.' This is the pattern (*παράδειγμα*) after which God makes heaven and earth and all that is in them, and is thus something metaphysically prior to God Himself. If we understand by theism the doctrine that God is the sole unconditioned source not only of existents but also of real possibilities, we shall have to say that it is only in Neo-Platonism that Greek philosophy succeeds in being fully theistic. A word or two may be said about the argument by which Plato establishes the existence of God. It contains in itself the germs of more than one of the 'proofs of the being of God' which have become traditional. Its presuppositions are two: (1) the universal validity of the principle of causality, and (2) the regularity of the cosmical motions—the 'reign of law' in the physical world. From the principle of causality, taken together with the assumption that there cannot be an infinite regress in the causal series, comes the conclusion that there must be an original cause (or causes) of all movements, which is 'self-moving'—*i.e.* a 'soul' or 'souls'—and from the regularity of the cosmic motions and the systematic interconnexion between them it follows that the ultimate 'mover' is the perfectly good soul. Thus Plato's reasoning combines in one argument the principle of the cosmological argument from the 'contingency of the world' to the existence of a First Cause and that of the argument from design, which is not degraded by Plato, as it has often been by modern apologists, into an argument from the alleged adaptation of the world to our individual convenience. As understood by Plato, the

¹ The distinction in this form became fixed in consequence of the fact that it was adopted by the Roman encyclopaedist M. Terentius Varro and taken over from him by St. Augustine in the *de Civitate Dei*. The theology of the philosophers was called 'natural,' not, of course, with any thought of a contrast with 'revealed' truth, but because it was held to be scientific and true, unlike mythology, which the poets were believed to have invented, and the cultus of the State, which, as Hobbes puts it, 'is not philosophy but law.'

² *Greek Philosophy*, pt. i., *Thales to Plato*, London, 1914, p. 335.

argument from design is simply the argument from the intelligibility of the world of actual facts and events to intelligence in the cause which produces and sustains it.¹ Plato's argument is thus an *argumentum a posteriori*, in the correct scholastic, not in the inaccurate Kantian, sense of the phrase *a posteriori*; i.e., it is an argument from the character of a known effect to the character of its cause. That there is a world of mutable things, and that, as scientific insight advances, the processes in this world of mutability are more and more found to exhibit conformity to intelligible laws, are assumed as empirically known truths, and without these empirical premisses the demonstration would not work. There is no hint in Plato of the line of thought which at a later date crystallized into the one genuinely *a priori* argument for the existence of God, the ontological proof, which, if valid, establishes its conclusion without any empirical premiss whatsoever.

4. Aristotle.—Aristotle's doctrine of God, though better known to the modern world than Plato's, is simply the Platonic doctrine rather more precisely expressed and shorn of its ethical and practical applications. With Aristotle, as with Plato, the doctrine of God is absolutely central, and the argument is once more based upon the assumption of the causal principle. Like Plato, Aristotle contends that communicated or impressed motion presupposes original or spontaneous motion, and like Plato he regards *ψυχή* as the one source of spontaneous movement. But here he is led to make a further refinement. The 'motions of the soul' arise from *ὄρεξις*, 'appetition,' and appetition is always appetition of something apprehended as good (*ὄρεγόμεθα διὰτι δοκεῖ*). This apprehension of an object as good is an exercise of *νοῦς*, an act of immediate intelligent apprehension. The apprehension is not itself a movement, though it gives rise to motions both of the soul and of the body. We must not then be content to trace back all motions to their origin in the 'movement which can move itself,' but behind even this we must look for an 'unmoved mover,' an unchanging initiator of all change. Otherwise we shall simply fall into an indefinite regress, and an indefinite regress in the order of efficient causes is unthinkable (the principle of the argument from the 'contingency of the world'). The unity of the supreme First Mover once more follows from the unity of the physical world. The whole physical world is a scene of 'becoming,' in which the potentialities latent in things are developed into actuality by the agency of efficient causes which are already themselves developed actualities. Behind every process of development lies the agency of such already developed actualities, and thus, just because there really is something and not nothing, there must be some actual agents which have never developed at all, but have been eternally and immutably active. From Aristotle's point of view, all processes of development depend upon the eternally regular and uninterrupted movements of the heavenly bodies. Hence there must be as many 'unmoved movers' as there are independent astronomical movements. Further, astronomical movements form a hierarchy. Each of the 50 odd concentric 'spheres' which Aristotle postulates to account for the apparent movements of the heavenly bodies has its own proper revolution and its own 'unmoved mover.' But there is one sphere which, without being enclosed by any other, encloses all the rest, and, according to the Aristotelian astronomy (which disagrees on this point wholly from Plato), communicates its movement

to all the spheres it contains. This is the sphere of the fixed stars, which rotates uniformly on its axis in the period of 24 hours. The 'unmoved mover' of this sphere is consequently God. As that which He moves is one, and its movement is eternal, continuous, and regular, God is also one, eternal, immutable, the First Mover upon whom all motion in the universe depends.¹ So far Aristotle's doctrine is, in substance, that of Plato in the *Laws*, except that Aristotle has dogmatically committed himself to a particular astronomical theory, that of Eudoxus, which, for sound scientific reasons, did not commend itself to Plato. In his conception of the nature of the First Mover Aristotle departs more widely both from Plato and from true theism. God, as Aristotle describes Him, is not a *ψυχή*, but a *νοῦς*. And he infers from his doctrine that the First Mover must be unmoved the conclusion that the divine mind, unlike our minds, because it is unmoving, must eternally think one and the self-same object. Further, this object must be adequate to occupy the divine mind through eternity. It follows that the object of God's unbroken Sabbath of contemplation is God Himself. 'He thinks Himself and His thinking is a thinking of thinking (*νόησις νοήσεως*).'² In fact, though without the presence of God there could be no motion in the universe, God is supposed to be wholly unaware of the existence of the universe which He moves. He moves it by being an object of appetition to it, and thus it is aware of Him, but He is no more aware of it than the various objects of our human appetitions need be aware of us and our desire for them. The world's desire after God is precisely and exactly the 'desire of the moth for the star.' This conception, due apparently to Aristotle's own temperamental indifference to the practical life, of course strikes out of philosophical theology the doctrine of Providence and of the righteousness of God's dealings with man. In fact, since Aristotle held that 'goodness of character' is a different thing from 'goodness of intellect,' he is quite consistent when at the end of his *Ethics* he expressly denies that goodness of character or moral goodness is predicable of God.³ God, in fact, becomes in Aristotle what Aristotle himself would have liked to be, if the conditions of human life would allow it—a mere 'magnified and non-natural' scientific thinker. In respect of this evacuation of all ethical content from the idea of God, Aristotle may fairly be said to be the founder of philosophical deism, as Plato was the founder of philosophical theism. It is clear that to Aristotle and his disciple Eudemus, who identifies the speculative life with the contemplation and worship of God,⁴ the First Mover was an object of genuine worship and reverence, though the worship of such a being could have no real connexion with active good works; but a non-ethical deity, who knows nothing of humanity's needs and aspirations, can never become the centre of an enduring religion. Hence it is not surprising that, while Platonism continued throughout later antiquity to be the creed of educated religious men, Aristotelianism was reduced to simple naturalism within half a century of Aristotle's death by the third head of the school, Strato of Lampsacus.⁵

5. Epicureans.—The deism of the Epicureans is of no significance for natural theology. For all practical purposes the school were, what their opponents called them, pure atheists, since it was

⁵ Cicero, *Academ.* ii. 38, *de Natura Deorum*, i. 35; Plutarch, *adv. Colotem*, p. 1115.

¹ The notion of an unconscious intelligence or reason as the ground of things is excluded by Plato's doctrine that *νοῦς* can only exist in a *ψυχή* (*Sophistes*, 249 A, *Philebus*, 30 C, *Timaeus*, 30 B).

one of their principal tenets that the gods not merely take no interest in the doings of men but play no part in cosmology; the world has been formed and continues to exist *opera sine divom*. The only use made by Epicurus of gods is a trivial one; their existence accounts for the phantasms of superhuman beings which are seen in dreams.

6. Stoics.—In Stoicism, on the other hand, natural theology of a kind plays a prominent part, though the original Stoic doctrine can hardly be called theistic. The theology of Zeno, Cleanthes, and Chrysippus is a materialistic doctrine of immanence. The substance of all that exists is a single body; in fact, the universe is a 'fire.' The cosmic fire is intelligent, and it is this fire that is God. This doctrine, borrowed by the founders of Stoicism from Heraclitus, but put forward with a conscious opposition, which Heraclitus would not have understood, to the immaterialism of Plato and Aristotle, is the nearest counterpart that ancient thought has to show to the Spinozist conception of the one substance with its plurality of disparate but 'parallel' attributes. But with the Stoics it is not, as with Spinoza, thought, but extension, that is the 'Aaron's rod that swallows all the rest' of the attributes.

As to the details of the doctrine. God and the world, though really one, are logically distinguished. At one time in the history of the universe the 'fire,' or God, exists alone in its purity and contains within itself all the *σπερματικοὶ λόγοι*, or constitutive ratios, of everything. There follows a process of evolution, identified by the Stoics with the 'downward path,' or *ὁδὸς κάτω*, of Heraclitus, in which the *σπερματικοὶ λόγοι* of all things are unfolded and a world of diversified existents produced. There is a second and antithetical process, regarded as identical with the Heraclitan *ὁδὸς ἄνω*, or 'upward path,' and ending in an *ἐκπύρωσις*, or general conflagration; the plurality of diverse existents is once more converted into the original fire, and God is left once more as the only existent. The whole double process of evolution followed by involution constitutes a 'great year,' and the life of the universe is made up of an endless succession of such 'great years,' each repeating the events of the preceding without variation (a fancy which we know from a fragment of Eudemus preserved by Simplicius in his commentary on the *Physics* of Aristotle¹ to go back to the early Pythagoreans, and which has been revived in our own time by Nietzsche as the doctrine of 'eternal recurrence'). The details of the process of evolution belong to the Stoic physics and do not concern us here. In accord with this doctrine, God is sometimes declared to be the same as the *κόσμος*, or universe, sometimes distinguished from it. 'They use the word *κόσμος* in three senses, to mean (1) God Himself . . . who is, of course, imperishable and everoriginate, the artificer of the world-order, who resumes into Himself and again begets out of Himself the whole of being in accord with certain cycles of time; (2) the world-order formed by the heavenly bodies, (3) the composite of these two.'² Hence the full definition of God was that God is *πῦρ τεχνικόν, ὁδῶν βαθίων ἐπὶ γένεσιν κόσμου, ἐπιτελεῖν ἄλλος πάντας τοὺς σπερματικὸν λόγους, καθ' οὓς ἕκαστα καθ' εἰρηρμένην γίνεται* 'a fire of craft [or 'art'] proceeding in order to the generation of a world, continuing in itself all the constitutive ratios in accord wherewith all things come to be in the order of destiny.'³ Strictly speaking, this doctrine, which equates God with the *κόσμος*, is not theism at all, since it denies that there are any real existents other than God. But religiously the founders of Stoicism, as we see from the well-known *Hymn* of Cleanthes, were fervent worshippers of God. It was characteristic of the school from the first that they insisted strongly on the moral side of theism. Like the Platonists, they were vigorous asserters of Providence and used the doctrine to justify even such things as astrology, prophetic dreams, oracles, and divination. Providence was, however, regarded as identical with absolute predestination, and scientifically explained by the rigid mechanical concatenation of all events in a single causal system. Hence, as may be seen from the controversial essay of Plutarch on *The Contradictions in Stoicism* (*περὶ στοικῶν ἀναρτιωμάτων*), the devices by which the Stoic philosophers tried to conciliate their optimistic belief in the providential order with their materialistic monism were often really fatal to the ascription of moral goodness to God.

In the writings of the Stoics of the Roman period, from whom the ideas of the school have become familiar to the modern world, the materialistic and fatalistic side of the doctrine is less prominent. They often seem to be teaching a simple

spiritual theism. It must be remembered that all these writers are later than, and were greatly influenced by, Posidonius of Apamea (first half of 1st cent. B.C.), who gravely modified the original doctrine of Zeno and Chrysippus by contaminating it with Platonism, as his contemporary, Antiochus of Ascalon, tried unsuccessfully to introduce Stoicism into the Academy. It is precisely those among the later Stoics, such as Seneca, who can be shown to depend most completely on Posidonius in whom the monism and materialism of Stoicism is least apparent. To understand the real tendencies of the system, it is important to study it as it was before Posidonius had Platonized it. For this purpose the anti-Stoic essays of Plutarch and the account of Stoic doctrine given in the life of Zeno by Diogenes Laertius are particularly valuable. Indispensable for special students is H. von Arnim's collection of the complete fragments of the Stoics of the pre-Roman period, *Stoicorum Veterum Fragmenta*, 3 vols., Leipzig, 1904-05.

The one really original contribution made by Stoicism to natural theology is the appeal to 'innate ideas' and the *consensus gentium* as an argument for the existence of God. The doctrine of innate ideas (*κοινὰ ἔννοιαι, notitiae communes*) is a consequence of the Aristotelian criticism of Plato. According to the theory of method expounded more specially in the *Phaedo* and the central books of the *Republic*, the work of science begins with the provisional assumption of a theory (*ὑπόθεσις*) to account for a group of observed facts. If the observed facts (*τὰ φαινόμενα*) agree with the results of deduction from the *ὑπόθεσις*, the 'appearances' are said to be 'saved' by the theory, and it is so far vindicated. It may still, however, be called in question, and in that case will have to be defended by being deduced from some more ultimate premisses which the impugner himself admits. It thus becomes a task for dialectic (or, as we should say, metaphysics), the highest science of all, to make a critical examination of the provisional assumptions (the unproved postulates) of all the other sciences and to discover the real unquestionable presuppositions of all knowledge. Aristotle insisted, as against this view, that the special postulates of each science must be self-evident when once they have been formulated. For the Stoics this doctrine, that every science depends upon self-evident universal premisses, created a difficulty, as in their theory of knowledge they were, unlike Aristotle, extreme sensualists, regarding particular sense-perceptions as the foundation of all knowledge. They were accordingly obliged to provide some criticism or test by which those universal propositions which are valid generalizations from sensation may be discriminated from those which are not. An obvious test suggested itself. Generalizations which are made only by certain special groups of men or by particular individuals may fairly be supposed to be due to temperamental, educational, national, or racial bias; those which appear to be made without exception by all men, no matter how widely they differ in temperament, education, national traditions, social institutions, may be presumed to be formed spontaneously, and therefore naturally, *i.e.* as a consequence of the intrinsic character of mind. It is thus reasonable to regard these generalizations as true and thus to take the *consensus gentium* as the best guarantee for the truth of a belief. The Stoic *κοινὰ ἔννοιαι*, 'common' notions, are thus innate in the very sense in which Descartes afterwards used the word. It is not meant that we come into the world with them already in our possession, but that the formation of them is due to the normal development of intelligence independently of any kind of bias. As the most obvious examples of such common notions the Stoics instanced the beliefs, which they held to be common to all mankind, 'that there are gods and that they care for us.'¹ All this passed, mainly through Cicero, into the natural theology of the 17th century. This explains why modern natural theologians have often been anxious to prove the universal diffusion

¹ Diog. Laert. vii. 38, 52.

² Diogenes Laertius, vii. 70, 137.

³ Aetius, *Placita*, i. 7, 33 (Diels, *Doxographi Graeci*, Berlin, 1879, p. 305). The same definition was given of *φύσις*, 'nature.' Cf. Cicero, *de Deor. Nat.* ii. 57: 'Zeno igitur ita naturam definit, ut eam dicat ignem esse artificiosum, ad gignendum progredientem via.'

of the belief in God and why their critics have often laid great stress on travellers' reports which have been supposed to indicate the existence of 'atheistic' savages. The Stoics themselves, in appealing to universal agreement, did not, of course, mean to deny the sporadic appearance of individual atheists. This could be accounted for as the consequence of individual prejudices due to improper education and 'unnatural' institutions. What was supposed to be demonstrated was merely that belief in God and Providence is too widely diffused to be regarded as anything but a spontaneous and 'natural' conviction. The position taken up by some modern apologists who deny that there has ever been a single convinced and sincere atheist is an exaggeration of the Stoic doctrine.¹ It may be added that the degradation of the argument from design or 'intentional causality' into the crude form which it assumes in so much of our popular apologetics is mainly due to the extravagant exaltation of man by the Stoic philosophy. With Plato and Aristotle teleology means simply that the world of historical existents and processes is so ordered that it realizes an end which has absolute intrinsic worth.² It is to the Stoics that we owe the coarsening of the thought into the assertion that man and man's convenience and comfort are the intrinsic and absolute good which is the end realized by the cosmic processes. Thus they maintained that plants and animals exist only to furnish man with food and raiment convenient for him, or even with agreeable luxuries.

Porphyry³ quotes from Chrysippus the statement that 'the gods made us for ourselves and one another, but animals for us, the horse to help us in war and the dog in hunting, leopards, bears, and lions, to practise ourselves in valour upon. The pig was made for nothing but to be sacrificed, and God mixed soul with its flesh like a seasoning to make it readily digestible for us. Shell fish of all kinds and birds he contrived that we might have no lack of soups and *entrées*.'⁴ According to Plutarch,⁵ Chrysippus carried things so far that he asserted in his work *περί φύσεως* that God made bugs to prevent us from sleeping too long and mice to teach us to take proper care of our cupboards.

7. Neo-Platonism.—In any account of the popular theism of antiquity prominence would have to be given to the utterances of the later Platonizing Roman Stoics, such as Seneca, and to the earnest defence of the ethical side of theism by writers like Plutarch and his contemporary Maximus of Tyre. Plutarch's philosophical essays which deal with the theistic problem are specially interesting, as his determination to treat Providence and the moral government of the world by God as serious matters leads him into sharp and acute criticism not only of the perfunctory deism of Epicurus but also of the Stoic pantheistic necessitarianism (especially in the essay *περί στωικῶν ἐναντιωμάτων*, which aims at showing that the materialism, pantheism, and determinism of Zeno and Chrysippus are inconsistent with their moral optimism and professed belief in an ethical Providence). Interesting, however,

¹ For a classic statement of the general Stoic view of the place of God in the scheme of things see, besides the famous *Hymn of Cleanthes* preserved in Stobaeus, *Ecl. i. 1, 12, p. 25, 3* (critical text in von Arnim, *Stoicorum Veterum Fragmenta*, i. 121 f., also J. Adam, *Texts to Illustrate a Course of Elementary Lectures on Greek Philosophy after Aristotle*, London and New York, 1902, p. 54 f., and A. C. Pearson, *The Fragments of Zeno and Cleanthes*, Cambridge, 1891), the eloquent conclusion of [Aristotle] *de Mundo*, 397, b 9 ff. The latter gives the Posidonian version and betrays Academic influence by ending with a direct quotation from the 'admirable Plato' of *Laus*, 715 E-716 A. Cicero's expositions of Stoic theology, based mainly on Posidonius, are too well known to require special mention.

² It is significant, as Burnet has remarked, that the very word 'teleology,' as its form shows, is derived not directly from *τέλος* but from the adjective *τέλειος*, 'whole,' 'complete.'

³ *De Abstinentia*, iii. 20.

⁴ Cf. Cicero, *de Nat. Deor.* ii. 37: 'Scite enim Chrysippus, ut clype causa involucrium, vaginam autem gladii, sic praeter mundum cetera omnia aliorum causa esse generata: ut eas fruges atque fructus quos terra gignit, animantium causa; animantes autem, hominum. . . Ipse autem homo ortus est ad mundum contemplanandum et imitandum.'

⁵ *De Stoicorum repugnantiis*, 1044 C.

as this theological literature is to the historian of Platonism, it cannot be said to add anything of value to philosophical theism. The Neo-Platonist school, founded in Rome by Plotinus (c. A.D. 205-270), worked out for the first time a thoroughgoing metaphysical theism which provided the philosophical basis for the Christian theism of the whole Middle Ages. For the purposes of the present article it will be most convenient to reproduce the main features of this doctrine as it is presented by the great systematizer of the school, Proclus (A.D. 410-485), in his *στοιχείωσις θεολογική*, *Elements of Platonic Theology*.¹ In what follows nothing will be quoted from Proclus which does not form part of the teaching of the whole Neo-Platonic school from Plotinus onwards.

In Plato's own theology, or at least in the statement of it which he gives in his writings, as we have seen, God is not quite all that the Christian theist has usually meant by God. God is the supremely good 'soul' and the source, it appears, of all existents other than Himself. But we are not positively told what is the relation of God to the supreme principles of the Platonic system, the forms (*εἶδη, ἰδέαι*) or numbers, and in the mythical picture-language of the *Timaeus* these forms (or numbers) are certainly represented as superior to God; they are the pre-existing model or pattern which God contemplates in fashioning the world of finite existents, or, as Plato calls it, the world of 'becoming.' There is no warrant anywhere in Plato for the psychologizing interpretation, often put on his language since the time of Philo of Alexandria, which makes the forms into thoughts of the divine mind. This means in modern language that, though God is regarded as the source of actuality, He is not unambiguously held to be also the source of all real possibility. In Neo-Platonism the further step is taken. God is thought of as the absolute *prius* of everything, and the world of existents as dependent on Him not only for its actuality but also for all its possibilities. God is no longer regarded as a soul or even as a mind, but is simply identified at once with the Good which is described in *Republic*, bk. vi., as the source of 'being and knowledge,' though itself 'on the other side of' both being and knowledge, and with the One which, according to Aristotle, Plato regarded as the *οὐσία*, or formal element, in the forms themselves and as the same thing as the Good.² The One thus becomes in Neo-Platonism a transcendent God of whom nothing can in strictness be predicated. It must not even be said to be good, since it is identical with goodness, not a subject to which goodness can be ascribed as an attribute. Nor must it be said to be or exist; it is not a being or existent, but the transcendent source of all being, and is therefore regularly said to be *ὑπερούσιον*, 'super-essential,' or 'super-substantial.'³ God, thus conceived as the transcendent and ineffable source both of actuality and of real possibility (of existences and of 'essences'), is connected with the actual world by the Neo-Platonic theory of causality. The theory is commonly known as that of 'emanation,' but the metaphor of emanation is with Plotinus and Proclus only a metaphor, and the

¹ There is no good critical edition of this important work. The least defective is that in F. Creuzer's *Initia philosophiae ac theologiae*, 3 vols., Frankfurt, 1820-22.

² *Metaphys.* A 987b 20: *ὡς μὲν οὖν ἕλην τὸ μέγα καὶ τὸ μικρὸν εἶναι ἀρχὰς, ὡς δ' οὐσίαν τὸ ἓν.* A 988a 14: *ἐπι δὲ τὴν τοῦ εἶ καὶ τοῦ κακῶς αἰτίαν, τοῖς στοιχείοις ἀπέδωκεν ἑκατέρους ἑκατέρων.*

³ Here we have the origin of the mystical 'negative way' in theology, and of the familiar scholastic doctrine that nothing whatever can be predicated univocally of God and of any creature, as well as of the proposition *Deus est suum esse*; i.e. in God the distinction between existence and *essentia*, valid for every other existent, ceases to have any meaning. It is from this last thought that the famous ontological argument for the being of God was destined to take its origin.

theory requires to be explained a little more fully, as it was not only influential throughout the Middle Ages but is tacitly presupposed in the famous attempt of Descartes to establish the existence of God in the *Third Meditation*. Causality, as understood by the Neo-Platonists, does not necessarily imply antecedence in time and is always a relation between substantival terms, not between events. The relation is dyadic and subsists between a producer (τὸ παράγον) and something which the activity of the producer calls into being (τὸ παραγόμενον). The cause of anything is the ground not merely of the existence of that thing but of its being what it is and having the character it has (the cause of its *essentia* as well as of its actuality). Causality is a relation of 'participation' (μέθεξις) or 'likeness'; i.e., the effect (τὸ παραγόμενον), since it derives the fact that it is and its whole quality from its cause (τὸ παράγον), is like its cause, exhibits the same character but in a less perfect form.¹

The Neo-Platonist theology is strictly creationist, not in the popular sense of regarding the world as having been made at a definite date in the past (all the Neo-Platonists held strongly that Plato, like Aristotle, meant to teach the 'eternity of the world'), but in the philosophical sense of maintaining the causal dependence of everything in the world upon God and upon God alone. What 'really is' and what 'becomes' form a hierarchy of manifestations of the excellences contained 'eminently' in the One, each member of the hierarchy, according as it is at a farther remove from God, exhibiting these excellences in a less perfect way. Proclus adds the further point that the causal activity of the higher principles extends farther down in the scale of being than that of those below them.² The One, or God, as we have seen, is 'above being' and is absolutely simple, not because it is void of character, but just because all perfections are completely and perfectly united and interpenetrant in it.³ The reason why the One creates at all is that the One is goodness, and goodness is, of its very nature, active. It must 'overflow.'⁴ That which is immediately produced by the 'overflowing' is νοῦς, 'intelligence' or 'understanding.' Or rather, since the fundamental inferiority of produced to producer shows itself at this stage in the form of a dualism, it is νοῦς together with the objects it contemplates, τὰ νοητά, the connected system of scientific concepts. The two are inseparable; for the νοητά 'have no subsistence outside the understanding'; they are not a realm of 'things-in-themselves,' for which Neo-Platonism has no room. As mind or understanding is an imperfect image or mirroring of the divine One, so soul is a further image or mirroring of mind. And mind and soul together make up for the Neo-Platonist the whole system of ὄντα, real things. Bodies, the natural world as disclosed through the senses, are images of soul and are properly not ὄντα but γιγνόμενα; they 'are' not, they 'become'—i.e., they are 'appearances,' though we must remember that they really do appear and are the appearances or shows of souls, which are real ὄντα. Below these real shadows of real things, just as God was placed above the real things themselves, stands that 'shadow of a shade,' πρώτη ὕλη, bare 'stuff,' which neither is nor appears, and, as a mere potentiality of something better than itself, may properly be called μη ὄν.⁵

Besides being causally dependent on God, the series of ὄντα and γιγνόμενα is further connected with the One by ἐπιστροφή, 'inversion' or 'reflexion.' The effect not merely proceeds from its cause, but is inverted or reflected back into its cause. This is, in fact, a consequence of the identification of the First Cause with the universal Good. For the good of anything is that to

union with which the thing in question aspires, and the universal Good is therefore, according to the old definition of Eudoxus, that οὐ πάντα ἐφίεται, 'that which all things go for.' As all things have their source in God, so all things find their end or completion in Him. In souls and minds this process of inversion takes place, as Proclus puts it, γνωστικῶς, as a γνώσις, or knowing. It is in turning back on their source in contemplation that they come by self-knowledge, and are thus inverted into themselves as well as into it. The soul gets to know itself in learning to know νοῦς, and νοῦς learns its own true nature in contemplation of the One; in both cases self-knowledge is got by reaching out of one's self towards the higher.¹ Thus the transcendence of God, though it is so complete that we may not even predicate 'being' of Him, in no way interferes with the truth that the whole world 'lives and has its being' in God and has no origin or support but God.² The monotheism of this philosophy of religion is, of course, no more affected by the belief of the Neo-Platonists in an elaborate hierarchy of superhuman beings whom they call θεοί than the monotheism of Christians by the belief in the various orders of the angelic hierarchy, or that of Milton by his application of the appellation 'gods' to the fallen angels in *Paradise Lost*.

It should be particularly observed that the Neo-Platonic school, by definitely making the One its God and teaching that the One is 'beyond being,' is committed to theism as against pantheism. The world is in the One, but, precisely because the effect is only an imperfect mirroring of its cause, it would not be true to say in the same sense that the One is in the world. The relation between God and the world is that of one-sided dependence. God, or the One, produces νοῦς, ψυχή, and bodies; they do not produce the One. In fact, in the mythology elaborated by Proclus the ἐγκόσμοι θεοί occupy the lowest rank among the orders of beings to whom he gives the name 'god,' thus corresponding to some of the middle ranks of the mediaeval hierarchy of angels.³

8. *Anselm*.—As is well known, when the Christian Church began to feel the need of a philosophical foundation for its theology, it sought that foundation primarily in Neo-Platonism. The Neo-Platonic influence was exerted in three main ways—through the Cappadocian Fathers, who, without incurring the condemnation which was passed on the speculations of Origen, incorporated much of Origen's Platonism in their system, through the prominent part played in the development of Christian theology by St. Augustine and Boethius, and through the authority enjoyed by the writings of the supposed Dionysius the Areopagite, a superficially Christianized version of the theological and angelological speculations of Proclus. The Neo-Platonic conception of God thus became part and parcel of orthodox Christian thought. It is this conception that St. Anselm assumes in his famous attempt to prove the existence of God by an argument which, in one form or another, has been a centre of philosophical controversy from the date of its first becoming generally known to our own day—the so-called 'ontological proof' of the existence of God. St. Anselm's own formulation of his argument will be found in chs. 2-3 of the little tract, written before he had been called from his monastery at Bec, to which he gave originally the name *Fides quaerens intellectum* and afterwards that of *Proslogion seu Allogium de Dei existentia*. The object of the reasoning is to show that the existence of God is in fact an immediately evident truth. Uncertainty about God's existence is possible only so long as we are unaware of the true meaning of the word *Deus*. The argument, as given by Anselm, runs thus. By 'God' we

¹ Bodies are incapable of 'inversion into self,' and they are not inverted into their immediate cause, soul, γνωστικῶς.

² When Kingsley in *Hyppatia* makes his Neo-Platonic philosopher misquote St. Paul as saying that it is God who 'lives and has His being' in us, he is going wrong from mere ignorance of the doctrine he is criticizing.

³ For the sources of the preceding paragraphs see Proclus, *Institutio theologica*, props. 1-6 (unity and plurality), 7-14 (causation, the good), 15-20 ('inversion'), 21, 23, 24, 31-47.

¹ The technical phrase of Proclus is that the characters which exist καθ' ὑπαρξιν—i.e., so as to be properly predicable of it—in the effect exist καθ' αἰτίαν in its cause. The scholastic way of putting the matter is to say that what exists *formaliter*—as constituting the *forma* or *essentia*—in the effect exists *eminenter* or *eminentiore modo*, 'in a more excellent manner,' in its cause. It is in virtue of this doctrine that the philosophical theology of Neo-Platonism and orthodox Christianity acquires a positive side. Though we may not predicate of God any 'perfection' (i.e., positive attribute) of a creature, yet, since all creatures are produced solely by God, we may say that their perfections are in God 'in a more excellent manner.' Hence, though we are forbidden to predicate anything univocally of God and a creature, we are permitted to reason *per analogiam* from beauty, wisdom, power, goodness in the creatures to the presence of super-excellent beauty, power, wisdom, goodness in the Creator.

² This is intended to justify in particular the view that 'bare matter,' though it cannot be regarded as produced by mind or soul, is still created by the One, and so to get rid of the dualism of God and matter.

³ So the schoolmen maintain, on the same ground, that each attribute of God, power, wisdom, and the rest, is God.

⁴ As the Christian mystics say, 'love cannot be idle.'

⁵ The Neo-Platonist 'matter' is thus identical with that of Aristotle, but it is important that it is regarded as the remotest production of the One, not, as with Aristotle, as a principle independent of and coeval with God.

mean 'that than which nothing greater can be conceived.' It seems that a doubt may be felt about the existence of anything answering to this definition, since Scripture tells us that the fool has said in his heart (*i.e.* has thought) that there is no God. Anselm, in reply to such a 'fool,' argues as follows. Even the fool who doubts or denies the existence of 'that than which nothing greater can be thought' must understand what this phrase means before he can doubt or deny that there is such a thing.¹ Thus it is certain that God, as defined, is *in intellectu*—a phrase which means simply that the words 'that than which nothing greater can be thought' have a definite meaning. But, if God were only *in intellectu* (*i.e.*, if there were no object answering to the definition), we could think of something greater than God, for we could at least conceive that such a being was not merely thinkable but real.² Thus the argument is that, if 'that than which nothing greater can be conceived' exists only *in intellectu*, 'that than which nothing greater can be conceived' is not 'something than which nothing greater can be conceived,' and this is a formal contradiction *in terminis*. It follows therefore³ that God cannot be conceived as non-existent and therefore that God cannot be conceived not to exist. How then can it be true that the fool 'has said in his heart' that God does not exist? Only in the sense that the fool attaches no sense or a mistaken sense to the word 'God.'⁴ These few lines contain the whole of the famous 'proof'; the rest of the pamphlet is really taken up with the identification of 'that than which nothing greater can be conceived' with the universal Good.

Before going any farther, it may be well to make one or two reflexions on the general character of the argument as given by its originator. This is the more necessary as Anselm's reasoning is not quite identical with that of Descartes, who gives his own ontological proof in his *Fifth Meditation*, and it is principally from Kant's criticism of Descartes' argument that the ontological proof is known to modern students of philosophy. It will be noted that Anselm expressly presupposes the Neo-Platonic conception of God; it is the One of Plotinus and Proclus of which he undertakes to prove the reality. We should also observe that Anselm for the first time attempts a proof which is *a priori* in the proper sense of the phrase. The existence of the world is not one of the premisses of his reasoning, whereas with the Neo-Platonists the reality of the many is the starting-point of all argument. Again, it is no valid retort to Anselm to urge that his proof depends upon a definition and on nothing else, but nothing can be proved simply from a definition, since all definitions are merely conventions about the meaning of a sign. Anselm is not, of course, concerned to deny the truth of this account of definitions or to maintain that men are not free to attach any meaning they please to the sign *Deus*. The real question is whether among all our concepts there is just one, the concept of 'an *x* such that nothing greater than *x* can be conceived,' which implies *as part of its meaning* the actual existence of the corresponding object. It seems to the writer of this article that Anselm is at least right in maintaining that, if we can frame the concept 'thing than which no greater can be conceived,' we are bound to think of the object thus conceived as actual. To admit that what we are necessitated to think may be false is fatal to all philosophy and all science, and no exception can be taken to Anselm's argument on the ground that it excludes such an ultimate agnosticism. The really difficult question is rather whether there is any such concept as 'thing than which no greater can be conceived.'⁵ The

problem is not whether, granting that Anselm's definition of God has a meaning, the actual existence of God is included in that meaning, but whether the words given as the definition have a meaning at all or are not rather an 'unmeaning noise,' like the words, *e.g.*, 'line so crooked that none crookeder can be conceived' or 'rational fraction so small that none smaller can be conceived.' This is the difficulty which we shall find arising in connexion with every version of the ontological argument which has been given by metaphysicians. Whatever we may think on this point, it is plain that a proof of the Anselmian type is not what is ordinarily meant in logic by proof or demonstration. Its real object is not to deduce the existence of God from any more ultimate or certain premisses, but to find a definition of God such that, when the definition is substituted for the *definiendum*, the proposition 'There is one and only one God' is seen to be self-evident. The real function of the argument is, like that of an Aristotelian 'induction,' not to demonstrate something, but to 'point something out.'

Anselm's argument was at once subjected to severe criticism by his contemporary Gaunilo of Marmoutiers, in his 'Apology for the Fool' (*Liber pro Insipiente*), a tract which more than sustains comparison for real acumen with the better-known criticisms of the *Critique of Pure Reason*. Gaunilo remarks that it is one of the premisses of the Anselmian argument that *id quo nihil maius cogitari potest* exists at least in the *intellectus* even of the atheistic fool. It is assumed that God exists *in intellectu*, and the only point discussed is whether He exists also *in re*. But what is meant by this statement? It may mean only that the fool understands the meaning of the statement 'God exists.' But we understand the meaning of many propositions which we know to be false. Hence the existence of God is not proved by simply urging that we know what the theist means when he says that God exists. To make the argument valid, it ought to be shown that the fool cannot understand what the theist means without also seeing that his assertion is true, and Gaunilo denies that Anselm has established this point. Arguing, not as an empiricist, but from Neo-Platonic premisses common to himself with Anselm, he urges that in point of fact we have no positive adequate concept of God;¹ and it adds nothing to our information to be told that God is greater than all the things of which we have positive concepts.²

So far Gaunilo (who has been oddly mistaken by some modern critics for an empiricist) is simply playing off the negative or agnostic side of the theology common to himself with Anselm against the positive, and it is significant of his real purpose, which is that of a mystic rather than of an empiricist, that he quietly replaces Anselm's definition of God as 'that than which nothing greater can be conceived' by the very different phrase 'that which is greater than all which can be conceived.' He then continues as follows. Even if I admit, what is itself questionable, that I understand the meaning of the phrase 'something which is greater than all which can be conceived,' Anselm's argument cannot force me to admit that there really is such a thing. All that the argument proves is that it would be inconsistent to admit that there is such a thing and at the same time to deny its reality, since, if it is not real, it is not greater than things which are conceived and are real. But the 'fool' is not really convicted of this inconsistency, since all that he admits is, at the outside, that he understands the sense of the words 'something greater than all that can be conceived.' To make Anselm's argument cogent, some proof ought to be supplied that this something actually exists. If this proof is once forthcoming, Anselm's further demonstration that the something in question is all that God is

¹ 'Neque enim nim rem ipsam quae Deus est, novi' (*Pro Insipiente*, § 3).

² 'Nec prorsus aliter adhuc et in intellectu meo constat illud haberi, cum audio intelligoque dicentem esse aliquid maius omnibus quae valent cogitari' (*ib.* § 4).

¹ 'Certe idem ipse insipiens, cum audit hoc ipsum quod dico . . . intelligit quod audit, et quod intelligit in intellectu eius est, etiamsi non intelligat illud esse' (*Prosligion*, ch. 2).

² 'Convincitur ergo etiam insipiens esse vel in intellectu aliquid, quo nihil maius cogitari potest; quia hoc cum audit, intelligit; et quidquid intelligitur, in intellectu est. Et certe id, quo maius cogitari nequit, non potest esse in intellectu solo. Si enim vel in solo intellectu est, potest cogitari esse et in re: quod maius est' (*ib.* ch. 2).

³ 'Sic ergo vere est aliquid quo maius cogitari non potest ut nec cogitari possit non esse: et hoc es tu, Domine Deus noster' (ch. 3).

⁴ 'Nemo intelligens id quod Deus est, potest cogitare quia Deus non est; licet haec verba dicat in corde, aut sine ulla, aut cum aliqua extranea significatione' (ch. 4).

⁵ Hobbes and others raised this question very pertinently when they replied to Descartes' argument from our possession of an 'idea of God' that we possess no 'idea' of God.

held to be will be valid. It is to illustrate this second point that Gaunilo introduces the reference to the famous lost island by which he is principally remembered. If this lost island were described to me as wealthier and better than any inhabited land, I should readily understand the meaning of the words, and the lost island would be 'in my understanding' in the same sense in which God may be said to be in the understanding of the fool. But it would be idle to say that the island must also really exist somewhere in the ocean because it would otherwise not be, as by definition it is, richer than all habitable lands. Finally he contends that it is not, as Anselm had assumed, a *proprium* of God that He can only be thought of as existing. It is true, no doubt, that we who know that God exists cannot think the proposition 'There is no God' true, but neither can we think any other proposition to be false which we know to be true; e.g., I cannot think it true that I do not exist at this moment, because I know it to be true that I do exist. There may be a sense in which it is possible to think of my own non-existence, but, if there is, it is equally possible, in the same sense, to think of the non-existence of God, even though we know that God does exist.¹ This last point, of course, anticipates Hume's criticism that whatever we can think of as existing we can equally think of as not existing, and if sustained is fatal to every argument of the ontological type.

Anselm's reply to his critic is contained in the short *Liber Apologeticus contra Gaunilonem respondentem pro Insuperante*. He points out, naturally enough, that Gaunilo's substitution of the phrase 'that which is greater than everything which can be conceived' for 'that than which nothing greater can be conceived' alters the character of the argument, and that Gaunilo's reasoning about the lost island is not a real parallel to his own proof, which, as he insists, is applicable only in the case of the concept 'that than which nothing greater can be conceived.' What he does not prove, but merely asserts, is that this phrase really has a definite meaning and is not a nonsensical or insignificant sound. On this point he is content to say that even the 'fool' must conceive the meaning of the words before he can deny that they stand for a reality.

It is very difficult to follow Anselm here. If his reasoning is sound, it will prove not only the real existence of God but also the existence (in the logician's sense) of nothing, round squares, equilateral right-angled triangles, fabulous monsters, the greatest of all integers, since it is beyond a doubt that the propositions 'There is no such thing as a round square,' 'There are no fabulous monsters,' 'There is no integer which is the greatest of all integers,' etc., are true; and it may then be argued that, since they are true, round squares, etc., must exist in the *intellectus* of the person who asserts the propositions. What Anselm is assuming is, as he himself says, that a proposition cannot be understood unless its 'parts' are severally understood. From this he infers that, if 'there is no such thing as x ' is a significant proposition, x must be a significant term. The assumption is plainly not justified, since my ground for asserting the proposition may be precisely that x has no intelligible meaning. The state of the case, then, seems to be that Anselm's argument certainly proves that, if 'that than which nothing greater can be conceived' (or 'that which cannot be conceived as not existing') exists *in intellectu*, it also exists *in re*. But the question whether it exists *in intellectu* remains undecided.

9. Thomas Aquinas.—The history of the subsequent fortunes of Anselm's theistic argument is a highly interesting one. In the 13th cent., the golden age of scholastic philosophy, it was widely known and discussed by all the leading thinkers. In the main the mediaeval philosophers seem to have been disposed to accept it until it was rejected as a sophism by St. Thomas, whose great authority

¹ 'Cogitare autem me non esse, quamdiu esse certissime scio, nescio utrum possim; sed si possum, cur non et quidquid aliud eadem certitudine scio? Si autem non possum, non erit jani istud proprium Deo' (*ib.* § 7).

has ever since discredited it. The principal 13th cent. texts relative to the subject have been edited with an acute commentary by the Benedictine Augustin Daniels.¹ It is a singular fact that, though all the teachers of the second half of the 13th cent. seem to have felt themselves obliged to make their attitude to Anselm's argument clear, no theologian of the 12th cent. appears to have taken any account of it. The most probable explanation of this silence seems to be that of Daniels, that the circulation of the *Proslogion* was slow and the work unknown to theologians in general until well on into the 13th century. It is certainly not true, as is sometimes said, that acceptance of the argument was confined to the Oxford Franciscans. Of the fifteen scholastics whose writings are examined by Daniels, three (one of whom is Albert the Great) express no opinion on the validity of the proof, ten (including Alexander of Hales, Bonaventura, and Scotus) accept it, only two (Richard of Middleton and St. Thomas) reject it. These facts seem of themselves to show that the discredit into which the ontological argument fell—it will be remembered that, when Descartes revived it in the 17th cent., critics were quick to remind him that he was laying himself open to at least the suspicion of heterodoxy—was due almost entirely to the general recognition of the weight of St. Thomas's criticisms. They are, in fact, so formidable that they still repay the closest attention and are, in the present writer's opinion, altogether on a much higher philosophical level than the better-known polemic of the *Critique of Pure Reason*. The general position of Thomas is precisely what we should expect from a philosopher whose thought has been moulded partly by Neo-Platonism and partly by Aristotelianism. He holds that the existence of God can be, and has been, sufficiently proved *a posteriori*, by reasoning from the works of God to their Author, and consequently he accepts as valid both the argument from the necessity of an unmoved First Mover (the Aristotelian argument) and the argument from design, in the wide sense of an argument from final or intentional causality (the Platonic argument from order and intelligibility in the world to an intelligent Creator). But he rejects altogether and on principle the attempt to demonstrate the existence of God *a priori* (from a mere consideration of the content of the concept of God).

The most important of the relevant passages in the works of Thomas are *Summa contra Gentiles*, i. 10, 11, and *Summa Theologica*, i. qu. ii. art. 1, both dealing formally with the question whether the proposition 'God exists' is self-evident. His own view on this question is that the proposition is self-evident if the *essentia* of God is once adequately known, but, since we in this life do not behold the *essentia* of God, His existence is not self-evident to our understanding. It is not immediately evident to us that there is anything 'than which a greater cannot be conceived,' or that 'God cannot be thought not to exist'; on this point St. Thomas is in complete agreement with Gaunilo. Anselm's argument, in fact, is a sophism arising from failure to distinguish between that which is *notum per se simpliciter* and that which is *quoad nos notum*, evident to us. 'For *simpliciter* it is self-evident that God exists, since what God is is his *esse*' ('cum hoc ipsum quod Deus est sit suum esse'; i.e., God's *essentia* or 'what' and His existence are identical). 'But because we cannot conceive what God is, it remains unknown relatively to us.'² Anselm's reasoning is fallacious because (a) not all even of those who admit the existence of God are aware that God is 'that than which nothing greater can be conceived'; and (b), even if every one were aware of this, it would not follow that God exists otherwise than *in intellectu*; i.e., all that would be proved is that we can think of such an object without absurdity. So Thomas asserts against Anselm that there is no logical absurdity in supposing the non-existence of God.³ The same considerations are urged in much the same language in the article of the *Summa Theologica* already referred to. Thomas's own view is⁴ that the existence of God can be demonstrated *a posteriori*, by reasoning

⁴ i. qu. ii. art. 2.

from effect to cause. He relies on five such *a posteriori* arguments,¹ which are (1) the argument from the fact of motion to the First Mover; (2) the parallel argument from causal agency to a First efficient Cause; (3) the argument from possibility and necessity, known more commonly as the argument from the contingency of the world;² (4) the argument from the scale of 'degrees of reality,' by which we infer from the existence of greater and lesser goods the existence of a perfect good which is the cause of all lesser degrees of goodness (in virtue of the specifically Neo-Platonic theory of causality already explained); (5) the argument *ex gubernatione rerum*, i.e. from final or intentional causality. (Even the processes of inanimate nature are ordered or adapted to the realization of an end or good; this adaptation presupposes an intelligent intention, and, since inanimate things have no intelligence of their own, a supermundane intelligence.) St. Thomas's arguments are thus all of one type. They are all appeals to the principle of causality taken in combination with the denial of the possibility of an infinite regress. Both the appeal to the principle of causality and the refusal to admit the infinite regress are direct inheritances from the Platonic-Aristotelian philosophy. The former is invalidated if the soundness of the Kantian criticism of speculative theology be admitted; the latter requires reconsideration in the light of what may be called the 'logical realism' of Bertrand Russell and the 'new' realists. Scotus, in the *Scriptum Ozoniense*,³ restates the Anselmian argument with a modification which seems obviously meant to meet the fundamental point in Gaunilo's criticism and anticipates a line of thought afterwards developed by Leibniz. God is defined as 'quo cogitato sine contradictione maius cogitari non potest sine contradictione,' 'that which can be thought without a contradiction but than which nothing greater can be thought without a contradiction.' The important modification is the addition to the definition of the first *sine contradictione*. As Scotus says, 'in cuius cogitatione includitur contradictio illud dicitur non cogitabile.' It thus becomes a preliminary to the ontological proof to show that God can be 'thought without contradiction,' i.e., that we really have a concept of God, or that the word 'God,' or the phrase employed as by definition equivalent to the word, is not an unmeaning noise. When this condition is fulfilled, Scotus holds, the Anselmian inference from the *esse in intellectu* of the *summum cogitabile sine contradictione* to its *esse in re* is valid.

10. Descartes.—Descartes' theism, like that of his mediaeval predecessors, is predominantly of the Neo-Platonic type, and is intimately connected with the assumption, which underlies the reasoning of the *Meditations*, that the principle of causality, in the very form which had been given to it by Proclus, is evident by the natural light of the understanding. The extent to which the thought of Descartes is in fundamentals Platonic is probably not adequately realized by most of his readers. Even the most original feature of his philosophy, the thoroughgoing reduction of natural science to mechanics, is really a reversion from mediaeval Aristotelianism to the standpoint of the early Academy, and the metaphysics of the *Meditations* is thoroughly Neo-Platonic. We quite misconceive Descartes' meaning if we regard the presence of God in his system as an excrescence due to the necessity of artificially bringing together again the artificially sundered worlds of body and mind. Even from the point of view of a merely mechanical interpretation of the world, Descartes is, of course, much more true to the analogies on which mechanical interpretations are founded in assuming the direction of the mechanism by God than those modern half-philosophers who attribute to the cosmic machine an inherent power of directing and repairing itself. He has not forgotten, as the modern materialist tends to do, that behind the most complicated and perfect machinery there is always intelligence which is not that of the machine to start it, to direct its workings, and to repair it. But, beyond this, Descartes has reasons for asserting the existence of God which are wholly inde-

1. *qu. ii. art. 3.*

2 The argument is that whatever is merely possible or contingent exists at some times but not at others. Hence, if all things are merely possible or contingent, there must have been a time when nothing existed at all. But (in virtue of the principle of causality), if there had ever been a moment when there was nothing at all, nothing could ever have come to be. Hence the fact that there is something now proves that there must be 'something in things' which is necessary, i.e. incapable of not existing. And the argument from the impossibility of an infinite regress is then invoked to show that there must be *one* ultimate necessary being.

3 See the relevant passages in Daniels, pp. 105-107.

pendent of his reversion to the mathematical and mechanical standpoint in physics and would have been equally strong if he had adopted any other type of physical doctrine. The theism of Descartes is, in fact, dictated by two considerations—his unqualified acceptance of the principle of causality and his adherence to the conception of the 'Perfect Being' as the only adequate object of the understanding, and therefore the 'natural good' of rational beings (the 'ben dell' intelletto,' to use Dante's phrase). He is a theist, not because he holds the mechanical view of nature, but for the same more ultimate reason which leads him to hold that view, that he is, like the whole Platonic succession, a rationalist and consequently regards the knowledge of the 'Supreme Being' as the culmination of science.¹ The actual proofs of theism offered by Descartes are two. In the third *Meditation* we have the *a posteriori* proof in the special form of an argument from our possession of an idea of God to the existence of God as the cause of the idea. This is, of course, strictly on Neo-Platonic lines. In the fifth *Meditation* the *a posteriori* proof is confirmed by an *a priori* proof which turns out to be, in principle, a restatement of the Anselmian argument with a modification which is by no means an obvious improvement.

The well-known argument of the third *Meditation* runs thus. I have an 'idea' of the 'Perfect' or 'Infinite' Being. My possession of this idea, like any other fact, demands a causal explanation. The explanation cannot be that I am myself the Perfect and Infinite Being and that the idea is derived from my immediate awareness of myself, because I am aware of myself as, in many ways, defective and limited. It is not derived from acquaintance with other persons or things, which are all no less limited and finite than myself; and it has not been obtained by an imaginative combination of the various perfections I have observed separately in different finite things, for internal simplicity is itself one of the perfections which I think of as constituting the 'Infinite Being.' Nor again is 'infinite' a merely negative expression. (If it were, it might, of course, be objected that, when I say 'infinite,' there is no definite concept corresponding to the word.) For in the order of logic the infinite is prior to the finite. If I had not already an intelligible concept of infinity, I could not even be aware of my own finiteness. There is thus only one possible cause of my possession of the idea of the Infinite Being. It must be the effect of a really existing Infinite Being, who possesses *eminenter* or *formaliter* all the perfection which my idea of the Infinite Being contains objectively, i.e. by way of representation. God therefore exists, and my idea of God may be said to be the mark which the Creator has stamped on His creature. It may be added that, to argue the point even more generally, I who have this idea could not exist if the object of the idea did not also exist. For, since time is no more than a sequence of moments, each independent of all the rest, conservation, continuance in existence, is logically equivalent to fresh creation at every moment, and it is certain that I have no power to create myself. (This is proved by urging that it is easier to bestow new excellences on what already exists than to create. If then I cannot bestow infinite wisdom or power on myself, as I know I cannot, *a fortiori* I am not my own creator.) If it is urged that my parents are my creators, and their parents in turn their creators, we fall into the infinite regress. Thus the mere fact of the existence of any finite thing is proof of the existence of the Infinite Being; i.e., if anything whose existence requires an external cause exists (and the Cartesian *cogito* assures me of the existence of at least one such thing), there exists also a Supreme Being whose existence requires no external cause (another form of the argument called by St. Thomas the argument from possibility and necessity).

The argument from my possession of an idea of God is Descartes' own substantial contribution to the philosophy of theism. It must be carefully distinguished from the old Stoic appeal to the *consensus gentium*. Descartes' critics were not really hitting a blot in his reasoning when they said that savages and atheists do not possess this idea. Against such objections Descartes' own explanation, that he only meant that, given the knowledge of myself from which he starts, reflective analysis is sufficient to lead to the concept of an Infinite Being, is a sufficient rejoinder. He seems to be equally right in his contention that the concept of an Infinitely Perfect Being is logically implied in my recognition of my own finitude, just as T. H. Green maintains that the recognition of a morally 'better' implies the conception of a 'best.' The real point of weakness in the argument, so far as the present writer can see, lies elsewhere. Descartes is clearly right in maintaining that the concept of a Being who combines all perfections or excellences in the absolute internal simplicity of his own nature is not formed by a process of synthesis; it is clearly obtained by

1 'Perfecta scientia,' as St. Hilary puts it, 'Deum scire.'

the process of 'passing to the limit,' of which mathematical reasoning furnishes so many examples. But we are not really authorized to infer from our ability to conceive the limit of a series or of a sum of terms that a given series has a limit or a given sum a limiting value. Whether a series or a sum has a limiting value or not has to be discovered by examination in each special case; it is notorious that mathematicians down to a very recent date have been repeatedly led into fallacies by the assumption that limits exist where, in point of fact, they do not. Thus, when we have conceded to Descartes that there is an idea of the Infinitely Perfect Being and that this idea is presupposed in our own judgment that we and other things are finite, it does not follow of itself that the series of existents, arranged in ascending order of perfection (assuming such an arrangement to be possible), must have an actual upper limit. This is the very point which ought to be proved, and has not been proved. Descartes himself was presumably led to ignore the difficulty by the laxness with which he employs the word idea to cover alike memory-images, concepts, and judgments. When once he has allowed himself to call a judgment an idea, it is easy for him to think that he has bridged over the chasm between the concept of God and the judgment that God exists. The whole argument, it will be observed, is based on the combination of the Neo-Platonic doctrine of causality with the doctrine of representative perception. According to the latter doctrine, the direct and immediate object of apprehension, both in sense-perception and in thought, is never an extra-mental reality, but always itself mental or 'in the mind.' When this theory is combined with the view that everything that becomes has a cause and that all causality is imperfect mirroring, we get at once the proposition of Descartes that the cause of any idea must contain eminently or formally at least as much perfection as the idea contains objectively. 'Eminently' here answers to the *κατ' αἰτίαν* of Proclus, 'formally' to his *καθ' ὑπερίαν*, 'objectively' to his *κατὰ μέγεθος*.

The *a priori* or ontological argument of the fifth *Meditation* runs as follows. By 'God' I mean a being who has all perfections. But existence is a perfection. Therefore the being who has all perfections has existence; i.e. God exists. Or, in other words, just as I see when I analyse the idea of a [rectilinear] triangle that it includes the property of having the sum of the internal angles equal to π , so, when I analyse the idea of God, I find that it includes existence. God therefore exists and exists necessarily. (Thus Descartes seems to assume that there is just one existential proposition, and only one which is, in Kant's sense of the term, analytical, viz. the proposition 'God exists'.) The objection that St. Thomas (now the recognized chief authority in all questions of theology) had rejected the Anselmian argument leads Descartes, in his *Reply* to the *First Objections*, to insist vehemently that his own proof is not that of Anselm, but differs on a vital point. The force of his own reasoning depends entirely on the fact that existence is already contained in the concept of God. Anselm¹ had said nothing about this, and that was why St. Thomas was reasonably dissatisfied with his argument; i.e., the all-important point is that, according to Descartes, the proposition 'God exists' is analytic; Anselm had left it an open question whether it might not be synthetic. Historically this modification of the ontological proof is important, since Kant (who appears not to have known the writings of St. Anselm) makes it the main object of his attack on the proof to show that the proposition 'God exists' is synthetic. It is precisely because the proposition is synthetic, though the conditions which make the affirmation of an *a priori* synthetic proposition legitimate are, in this case, not fulfilled, that we can, according to Kant, have no speculative certainty of the existence of God. If Descartes should be right in regarding 'God exists' as an analytic proposition, Kant's antitheological polemic would become a mere *ignoratio elenchis*.

The further peculiarity of the Cartesian argument on which Kant fastens, that it improperly treats existence as a predicate or attribute, is not really of much importance. Whether all propositions can without violence to their meaning be represented as asserting (or denying) a predicate of a subject is an important question for formal logic, but seems to have no relevance to theology. If there is no predicate in the proposition 'God exists,' it must be held, on the same ground, that there is no predicate in such a proposition as 'Joseph dreams' or 'Esau hunts' or 'The rich man died.' *Per contra*, if dreaming, hunting, and dying are predicates in these propositions (as Kant, who professed to regard logic as a science created perfect by Aristotle, ought to hold, and presumably did hold), existence is a predicate in every proposition of the form 'x exists.' The only question it is relevant to raise about the Cartesian argument is the question whether in the special case of the *ens summe perfectum* existence (whether existence be regarded as a predicate or not) can be asserted to be part of the meaning of a concept.

Whether there is really so much difference as Descartes maintains between his own argument and Anselm's may be doubted. Certainly the definition from which Anselm starts

(God is *id quo maius cogitari non potest*) does not specify existence as part of the meaning of the concept. But, since Anselm tries to show that admission of the definition is logically tantamount to admitting that 'God cannot be thought not to be,' the difference between him and Descartes seems to be that Anselm tries to prove the point which Descartes is content to assume without more ado. It is hard to believe, as Descartes does, that St. Thomas, who denied that God is *notum per se quoad nos*, and gave a very sensible reason for his denial, would have regarded the Cartesian version of the proof as anything more than a glaring *petitio principii*.

ii. Spinoza.—With Spinoza's attempt to give a pantheistic turn to the Neo-Platonic and Cartesian lines of thought it is not necessary to concern ourselves further than to remark that the whole of the First Part of the *Ethics* is logically no better than one long *petitio*. The first, third, and sixth of the definitions already contain the two assumptions, that God = *substantia* = *causa sui* and that *causa sui* (which is defined as 'that whereof the nature cannot be conceived but as existing') exists. Where the whole doctrine has thus been taken for granted by arbitrary definition, it is really superfluous to add anything in the way of 'proof,' even if the 'proofs' themselves were more free than they are from formal logical fallacy. What Spinoza wholly evades considering is the question, which is really fundamental, whether the definition of *causa sui* is more than a 'meaningless noise.'

One particularly glaring example of Spinoza's singular carelessness about his initial definitions may be noted. He has taken from Neo-Platonism the first and most fundamental notion of his system, that of *causa sui* (*τὸ αὐθιπόστατον* of Proclus). Now, by calling a thing *αὐθιπόστατον*, the Neo-Platonists meant exactly what they said, that it 'causes' or 'produces' itself (*πρῶτα ἐαυτόν*). Hence they confined the name *αὐθιπόστατα* to minds and souls and expressly maintained that the One, or God, having no cause, being unproduced, is not *αὐθιπόστατον*;¹ i.e., they understood *causa sui* in a positive sense. Theologians had done the same thing; as Arnauld said in his comments on Descartes' *Meditations*,² no theologian would admit that God is a *se positive tanquam a causa*, but at most that God may be said to be a *se* in a purely negative sense—i.e., in the sense that He is not an effect of anything else. Spinozism succeeds in appearing to satisfy our demand for an object of religious adoration only by a constant equivocation. It defines *causa sui* (= *τὸ αὐθιπόστατον*) in the positive Neo-Platonic sense as *id cuius essentia involvit existentiam* (*τὸ τοῦ εἶναι ἐαυτὸν παρ᾽ ἑαυτόν*) and then asserts of it all that Neo-Platonism had asserted of the uncaused One. To put the point rather differently, it defines God as 'that whereof the *essentia* implies existence' and transfers to God, so defined, what theologians have asserted of a God in whom the distinction between *existentia* and *essentia* is unmeaning. Spinoza commits the paralogism in set terms in the first sentence of the *Ethics*: 'Per causam sui intelligit id cuius essentia involvit existentiam, sive id cuius natura non potest concipi nisi existens.'

12. Locke.—Locke's proof of theism,³ which he regards as having an evidence 'equal to mathematical certainty,' though in some ways perfunctory, is in its general character of the Neo-Platonic type. He does not refer to the *a priori* or ontological argument, and refuses to pronounce any opinion on Descartes' own special argument from our possession of an idea of God except to remark that 'It is an ill way of establishing this truth and silencing atheists to lay the whole stress of so important a point as this upon that sole foundation.' (As the context shows, Locke thinks that it would be a true and relevant criticism of Descartes to say that some men have no idea, and others false ideas, of God.) It is not quite clear whether Locke regards the certainty of theism as equal to the certainty with which we know actually perceived facts or the fact of our own existence. He says that we have more certainty of it 'than of anything our senses have not immediately discovered to us,' and again that 'we more certainly know that there is a God, than that there is anything else without us.' This certainty looks as if Locke held (as Descartes did not) that the existence of God is less certain than our own, and

¹ Proclus, *Instit. theol.*, prop. 40: ἀνάγκη ἄρα τὸ αὐθιπόστατον εἶναι μετὰ τὸ πρῶτον.

² *Objectiones Quartae*, § 'de Deo.'

³ *Essay*, bk. iv. ch. 10, 'Of our Knowledge of the Existence of a God.'

¹ The name of Anselm occurs neither in the *Objections* nor in Descartes' *Reply*. Apparently both he and his critic knew the Anselmian argument only at second hand, through Thomas. Descartes' point, to be strictly accurate, is that his own argument turns wholly on the contention that concepts in general contain only the 'possible existence' of a corresponding object, but the concept of God 'contains the necessary existence' of God.

possibly less certain than that of the objects of actual and present sense-perception. But it is also possible that he only means that our certainty in the last two cases is immediate, but in the first depends on an ability, not found in all men, to follow the steps of a deduction. He may not intend to suggest that, to the man who can perform the deduction, its conclusion is inferior in certainty to any immediate cognition, 'intuitive' or 'sensitive.'

Locke's own proof is the usual *a posteriori* one based on the principle of causality and the empirical proposition (guaranteed by the *cogito*) that something (viz. myself) exists. It is also assumed, as usual, that a cause must contain more reality or perfection than any of its effects, as the Neo-Platonists had taught. The argument then becomes this: I exist; therefore I must have a cause; this cause cannot be 'bare nothing'; therefore it is a positive something. Since 'bare nothing' cannot be the cause of anything, therefore the cause of my own existence and that of all other existents must be eternal. (The impossibility of the endless regress and the 'contingency of the world' are not mentioned, but are of course tacitly presupposed.) An effect must derive all its properties from its cause. Therefore the 'eternal cause' must be the most powerful of things. (It is assumed that the cause has not only as much 'reality' as the effects, but more, and further that there can be only one 'eternal cause'—a point which Locke is hardly entitled by his own metaphysics to assume.) There is intelligence in myself, the effect, and therefore there is intelligence (of a higher degree) in the cause. The 'eternal cause' is thus 'most knowing' as well as 'most powerful.' From this Locke thinks it follows that this cause is what we mean by God; whether we use the name or not is a mere matter of vocabulary. 'There is an eternal, most powerful, and most knowing Being; which whether any one will please to call God, it matters not.' The rest of the chapter is given to an argument in proof of the immateriality of the eternal cause. The goodness of this cause Locke presumably held, as any Platonist might, to be inseparable from its wisdom. He does not seem to reflect that he has given no reason for supposing either the power or the intelligence of the 'eternal cause' to be perfect. His argument is thus only the familiar one from causality very badly stated and with most of its real premisses left unexpressed.

13. Leibniz.—Leibniz's treatment of the subject is far more adequate. In his system, at least as represented in his best known works, the proposition 'God exists' holds a unique position. It is a 'truth of fact,' and therefore, like all 'truths of fact,' synthetic. But it is the only truth of fact which is capable of demonstration. In general, only 'truths of reason,' analytic propositions, admit of formal demonstration, because the demonstration of a proposition is nothing but its analysis into simpler propositions which are seen on inspection to be identities. This is why the 'principle of contradiction' (A is not non- A) is regarded by Leibniz as the supreme principle of all truths of reason. Truths of fact (which all assert actual existence) do not fall under the principle of contradiction, but under that of sufficient reason, and thus, with the one exception of the proposition that God exists, they are not analysable into identities and cannot be formally demonstrated. The anomalous character of the proposition 'God exists' vanishes, however, when we discover from the papers published by Couturat¹ that Leibniz's real view was that all truths are analytic, the only difference between 'truths of reason' and 'truths of fact' being that the former can be resolved into identities by a finite number of steps of analysis, the latter require (like the extraction of the square root of an integer which is not a perfect square) an infinite number of intermediate steps.² It follows that God, being omniscient, knows all truths of fact *a priori* (i.e. sees them to be identities), just as Leibniz says more

¹ *Opusculum et fragments inédits de Leibniz*, Paris, 1903, p. 518 ff.

² *Ib.* p. 518: 'Semper igitur praedicatum seu consequens inest subiecto seu antecedenti et in hoc ipso consistit natura veritatis in universum'; p. 519: the law of sufficient reason itself is a consequence of this, for 'alioqui veritas daretur, quae non posset probari a priori, seu quae non resolveretur in identica, quod est contra naturam veritatis quae (semper) vel expresse vel implicite identica est'; p. 376: 'omnes propositiones existenciales sunt verae quidem, sed non necessariae, nam non possunt demonstrari nisi infinitis adhibitis.'

than once that God sees 'from eternity' in the 'notion' of Peter that Peter will repent of his denial, and in the 'notion' of Judas that Judas will die impenitent, and that the distinction between the necessary truths of reason and the contingent truths of fact means nothing to him. *Quoad nos* truths of fact are, in general, contingent merely because we cannot perform an infinite analysis. The peculiarity of the one truth of fact which is necessary *quoad nos*, 'God exists,' is merely that this proposition does not require for its proof *a priori* an infinite series of resolutions. In being capable of resolution into identities by a finite number of steps it resembles the truths of reason.

Consequently Leibniz is bound to hold that the Anselmian argument *a priori* from the meaning of the concept of God to the real existence of God is in principle valid. Since he also held that all propositions without exception are predicative, he naturally adopts the form of the argument used by Descartes, viz. that the predicate of the proposition 'God exists' is already implicitly contained in the subject. Descartes' proof is valid, but incomplete. To make it complete it is only necessary to show that the concept of God is a genuine concept, i.e. that it contains no contradiction, i.e. does not attempt to unite incompatible constituents.¹ Leibniz thinks that this can be shown by the consideration that the 'most perfect' or 'most real' being means the being of whom no simple positive predicate can be denied. (Any being of whom a positive simple predicate could be denied would be without the excellence or perfection for which that predicate stands.) Now, all complex predicates can be resolved into simple ones, and Leibniz holds that all positive simple predicates are compossible in a single subject just because they are all positive. If any two predicates are impossible, one of them must deny what the other affirms. But no simple predicate denies anything. Consequently all simple predicates can 'inhere' in a single subject. This proves that 'the most real' being is possible. And Descartes has proved in the fifth *Meditation* that, 'if the most real being is possible, it is also actual.' Hence the 'ontological' proof, when completed by the preliminary proof that the most real being is possible, is a valid demonstration.² There is an obvious weakness in the argument. Leibniz assumes that, if we have one proposition, ' A is B ,' where B is a 'simple' predicate, and a second, ' A is C ,' and the two are incompatible, the proposition ' A is C ' must be capable of resolution into simpler propositions, of which one is ' A is not B .' It ought to follow that, since the propositions ' A is red' and ' A is green' are incompatible, if 'red' is a simple quality, 'green' is a complex. But, in point of fact, green is as much a simple positive 'perfection' as red. This seems sufficient reason for regarding Leibniz's proof that the *ens realissimum* is possible as a failure. A more promising line of thought is suggested by the short memoir of 1701, *De la Demonstration Cartésienne de l'existence de Dieu du R. P. Lami*, where Leibniz is content to argue that the *ens a se* must exist because, if there were no *ens a se*, there would be no real possibilities—a position since made familiar by Lotze's adoption of it. It is worth noting that in the chapter of the *Nouveaux Essais* where Leibniz is commenting on the corresponding chapter of Locke's *Essay* he feels himself, as standing outside the Roman Church, free to say expressly that St. Thomas was wrong in rejecting Anselm's proof and to commend Descartes for rehabilitating it.

Leibniz naturally agrees with Locke that there are several ways of proving the existence of God and that none of the proofs should be neglected. He himself expressly recognizes three proofs besides the ontological.³ These are (a) the cosmological argument from the actual existence of the world to the existence of God as its cause (the standing Platonic-Aristotelian proof); (b) the argument from 'eternal truths'—truths which involve no reference to time or particular temporal existents in time, and would still be true if the world of temporal existents had never existed—to the 'eternal' intellect of God as their source; (c) the argument from 'pre-established harmony.' This is a special version of the teleological argument from the order and purpose revealed in the world to an ordering and designing intellect as its source. Any remarks which the present writer desires to make upon these *a posteriori* theistic arguments will more naturally find their place in a later paragraph. But it should be mentioned that the use of the argument from design introduces a curious contradiction into Leibniz's peculiar metaphysics. From his view that all propositions are predications and that all true propositions can be analysed into identities it follows at once that, as he constantly asserts, every real existent (every monad) is the ground of all its attributes. Since existence itself, on this view, is a predicate or attribute, the world of existing monads ought to be its own ground, and there should be no need of any external cause to account for the order found in it. Accordingly we find

¹ Cf. what has been said above about the attitude of Scotus, by whom Leibniz was very possibly have been influenced.

² *Nouveaux Essais*, iv. 10, § 7: *Méditations de Cognitione, Veritate et Ideis*.

³ See the discussion of them in B. Russell, *A Critical Exposition of the Philosophy of Leibniz*, ch. ix.

Leibniz himself at times explaining why the actual world, rather than any other equally possible world, exists, by ascribing to the various possible worlds an 'appetence of existence' (*existuntio*) proportionate to their degree of internal harmony, and saying that the most orderly of them is actual just because its *existuntio* is a maximum,¹ but elsewhere, especially in more popular writings, treating existence as something which is conferred on the most orderly and harmonious of the possible worlds by God in virtue of His 'choice of the best.' Unless one is prepared, as the present writer after long study is not, to accuse Leibniz of insincerity, it seems impossible not to recognize here a fundamental inconsistency between his personal religious convictions and the logical requirements of his metaphysical system. If all true propositions are identities, philosophy must be atheistic.²

14. Hume.—The most important philosophical treatment of the theistic problem between Leibniz and Kant is unmistakably that of Hume in his *Dialogues concerning Natural Religion* (written apparently before 1751, though not published until 1779, three years after the author's death). In judging this work it must be borne in mind that it makes no pretence to expound the theology of the author. It is strictly what it purports to be, a conversation between a supporter of philosophic 'natural theology,' Cleanthes, a violent fideist, Demea, intended as a representative of orthodoxy, and a sceptic, Philo. The responsibility for the positions maintained by the three speakers rests entirely with themselves. Hume abstains from indicating his own sympathies except in the final sentence, where he suggests that the 'opinions' (he is careful not to say 'the arguments') of the 'natural theologian' Cleanthes probably come nearer to the truth than those of Philo, and those of Philo than those of Demea.³ Hume's real position in natural theology, as in philosophy in general, seems to have been that of a consistent Academic. Genuine scepticism is a rare thing and liable to be misunderstood. So Hume's general philosophy has commonly been mistaken, as by T. H. Green, Huxley, and others, for a shallow sensationalistic phenomenalism. In reality he is neither a sensationalist nor a phenomenalist. He holds that there are insuperable difficulties in the Cartesian rationalism, and that, on the other hand, sensationalism leads to the conclusion that science is an impossibility. Being unable to accept either Cartesianism or sensationalism, and knowing of no third choice in philosophy, he adopts the sceptical attitude of *ἔποχη*, 'suspense of judgment.' There can be no question of seriously regarding principles presupposed in all science as false; at the same time Hume confesses himself unable to justify these principles. His real attitude towards theism seems to have been the same. It is probably true, and, as the letter to Elliot shows, Hume is very unwilling to believe that his leaning towards it rests on nothing more solid than emotional bias, but the alleged proofs of theism are open to criticisms which Hume does not know how to refute, and there are 'appearances' which it is hard to reconcile with the theistic 'hypothesis.' We have not, as it is to be wished we had, convincing proof of its truth, though Hume lets us see that personally he inclines to accept it. His attitude is neither that of a zealous 'infidel' nor that of a 'phenomenalist' and anti-theist. Neither

the Hume of contemporary High Churchmen like Johnson and Wesley nor the Hume of Huxley's biography is the Hume of historical fact.¹

In form the *Dialogues*, like some of Plato's greatest works, are reported conversation. An unnamed narrator informs his friend Hermippus of the discussions between Cleanthes, Philo, and Demea. The narrator, it should be observed, is a theist.

'What truth so obvious, so certain, as the *BEING* of a God? . . . What truth so important as this, which is the ground of all our hopes, the surest foundation of morality, the firmest support of society, and the only principle which ought never to be a moment absent from our thoughts and meditations? But in treating of this obvious and important truth, what obscure questions occur, concerning the *NATURE* of that divine being; his attributes, his decrees, his plan of providence?'

There is no sign of irony in this utterance, and its seriousness is all the more probable that Hume proceeds to dwell on the intellectual difference between the characters of the dialogue, assigning an 'accurate philosophical turn' to Cleanthes the theist, 'careless scepticism' to Philo, and 'rigid inflexible orthodoxy' to Demea.² His obvious intention is to predispose the reader to find in Cleanthes the hero of the work. It is with the same object that, until the discussion is near its end, Demea, the zealot for unreasoning faith, is made to regard Philo as an ally against Cleanthes.³ The intimate correspondence between what Cleanthes says about the impossibility of seriously acquiescing in complete philosophical scepticism and Hume's own utterances to the same effect in the *Treatise of Human Nature* further helps to indicate that we are not to take Philo's estimate of the theistic arguments as meant to be that of his creator. His function is not to refute Cleanthes, but to call attention to the difficulties and weak points in his exposition.⁴ The precise position at the opening of the discussion is this. Cleanthes affirms the existence of a 'cause' of the universe and, reasoning by analogy from the products of art to those of nature, holds that this cause is a mind resembling our own. He denies the doctrine of the Neo-Platonists and Christian theologians that God is absolutely simple and therefore unknowable in His *essentia* to us, on the ground that this amounts to atheism. Philo and Demea are agreed in opposing him, though for different reasons—Demea because he accepts the negative theology, Philo on the ground that, as we have no experience of 'world-making,' we are not entitled to say that the order in the world presupposes a world-building intelligence. Cleanthes has rested his case on the old Platonic argument from 'orderly motion,' but has admitted that the argument is one from analogy. Philo replies that there is no sufficient basis for an analogical argument. He further appeals to the difficulties of the 'infinite regress.' If matter and mind must be effects of a cause, why must not that cause have a more ultimate cause, and so on *ad indefinitum*? Cleanthes declines to consider the problem: 'You ask me what is the cause of this cause? I know not; I care not; that concerns not me. I have found a Deity; and here I stop my enquiry. Let those go farther, who are wiser or more enterprising.' Philo not unnaturally replies: 'I pretend to be neither; and for that very reason, I should never perhaps have attempted to go so far; especially when I am sensible, that I must at last be contented to sit down with the same answer.'⁵ Philo, it must be remembered, calls himself a theist, though he professes to regard the nature of God as totally unknown. The point at issue between him and Cleanthes is that Cleanthes maintains that the 'First Cause' is not only a mind but also 'a mind like the human,' and that the teleological argument is an 'experimental proof' of this. These two points are what Philo disputes and Demea regards as 'anthropomorphist' heresy. Philo, in fact, wishes, like Kant, to maintain that speculative theism is dependent upon the validity of the 'a priori proof.' If we rely solely on the argument from

¹ That Hume was personally an orthodox Christian is, to be sure, unlikely, but there is no reason to suppose that he was much further removed from orthodoxy than more than one of the prominent 18th cent. latitudinarian bishops or Scottish 'moderates,' and in his philosophy he never commits himself to any view not compatible with the completest orthodoxy, as orthodoxy was understood in his day. Huxley's anti-clericalism is quite incompatible with Humanism.

² There is a certain want of definiteness about the position ascribed to Demea. He is spoken of as a 'mystic' and a deprecator of the powers of reason; on the other hand, he is the champion of the 'simple and sublime argument a priori'—an odd attitude for an irrationalist. Hume does not seem to have distinguished between negative theology, the creation of philosophic rationalists, and the scepticism of despair which arises from sheer distrust of reason. Philo's 'scepticism' is quite another thing, a mere declaration that, 'as at present advised,' he has not sufficient material for a definitive conclusion.

³ Demea is, in fact, so little of a real theologian that he is unaware that it is actually unorthodox to maintain that the existence of God is known only 'by revelation.' Perhaps, like Hume himself, according to Johnson, 'he had never read the New Testament with attention,' and he almost certainly did not know that his position had been formally condemned by the Fifth Lateran Council.

⁴ Huxley's exploitation of Philo for an antitheistic purpose rests on the false assumption that it is he who is the real 'hero of the dialogue.'

⁵ Hume, *Philosophical Works*, ed. T. H. Green and T. H. Grose, London, 1874-75, ii. 410.

¹ Cf. Couturat, *La Logique de Leibniz*, Paris, 1901, pp. 224-226, with the passages cited there.

² For a useful conspectus of all the more important utterances of Leibniz on the existence of God known before the publication of Couturat's volume of *Opuscules* see Russell, *Crit. Expos. of the Philosophy of Leibniz*, pp. 284-291, and, for a 'smashing,' but by no means final, attack on all the four arguments, ch. ix. of the same work.

³ That this remark is made in good faith seems clear from Hume's letter to Gilbert Elliot of March 10th, 1751, where he speaks of Cleanthes as the 'hero' of the dialogue and asks his friend for any suggestions which will 'strengthen that side of the dialogue,' protesting against the ascription to himself of 'any propensity to the other side,' by which he plainly means the side of Philo. No one could suspect him of 'propensity' to the side of the 'mystic' Demea.

effect to cause, the known effect is not perfect and we are not entitled to infer that its author is free either from intellectual or from moral deficiencies, or even that 'several deities' may not combine to construct a world as many men co-operate to build a house or a ship. 'A man, who follows your hypothesis, is able, perhaps, to assert, or conjecture, that the universe, sometime, arose from something like design: but beyond that position he cannot ascertain one single circumstance, and is left afterwards to fix every point of his theology, by the utmost licence of fancy and hypothesis.'¹ The God of Cleanthes is, in fact, a 'finite deity,' and a finite deity is as bad as none at all. And, if reasoning by analogy be in place at all, analogy suggests that we should look on the material world as an animal of which God is, as with the Stoics, the soul, and thus we shall be led to affirm the eternity of the world (contrary to the position of Cleanthes, who has tacitly assumed that the thing to be accounted for is its origin). Or, again, if the world is more like an animal or vegetable than a watch or loom, why should we not infer that worlds are propagated rather than made? A comet may be the 'egg' of a solar system. Demea, of course, comments on the absence of any data for such 'wild' theories. But this is exactly the point on which Philo wishes to insist; 'we have no data to establish any system of cosmogony.' He insists, none the less, that such analogies as we have suggest that intelligence itself is caused by physical generation. Generation, itself an unintelligent process, is explained to be a 'principle of order in nature,' and 'we see every day the latter [intelligence] arise from the former [generation], never the former from the latter.' (It is, of course, obvious that Cleanthes is here making two very questionable assumptions—that the 'rational soul' is generated like the body, and that, because an oak or a spider is not rational, the growth of the one and the instinctive behaviour of the other are not guided by intelligence at all. 'Experience' does nothing to assure us of these negations.) Philo finally reaches the climax of his polemic against the *a posteriori* argument when he urges that the 'unguided' motions of material particles may give rise to 'an uniformity of appearance,' and thus 'account for all the appearing wisdom and contrivance' in nature. (As before, he makes the wholly illegitimate assumption that we know from experience that this has really happened. 'This we know to be the case with the universe at present. . . . May we not hope for such a position, or rather be assured of it, from the eternal revolutions of unguided matter?' Of course, experience does not warrant the statement that there is or ever has been 'unguided matter.') He had himself repudiated the notion that chance has any place in a scientific theory, but he ends by suggesting that the only reason why there is order in the world is that 'it happens' so.² Cleanthes reasonably retorts that the degree of harmonious adaptation in the known part of the universe to the needs of an intelligent civilization goes far beyond what Philo undertakes to account for—such order as is necessary 'for the subsistence of the species.' But Philo has made the main point for which he was concerned, that the *a posteriori* argument, taken by itself, is not adequate to establish the existence of the all-perfect or 'most real' being. Accordingly the dialogue now proceeds to consider the *a priori* argument by which the existence of the *ens realissimum* is to be established from an analysis of its own nature. The exposition of this argument is given to Demea, the spokesman of traditional theology, and the objections against it are put into the mouth of Cleanthes, the upholder of the argument from design, as well as into that of Philo. We now find Cleanthes and Philo allied against Demea, as we have hitherto had Demea and Philo combining against Cleanthes. The particular argument regarded as conclusive by Demea is one which ought more properly to be called *a posteriori*. It is, in fact, as he words it, a combination of two of the forms of the *a posteriori* argument admitted by St. Thomas—the argument from the fact of motion to a First Mover and the argument from the possible to the necessary. Since the indefinite regress is illegitimate, in arguing from effects to causes, we must come to a First Cause, and, when we ask why the 'succession of causes' should be what it is and not a different series, we are forced to answer that the First Cause is a 'necessarily-existent Being, who carries the REASON of his existence in himself; and who cannot be supposed not to exist without an express contradiction.'³ (This last clause thus gets in the point of the ontological proof under cover of the argument from causality; this may be the justification for calling Demea's reasoning *a priori*. Or Hume may possibly mean that his argument is based simply on the general principle of causality and not on the special character of the effect under consideration, the actual universe.) Cleanthes urges against the proof the five following considerations. (1) No fact can be demonstrated *a priori*. 'Whatever we conceive as existent we can also conceive as non-existent. There is no being, therefore, whose non-existence implies a contradiction. Consequently, there is no being whose existence is demonstrable.' This agrees with Thomas's verdict on Anselm except for the fact that Hume disregards the fine distinction between what is evident *in se* and what is evident *quoad nos*. (2) We cannot know that 'the Deity' is a 'necessarily-existent Being' while our faculties remain the same as at present, and therefore 'the words necessary existence have no meaning' to us. Here there seems to be a direct contradiction between Cleanthes and St. Thomas. But on looking more closely we see that Cleanthes is merely repeating his former objection in fresh words. By a 'necessary existence' he means one that cannot

be thought of as not existing, and St. Thomas also admits that 'our faculties' do not allow us to perceive that God's existence 'flows from His essence.' St. Thomas's argument only went to show that there is a being who exists always. This contention Cleanthes does not refute, but merely denies without giving a reason; 'nor can the mind ever lie under a necessity of supposing any object to remain always in being.' (3) If there must be a 'necessary being,' or a being which cannot be thought not to exist, why may not 'the material universe' itself be this necessary being? 'For aught we can determine, it may contain some qualities which, were they known, would make its non-existence appear as great a contradiction as that twice two is five.'¹ (4) How can there be a first cause of an 'eternal succession of objects'? (5) In such a 'succession of objects' each may be said to be caused by something that preceded it, but there is no sense in asking for a cause of the whole chain. Demea adds that possibly the 'whole economy of the universe' is 'conducted by a necessity,' undiscovers to us, which he compares with the arithmetical rule that the sum of the digits of any multiple of 9 is divisible by 9.² These reflexions really suggest more than they actually contain. Consideration (4), if thought out, raises the question whether the 'infinite regress' is really an impossibility, and consideration (5) is at least a hint of the more modern doctrine of ultimate pluralism that the universe may consist of a multitude of independent but inter-related constituents. Demea's remark deserves less consideration. It amounts manifestly to the suggestion that the 'material universe' itself may be the 'necessary' being whose existence follows from its 'essence,' and is inconsistent with the objection already urged against the ontological proof, that there is no existent which may not be conceived not to exist.

The discussion now turns to the moral character of the First Cause. Philo and Demea agree in arbitrarily assuming the pessimistic view of the general misery of creation and in particular of man. The case is argued by Philo with an abundance of rhetoric and manifest want of logic which of themselves suggest that Hume is treating him with some irony. That Cleanthes declares that he feels little of this misery himself and hopes that pessimists are not very common is a further indication that it is he who is the spokesman of Hume's own conviction, so far as any of the characters can be said to be so, Demea, of course, means only to infer from the pessimistic estimate of life that the true good of man is not to be found on this side of the grave, and is driven out of the company by disgust when Philo goes on to argue at great length, and with still more obvious begging of the question than before, that all the indications show that the cause or causes of the cosmic order are either incompetent, evil, or indifferent to morality. (It is almost incredible, again, that Hume was not aware that the whole of Philo's eloquence depends on the tacit assumption that nothing is good but pleasure. He merely revives the old Epicurean argument against Providence in its crudest form, and it is no surprise to an intelligent reader when he informs Cleanthes, after Demea's departure, that his real object has been merely to protest against the abuse of the topic of benevolent design by popular preachers. It is not quite so easy to believe him sincere in his assertion that, in spite of all that he has hitherto said, he thinks the evidence of rational design in nature overpowering and regards doubt about the existence of a 'Supreme Intelligence' as 'pertinacious obstinacy.') Philo's final conclusion is that the controversy between theists and atheists is at bottom verbal. The order and design in the world prove that its cause (he quietly abandons his own former objection to the demand for such a cause) bears an analogy, though, no doubt, a remote one, to the human mind. If theists would remember the remoteness and atheists the reality of the analogy, there would be nothing left to dispute. But he objects *in toto* to all 'religion' which goes beyond the intellectual admission of this one proposition (and thus is plainly meant to be insincere in his assertion that his 'philosophical scepticism' is 'the most essential step,' in an educated man, 'towards being a sound, believing Christian'). Deism—bare intellectual affirmation of the existence of an intelligent First Cause which exercises no influence whatever on the practical conduct of life—is manifestly what Philo really means to recommend. (His attack on 'religion' is little more than a denunciation of the 'horrors of the Inquisition' and contains a logical contradiction to which his creator must have been alive. He maintains, on the one hand, that 'religious motives' are so weak, by comparison with others, that 'religion' is impotent to influence conduct for the better, and, on the other, that it is so strong that all the worst evil in life is due to 'priests' who play on the fanaticism of the vulgar for their own interested purposes. It is hard not to believe that Hume is treating his puppet with intentional malice, just as he is treating Demea with malice when he represents him as welcoming Philo's description of the hopeless wretchedness of existence without any suspicion of its drift, though, as an educated man, he must have known what conclusions Lucretius had drawn from the same premisses.) Cleanthes, it is to be noted, listens to this assault on religion almost in silence and leaves Philo with the last word. It is to be supposed that he does not assent, though he may not see his way to 'dissolve the *ἀπορία*.'

15. Kant.—Much more closely knit is the assault on the whole of natural theology in Kant's *Critique of Pure Reason*. It should be remembered that Kant had not always been a disbeliever in the

¹ *Philosophical Works*, p. 414. ² *Ib.* p. 425. ³ *Ib.* p. 432.

¹ *Philosophical Works*, p. 432.

² *Ib.* p. 434.

possibility of demonstrating theism. In his thesis for his degree,¹ which aims at showing the irreducibility of the principle of sufficient reason to the logical principle of contradiction, he offers a proof, based on the former principle, that 'there is a being whose existence is antecedent to the possibility of itself and of all things, which being must therefore be said to exist with an absolute necessity.'² This is, in principle, the contention most fully developed later by Lotze.

As Kant states it, the argument runs thus. 'Possibility' means the absence of contradiction (*non repugnantia*) between the constituents of a 'complex notion.' The 'constituents' are thus presupposed as the 'matter' of the 'complex notion.' Thus a 'possibility' with no presuppositions, a 'possibility' when nothing whatever has been given as actual, is meaningless. It follows 'that nothing can be conceived as possible unless that which is real in every possible notion exists, and, indeed, exists with absolute necessity (since, if you leave this [reality] out of account, nothing whatever would be possible, i.e., everything would be impossible). Further, he urges, this 'necessary reality' must be a single being. The argument for this is that, if we suppose 'the reals, which are, so to say, the matter of all possible concepts, to be found distributed among many existents' (i.e., if we suppose a plurality of ultimate 'reals'), each 'real' will have limitations, i.e. 'privations,' negative characters. But negative characters have not, like positive 'realities,' an 'absolute necessity.' The supposed 'reals' will therefore all contain an element of contingency. The being which exists with absolute necessity must therefore be without any limitations and therefore infinite. (Like Leibniz's God, it must be the subject of every proposition affirming a positive 'perfection.') If there were more than one such infinite being, the very plurality would re-introduce contingency. 'Thus God, and one only God, is given as the absolutely necessary principle of all possibility.' Kant thus, by deducing the existence of God from the principle of sufficient reason, is already anticipating the doctrine of the *Critique* that all existential propositions are synthetic without exception. Descartes' ontological argument is pronounced to be invalid, precisely because it attempts to deduce the 'existence' of God from His 'essence' (thus treating an existential proposition as analytic), whereas, in the proof given by Kant, the 'possibility' of God is itself made to depend on His 'existence.'

Kant returns to the subject in his short essay on *The Only Possible Proof of the Being of God*.³ The proof offered is substantially that of his thesis of 1755, divested of scholastic terminology. Existence is not a predicate or determination of a subject, but the absolute positing of the subject itself; e.g., when I am fully acquainted with the whole story of Julius Caesar and know every predicate of the hero of the story, it is still an intelligible question whether this Julius Caesar is a 'real' man or only the hero of a fiction, and by calling him a 'real' man I do not add an $(n+1)^{th}$ predicate to the n predicates which I have already asserted about him in telling the story. The difference between a 'real' and a merely possible thing lies not in what is posited in each case, but in the way in which it is posited. If I think of a thing first as possible and then as real, the same complex of predicates and relations is posited in both cases; but in the first case this complex is posited hypothetically (a complex of propositions are true about the thing if it exists), in the second case absolutely—i.e. categorically. I cannot think of anything as possible unless its predicates are all compatible with one another; e.g., I cannot think of a triangle with four sides as possible, but I can think of a triangle with a right angle as possible. 'Both the triangle and the right angle are the data or material element in this possibility; the agreement of the first with the second in respect to the law of contradiction is the formal element of the possibility.' Since the material element (the data) as well as the formal is required to constitute a possibility, 'the internal possibility of all things presupposes some existence' (*irgend ein Dasein*), and 'it is wholly impossible that absolutely

nothing should exist.' (In more modern language this means that the difference between the logically possible and impossible depends on the compossibility of some predicates and the impossibility of others; thus, that there may be so much as the difference between what is logically impossible and what is possible, there must be predicates, and predicates are predicates of something. Hence there must be something, to be the subject of predicates if the very word 'possible' is to have a meaning.) Thus we get back to the starting-point of the proof of 1755. Possibility logically presupposes actual existence as its foundation. Therefore there is something actual, the elimination of which would destroy all 'internal possibility'; i.e. there is 'an unconditionally necessary being.' Kant then proceeds, as in 1755, to prove that the necessary being is one, simple, immutable, and eternal, and, as that which contains the data of all possibilities, is, in fact, the *ens realissimum*. From these attributes it is inferred that 'the necessary being is a spirit (*Geist*),' and this completes the proof that God exists.

It still remains for Kant to show that his form of the argument 'from the possible to the necessary' is the only valid theistic proof. The Cartesian proof of the fifth *Meditation* is set aside on the ground that it treats existence as a predicate. The familiar argument from the contingency of the world (the world is an effect, therefore it has a cause which is itself uncaused and therefore 'necessary') is unsatisfactory. Kant allows in this essay, as he does not in the *Critique*, that the inference to an uncaused First Cause may be valid. It is not so clear that 'this independent thing is unconditionally necessary,' i.e. that it cannot even be thought not to exist, since the demonstration of this turns on the principle of sufficient reason, which is not admitted by all philosophers. But, even if the point be conceded for the sake of argument, it is not proved that the absolutely necessary being is what we mean by God, i.e. is utterly perfect and utterly One. To establish this point (that 'the necessary being = the perfect being') we require to prove that, 'if X is perfect, X necessarily exists,' and this is just the ontological argument, with its treatment of existence as one predicate among others, over again (a point on which Kant expatiates more fully in the *Critique*). The teleological or, as Kant calls it, the physico-theological proof here, as in the *Critique*, comes off better. Like Hume's Philo (in one of his moods), Kant is convinced that there is such evident system, adaptation, and benevolence in nature that its author must be thought of as One, wise, and good. But, though the argument deserves to be enforced in the interests of practical piety, it is not enough to prove perfect wisdom or benevolence in the Creator, and thus not enough to prove that He is all we mean by God. The same criticism will meet us again in the *Critique*.

The argument for the dependence of the world on a 'necessarily existing being' recurs again, in a slightly different form, in a third 'precritical' work—Kant's inaugural lecture as professor on 'The Form and Principles of the Sensible and Intelligible World.'¹ As in the two works already considered, Kant assumes the Leibnizian conception of the universe as a complex of simple substances or monads. His object is to show that such a complex must depend for its existence and character upon a supreme and 'necessary' extramundane 'substance,' which is God. The theistic argument is more specially contained in §§ 17-22, and runs as follows. The principles of interrelation between a plurality of substances cannot have their complete ground in the existence of these substances. Each substance is indebted for its mere subsistence only to its cause (if it has a cause). But the relation of effect to cause is not *commercium* (reciprocal interaction), but *dependentia* (one-sided dependence), and what we have to account for is the *commercium* of the substances which make up the universe. Not all these substances can be 'necessary,' because, if they were, they would be absolutely without dependence on each other; there would be no *commercium* between them, and they would not form a world at all. The world, or 'totality

of substances,' is, therefore, a 'totality of contingents'; and 'the world, in virtue of its essence, consists of mere contingents. Moreover, no necessary substance is connected with the world (*mundus*) at all, unless as cause with effect, and therefore not as a part with a whole, since the parts of one and the same whole are connected by reciprocal dependence, a relation which does not affect a necessary being. The cause of the world, then, is an extra-mundane being and not a "soul of the world." And the necessary being which is the extra-mundane cause of the world is one and not many. For the effects of different 'necessary beings' would stand in no relations of reciprocal dependence, since their assumed causes are not reciprocally inter-related. Hence the unity of the substances composing the world in a single system is a consequence of the dependence of them all on one being, and it follows that this one being is not a mere 'architect of the universe' (*i.e.* *δημιουργός*), but its Creator. Incidentally also the argument removes the ambiguity which had haunted Leibniz's account of the 'pre-established harmony' to God. It definitely makes the harmony itself dependent on God.¹

Thus down to 1770 Kant shows no doubt of the possibility of demonstrating theism. The argument on which he relies in all the essays examined is one and the same—the Neo-Platonic argument *a posteriori*—and rests on the assumption that the world as given is an object for which we are bound by the principle of causality to seek an explanation.² The proof, as with the Neo-Platonists, aims at establishing the existence of the One—the single, internally simple and perfect, extra-mundane source of all the existents which together make up the *κόσμος*. The peculiarity of Kant's special version of it is that, to escape the criticisms which had been directed against Descartes, he sets himself to deduce the existence of a 'being which cannot be thought not to exist,' not from the logical concept of *ens realissimum*, but from the consideration that, in the universe itself, some combinations of predicates of the same thing and some combinations of relations between the same things are possible, and others not. The existence of an actual extra-mundane being once established as a pre-condition of the difference in intra-mundane things between what is possible and what is impossible, the internal unity, simplicity, and perfection of the necessary being are then deduced as consequences of its necessary existence. If this line of argument is not fallacious—*i.e.* if it really proves that something 'exists of necessity'—it clearly has the double merit of being free from the objection to the ontological proof, and of being equally untouched by the considerations urged by Philo and Demea in Hume against the *a posteriori* proof. If the principle on which Kant relies—that the possible presupposes the actual—is sound, his argument seems to be a complete speculative demonstration of the 'being of God' reduced to its most succinct expression. Why, then, did Kant, in his later 'critical' years, pronounce the question whether God exists to be transcendent—*i.e.* outside the legitimate limits of speculative investigation—and all 'proofs of the existence of God,' including that for which he had himself formerly claimed 'geometrical certainty,' mere fallacies?

In dealing with Kant's drastic assault on speculative natural theology in the *Critique of Pure Reason*, we may perhaps distinguish two questions which Kant himself naturally treated as one. It is one question whether Kant has proved that the demonstration of theism is impossible on the assumption that the special doctrine of his *Critique* as to the limits of human knowledge is true, but quite another question whether that doctrine is true, and consequently whether Kant has proved the fallaciousness of natural theology unconditionally. The first of these two questions no doubt permits of only one answer. Kant is clearly right when he asserts that all existential propositions are synthetic, at any rate (to repeat the distinction of St. Thomas to which Kant himself pays no regard) *quoad nos*. And it follows at once from this single consideration that, if, as the *Critique* maintains, the synthesis in a synthetical proposition must always in the end be effected by an

application of formal 'categories of the understanding' to a material supplied in sensation or sensuous imagination, no synthetical proposition (and, by consequence, no existential proposition) can be affirmed of a subject which is purely 'intelligible,' *α νοητόν*. And Kant expressly makes this a main point in his criticism of the ontological proof. Unfortunately, however, this doctrine, if carried out to its full logical consequences, would lead to a result which Kant would have been the first to reject. For it follows that there can be no such sciences as pure arithmetic and pure geometry. The subjects about which synthetical propositions are asserted in these sciences are one and all *Objekte des reinen Denkens* no less than the *ens necessarium* or the *ens realissimum* of speculative theology. No element whatever supplied by sense enters into the mathematician's concept of a circle, a parabola, an integer, or a real number. Kant overlooks this all-important point because he assumes throughout his whole reasoning that, before I can demonstrate a proposition in geometry, I must draw the figure, and similarly that, before I can say what the sum of two integers is, I must count the units of which he supposes the integers to consist. The erroneous character of this view has been sufficiently demonstrated by the subsequent history of mathematical science, but ought to have been clear to Kant himself. Even if all geometry, as he tacitly assumes, were metrical geometry, he ought to have seen that Descartes' invention of co-ordinates had already made the drawing of figures in principle superfluous in geometrical science. His conception of arithmetic is even more superficial—in fact, on a level with Aristotle's. As Couturat has correctly observed, Kant's examples are all drawn from the demonstration of singular propositions (such as $7+5=12$). If he had asked himself how any general truth in the theory of numbers is proved (how, *e.g.*, we prove Fermat's theorem), he would have seen at once the inadequacy of his own theories. Indeed, mere consideration of a singular proposition which does not relate to integers (*e.g.*, the proposition $2\cdot5+3\cdot6=6\cdot16$) might have taught him that arithmetic is not the same thing as counting, and even suggested to him that an integer is not a 'collection of units.'

With the discrediting of Kant's 'Transcendental Aesthetic' and the section of the 'Transcendental Dialectic' containing the famous antinomies, which may now be fairly regarded as a *fait accompli*, our task becomes the comparatively simple one of considering whether natural theology does or does not involve (as Kant alleges that it does) an illegitimate use of the principles of pure logic. From Kant's point of view, to be sure, it does. But this is just because Kant assumes that the only legitimate use of logical principles is their employment to order a material given by sense. If the doctrine of his 'Aesthetic' is rejected, and with it that part of the 'Dialectic' in which he absurdly tries to show that the mathematical doctrine of infinite series leads to antinomies,¹ it is no longer obvious that what Kant calls a transcendent employment of the principles of logic—*i.e.* their employment independently of application to 'the manifold' of sense—need be illegitimate. In fact, it is not clear that the whole of the general theory of arithmetic is not just such an employment of logical principles as 'constitutive of a *Denkobjekte*.' (It is certainly so if, as is probably the case, the series of natural integers can be defined wholly in terms of the primitive indefinables of logic.) One Kantian paralogism, in particular, may be noticed here, as it plays a prominent part in the assault on the theistic arguments. Kant complains that all the arguments for the 'necessary being' based on the causal principle depend on employing this principle, which is a mere rule for ordering the appearances of the sensible world, and has no meaning apart from these appearances, as a means of transcending the world of sense.² It might be a sufficient retort that the one form of causality with which we are intimately acquainted is our own volitional activity. In this activity, which is at once efficient and intentional causality, what are connected as cause and effect are not an earlier and a later event in the 'world of sensible appearances,' but the self, which does not belong to that 'world' at all, and an event

¹ *Commercium itaque omnium substantiarum universi est externe stabilitum per causam omnium communem* (*ib.* p. 22).

² Philo, in Hume, it will be remembered, had at least suggested that this need not be the case; the material world may be its own explanation.

¹ On the absurdity of all this see, in particular, the crushing exposure of Couturat, *De l'Infini mathématique*, Paris, 1896, bk. iv. ch. 4.

² *Kritik der reinen Vernunft*², Riga, 1787, p. 637.

which does belong to it. Kant could not deny the causal relation between the rational self and events in the *Sinnenwelt* without ruining the foundations of his own ethics, but the admission of such causality ought to debar him from attacking natural theology on the ground that it 'uses the principle of causality as a means to transcend the world of the senses.' He only escapes open self-contradiction by his monstrous theory, which is not likely to find a defender at the present day, that the self with which we are acquainted is not the real self at all, but a phenomenal self apprehended by an inner sense. From the point of view of logic, the criticism is equivalent to a refusal to admit the validity of any logical inference from the terms of a series to a limit which is not itself a term of the series. It is not in itself any more absurd to hold that examination of the things and events of the *Sinnenwelt* in the light of the causal principle reveals their dependence on something which does not belong to that world than it is to hold that a series of which every term is a rational fraction can be shown to have a limit which is not a rational fraction. (This is, e.g., the case when we represent a surd 'square root' as a recurrent continued fraction. Each of the 'convergents' is a rational fraction, but the limit of the series is not.) The general argument is thus invalid. No *a priori* reason can be given why the causal principle should not enable us to transcend the world of sense, and the only real question which remains is whether the particular arguments of theists will stand scrutiny on their merits. There is no general logical presumption against them of the kind Kant imagines.

We are thus brought to the consideration of the force of Kant's attack on natural theology taken by itself and apart from its connexion with a general theory of the nature of scientific knowledge which is certainly erroneous. We may therefore confine ourselves to the sections of the *Critique of Pure Reason* which profess to make a complete enumeration of the possible proofs of the existence of God and to convict each of the 'proofs' of fallacy, together with the 'Critique of all Speculative Theology,' in which Kant sums up his results.¹ The general line of argument is as follows. The scientific interpretation of facts consists in regarding any given actual condition of things as conditioned and asking for the antecedent facts which condition it. When they have been found, science once more requires an interpretation of them on the same lines, and so on *in indefinitum*. Every set of facts has thus to be regarded by the scientific intellect as conditioned by an antecedent state of things which has, in its turn, to be discovered. The scientific 'explanation' of the world is thus a task which, from its nature, can never be completed. Behind every set of conditions, however remote, at which we may arrive there is always a body of still more remote conditions to be discovered. (The conditions, in every case, like the facts they condition, are facts and processes of the *Sinnenwelt*.) The unending regress from conditioned to conditions, however, naturally suggests the thought that the process of explanation would be completed if we could find something ultimate, itself unconditioned but the condition of everything else. Thus we arrive at the notion of a being which 'exists necessarily' and contains in itself the explanation of everything else, the one and only being which is not contingent (*i.e.* a consequence of something other than itself). Next, it occurs to us that, if there is such a 'necessarily existing' being, it must, as the condition of everything else, contain in itself all that is truly real or positive; what is real in all limited and finite things must come to them from it. Thus we identify the *ens necessarium* with the *ens realissimum* ('*dasjenige was alle Realität enthält*'). Finally, since we ourselves, who are among the things dependent on this being, are intelligent moral persons, we 'personify' this being, and thus we arrive at the conception of God as the Supreme Being and source of the world. But the whole process has no scientific worth. The inference to the existence of a 'necessary being' is invalid because it employs the causal principle, which is really only a rule for the interconnexion of sensible events, as a

¹ *Kritik der reinen Vernunft*², pp. 611-670.

means of connecting the sensible with the intelligible (a general criticism which has already been considered in the last paragraph); we have no positive conception whatever of the character of this necessary being (supposing it to exist), and the attempt to find one by identifying it with the 'most real being' will not stand examination, since it is logically possible that there might be a plurality of 'necessary' beings, each imperfect and finite (one may illustrate by the theory that 'ultimate reality' is a 'society' of unoriginate 'persons' without any Creator); and the attempt to prove the existence of a single 'most real being' directly is a pure sophism. The conclusion then is that, though speculation may suggest to us the possibility that God (conceived after the fashion of the Neo-Platonic 'One') is the source of the world, it can do no more. It cannot even prove that the possibility is more than 'logical'; *i.e.*, speculation may convince us that there is no internal contradiction in the notion of such a being; it cannot show that God is a 'real' possibility—*i.e.*, that there is no incompatibility between the existence of God and the actual facts of the world of experience, if we knew them all instead of being aware of a mere fragment of them. The whole value of speculative theism is to suggest this mere possibility, to warn us that we are not speculatively justified in regarding the sensible world as undervived, but must keep an open mind. If, however, apart from all speculative philosophy, there are *practical* grounds for believing in God—*i.e.*, if the reality of absolute moral obligation can only be made intelligible by appeal to our dependence on God—then, for practical purposes, the open possibility is converted into a moral certainty. Kant means, as he explains,¹ that, in shaping the conduct of our lives, *il faut parier*. We must act either on the assumption that moral obligation is absolute or on the assumption that it is not; there is no third course. But all moral obligation, as is shown at length in the *Grundlegung zur Metaphysik der Sitten*,² is absolute, and there is no fact more certain than this. Without God as ruler of the world, however, the system of absolute obligations would be a logically flawless construction ('*in der Idee der Vernunft ganz richtig*'), but would have no 'reality of application to ourselves, *i.e.* would be without motives.'³ A virtuous man is thus necessitated to a firm rational belief in theism, but that which makes the necessity is not the demonstrative force of the theistic arguments (which in fact is zero), but the virtuous man's immediate conviction of the absoluteness of moral obligations. This is what Kant meant when he described himself as abolishing knowledge to make room for faith.⁴ If our unfavourable judgment on the 'Transcendental Aesthetic' is justified, we plainly cannot concede to Kant that all speculative theism must be baseless. The theistic arguments must be scrutinized on their merits, not condemned *en bloc* like the generals at Arginusae. With his usual love for formal schematism Kant urges that there can be three and only three ways of trying to prove the existence of the Supreme. We may attempt to

¹ *Kritik der reinen Vernunft*², p. 615.

² Riga, 1785.

³ *Kritik der reinen Vernunft*², p. 617.

⁴ He must not be understood in a pragmatist sense. He did not mean that the existence of God is a speculation which a man may accept or decline 'at his own risk,' may adopt 'because up to the present it works,' or because inferences can be drawn from it which gratify the believer. The faith of which he speaks has its foundation in the conviction that the law of duty is absolute, and this proposition is admitted by the good man not as an 'hypothesis accepted at his own risk to see whether it works,' or because he chooses to accept it, but because, being a good man, he sees it to be true and certain.

prove the existence of the 'most real being' entirely *a priori* (i.e. without the use of any 'truth of fact' as a premiss) by arguing that existence is included in its very nature—the ontological proof; we may, departing from the strictly *a priori* method, employ the single truth of fact, 'something exists,' as one of our premisses, and then argue to the conclusion that a 'necessary being' exists—the cosmological proof; we may include among our premisses specific assertions about the character of the 'something that exists'; i.e., we may argue from the marks of intelligent and benevolent design in the actual world to intelligence and benevolence in its source—the physico-theological proof. Each of these proofs is now to be shown unsatisfactory. The first is a pure verbal sophism and the second no better, and; as proofs of the existence of God, both the second and third have to be eked out by a silent combination with the first.

The refutation of the 'ontological' proof is one of the best-known passages of the *Critique of Pure Reason*. Kant speaks of the argument as the 'ontological (or Cartesian) proof.' He examines it only in the form in which it has been revived by Descartes, and was apparently not acquainted with its earlier history. His objection, put briefly, is simply this, that the proposition 'God exists' can only be got out of the concept of 'God' if existence has already been included in that concept. If I define God as a 'really existing X,' of course I can make the true proposition, 'If there is such a being as the God thus defined, then that being exists.' But I am not entitled to assert that there is such a being, and consequently not entitled to assert the consequent of the foregoing hypothetical proposition ('God exists') categorically. In fact existence is not a real predicate. The concept 'a hundred dollars' has precisely the same content whether the hundred dollars actually exist in my pocket or not. 'Our concept of an object may contain what and as much as you please, still we must go outside it to impart existence to the object.'¹ Hence the ontological proof is not really a proof of anything. 'The Idea of a Supreme Being is in many respects a most useful Idea, but just because it is merely an Idea it is wholly incapable of extending our knowledge of what exists by means of itself alone.'² Since Hegel undertook to rehabilitate the argument, it has been fashionable to retort on Kant that, though it may be true that the real existence of a sum of a hundred dollars cannot be inferred from analysis of the corresponding concept, the case is wholly altered when we come to deal with the unique and exalted concept of the Supreme Being. The present writer does not feel that Hegel's witticisms on this point are any answer to Kant's criticism. Kant is certainly right in saying that mere success in defining a concept without contradiction does not in general warrant our asserting that the concept has an 'extension.' The logical investigations which have issued in the creation of the modern 'exact' or 'symbolic' logic of Frege, Peano, and Russell have made this point even clearer than it could have been to the first readers of the *Critique*. If it is immediately evident that there is a member of the unit-class of which 'supreme being' is the class-name, there is neither room nor need for proof. If this is not immediately evident, proof is wanted. In general it cannot be inferred from the definition of a class that the class has members. If the class 'supreme being' or 'most real being' is an exception, we require proof that it is an exception to the rule, and neither Hegel nor any one else has ever offered anything in the way of proof. Thus, as against Descartes, Kant's argument is, in the present writer's opinion, decisive. Nor does he see that the original Anselmian proof fares any better. It is not directly touched by Kant's denial that existence is a predicate, since Anselm does not rest his case on the assertion that existence is a predicate. But Kant's counter-argument can equally be stated without raising this question. Whether existence is a predicate or not, it is equally true that we are not entitled to infer from the hypothetical proposition, 'If there is a God, that God is an existent,' the categorical proposition, 'God is an existent'; and this is what Anselm tries to do. He is really committed, as every defender of the ontological line of argument must be, to the attempt to prove that it is irrational to suppose that there might have existed nothing at all. In point of fact most of those who have tried to turn the edge of Kant's criticism have not attempted so desperate a task. They have consciously or unconsciously assumed as a premiss the proposition that something exists, and have been content to argue that, since something exists, God exists also. In doing this they tacitly admit the truth of the contention of Kant and St. Thomas that no purely *a priori* proof of theism is possible.

Kant's attack on the cosmological proof is more elaborate and, in the present writer's opinion, less successful. The rejection of the ontological proof does not depend in the least on the acceptance of the peculiar theory of knowledge expounded in the *Critique*. The proof had been rightly treated as a sophism in all the pre-critical essays in which Kant deals with

the foundations of natural theology. The case of the cosmological argument is different; Kant's own pre-critical proof, based on the need for an actual ground of real possibility, was itself a form of the cosmological proof, and is thus among the inferences now rejected as illegitimate. We may therefore expect to find that the rejection of this type of argument does depend on the special critical theory of the limits of human knowledge, and is thus only valid on the hypothesis that the doctrines of the *Critique* are accepted. The typical form of the proof as stated in the *Critique* for examination is this: (a) If anything exists, an absolutely necessary being exists; but at least one thing (viz. myself) exists; ergo an absolutely necessary being exists; (b) a necessary being must be completely determined by its concept; the only concept which thus completely determines an object is the concept of the *ens realissimum*; ergo the concept of the *ens realissimum* is the only one by means of which a necessary being can be thought; i.e., a Supreme Being necessarily exists. The argument thus consists of two stages: first, the proof that, because at least one thing exists, a necessary being exists, and, second, the proof that a necessary being can only be the Supreme Being.

Kant denounces this cosmological argument with special vehemence, as was only natural in one who had until his late middle age built on it with perfect confidence and then come to distrust it. His tone in criticizing it is not unlike that of a rather unscrupulous attorney determined to secure a verdict against the accused party by fair means or foul. He begins by a charge of general fraudulence. The cosmological proof professes to appeal to experience, but it is really only the old discredited ontological argument dishonestly disguised. For it only uses the appeal to experience to establish the result: 'There is a being which exists necessarily.' When we ask what this being is, we are referred back to the *ens realissimum* as the only thing which meets the requirements of the case. Therefore 'it is only the ontological proof from mere concepts which contains the force of the demonstration and the alleged experience is wholly superfluous.'¹

The complaint is surely unfair. The objection to the ontological argument did not lie in the concept of the *ens realissimum*, but merely in the absence of an existential premiss. If, then, the new argument supplies the missing existential premiss, it is no objection to it to say that the necessary being of which it speaks turns out to be the *ens realissimum*. The only legitimate objection would be that the argument does not actually supply such an existential premiss as is really needed. This is what Kant next proceeds to urge.² He complains that it ought to be shown that the necessary being is the *ens realissimum*. To prove this, we require to establish two propositions, of which one is the simple converse of the other: (a) every necessary being is an *ens realissimum*, (b) every *ens realissimum* is a necessary being. But this second proposition is 'determined merely by *a priori* concepts,' and therefore 'the mere concept of the most real being' must be the ground for ascribing to it necessary existence. Thus we commit the fallacy of the ontological proof, the establishment of a proposition by mere analysis of concepts. This criticism seems wholly *verfehlt*. The real objection to the ontological proof was that it aimed at proving an existential proposition by mere analysis of concepts. There can be no logical objection to the attempt to prove by such analysis the hypothetical proposition, 'If anything is an (or the) *ens realissimum*, it is *ens necessarium*,' or the simple converse, 'If anything is *ens necessarium*, it is also *ens realissimum*.' Both these propositions are implications, not assertions of existence; the existential import is brought into the cosmological argument entirely by the preceding proof, or attempted proof, that, if anything exists (as we know to be the case), a necessary being exists. Kant is entitled to contend that this has not been proved; he is entitled to contend that the equivalence of *ens necessarium* and *ens realissimum* has not been made out. He is not entitled to treat the fact that the equivalence is an equivalence of concepts as proof of this second charge. Up to this point he is merely following the recommendation to give a dog a bad name and trust to its hanging him. We now come to the really relevant part of his onslaught. This consists of the following allegations: (1) the inference from the contingent to its cause has a meaning only in the sensible world, but the principle of causality is used in this proof to transcend the sensible world; (2) the argument from the impossibility of an infinite series of causes in the sensible world to a first cause is illegitimate; (3) the very notion of necessity presupposes conditions upon which the necessity in question depends, and it is therefore impermissible to cut short the regress from proximate to more ultimate conditions by the really empty concept of an unconditioned necessity; (4) the proof confuses the mere logical possibility of a concept (absence of internal contradiction) with its transcendental possibility, which 'requires a principle establishing the possibility of performing such a synthesis,' but this latter can only be established 'in the field of possible experiences.' All these objections are valid only on the hypothesis that the Kantian theories about the limits of scientific knowledge are true, and it has already been contended that this hypothesis (involving, as it does, the acceptance of the 'Transcendental Aesthetic' and the consequent recognition of the antinomies of the 'Transcendental Dialectic' as inevitable) is certainly false. In particular, it may be replied to (1) that all use of the principle of causality involves transcending the sensible world; consistent phenomenalism, as the work of such writers as Mach, Pearson, Avenarius, abundantly shows, is bound to eliminate

¹ *Kritik der reinen Vernunft* 2, p. 629.

² *Ib.*

¹ *Kritik der reinen Vernunft* 2, p. 635.

² *Ib.* p. 636.

the category of causality from science; to (2) that the 'cosmological argument' is not an argument from the impossibility of an infinite series of events at all. In fact it has been often maintained by thinkers who, like Aristotle, deny that the series of events has a first term, or, like St. Thomas, hold that it can only be known by revelation whether the series has a first term or not. The real bearing of the argument cannot be seen at all, so long as we mere rule of uniform connexion between earlier and later events. Its real foundation is in the conception of efficient causality (activity or agency). The point of the argument is that, if there is not a First Mover or First Agent (or 'movers' or 'agents' in the plural, as the case may be), the whole history of the world is a mere accident. Things are what they are because there 'happen to be' such and such agents, and the reason why there are just these agents and no others is that there 'happen to be' (or 'to have been') certain others by which the set first mentioned have been produced, and so on *in indefinitum*. This means that there might just as well have been no world at all, or one quite different from that which there is. An ultimate pluralistic realism, no doubt, might maintain this thesis, and we shall have to face it in the sequel. But it is an *ignoratio elenchi* to defend it by assuming phenomenalism plus an erroneous theory of the mathematical meaning of infinite series. The phenomenalism is further in flat contradiction with the presuppositions of Kantian ethics, for which it is indispensable that every human self shall be a 'first cause' of its own morally and legally imputable acts. If 'first cause' really means nothing intelligible, Kant's practical philosophy is no better than an idle sporting with insignificant words. One must add that the full force of the cosmological argument is only seen when it is combined with the argument from intentional causality. If the historical world-process has a meaning of any kind, whether its meaning lies in the direction of events towards an end or result or in their internal, quasi-aesthetic harmony, the explanation of it cannot, in the end, be merely that the constituents of the universe happen to be what they are. An ultimate pluralism must, to be consistent, deny that there is any meaning at all in the world-process. But, again, the Kantian phenomenalism affords no valid reason for entertaining this view. As to the last point, it does depend on the special principles of the critical philosophy, and, in particular, on the theory that an appeal to the senses lies at the root of all valid synthetic propositions. As has already been remarked, this theory is sufficiently disposed of by the simple consideration that every proposition in the theory of numbers is synthetic in Kant's sense of the word. In the present writer's opinion, then, Kant's attack on the cosmological argument (which he himself clearly regards as the central feature of his general assault on speculative theism) is a complete failure. He proves neither that the argument from the fact of existence to the existence of a 'necessary being' is fallacious nor that there is any sophism in the reasoning by which he himself had formerly established the equivalence of the 'necessary being' with the perfect or 'most real' being. This does not, of itself, prove that the cosmological argument is valid, but it does prove, if the remarks just made are in principle sound, that Kant's objections to the argument are unfounded. Even the complaint that we have no positive conception of either 'necessary' or 'most real' being only amounts to the true assertion that we do not know what it would be like to be God—a proposition which no reasonable theist, least of all an orthodox Christian theologian, need be concerned to deny. For the matter of that, I do not know what it would be like to be my cat, but that is surely an insufficient reason for denying the existence of my cat's mind.

Kant's treatment of the argument from intentional causality—the physico-theological proof, as he calls it—may be summarized more briefly. This argument, which he reduces to the argument from design, he regards with great respect as the most ancient, most obvious, and soundest of all. He assumes it as an undoubted fact that nature, so far as we know it, exhibits all the marks of intelligent purpose, and admits that it is correct to argue from such marks to a designing intelligence. It does not occur to him to explain away the appearances of order and purpose as merely apparent or as the results of anything in the nature of a struggle for existence. He is content to call attention to the limitations imposed on the argument by the imperfection of our knowledge of nature. It is only a part of nature with which we are acquainted, and any inference from the orderliness and purposiveness of that part to thoroughgoing order and purpose in nature everywhere has at best a degree of probability which falls short of certainty. We cannot therefore be sure even of the unity of the designing intelligence, since we do not know that, if all the empirical facts were before us, they would show absolute singleness of design. Even if we knew all the empirical facts, and knew that they all showed perfect unity of purpose, we could only infer that the intelligence which designed the natural order was very wise, very good, very powerful. We could not argue from any knowledge of empirical facts to infinite wisdom, etc. In particular, we only detect intelligence in the arrangement of the 'stuff' of the world, and thus, even if we knew all the facts, we could not use them as a proof of the existence of the Supreme Being, but at most as a proof of the existence of a demiurge or 'architect of the universe.' Thus, if a theologian appears to demonstrate the existence of God by the appeal to design in nature, it is only because he is illegitimately supplementing his reasoning by a concealed appeal to the ontological argument. In these criticisms, in which Kant is manifestly justified, he is, of course, urging considerations with which Hume had already made

Philo confront Cleanthes. It is abundantly manifest that no empirical reasoning can establish the existence of a Supreme Being. Kant's final result, stated with his usual love for pedantic formal distinctions, is given in the section of the *Critique* which bears the special title 'Critique of all Theology based on Speculative Principles of Reason.' Theology, we are told, may be based on revelation or on mere reason. Rational theology, again, may think of its object (God) either as *ens realissimum* without further specification or with a further determination as the Supreme Intelligence. The first is transcendental theology, and its supporters may be called deists; the second is natural theology and is the doctrine of the theist. Natural theology, once more, may conceive God as the source of the order that actually exists (the natural order) or as the source of an order that ought to exist (moral order). It is only consideration of the latter that really gives us a right to postulate the existence of a Supreme Being; speculative theology, which attempts to establish the existence of God as required to explain the order of nature, is, as we have seen, condemned to failure, because it seeks to prove the reality of a being which cannot be an object of possible experience. Its value is simply that it shows us that there is no logical impossibility inherent in the notion of a Supreme Being. Thus it forbids us to assert that we know that there is no God, or that, if there is, He is not an intelligent being or is imperfect and limited like ourselves (it saves us from dogmatic atheism, deism, and anthropomorphism), and thus leaves us free to maintain the existence of a supreme spiritual principle, if the moral order proves to be unintelligible apart from the postulate that such a principle exists. For the present it may suffice to make two observations on this. The denial that God is an object of possible experience depends, of course, on taking a specific view of what is meant by experience. If it is indispensable to an experience that it should have an object into which sense-data enter as constituents (and this is what Kant always assumes), manifestly God cannot be experienced. But it may be observed that it is no ground of objection to speculative theology in particular to say that it claims to give us knowledge about a being which is not an object of 'possible experience' in this sense. The same thing is equally true of arithmetic or any other part of pure mathematics. The integers, e.g., are not objects of experience in this sense; still less would it be possible to maintain that, when one utters the well-known proposition, 'Every integer can be represented as the sum of four squares, of which—except in the case of the integer 0—one at least is not 0,' one is not transcending possible experience. It would be quite impossible to verify the proposition by examining its validity for each successive integer (since there is an infinite number of them). Wherever I make a statement about a class with an infinity of members, I am dealing with an object which is not, in Kant's sense of the words, an 'object of a possible experience.' His doctrine reposes on the theory of his 'Aesthetic' that, in the case of arithmetical propositions, I can justify such an assertion by counting. But, though I could, e.g., prove the proposition quoted to hold good for a few cases by actual counting, I manifestly cannot verify it or any other general proposition of the science by this method of appealing to intuition. Again, we may fairly ask why experience should be assumed to be concerned only with objects which fall under the 'forms of intuition.' Why are the saint's moments of vision to be from the outset excluded from experience? If they are included, the statement that God is not an object of possible experience at once becomes questionable. It is a standing defect of the *Critique* that the concept of experience itself has never been subjected by Kant to careful and searching criticism. The second observation which naturally suggests itself is that the sharp opposition between speculation and practice might prove on a closer examination to be misleading. All that Kant can claim to have shown, even if every one of his charges against natural theology could be sustained, is that the facts of physical nature do not warrant the theistic hypothesis. But it is surely as much part of the task of a speculative philosophy to explain the facts of the moral as it is to explain the facts of the physical order. The absoluteness of moral obligations is a fact of the moral order, and, if this fact is only intelligible from the theistic standpoint, then it may fairly be said that speculative philosophy is committed to theism. This was, indeed, Kant's own conviction, and his hard and fast severance between speculation and practice does less than justice to the view he intends to maintain. It gives rise to the misleading suggestion that he regards theism as a doctrine which is doubtfully true but had better be taught to the proletariat with a view to keeping them out of mischief and making them conveniently submissive to their 'betters.' This was not in the least what Kant meant, but his unfortunate verbal distinction between theory and practice is what gave colour to the jest of Heine that after abolishing God in the first *Critique* Kant revived Him in the second in the interest of his old butler's morals, as well as to the strange view of Bernard Bosanquet¹ that Kant's theism is an 'unessential survival.'

It would be wholly unjust to Kant to confine our attention to the destructive side of his treatment of philosophic theism; even more important is his positive teaching, which will be found most fully expressed in the *Kritik der praktischen Vernunft*.² If Kant's object was to destroy the

² *Iliga*, 1758 (*Werke*, v. 116-153).

old speculative natural theology, it is even more his purpose to replace it by a positive moral theology, and it is probably true to say that it is primarily due to his influence that in our own time it is mainly upon the moral argument that popular theistic philosophy continues to base itself. As the Kantian moral theology has often been very imperfectly understood by its critics, it is necessary to state Kant's real position rather carefully, in order to put in the clearest light the differences between Kant and those who hold that the existence of God remains after all a 'pious opinion,' suggested but not established by the facts of the moral life, or those who hold that it is a doctrine recommended mainly by its comforting character. To appreciate the strength of Kant's position, it is necessary to understand that theism is not in any sense an arbitrary hypothesis tacked on to a system of ethics, or, as Bosanquet calls it, a 'survival' of belated superstition, but a logically necessary part of 'practical' philosophy. The argument starts from premisses which are taken as once for all established in the *Grundlegung zur Metaphysik der Sitten* and the *Analytic of Practical Reason*.¹ These premisses are as follows. The object which all moral action has in view is the realization of the highest or complete good. The complete good means a state of things in which the reasonable will finds full and complete satisfaction. Such a state of things implies two constituents: virtue (a right state of the will itself), and happiness (by which Kant means, as he says, a condition of things in complete accord with the rational will, *i.e.* the successful domination of rational will in the universe). If only the first constituent were real, *i.e.*, if the will of every rational being were morally wholly good, this would not of itself be enough to satisfy the demands of the rational will itself. We should not think a universe satisfactory or rational if it consisted of beings of perfect morality whose volitions were always defeated and disappointed by the course of things. The only condition of things which would satisfy our rational demand for the triumph of the virtuous will would be one in which every rational being should be happy (*i.e.* should find his volition effective), in proportion to the moral goodness of his will. The highest good—the object of the moral will—is thus a union of virtue with happiness, but a union in which the inner virtue of the agent is the condition and cause of his happiness.² So the highest good means a condition of existence in which a rational being is (a) deserving of happiness, deserving that his 'will be done, as in heaven so in earth,'³ and (b) has the happiness which he deserves as a consequence of his deserving it. (More briefly, the highest good is that the actual order of things should be a moral order.) But—and here comes in the antinomy which Kant thinks indispensable in a *Critique*—the principle, as dis-

¹ That the *Critique of Practical Reason* should be divided, like the *Critique of Pure Reason*, into an 'Analytic' and a 'Dialectic'—of course there can be no 'Aesthetic' in this case—and that the 'Dialectic' must have its antinomy is a pure piece of pedantic formalism which Kant would have done well to dispense with.

² The words of this statement are not precisely those of Kant, but have been chosen to express as briefly and untechnically as possible the substance of his thought. It should be carefully observed that the central thought is not egoistic. Kant's point is that the 'ideal spectator,' apart from any consideration of his own happiness, would judge unfavourably of a world in which the will of the truly virtuous man was constantly thwarted by the 'force of circumstances.' My own happiness, as he is careful to state, only comes into the consideration in so far as I am one among the many rational and responsible beings in the universe. Nor is happiness understood in a merely hedonistic way. It is the condition in which things happen 'according to our will'—*i.e.* in which the rational will is really effectual.

³ In fact, though Kant would have been horrified by so 'fanatical' a phrase, he is at bottom quite agreed with 'Dionysius' that 'deification' (*theosis*) is the ultimate goal of the moral life.

tinguished from the object, of the virtuous will is always to act from reverence for the unconditional obligatoriness of the moral law, without any consideration of the results of our conduct. We must, as moral beings, will the highest good, yet we must also, as moral beings, will to do right for its own sake, without even asking the question whether our right actions will result in bringing about this good or not. We cannot escape from this antinomy, as Kant holds we can from those of speculative reason, by dismissing it as illusory. For we are under absolute obligation to be virtuous, and we cannot be really virtuous without desiring the highest good, nor yet can we be really virtuous if we allow this desire to affect our will to do right because it is right, regardless of consequences. Thus, if morality is to be more than an empty dream, the union of virtue and happiness must be realized, though we must not set ourselves to realize it by treating virtuous action as a means to it. The realization of the union must be brought about for us, not by us. Now, experience shows abundantly that in the empirically known system of nature there is no dependence of happiness on virtue. The most virtuous man is not regularly the man whose will is actually done 'in earth,' nor the man whose will is done the man whose volitions are morally purest. The union must therefore be effected for us by a supreme power, not our own, in the 'intelligible world' which disposes the course of events so that, if we could see the whole infinite series at once, we should see that every man is happy in proportion to the degree in which he deserves to be happy. Further, since morality demands not merely that the virtuous shall be happy but that the happiness shall be a consequence of their virtue, we could not regard the union of virtue and happiness as effected by a mere blind 'natural tendency' in things. The virtuous man's virtue must be the motive of the disposing power to make him happy—*i.e.*, this disposing power must be thought of as an intelligent and absolutely holy will. Thus it becomes a postulate of morality that there is an absolutely wise and holy Supreme Being. We have already seen that the speculative use of reason in finding an explanation for natural events themselves suggested the hypothesis that there is a Supreme Being, though all our attempts to demonstrate the truth of this hypothesis proved to rest on fallacy. The consideration of the pre-suppositions of morality now shows us that, unless there is to be a hopeless conflict between our conception of the highest good and the first principle of duty, such a Supreme Being must really exist and, what is more, must be spiritual. Practical reason then does not introduce us to any new idea; if it did, there might be an insoluble conflict between its suggestions and the results of speculative criticism. It only gives us the right to affirm as a reality what speculative reason itself unavoidably suggests as a possibility, the complete dependence of the world on a Supreme Being, and enables us to determine the character of that Being so far as to say that it combines perfect wisdom, holiness, and power. Beyond this moral theology cannot go. It tells us what God must be if the world is to have moral order, and it tells us nothing more. Kant pushes this consideration so far that he is not content to say with the Neo-Platonists and scholastics that we do not know God *secundum essentiam suam*. Recurring to his view that an object of possible experience must have sensuous constituents (must be given in intuition), he in effect denies that we have any experience of God at all. 'Mystics' profess to experience the divine, but for that very reason Kant sets them down summarily as 'fanatics' who must not be allowed a hearing.

The value of Kant's moral argument for theism seems quite independent of our judgment of the critical philosophy as a whole. The phenomenalism which is the weakest point of the system only affects Kant's unfavourable estimate of specific religious experience. It might, indeed, be said with an appearance of plausibility that God as the source of the subordination of nature to the moral order is only brought in to solve a difficulty which Kant has created for himself by the abstract formalism of his ethics. No Kantian doctrine has come in for more unsparing reprobation than the famous theory that the moral worth of an act depends upon its being done from mere reverence for universal law as such, and is destroyed if any desire for a specific result influences the agent's motives. But, apart from this untenable theory, it may be said, there is really no antithesis between the supreme object of virtuous willing and its true principle; the realization of the good is at once object and principle. And thus the problem which, according to Kant, is solved for us by the existence of God is not a real problem at all. Yet such criticism surely misses the mark. The problem Kant has in mind still remains when the pure formalism of his own conception of the good will has been dismissed. One and the same conviction of the absoluteness of moral values, the right of *δικαιοσύνη* to control the world, compels us to pronounce the world evil and our own moral striving a vain show if the highest good is not realized or realizable, and also forbids us to aim directly at the realization of this highest good by doing moral evil that good may come out of it or leaving the right undone because the consequences of doing right are judged by us to be, in a certain case, bad. It is certain that good often comes out of moral evil, and that moral integrity itself often demands action which leads to bad results which would not have followed if the agent had been less virtuous.¹ Thus, quite independently of any special Kantian theses in ethics, we are confronted by the dilemma: either the order of things, rightly understood (the intelligible world), is a moral order and realizes the highest good or the highest good is not realized and all moral effort is senseless and foredoomed to failure, in which case the conviction of the absolute value of the good, on which morality is based, is a mere illusion. If this be so, the argument from the reality of absolute moral values to the all-wise, all-holy, and all-powerful Supreme Being, in the present writer's judgment, holds, exactly on the lines on which Kant has conducted it. It is precisely the same argument, divested of its incidental trappings of Kantian 'critical' phraseology, which Solovyof compresses into a sentence when he writes:

'The unconditional principle of morality, logically involved in religious experience, contains the complete good (or the right relation of all to everything) not merely as a demand or an idea, but as an actual power that can fulfil this demand and create the perfect moral order or Kingdom of God in which the absolute significance of every being is realized.'²

16. Lotze. — This article cannot undertake to follow the history of the treatment of theism in philosophy beyond Kant with any detail. To do so would require a substantial volume, and it does not seem to the present writer that anything which is new in principle has been added to the arguments for or against theism since Kant's development of the moral proof in the *Critique of Practical Reason*. An exception, however, may be made for Lotze, more particularly on the ground that he has done so much, in the face of Kant's

critical repudiation of his own earlier position, to vindicate the speculative argument upon which Kant himself relied until advanced middle age.¹

It may seem strange to describe Lotze as reasserting the particular version of the cosmological argument which finds in God the necessary actual ground of possibilities, in view of the fact that Lotze himself, in the chapter on the 'Proofs of the Existence of God' in the *Grundzüge der Religionsphilosophie*, professes to have disposed of the cosmological proof in one or two paragraphs of not very profound criticism. Yet an analysis of his own argument will show that, though it is not quite identical with any former statement of the cosmological proof, it really follows the general lines of Kant's pre-critical argument for the 'being which exists with an absolute necessity.' The starting-point of Lotze's train of thought was historically determined for him by the necessity of taking up a definite attitude towards the philosophy of Herbart, and to a lesser degree of Hegel; this special concern with the problems raised in the metaphysics of Herbart further accounts for the very marked influence of Leibniz.²

Lotze starts with the fact of incessant change or becoming as the most obvious characteristic of the empirical world. The great problem of the metaphysician is to give an intelligible account of the pre-conditions of this universal fact of change.³ We can neither dismiss change or becoming as a mere illusion (since, even if you deny all change in the objective world, the illusion itself has to be regarded as a process of change in the inner states of the existents which we call minds or souls) nor resolve the history of the universe into a process of absolute becoming, a wholly lawless succession of disconnected states. This would be fatal to the possibility of all knowledge whatever. Change or becoming, then, is real, and it is always grounded change. This is shown by our success in formulating laws of natural processes. If we find that *A* is regularly, though not always, followed by *B*, we must suppose that there is a reason in the state of things in which *A* was present why *A* should be replaced by *B* rather than by *P* or *Q*, and, if on special occasions *A* (which is commonly followed by *B*) is followed by *P*, there must again be a reason why it is, on these occasions, followed not by the usual *B* but by the unusual *P*. At the stage of reflexion reached in natural science we attempt to do justice to this demand for an intelligible interpretation of change by the view that the state is made up of a plurality of different 'things' (*A, B, C, . . .*), each exhibiting a succession of 'states' (*a₁, a₂, a₃, . . . b₁, b₂, b₃, . . . c₁, c₂, c₃, . . .*). We then say that the changes of state of the various things are interconnected by laws according to which a definite change of 'state' in one thing (e.g., the occurrence of a state *a* in *A*) gives rise to the corresponding change in another (the occurrence of a state *b* in *B*). This interpretation of the facts, Lotze urges, cannot be final. If the universe were really a collection of independent existents, or 'things,' how could the occurrence of a change of state in one of these existents be conditioned by changes of state in the rest? The very fact that, e.g., *A* only exhibits the change from state *a₁* to state *a₂* on the condition that certain definite changes occur in a number of other 'things'—in a word, the interconnexion of things in obedience to determinate laws—shows that the universe is not an ultimate plurality. We are bound to think of it as *one* being of which what we commonly call the various 'things' are partial expressions or activities. We must amend the statement that the changes of state in a plurality of things are related according to definite formulae into the statement that the one and only real 'thing' has a determinate nature or character of its own which it maintains unimpaired. It is this self-maintenance of the 'living whole'—*M*, as Lotze symbolically calls it—that requires that the change of which we speak as occurring in the thing *A* should be compensated in a definite way by connected changes, which we are accustomed to refer to the other things *B, C, . . .*. Strictly speaking, then, every change in any element of *M* is correlated with changes in all the rest. But some of these changes may be minimal and so escape our notice. Hence we are able for our human purposes to formulate laws which connect a definite change in one element with definite changes in a finite number of others, *B, C, D*, and treat all the rest of the elements as a remainder *R*, which is irrelevant. The world, then, is not a plurality but a unity-in-plurality. How the unity is effected is more than we can ever expect to know. We may say, 'The unity is the plurality,' but we must remember that the 'is' here is a copula of which the concrete modality

¹ Lotze's treatment of the subject is to be found partly in his *Metaphysik*, latest ed. Leipzig, 1912, Eng. tr. 2, 2 vols., Oxford, 1887; see particularly bk. i. chs. 6-7, with which may be compared the more condensed *Grundzüge der Metaphysik*, Leipzig, 1883, Eng. tr., *Outlines of Metaphysics*, Boston, U.S.A., 1886, particularly the chapter 'Of Causes and Effects' (Eng. tr., pp. 67-73), partly in the *Grundzüge der Religionsphilosophie*, Leipzig, 1894. A longer and more popularly written exposition is given in *Mikrokosmos*, 3 vols., do. 1896-1909, Eng. tr., Edinburgh, 1894, bk. ix., 'The Unity of Things.' Only the general outline of Lotze's doctrine can be dealt with here.

² It must be remembered that Lotze was necessarily unacquainted with Leibniz's most important papers, which were mostly unpublished until after Lotze had arrived at his own fundamental doctrines; hence his version of the earlier philosopher's thought is not to be implicitly trusted.

³ This was precisely the problem which had specially occupied Herbart and the Herbartians.

¹ See the entertaining illustrations of this point in V. Solovyof, *The Justification of the Good*, Eng. tr., London, 1918, pt. iii, ch. 6.

² *Ib.* p. 130. The whole of Solovyof's book is worth reading as a corrective to Kant's thesis that philosophical theology is exhausted by the one proposition that God exists.

is not fully known to us. But it is important to be quite clear on one point of the first importance. The one 'living whole' *M* is not properly described as 'subject to universal laws.' If we think of the world as composed of things subject to general laws, it is quite impossible to give any ultimately intelligible account of the relation between the things and the laws. The absolute *prîus* is not a complex of laws, but the concrete *M* and its individual acts of self-expression and self-maintenance. Since we are part of the contents of *M*, we can compare facts with facts, recognize likeness and differences, and so come to formulate general propositions. We can even carry this so far as, when we have formed the notions of 'class' and 'member of a class,' to think of *M*, the real world itself, as one member of a class of worlds, and to speculate on the possibility that there might be others—'possible' worlds, as Leibniz said. Then we may be led, as Leibniz was, into the insoluble problem why just this world *M*, and not a different one *N*, is real. But this whole way of thinking of possibilities as metaphysically anterior to reality, or of the hypothetical propositions we call laws as anterior to the individual facts we call the actualized cases of these laws, rests on illusion. Metaphysically speaking, it is the actual nature of *M* that accounts for our existence and our possession of the mental capacities which we exercise in framing laws and hypotheses. If *M* were other than it is, its elements would be different, and, if we were among these elements, our views as to what alternatives are possible would be different also. It is a radical error in philosophy to confound logical with metaphysical priority.¹

How *M* can be the *ἐν καὶ πολλά* required by the theory we cannot say in detail. But we can see, at any rate, that *M* cannot be material. The only thing with which we are acquainted which, even imperfectly, discharges for a part of reality the functions which *M* must discharge for the totality is the soul which at once has or owns a multiplicity of states or activities and would have no life without them, and is yet aware of its own unity and its distinction from each and all of these states and activities. We are thus driven to think of *M* in terms of spirit. It must be akin to the soul, but must, at the same time, have all the differences from our souls which result from the consideration that it has nothing outside it, is wholly unique, and can meet with no resistance. We are thus led to think of *M* as an infinite spiritual and, Lotze adds, personal being, all-wise (because its knowledge has not to develop under difficulties and from point to point, like our own), almighty (because it is the absolute *prîus*, anterior to all 'law' as well as to all fact), and, above all, all-good (Lotze weakens his case on this point by a half-hearted tendency to take a hedonist view of good, and so to reduce perfect goodness to mere 'benevolence'; a Platonist would have no difficulty, since the all-wise must have complete knowledge of the good, and to know the good is to act it out). *M* is also 'out of space' and 'eternal,' since geometrical and temporal relations are, and are what they are, as a consequence of *M*'s existing and being what it is. Thus the conception of *M* with which we began as 'the one real being' passes into the conception of the almighty and eternal God, and the close of our historical retrospect brings us back very close to the position of Neo-Platonism again. It calls for remark that, though Lotze's initial account of *M*, taken by itself, would suggest a pantheistic or immanence theory, the doctrine, as fully worked out, is, definitely theistic. Lotze is careful to guard himself, even when he says that *M* is the world, by adding that 'is' here has a unique sense which it has in no other judgment, and is consequently not the 'is' which occurs in an ordinary identity. Later on we find that each soul, being aware of its own unity, is a real individual distinct from God and from every other soul, though it is from the creating and sustaining activity of God that the soul derives this character. And mere inanimate things are held to be a superfluous hypothesis. There are, according to Lotze, only the one living God and His acts. Some of these acts are souls with a real spiritual individuality of their own. In this way, while avoiding the customary theistic language about the transcendence of God, Lotze secures the same result by maintaining not that God is immanent in the world, but that the world is 'immanent in God.' The limitation of real individuality to souls naturally reminds us of the Neo-Platonic view that souls hold the lowest place in the system of *ὄντα*, bodies being not *ὄντα* but *γενόμενα*, 'what becomes,' or *εἰκόνες τῶν ὄντων*, 'images of *ὄντα*.' The resemblance with Neo-Platonism is even more marked when Lotze uses his view of *M* as the metaphysical *prîus* of universal laws or eternal truths as a ground for urging that life, truth, and goodness are not, as the Aristotelian phrase has it, 'naturally prior' to God; God is Himself the concrete Life, Truth, and Good.

17. Logical pluralism.—The foregoing statement of the theistic argument as presented by Lotze provides an opportunity for considering the type of ultimate pluralism of which we have spoken as the most serious philosophical alternative to theism. This type of view is best represented in contemporary English philosophy by the writings of G. E. Moore and Bertrand Russell, though, as neither of these authors has ever directly attempted

the construction of a metaphysical system, we must be content to indicate the general view to which their studies in logic, ethics, and the philosophy of the exact sciences seem to point. A pluralism of the type in question would take issue with Lotze over the validity of the ground on which he maintains the existence of such a being as *M*. It would insist on precisely that form of 'dualism' which Lotze assumes to be unthinkable—the 'dualism' of actual existence and hypothetical universal laws. It would be maintained that what we actually find the 'world' to consist of is a plurality of existing things standing in a complicated network of relations of all kinds with one another. These relations, it would be further said, cannot all be reduced, as Lotze assumes, to reciprocal causal inter-connexions. Causal connexion is only one of the many types of relation; there are others, such, e.g., as the mere 'togetherness' or 'compresence' which language represents by the word 'and,' the 'disjunction' symbolized by 'or else,' and so forth, in which causality is not a component at all. Relations are all 'universals,' and no relation is an 'existent,' while 'existents' are all individual. We have to accept it as an ultimate fact which permits of no explanation that specific individual existents stand in certain definite relations to other specific individual existents. To ask why this is so is to ask a question quite as illegitimate as that which Lotze ascribes to the purely mechanical philosophers whom he ridicules for asking 'how being is made.' More particularly, the special problem which leads Lotze to frame the concept of *M*—the problem how a change of 'state' is brought about, how one thing can exhibit a succession of different states or first have a relation to a second thing and then lose it—would be declared illegitimate. According to the view which has been most elaborately developed by Bertrand Russell,¹ the proposition that at a certain moment *A* changes its state from a_1 to a_2 , or changes its relation to *B* from R_1 to R_2 , if expressed accurately, only means that the whole duration of *A*'s existence can be resolved into two mutually exclusive classes of moments. In any moment of the one class *A* has the state a_1 , or stands to *B* in the relation R_1 ; at any moment of the other class *A* has the state a_2 , or stands to *B* in the relation R_2 . And, further, every moment of the one class a_1 comes before any moment of the other class a_2 . There is no moment in the whole conjoint class $a_1 + a_2$ at which *A* has both states or both relations, and no moment at which it has neither. Thus, strictly speaking, there is no such process as that which Lotze calls change, and we live, in fact, 'in a changeless world.' Fully thought out, this view leads to the position, adopted of recent years by Russell, that all existents really exist only at a mathematical instant. What we commonly call one and the same thing or one and the same mind is an infinite succession of different things or minds which we mistakenly regard as one, because the thing or mind which exists at a moment m_2 separated by a minute interval from a preceding moment m_1 is very much like its predecessor. Thus Lotze's argument is invalidated by denying the reality of the facts it is employed to make intelligible. As there are no changes, in the sense in which Lotze understands the word, there is no ground to assert the existence of *M* to account for them. All arguments for the reality of a 'being which necessarily exists' are thus invalidated; and it is, further, at least highly doubtful whether we can even form the thought of

¹ It will be clear from these last sentences why the present writer regards Lotze's argument for the unity-in-multiplicity of *M* as in principle identical with Kant's pre-critical argument for a 'necessary existent' as the foundation of real possibility.

¹ In *The Principles of Mathematics*, Cambridge, 1903. The later work of Russell and Whitehead, *Principia Mathematica*, Cambridge, 1910 and subsequent years, does not assume this metaphysic.

a 'being which cannot be conceived not to exist.' Causality, as commonly understood by metaphysicians, likewise disappears. The causal principle reduces to the modest proposition that an observed frequent sequence of an event of the class β on an event of the class α affords ground for the judgment that in cases not previously observed an event of class β is likely to have been preceded by an event of class α . How likely this conclusion is is then a mere problem in the mathematical theory of probability. Whether all events have causes or not remains an open question, and must always remain so. It is clear that such a theory leaves no room for theism in philosophy. If it is really the last word of metaphysics, belief in God loses all rational foundation, though it is, to be sure, still possible that the belief may 'happen' to be true. It must further be admitted that the theory has its strong points. It is by no means obvious that a philosopher is entitled to assume as axiomatic such a conviction about the thoroughgoing interconnexion of all events as Lotze makes the basis of his argument. In what sense or to what degree the 'world' is a unity is a question to which philosophy must find the answer. The interconnexion might conceivably be very much looser than Lotze is willing to admit. And it seems clear that the mathematical analysis by which the particular puzzle about change is eliminated is, *as far as it goes*, entirely justified.¹ Nor yet can it be denied that the very modest statement to which the principle of causality is reduced is all that is required at any rate for the purposes of natural science.

It still, however, remains a question whether we could possibly be content with a logical pluralism of the kind just described as the final answer to our intellectual demand for a rational explanation of the world. For the purposes of the present article it must be enough to call attention to a few of the considerations which suggest that such a theory can only be provisional. One may fairly doubt whether it can really be called an explanation or interpretation at all. The system of inter-related existents with which it presents us as the solution of a perennial intellectual problem seems to be simply the problem itself stated in an unusually abstract way. And it ought to be clear that, when it has been granted to the full that the special problem about the meaning of change has been eliminated, there is a more fundamental problem which the theory has simply left out of account. However true it may be that 'we live in a changeless world'—*i.e.*, that there never is a 'moment' in which anything is 'passing from one state to another'²—Lotze's main contention, that the analysis of the universe into relations and existents, which are the terms of the relations, rests on the uncriticized assumption that the successive steps of the logical construction by which we try to make things intelligible correspond exactly to the steps of the real process by which 'being,' so to say, constructs itself, has been left unanswered. Logical pluralism, no less than the 'panologism' of Hegel, simply assumes that the logically prior and the metaphysically prior are identical. The only difference is that the logic of Hegel is so much inferior as logic. To put the point in the simplest possible way, we cannot avoid raising the question why, out of the infinity of relations open to the study of the logician, some

¹ The question is *how far* does it go? Is an 'instant' more than a mathematical 'limit'? The 'Theory of Relativity' becomes important at this point (consult A. N. Whitehead, *Enquiry into the Principles of Natural Knowledge*, Cambridge, 1919).

² Yet it is surely true, as maintained, *e.g.*, by Whitehead, that 'passage' is just the fundamental fact about Nature, however we choose to analyse it. 'Nature' is, as Plato called it, a *γυρόμενον*.

and only some are actualized—have existents as their terms. Logical pluralism has no answer to this inevitable question except that 'it happens to be so.' And this is really no answer at all. It amounts to saying not merely that the world might have been wholly different from what it is, but that there might equally well be no actual existents whatsoever. The theory fails to satisfy us for the same sort of reason as that which prevents the ontological proof from producing conviction. Just as that argument assumes that 'there must be something,' so the theory we are now considering assumes that 'there might just as well be nothing.' Now, we cannot prove that there must be something, nor can we prove that there might have been nothing; we have to start from the fact that there is something and that this something has a definite character. Hence, to the present writer, Lotze seems right in contending that it is the character of this something that accounts for the range of logical possibilities itself being what it is, and Kant in arguing that there is an actual ground presupposed by the very distinction between the possible and the impossible. In fact the logical pluralists themselves seem to admit as much when they rightly insist that the so-called laws of thought are laws not of thinking but of things. It is therefore by a rightful exigence of the intellect itself that we are driven to conceive of the structure of the world as explicable only by the metaphysically 'first' character of the 'necessary being'; and, when once we have taken this step, it is not hard to show that the 'necessary being' must have the character of the *ens realissimum*. It must be its own justification, its own *raison d'être*. If so much be granted, it follows at once that, though we can form no adequate positive concept of such a Supreme Being, the least inadequate way in which to think of it is in terms of the highest values known to us—*i.e.* by analogy with the human spirit at its best. How inadequate such an analogy is has always been patent. Even of the human spirit at its best we can only form very inadequate notions from what we see of its actual achievements, and our notion of the Supreme Reality which is the source of our estimates of worth, as of all other possibilities, must needs be doubly imperfect when it has to be framed in so unsatisfactory a way. But we can at least say that such a being must be all that we mean when we think of perfection in ourselves, and infinitely more. If we are not satisfied with theories which, under a disguise, offer us the unexplained detail of the world as its own explanation, it is only in the thought of the detail as throughout conditioned by the living Good that the intellect itself can finally acquiesce. Of course we cannot expect to know in particular how each constituent of this detail is consequent on the character of the Good—why, *e.g.*, it is 'best' for us in particular to be living on the particular planet on which we do live, rather than any other; why there should be just the number of members of our planetary system there are; why the range of colours we can perceive should be neither more nor less extended than it is; and the like. But the conviction that all this detail is as it is 'because it is best' gives an adequate reason why it is what it is, even though we may be quite unable to see why it is best.¹ And it is only the thought of the dependence of the world on the absolute Good which, by removing the artificial severance between the realm of fact and the realm of values, can achieve

¹ It would be a superficial objection to say that 'because it is worst' would be also an answer to our question. Good (no one has done more to insist on the point than Moore) means something definite and positive. So 'best' has a meaning, but 'worst' has none, any more than 'so crooked that nothing can be crooked' has.

the solution of the supreme intellectual problem, the reconciliation of science with life.

These considerations suggest certain further reflexions on the limitations of logical pluralism. The whole theory has manifestly been thought out in the exclusive interest of pure mathematics and the application of mathematics in the natural sciences, and for that purpose it works admirably. But there is more in heaven and earth than these sciences take into account. Even within their limits it remains to be seen whether the theory as it stands will really do all that a philosophy of the sciences should. The fundamental difficulty is that it is a consequence of the theory that, as has already been said, the establishment of scientific laws by induction comes to be simply a problem in the theory of probabilities. But the theory of probabilities, taken by itself, seems to give us no ground whatever for attributing to the conclusion of an inductive generalization any finite probability, however small.¹ Science would thus seem to be impossible in principle unless some as yet undiscovered premiss for induction, which is not included in the theory of probabilities, can be unearthed; and it remains to be seen whether such a premiss, if discovered, is consistent with the rest of the theory. Again, the replacing of the individual existents of popular common sense and ordinary science by infinite series of momentary individuals seems an absolutely necessary consequence of the initial assumption of the theory, and, so far as the things of the external world as conceived by common sense, or the constituents of the physical order as conceived by the physicist, are concerned, there might be no difficulty about it.² But it is quite another question whether the substitution does not destroy the whole significance of the moral realm, the system of intelligent spirits. It is not merely that it creates a difficulty in psychology, though surely it does create such a difficulty. The immediate witness of consciousness to our identity as subjects of experience is a real fact which no logical theory about the constitution of the world has a right to ignore. It may be that 'the mind thinks not always,' that there are intervals in which each of us is wholly unconscious, though such evidence as we have does not seem favourable to the supposition; but, at least when we are conscious, every conscious act fills an actual interval and yet has its absolutely unitary character. A 'duration,' though a brief one, is necessary to think the simplest proposition, and much more to draw the easiest inference. Yet the thinking of the proposition or the making of the inference is a unitary act only intelligible as the act of a unitary intelligence. It is nonsensical to say that, when I think 'God is,' this thought, as a mental event, is really made up of an infinity of momentary 'mental states' of similar but numerically different minds, or that the 'I' which resolves on a given act and the 'I' which carries out the resolve are each an infinity of different 'I's' with a further infinity of still different 'I's' between them. Only the elementary blunder in analysis of resolving activity into mere succession can account for the promulgation of such a view. It is a still more serious matter that the doctrine is wholly incompatible with the fundamental prerequisites of ethics. This point is capable of being developed in great detail and from more than one side, but in principle it should be enough to say that the denial of permanent personality is fatal to the conception of personality as having moral

worth. If we analyse any act upon which a moral judgment would normally be passed into an infinity of momentary phases, no moral predicate can be ascribed to any one of these stages. The moral judgment for approval or condemnation has no meaning if it be applied to any such single stage; to be significant, it must be passed on the whole act, considered as one, and as an expression in act of the inner will of a subject who is one and the same from its first inception in thought to its completion. Similarly the notion of duty loses all its meaning with the relegation of permanent selfhood to the realm of illusion. That an act is my duty in the present situation means that it is something not yet done, but which ought to be done and to be done by me. But if 'I' only exist at a mathematical *punctum temporis*, the proposition that I ought now to do a certain act has no longer an intelligible significance. A merely momentary 'I' can do nothing and can be nothing except just what it is; 'ought' is a category which has no application to it. It is no mere accident that Russell should have dropped significant hints in his latest writings of conversion to the view that moral judgments are only 'subjective,' mere expressions of fundamentally irrational moods. The real outcome of a logical pluralism, put forward as the ultimate truth about what is, is not even that standing dualism of what is and what ought to be of which Lotze complains; it is rather the pronouncement that categories of value (there can be no reason to confine the conclusion to specifically ethical values) are one and all devoid of any real application. For those who cannot accept this result, Kant's moral argument for theism seems to the present writer unanswerable. For it is only if the Good is also the supreme principle of all existence that it becomes possible to understand how what is and what ought to be can form one 'world,' and from the recognition of the Good as the Supreme Being theism follows directly. This seems to be illustrated by the present state of philosophical opinion in our own country. Throughout the thirty years or so, from the seventies of the last century onward, in which Hegelianism, interpreted with a marked Spinozistic bias, was the dominant philosophy in academic circles, there was a natural tendency to make it almost the test of a man's philosophical capacity that his attitude towards the problems raised by the religious life should be an emotional pantheism; atheism was in discredit as indicative (as indeed it is) of lack of interest in or understanding of the whole realm of personal values; theism as a supposed mark of want of logical thoroughness. In the present generation the issues seem to be clearing. Philosophers are certainly tending, though not without exception, to range themselves into two camps. Those to whom the business of philosophy seems to consist mainly, if not exclusively, in providing a logical basis and a methodology for exact science appear to be identifying themselves with the doctrine of logical pluralism and taking up a definitely atheistic attitude which involves the denial of the objectivity of judgments of value; those, on the other hand, who are convinced that the business of philosophy is to make life, as well as science, intelligible, and consequently find themselves obliged to maintain the validity of these categories of worth apart from which life would have no significance, are, in the main, declared theists.

18. **Objections to theism.**—It may be desirable to add some brief observations on certain types of objections which are often quite sincerely raised against a theistic interpretation of the world. In principle none of these difficulties are novel; most of them find their expression in Hume and may be traced back far behind Hume to the literature of

¹ See the acute discussion by C. D. Broad, in *Mind*, new ser., cviii, 389-404, and the criticisms of P. E. B. Jourdain, *Mind*, new ser., cx, 162-180. Jourdain's criticisms do not seem to the present writer to affect the soundness of Broad's contentions.

² But the philosophical interpreters of the 'Theory of Relativity' would have something to say on this point.

the ancient world. Popularly these objections are often called 'scientific,' though their only connexion with modern natural science is that its discoveries enable some of them to be stated in a more impressive way. For the most part they are all summed up in the antitheological assertion of Lucretius that the existing world is too bad to have been created or to be administered by a divine intelligence, 'tanta stat praedita culpa.' Thus it is urged that the suffering of the animal creation is too great, the cost of the 'struggle for existence' too painful, for us to ascribe a world like that we know to a benevolent Creator. Or, again, it is said that an almighty Creator might have made the human race, in particular, such that it would not be exposed as it is to suffering, to constant struggle with its environment, to the consequences of its own mistakes and wrongdoing. It is then inferred that, if there is a superhuman intelligence behind nature, that intelligence is either deficient in wisdom or wanting in goodness. Now, obviously, criticisms of this kind rest upon premises which may be fairly called in question. One might reasonably doubt whether the pessimistic interpretation of the facts which sees misery predominant everywhere in animal and human life has any real warrant. To an unbiased observer an animal does not seem normally to give signs that it finds its existence miserable, and it is notable that suicide is not common among men, and, unless the stories of the scorpions which kill themselves when surrounded by fire are true, apparently as good as non-existent among the lower animals. The misuse of the metaphorical phrase which describes the process by which species are selected for survival as a 'struggle' is too glaring to need more than a word of comment. If competition plays a prominent part in the economy of the animal and vegetable kingdoms, as it does in the economy of commerce, it no more follows that the life of every animal, or most animals (and? vegetables), is one of wretchedness than it follows that all or most business men are hopelessly miserable.¹ Still, of course, it may be said that there is, at any rate, some suffering in the world and that perfect goodness would have permitted none at all. Such an argument, however, tacitly assumes that perfect goodness can have only one end, a hedonistic one, and thus permits of the answer that whatever the end which perfect goodness conjoined with omnipotence would propose to itself—and we clearly are not in a position to say what that end would be—it is at least unreasonable to suppose that it can be the mere promotion of agreeable feeling, an end which even we ourselves regard as a low one. If we could know the purpose of creation, it might well be that we should see that it is entirely good and at the same time could not be attained without the presence of an element of hedonic evil in things. Similarly, with respect to the objection based on the view that it would be 'better' that human beings should have been placed in a world where there were no unfriendly or intractable environment to master, and should have been *ab initio* infallible and impeccable, it is obvious that it loses its force if we decline to assume (1) the hedonistic identification of good with pleasure, and (2) the proposition that the good of the human race must be the sole or at least the principal design of God. If God's aim in dealing with us is to educate us into noble character—a much worthier aim than that of making us comfortable—it may well be that such an end could not be obtained except by the discipline of struggle with our surroundings, with our own mistakes and our own misdeeds.

¹ And is it possible, in the present state of knowledge, to regard 'competition' as playing anything like the part Darwin assigned to it in determining the fate of 'varieties'?

Nor have we the right to assume that the human race must necessarily be the sole or even the chief object of the divine care; we do know, unless ethics is a delusion, that a human soul is a thing of absolute worth; that it is of higher worth than everything else which God has created is more than we can know. Indeed there is a rival objection which proceeds on the opposite assumption. We are asked to think of the enormous spaces revealed to us by astronomy and the number and bulk of the heavenly bodies, and then to reflect on the absurdity of supposing that the fate of the inhabitants of one petty planet can count for anything in the scheme of the universe. Yet it is clear that here, too, the antitheist is reasoning (if it can be called reasoning) upon a false assumption. He is assuming that we know that the absolute worth of a member of the universe is estimated by its bulk and duration. Man must be of little value in the scheme of things because his body is tiny and its lifetime short. Plainly we have no right to make serious objections to the theist's belief in God's care for man on such flimsy grounds. If we do not know that man is the thing of highest worth in the creation, neither do we know that he is not. The one thing which a theist can affirm is that the absolute worth of moral personality must be respected in a system which is the work of God. 'Justorum animae in manu Dei sunt'; that is all we can say, but surely it suffices. If the Good is the principle of actuality, that means that we can say that a thing has come to be because it was better that it should be than that it should not; it is where and when it is because this is better than that it should be elsewhere and otherwhen; that befalls it which does befall it because it is best that it should befall—*i.e.*, God is alike Creator, Providence, and Judge of His creatures. Of course, if we had no grounds at all for our theistic conviction, difficulties like those mentioned might forbid us to entertain it as a mere 'extra' belief. But, if it is true, as has been urged in this article, that speculation and practice alike point to the eternal nature of God as the object in which both find their completion, we have a double exigence of the practical and the speculative reason on the side of theism, and in the presence of such an exigence we are justified in applying Newman's remark that 'a thousand difficulties do not amount to one doubt.' One might add that there is a third exigence—the specifically religious. It would be perhaps a more serious objection to theism than any we have yet considered to urge that our whole procedure in looking for a First Cause is vitiated by one obvious fallacy. The world, it might be said, even if it has attained its present structure as the result of processes which are in the last resort reducible to mere redistributions of unintelligent primary constituents, directed by no mind and having no end, still must, of course, have a perfectly determinate structure, and, as we ourselves happen to be included in that structure, of course we inevitably discover adaptations in our environment to our special needs, and are led to fancy that such adaptations are evidence of the direction of the world by an intelligence which aims at supplying our needs. But the real fact is simply that it is not the world that has been adapted to us, but we who have learned and are learning to adapt ourselves to the world. If we did not so adapt ourselves, we should not be here, and, if a time ever comes when our capacity for such 'adjustment' of our 'inner relations' to the 'outer relations' is exhausted, we shall cease to be here. If the actual course of events had been different, all the reactions which we now call good, because they further adaptation, might have hindered it, and those which now hinder it might

have furthered it. If in such a state of things there had been reflecting beings at all, they, judging from their standpoint, would have called good all that we think evil, and evil all that we think good. They would have inferred benevolent divine activity from the existence of conditions which we should regard as indicating the control of nature by malignant 'diabolical' intelligences; and their inferences would have just as much foundation as ours. These considerations, it might be said, are a *reductio ad absurdum* not merely of all attempts to reason from 'Nature up to Nature's God,' but of the moral argument itself, since they show after all that standards of valuation are and must be in the end purely subjective. Since the human race exists, and so long as it continues to maintain itself, there must, of course, be no irresolvable discord between human estimates of value and the actual conditions of existence. But, as the illustration shows, we have no right whatever to argue from this simple and obvious fact to the dependence of existence on an absolute 'Good.' In fact, any of the races which have 'gone under' in the struggle for existence would be equally justified in asserting that existence depends on the absolute 'Evil.' Here, as it seems to the present writer, we are confronted by the real ultimate difficulty for theism. If there is, after all, no realm of absolute values, a line of thought which is throughout determined by the conviction that the realm of facts and the realm of values cannot be separated must manifestly be futile. It is just the recurrent fear that the 'realm of values' may turn out to be a fiction of our imagination that is, in speculation, the last enemy to be overcome. How is it to be met? The answer, it may be suggested, is the old one, given in the memorable utterance of Pascal: 'Tu ne me chercherais pas si tu ne me possédais. Ne t'inquiète donc pas.'¹ The sentences may be applied to ultimate doubt about the reality of every kind of human value. Is a man tempted to doubt whether there really is any absolute and certain truth, whether all our 'truths' may not be mere 'human' or even 'personal' points of view, *βροτῶν δόξαι αἷς οὐκ ἐνί πίστει ἀληθῆς*? Let him bethink himself that it is only because he is not unacquainted with truths that he can frame the notion of the absolutely true, and only because he has framed the notion that he can raise his doubt. So it is only because we are all along secretly aware that there are things which we ought unconditionally to do that the question whether any given accepted obligation is really unconditional can so much as be put. If we knew no beauty, we could not even ask ourselves whether our judgments about beauty rest on illusion. In like manner it is only because the absolutely Good and utterly Adorable has not left Himself without a witness in our hearts that we feel the need of an object to worship and are driven on from the worship of trees, or streams, or animals, or mighty men, or anthropomorphic deities, towards an object in which our adoration can at last find rest because that on which it is directed is adequate to sustain it. Prayer and adoration need no more justification than the questioning attitude towards things which leads to science, or the impulse to make things of beauty which leads to art, or the desire to do right which leads to morality. It is not for nothing that man, as the Greeks said, is the only animal who has a god. If we look at the matter from this point of view, we may fairly say that the Stoic appeal to the *consensus gentium*, though no formal demonstration, still contains a thought which goes to the very root of things. There are, of course, individual men who do not feel the impulse to seek for Him whom they may worship

¹ *Pensées*, vii. 555 (ed. Brunschvicg, Paris, 1905).

with a *rationabile obsequium*, as there are men with no sense of humour, or men to whom music means nothing, or men who cannot be made to see that the difference between right and wrong is anything more than the difference between what society will allow them to do and what it will not let them do without making them uncomfortable. The existence of such individuals is about as important in any one of these cases as in any other. Nor does the number of such men without a religion seem to be on the increase. In our own day the only effect of persuading men that the Most High is a dream appears to be that they transfer their worship to the demonstrably not most high; we get such quaint aberrations as the Comtist worship of 'humanity,' or the elevation of Marxian Socialism into a faith. The one real question is not what certain individuals are unable to feel the necessity of searching for, but what those who do seek find, *sed quid invenientibus*? The lives of the 'saints' are the real answer of theism to the last insistent perplexities of the doubter who lurks in each of us. Others, without the theist's faith, have often led noble lives; they have fought a good fight with the untowardness of a world which they have believed in their hearts to be stupid or malignant; yet the most clear-sighted among them, like Huxley, have confessed that mortal heroism is a losing game, a battle with the cosmic forces. Such heroes, after all, do but apply to the universe the saying of the Emperor Marcus about base men: 'The finest revenge is not to become like them'; they have revenged themselves on the world. What they lack—and one does not see how the lack is to be made good—is the secret of spiritual joy which belongs to those who are assured that it is the Good which is supreme in heaven and in earth. It would be tempting to develop this argument farther, from a slightly different point of view—that of love. To love, no less than to worship, it may be said, is an ultimate human need. At least, if a man does not feel the imperativeness of the need, we should probably say there was something 'inhuman' about him. And love too, like worship, seeks its adequate object—that which, without any yielding to illusion, a man can love with all his heart and mind and strength. Love, with no limitations, if it is clear-sighted, for us at least must be an *amor ascendens*, and, as it has its source in good (for real love is always for what is good, not for what is evil, in its object), so, unless it can at last rest in the supreme Good, which is good altogether, it must remain unsatisfied. But we cannot here pursue the point farther. Only one thing more will be said in conclusion, and that for the believer in 'science' who scruples at admitting the reality of the Good. Why do we believe in science at all? Why do we, as we must if we have this belief, refuse to entertain the possibility that the 'progress of science' is only bringing us nearer to a point at which the whole construction would be found to culminate in manifest and hopeless contradictions? As a mere logical possibility there seems to be nothing absurd about the suggestion. If we dismiss it, as we do, it is because we believe that knowledge is good, and because in our hearts, whatever we may say with our lips, we believe that the Good is real. Therefore, little as we know of the facts of the world, we work on in confidence that, however drastically the discovery of new facts may compel us to modify our statements of truth and to supersede as provisional results we once thought established for ever, no new fact of the infinity which might be discovered in an endless 'progress' will ever show that 'science' has been a secular nightmare of the race.

LITERATURE.—Besides works mentioned in the text, the following may be recommended out of an enormous literature (it is, of course, impossible to make any attempt to ensure completeness, and only recent works have been named): S. Alexander, *Space, Time and Deity* (Gifford Lects.), 2 vols., London, 1920; A. J. Balfour, *The Foundations of Beliefs*, do. 1901; B. Bolzano, *Wissenschaftslehre*, vol. 1. (1837; reprinted Leipzig, 1914); B. Bosanquet, *The Principle of Individuality and Value* (Gifford Lects.), London, 1912, *The Value and Destiny of the Individual* (Gifford Lects.), do. 1913; F. H. Bradley, *Appearance and Reality*, 2nd ed. revised, do. 1908, *Essays on Truth and Reality*, Oxford, 1914; R. Flint, *Theism*, Edinburgh, 1885, *Agnosticism*, do. 1903; A. A. E. TAYLOR.

THEOCRACY.—The term 'theocracy' was coined by Josephus,¹ upon the analogy of 'aristocracy' and 'democracy,' to denote a certain kind of national polity. Any tribe or state that claims to be governed by a god or gods may be called a 'theocracy.' History has many different types; e.g., the theocratic idea underlies Brāhmanism, Islām, the papacy, and the theory of 'kingship by divine right.' Yet there is probably no historical instance of a 'pure' theocracy. Just as the British constitution to-day, while predominantly democratic, has monarchic elements, so of old time the Hebrew commonwealth, for example, while predominantly theocratic, had democratic elements. Different polities are distinguishable historically, not because a single principle exhausts them, but because some one principle is dominant within them. The idea of government by God was the dominant one in Israelite polity. In this way it was unique, as Josephus claimed, among the polities of his time. It is the leading instance of theocracy for all times. It is the only one discussed here.

Theocracy came to Israel by survival. The earliest form of human society, so far as anthropology has yet discovered, was the clan or kindred-group. This appears to have been world-wide. In religion it was 'henotheistic,' a particular god belonging to a particular clan. He was part of it, as much a part as any human member. His relation to it was too many-sided to be summed up in any one word. In some ways a tribe's god was like a father, in some like a captain, in some like a king, and so on. But, as monarchy developed among the Semitic races, the relation of the god to the tribe came to be chiefly like that of a king. So, among them as well as elsewhere, there arose the early 'henotheistic' type of theocracy. Its best-known examples are Biblical: Chemosh ruled

Moab, Milcom ruled Ammon, Jahweh ruled Israel, and so on. Sooner or later, however, this kind of theocracy perished in every settled land except one. The gods of such tribes as Edom and Moab passed away, with the tribal independence, before the attack of Assyria, or Babylon, or Persia. In other lands polytheism supervened on henotheism. There the gods slowly became rather an appendage of the state than its rulers. But in Israel the idea of the sole rule of a single God survived all the vicissitudes of history. It survived by development. Its history is the history of the way in which Hebrew thought about Jahweh's rule evolved to meet the varying challenge of national need. To set this out fully would be to write the whole story of Israel. Here a narrower question is in place: the idea of government by Jahweh being constant in Israel, how did the idea of its *method* evolve?

The study of the method of any kind of polity turns largely on the nature of its organs, for almost all civilized governments rule through organs. This is peculiarly so with theocracies, since it is only in legend that gods speak directly to their peoples. Josephus himself, in the very passage where he coins the word 'theocracy,' speaks, not of Jahweh, but of Moses, as 'our law-giver.' In Israel, as elsewhere, the organs of theocratic government were long associated with sacred shrines. Horeb, Shiloh, and Bethel are instances.¹ The shrine, so to speak, gave the organ authenticity. When doubt or dispute arose about Jahweh's Law, appeal would be made to the guardians of some great shrine.² These came to form a priestly class. At the great shrines, too, there soon began to be books of Jahweh's *tôrôth*;³ here as well there were the few men who could write and read books. Traditionally, at least, the original Law had been given, and its first edicts written, at the shrine of Horeb or Sinai.⁴ In later times, no doubt, when a Hebrew visited a shrine to learn Jahweh's will, its authorized exponent, the priest, would not only read the appropriate law, but explain it. Sometimes, again, he would need to extend an old principle to meet a new 'case.' So, little by little, the 'Law of Jahweh' would insensibly grow. For early Israel three things were indissoluble—Jahweh's shrine, Jahweh's book, Jahweh's priest. The three together formed the normal organ of theocracy.

The history of pre-monarchic Israel, however, has traces of two other theocratic organs—the so-called 'judge' and the 'prophet.' Of these a distinctive phrase is used: 'the spirit of the Lord came upon' so-and-so.⁵ The phrase has variants,⁶ but this is its usual form. It is the earliest explanation of the method of theocracy.⁷ There are some hints that the 'judge' was usually connected with a sacred spot.⁸ If so, this theocratic organ also cohered with the shrine. There was perhaps a similar connexion at first between the shrine and 'prophesying.'⁹ Before the days of Samuel the

¹ The 'Ark of God' was originally a kind of movable shrine.

² Cf. Ex 21^b and parallels; 1 S 22⁵ 716^r.

³ Cf. Jos 24²⁶, Dt 31⁹, 24^r, 1 S 10²⁶.

⁴ Ex 344. 12.

⁵ E.g., Jg 11²⁹, Nu 24², 1 S 10¹⁰.

⁶ Cf. esp. Jg 6³⁴.

⁷ It is possible that historical study will at length speak of three organs here instead of two, distinguishing the 'judge' from the warrior-'saviour.' For it has been implied above that to judge, in the ordinary sense of the word (cf. 1 S 81-5), was a function of the priest in Israel; and this was not confined to priests (e.g., Jg 4¹¹, 1 S 41⁸ 76). Such 'judges' were thought of as organs of the 'spirit of Jahweh' (cf. Nu 11²⁷). One who had 'saved Israel' (cf. Jg 3³¹ 61⁴ etc.) was also such an organ. Not infrequently a 'saviour' became a judge as well, and later Hebrew writers, used to the constant union of the captain and the judge in the king, treated it as constant in the leaders of early times too (e.g., Jg 21⁶ D 39^r D). Yet there seem to have been judges who were neither priests nor 'saviours' (Jg 10³ 12⁸⁻¹⁵; cf. 1 S 716^r 81). To 'save Israel,' to judge, to serve at a shrine, were distinct theocratic functions, though two of them might unite in a single man.

⁸ Jg 4⁵ 8²⁷, 1 S 22⁵ 715^r.

⁹ Cf. 1 S 320^r 91⁹.

1 C. Apion. ii. 16.

Hebrew 'prophet' was probably hardly more than the wandering saint of other Eastern faiths¹—a man who lived a separate and so a 'holy' life. In all lands these have frequented shrines, for, even where they have no 'official' connexion with the ritual, temples offer the best opportunities for the alms by which they live. The first band of 'prophets' named in the Hebrew records appears as 'coming down from the high place.'² Primitive thought does not readily isolate the different organs of a god's activity.

Scholars differ about the degree in which the religion of pre-monarchic Israel surpassed other tribal faiths, but all allow that within the period of the monarchy Hebraism became unique. In that period all the theocratic organs named above persisted, but in persisting changed. Every other Hebrew shrine was eclipsed by the Temple in Jerusalem, and at length disappeared. So, too, the Temple became at last the depository of the one recognized book of Jahweh's Law.³ In Jerusalem, again, the priesthood of Israel ultimately concentrated. At crises in the history of the Southern Kingdom the high-priest sometimes played a decisive part,⁴ and there is evidence that the Temple had a succession of priest-preachers who surpassed all contemporary priesthoods in the loftiness of their teaching and the purity of their lives.⁵ Their permanent memorial is the book of Deuteronomy. It was only at the close of the monarchy that they became utterly corrupt—a fate that also befell the 'sons of the prophets'—and even then Jahweh's great witness, Jeremiah, was born a priest. Of the three other theocratic functions found in the times before the kings, two—leadership in war and judgment in peace—which had previously often united in a single person⁶ now permanently blent in the king. While, of course, there were inferior captains and subordinate judges, he was both supreme captain and supreme judge. And he was effectively both. A king, unlike the earlier 'saviour,' held permanent office, and, unlike the earlier judge, had power to enforce his decisions. And he was king by the will of God. He was Jahweh's 'son,' as having His mind and acting under His guidance.⁷ He was 'the Lord's anointed.' At times even a wicked king fell back upon Jahweh's help at the pinch of his people's need.⁸ It is true that one king after another 'did that which was evil in the sight of the Lord,' and so repudiated the righteous God of Israel, but the ideal of a king who, like David, did the will of Jahweh remained a part of the hope of Israel. Ideally the Hebrew monarchy was theocratic.

The chief glory of monarchic Israel, however, was its prophets. They were different indeed from all other 'prophets'! With them the connexion of theocracy with shrines, maintained by the kings,⁹ began to loosen. At times, again, the prophet must perforce denounce the priest. Yet the prophets, more than any else, were the true organs of theocracy. 'Thus saith the Lord' was their watchword. They spoke under the impulse of the Spirit. In a sense they kept God alive. It is true that, from the time of Elijah, Israel began to refuse their guidance, that at last the Northern Kingdom rejected it altogether, and that even in Judah they became the leaders only of a 'remnant.' But it was just this 'remnant' that meant so much for the future of the world. Israel

is unique among theocracies because of its prophets.

The Exile was a signal proof of their greatness, for no other ancient people survived exile. 'To be carried captive' destroyed, as it was meant to destroy, nations and their gods together. Even in exile, however, Israel believed in the rule of its God. Of this creed the unknown prophet now called 'Deutero-Isaiah' was preacher *par excellence*. The Hebrew of the Return re-crossed the desert under the definite conviction that his God was leading him, as He had led Abraham.¹ In consequence a decisive change in the Hebrew idea of theocracy became complete. From Isaiah onwards the primitive notion that there were as many gods as there were nations had been gradually making way for the belief that there was but one God, and He the master of all nations. Only so could Jahweh save Jerusalem from Sennacherib, or redeem Judah from Babylon. Monotheism now entirely supplanted henotheism. While Israel was still Jahweh's 'peculiar treasure,' His theocracy was no longer limited to Canaan, but swayed the world.

Yet the immediate sequel was disappointing. 'Judaism'—to use the name appropriate after the Return—set out to be a pure theocracy. It rebuilt the old shrine; it gathered the ancient books; at length it made the ancient priesthood paramount. Yet it gradually became a splendid failure. The line of prophets dwindled away. The Jews looked in vain for kings like David. At last no priest dared, in the Lord's name, to add to His Law. And it seemed clear, besides, that the Lord did not rule the world. Theocracies tend to become hierarchies, and hierarchies tend to stagnate. Israel was now a hierarchy, and it looked as though Jahweh would sink to the level of the gods who had done great things in the past, but who did nothing in the present. The Jewish theocracy threatened to 'fossilize.'

Yet it escaped this fate. As the Psalms of the period show, there were always Jews who practised the creed that their God was still alive, and they knew that His time would come. The book of Daniel bears the same witness in a different way. It is the first apocalypse, and all apocalypses are theocratic. So, again, in its own way, is the book of Esther. The distinctive note of this epoch is not really its consummated ritual or its completed law, but its unextinguished hope. Israel believed that the future, as the past, was its God's and its own. There would be a perfect theocracy yet! The Kingdom of God would come!

There were two leading opinions about the way of its coming, readily separable in thought, though not always separated in fact. The one opinion found its aptest expression in the apocalypses. Broadly speaking, these expected a kingdom based on force, in which the Jew would rule all other nations—a kingdom won and maintained by a superhuman organ of God. This opinion laid hold of the external form of the old theocracy, kingship. It had an element of truth in it, for the NT has an apocalypse. In the interval before the perfect kingdom comes Christ does 'over-rule' all things and men, and this is a theocratic idea. Yet the other opinion is final for Christianity. Its earlier exponents were some of the later Psalmists; it lived in the quiet circles that 'waited for the consolation of Israel'; its perfect preacher was Jesus. He accepted the phrase 'the Kingdom of God,' and so looked for a theocracy, but He gave the phrase His own exposition and laid down the true method of the Kingdom's coming. It has been seen above that from the first a man who was the organ of

¹ Cf. Ezr 8²².

Jahweh was thought of as 'filled with' His Spirit. This was why and how he knew God's will. More than once it had been discerned, even by OT thinkers, that a perfect theocracy, therefore, could come only if all its citizens, and not a few only, had the Spirit of Jahweh.¹ This idea is really central in Jesus' teaching, though He was able to teach it only as men were able to bear it. With the Acts of the Apostles it became explicitly the master principle of Christianity. At the same time there began the evolution of the Christian doctrine of the personality of the Holy Ghost. There can be a perfect theocracy only when every man acts always under the guidance of the Spirit of God. Here is the culmination of Biblical theocratic doctrine. Yet here also is its euthanasia. For this kind of 'theocracy' does not satisfy the definition given above. It is not a 'theory of national polity.' The Christian doctrine of the Holy Spirit is naturally individual, and as naturally universal, but it is not naturally national.² Again, the term 'polity' implies government and its coercions, and one of the marks of the Spirit's sway just is that it is incoercive. Yet the husk of Israel's theocratic idea held a kernel of 'eternal' value. The last human society will be a Kingdom of God.

LITERATURE.—For Josephus's use of the term 'theocracy' see *HDB*, s.v., vol. v. [1904] p. 337 (V. H. Stanton); for the facts about the general Semitic notion of theocracy see W. Robertson Smith, *The Religion of the Semites*, London, 1894, lect. ii., and *The Prophets of Israel*, do. 1897, lect. ii.; for the development of the idea in Israel and in the apocalyptic literature see the standard authorities on the religion of Israel, the theology of the OT, and the extra-canonical Jewish books; the corresponding authorities on the NT discuss the relation of the idea of the Kingdom of God to the earlier theocratic doctrine. Separate treatment of the subject is unusual.

C. RYDER SMITH.

THEODICY.—I. The term.—Theodicy (Germ. *Theodizee*, adapted from Fr. *théodicée*, which is compounded of Gr. *θεός*, 'God' + *δικη*, 'justice') means literally the (or a) justification or vindication of God. Leibniz appears to have been the first to use the word in its distinctive sense. In a letter written in 1697 he spoke of employing it as the title of an intended work,³ and in 1710 the work duly appeared. The complete title was, 'Essais de Théodicée sur la bonté de Dieu, la liberté de l'homme, et l'origine du mal.' Since Leibniz's time the word 'theodicy' has been in common use.

2. The concept.—In modern usage the scope of the term is vague and ill-defined. Sometimes it is employed, as by P. Janet and G. Séailles,⁴ as equivalent to natural theology or philosophy of religion. For those writers theodicy comprises the general problem of religion, though it is also understood by them in a more particular sense, as comprising only the central problems of the nature of God and the relation of God to the world. In either of these senses it may escape the charge of being a theory put forward 'to save the situation.'⁵ But in the usual sense it does not so readily escape such a charge. For as a rule the use of the term is more in keeping with its literal meaning, and theodicy is understood as the (or a) vindication of the divine providence or government in view of the existence of evil. The 'theodicean' assumes the validity of the theistic conception of God as powerful, wise, and good, and on this basis seeks to defend the divine administration: he would

¹ E.g., Nu 11²⁹, Jer 31³⁴, Jl 2⁸.

² Except in the sense that every true nation, being an organic part of mankind and set to minister to the whole, is meant to be 'filled with the Spirit' for its office.

³ Cf. J. T. Merz, *Leibniz*, Edinburgh, 1884, p. 101.

⁴ *A Hist. of the Problems of Philosophy*, Eng. tr., 2 vols., London, 1902, vol. ii. pt. iv.

⁵ Cf. Plato, *Republic*, 380 A; and A. S. Pringle-Pattison, *The Idea of God*, p. 400.

'assert Eternal Providence,
And justify the ways of God to men.'¹

3. Origin of the concept.—The need of such a defence and vindication is not felt in primitive religion under polydemonism, with its animistic or spiritistic view of nature, because under polydemonism the world is subject to a multitude of spirits both good and evil, who limit each other and are themselves limited by the natural order. Nor is the need felt even at the polytheistic stage of religious belief, with its multitude or hierarchy of gods as distinguished from spirits or godlings, because at this stage thought, if no longer naive and instinctive, is still uncritical, and the gods are conceived as being subject to fate or necessity or as governing a world already given and never properly under their control. At the monotheistic stage of religion, however, where thought is become critical and reflective, the problem of theodicy arises and calls for a solution. Sometimes, as in Persian religion, a dualism in the divine nature is postulated, and the world represented as the scene of a grand conflict between the principles of good and evil, in which good is destined to final triumph; and obviously a dualistic philosophy of religion, if it could be otherwise satisfying, would ease the problem. Under a monistic philosophy of religion, again, the tendency is actually to get rid of the problem, by minimizing evil or even by reducing evil to illusion. This tendency is observable in the cosmic and acosmic pantheisms of Stoicism and Brāhmanism respectively. Only in a philosophy of religion in which God is recognized as wholly good, and evil as truly evil, is the problem of theodicy felt in all its insistence. *Si deus bonus, unde malum?* Christianity, theistically interpreted, supplies such a philosophy, and in the course of Christian history the problem of theodicy received distinctive treatment in the ecclesiastical doctrine of the Fall. Whatever may be said as to the form of that doctrine, it stands for a principle which should be acknowledged in theistic interpretations of the world, namely the principle of human freedom and responsibility. It is not without significance that the classical theodicy or theistic apologia of Leibniz bears in its title not only 'the goodness of God' and 'the origin of evil,' but also 'the freedom of man.'

4. Leibniz's Théodicée.—(a) In the problems of theodicy Leibniz had been interested since his boyhood, and he claims to have given more attention to them than most.³ There are many references to them, certainly, in his correspondence during the last decades of the 17th cent. with Pellisson, Bossuet, and others; and the *Essais* itself also bears ample witness to his long-continued interest in them. It should be remarked, however, that the *Essais* is not, properly speaking, a systematic presentation of the questions involved in theodicy. It is, in Leibniz's own word, a 'tissu'⁴ of what he had said and written in the course of the theological and philosophical discussions, centred in Pierre Bayle's works and especially his *Dictionnaire historique et critique*, which he carried on with Sophia Charlotte, queen of Prussia. From a letter of Leibniz's written to Sir Thomas Burnett in 1710 it appears that the *Essais* was compiled at the request of his friends and as a memorial to the deceased queen.⁵ The book was extraordinarily popular, and apparently the author finds satisfaction in recording that it was welcomed

⁵ *Ib.* p. 10. Sophia Charlotte died in 1705; a common but erroneous impression is that the *Théodicée* was compiled during her lifetime.

by Catholics as well as Lutherans and Evangelicals.¹ No doubt the *Essais* served its purpose well in an age of theological rationalism, and helped to stem the tide of scepticism which was now beginning to threaten the foundations of religion itself.² But Leibniz's theistic apologia does not commend itself so readily in our time.

(b) It will be sufficient for the purposes of this article to indicate a few salient points in Leibniz's theodicy, for the sake of illustrating the difference between the older and the newer theism in apologetic method and outlook.

(1) *God*.—Unlike most recent exponents of a theistic philosophy of religion, Leibniz was of the belief that the being or existence of God could be demonstrated by purely logical or rational processes. Though he recognized, he did not make much use of, the ontological proof, and the proof, so peculiarly his own, from the 'pre-established harmony' is bound up very closely with his monadology; but the cosmological or aetiological proof and the proof from the eternal truths are both characteristic of his theology or religious philosophy and independent of his ontological scheme. In accordance with the principle of the cosmological or aetiological proof, Leibniz starts from the world of finite existents as contingent and infers an Existent which is not contingent but metaphysically necessary. There must be a sufficient reason or cause, he says, for the existence of the whole collection of contingent things which composes the world, and it is to be found in the Substance which carries with it the reason or cause of its own existence, and which is consequently necessary and eternal; and that Substance can only be God.³ It may be objected to this argument that it is logically fallacious, as containing more in the conclusion than is contained in the premiss: as the premiss is contingent, so must also be the conclusion.⁴ As for the proof from the eternal truths—i.e. truths which involve no reference to time or to the world of existents in time—it is largely dependent upon Leibniz's notion of possibility. For Leibniz, as not for Spinoza, the possible was wider than the actual, essence than existence; and he argues that, if the eternal or metaphysically necessary truths are real, and founded on something existent, that existent something must be the metaphysically necessary Being of God, in whom essence involves existence, and to be possible is to be actual. Without God not only would there be nothing existent, but there would be nothing possible.⁵ Against this proof, as handled by Leibniz, it may be urged that it is inconsistent in one who regards the possible as wider than the actual, the essential than the existent, to regard truth as dependent upon existence; and that in any case we cannot on the premisses reach a necessary Being separate from the existent and actual world. In all such arguments indeed, as B. Russell points out, there is difficulty in avoiding Spinozism.⁶

(2) *The world*.—In presenting what may be named his teleological optimism Leibniz still moves on the high plane of metaphysical notions and *a priori* verbal proof, nor condescends to the lower empirical world, to which Bayle would bring him down. Founding upon the principle of sufficient reason and the idea of divine perfection, he holds that this is the best of all possible worlds; for, were a better world than this world possible, God would have chosen it. God is absolutely powerful, wise, and good; and His goodness moved Him to create and produce all possible good, His wisdom led Him by a moral necessity to the choice of the best, His power enabled Him to execute His great design.⁷ It is curious to reflect that the Leibnizian optimism may be associated with the most diverse ethical valuations of life, optimistic, pessimistic, melioristic; which gives point to Schopenhauer's objection that, even if this is the best possible world, it does not prove that it is a world good enough to have been actualized.⁸ An objection, this, on philosophical grounds, thus meeting Leibniz on his own plane, but it is on empirical grounds that the Leibnizian optimism has been most frequently challenged, from Voltaire's *Candide* down to the present. Nor could Leibniz himself ignore the empirical aspect of the problem of theodicy.

(3) *Evil*.—Accordingly—apart from his metaphysical theory of evil as necessary limitation appertaining to finite existence and the source of both moral and physical evil—we find him emphasizing the instrumental theory, according to which evil, especially physical evil, is to be interpreted as an instrument or means of good. In advocating this theory he sought to

counter Bayle's contention that the strength of Manichaeism was due to its conformity with an empirical rather than a *a priori* conception of the world. Even from the empirical standpoint, Leibniz would reply, physical evil may be reasonably accounted for by the theory of instrumental value; and, as for moral evil, it could not be prevented by God without the subversion of the freedom of self-determination which belongs to spiritual beings and makes morality possible. By other empirical arguments also Leibniz supports his doctrine of optimism, but enough has been said to show that, while his theodicy is forced to recognize the standpoint of experience, it rests primarily—like his theistic proofs—on metaphysical considerations.

(c) The difference between Leibniz's theodicy and the modern attitude in theodicy may now be briefly stated. Leibniz approached the problem of evil with a God whose existence had already been proved, as also His character of absolute perfection in power, wisdom, and goodness; and it was therefore an altogether reasonable pre-supposition on Leibniz's part that this world as being the creation of such a God was the best possible. No matter what exception might be taken to the case as presented, the case itself was excellent. But nowadays, with the spirit of pessimism abroad in society, and the spirit too—not unakin—of anti-religious agnosticism, the problem of evil has become more acute, and one has learned to sympathize with W. James and others in their impatience with Leibniz's optimism and the complacency of his attitude towards, e.g., a dogma like eternal punishment. The 'charmingly written *Théodicée*' is even described by W. James as a piece of 'superficiality incarnate'; as a 'cold literary exercise, whose cheerful substance even hell-fire does not warm.'¹ Such strictures are too severe, but let them be a reminder of the difference in spirit between the old and the new approach to the problem of evil. It would be quite untrue to say of modern exponents of theism that they compose theodicies 'with their heads buried in monstrous wigs.'² The modern theist is conscious of the failure of rationalistic or purely speculative theology to establish its claims, and of the necessity of fundamentally empirical methods in theology if scientific results are to be gained, and he therefore examines the world of experience in face of evil as an empirical problem, with the view of testing the reasonableness of the theistic faith in God as just, holy, and loving. And he is led to recognize that the observed facts of nature and history do not afford an unexceptionable argument for the goodness of God, and that after all the most solid ground of belief in the divine goodness lies in the needs and claims of the religious consciousness.³ No doubt there would be a *circulus in arguendo* involved here if such considerations were put forward as a solution of the problem of evil.⁴ On the one hand, it is by the faith of religion that God is affirmed to be perfectly good, despite the evil to be found in the world of His creation and governance. On the other hand, religious faith is based on the power of religion as a solvent, or at least a partial solvent, of the problem of evil: in religion men seek refuge from the various evils that assail, from without and from within—which shows that a non-rationalistic theism could not offer a real solution of the problem of evil. Nor does it profess to do so.

5. *Theodicy and philosophical reflexion*.—It is not necessary that this article should enter into a comprehensive discussion of the problem of theodicy from the side of philosophical explanation. This will be found in the art. GOOD AND EVIL, where it is affirmed with most students of the subject that 'every proposed solution either

leaves the old question—*si deus bonus, unde malum?*—‘unanswered or raises new ones.’ None the less we should like to express our sympathy with a type of solution—partial as it must be—which is on the lines of Leibniz’s theology, but which goes beyond Leibniz in its recognition of human freedom as real, in the sense of implying self-limitation on God’s part. Self-limitation does not mean finitude, nor freedom unqualified indeterminism. Such a solution is not only consistent with the moral and religious consciousness, but alleviates also the burden of the mystery of evil; and it lends itself to attractive exposition in the speculative sphere, as in the humanistic or personalistic idealisms which arouse so much interest at present. Yet it still leaves God, as indeed must every theodicy, ultimately responsible for both physical and moral evil. At the same time the recognition of the instrumental worth of evil somewhat relieves the weight of the divine responsibility. Take it first in connexion with the problem of physical evil. Pain and suffering are no doubt largely retributive and to be accounted for as the wages of individual and racial sin. But retribution is not an end in itself, and the positive rather than the negative purpose of physical evil is being more and more emphasized. Through pain, hardship, and loss moral energy may be stimulated and character moulded and shaped to finer issues. In this aspect of it suffering may be twice blessed, blessing those who suffer and those brought into contact with them. Take it also in connexion with the problem of moral evil. Here again the instrumental theory applies, and evil may be regarded as for education and discipline. In fact many theists regard moral evil or sin as having been always under the divine control, and interpret it as necessary like physical evil to human development. It is the discord without which there could be no harmony, the shade without which there could be no light. Through sin man learns his weakness, and his need of strength from on high. Through sin, and its direful effects in society, he learns the meaning of brotherly service and the measure of the sacrificial love of God.¹ Christianity looks for the time when man’s moral education shall be brought to completion, and his suffering and sin have served their purpose. Yet, when all is said, the problem of evil remains.

6. Theodicy and the religious consciousness.—The discussion of the problem of evil on empirical grounds, and in particular of the instrumental theory of value, leads us to a consideration of the religious solution. There is a philosophical theodicy, and there is a religious theodicy. In the first, evil is explained—or an attempt is made to explain it—in the light of the divine goodness; in the second, evil is not explained, nor is there any attempt to explain it—it is simply to be overcome. As Eucken has remarked, ‘religion does not so much explain as presuppose evil’;² and, as P. T. Forsyth so well insists, a religious theodicy is not ‘an answer to a riddle but a victory in a battle.’³ In a religious theodicy it is not man who justifies God’s ways, but God who justifies His own ways, and that not by accounting for the world’s evil, but by saving men from it. While this is said, religion can no more than philosophy escape the problem of evil. For the individual believer in God and His goodness the problem receives a practical solution through the victory of his faith: he estimates life no more by hedonistic standards, but discovers the Supreme

Good in moral and spiritual union with God. From the universal point of view the religious solution of the problem may be stated broadly in terms of the teleological idea. The end or purpose revealed in the universe is the creation of free ethical personalities capable of personal intercourse with God and of reflecting as in a flawless mirror the divine image and likeness.¹ To that purpose the presence of evil is subservient, and there are traces of it even in animate nature, which we have too often regarded as merely a field of struggle and carnage.

‘There is a legitimate scientific sense,’ says J. Arthur Thomson, ‘in which it may be said that Man is part of the system of Nature and the crown of its evolution; and it is assuredly of some significance that he can find in Animate Nature far-reaching correspondences to his ideals of the True, the Beautiful, and the Good.’²

We might therefore be content to state our theodicy in the following terms, which give due regard to the fact—made clear in modern science—that our world is still in the making, and which also illustrate the newer empirical as distinguished from the older rationalistic way of approach to the problem of evil, as well as the pragmatic tendency in modern theology and religious philosophy:

‘While this world is far from being as yet the best possible world, nevertheless in view of its general constitution it may be regarded as the best possible *kind* of world in which to have man begin his development, and . . . the evils which exist in the world furnish no good reason for abandoning belief in a God who is both good enough and great enough to meet every real religious need.’³

LITERATURE.—References to the problems of theodicy may be found in works on the history and philosophy of religion, dogmatic theology, and general philosophy. See in particular the literature mentioned in the art. GOOD AND EVIL, PESSIMISM AND OPTIMISM. Useful discussions will also be found in the following works, selected chiefly from recent philosophical and theological literature: O. Pfleiderer, *The Philosophy of Religion*², Eng. tr., 4 vols., London, 1886–88, esp. iv. 1–45; G. T. Ladd, *The Philosophy of Religion*, 2 vols., do. 1906; G. Galloway, *The Philosophy of Religion*, Edinburgh, 1914; J. Müller, *The Christian Doctrine of Sin*, Eng. tr., 2 vols., do. 1877, 1885; H. Siebeck, *Lehrbuch der Religionsphilosophie*, Freiburg i. B., 1893; J. Kremer, *Das Problem der Theodizee in der Philosophie und Literatur des 18 Jahrhunderts*, Berlin, 1909; O. Lempp, *Das Problem der Theodizee in der Philosophie und Literatur des 18 Jahrhunderts*, Leipzig, 1910; J. Martineau, *A Study of Religion*², 2 vols., Oxford, 1899; J. R. Illingworth, in *Luz Mundis*⁵, London, 1904; C. F. D’Arcy, *God and Freedom in Human Experience*, do. 1915; B. H. Streeter and others, in *God and the Struggle for Existence*, do. 1919; J. THEODORE OF MOPSUESTIA.—See ADOPTIANISM, ANTIOCHENE THEOLOGY.

THEOGNIS.—Theognis is the name attached to a collection of some 1389 erotic, convivial, reflective, and hortatory elegiac verses whose chief interest for this article is that they are the fullest extant repertory of Greek ethical commonplace in the half-century preceding Plato and the tragedians. The collection begins with invocations to Apollo, Artemis, and the Muses, and a dedication to a young friend Cyrnus, to whom many of the quatrains and couplets are addressed, and whose name may be meant by the seal that perhaps marks their genuineness.⁴ But many verses lack this certification. Some are addressed to other

¹ It is here that, in a more extended treatment, the ‘theodicæan’ aspect of the doctrine of immortality might be considered.

friends, including a Simonides who may be the poet.¹ After the first 100 lines there is little sequence or coherence of ideas. There are many repetitions, and some of the verses occur in the fragments of Solon, Phocylides, Tyrtaeus, and Mimnermus. These considerations, and the fact that quotations in Plato² and in a passage attributed by Stobæus³ to Xenophon are susceptible of various interpretations, raise many problems about the composition of the poem, if it is in any sense a unity, and have given rise to an extensive German literature of hypothesis most conveniently surveyed in E. Harrison's *Studies in Theognis*.⁴ Harrison argues plausibly, if not always quite convincingly, that the poems as they stand form a connected sequence. His book concludes with an excellent chapter on the life and times of Theognis. He was a noble of Nisean Megara, who apparently at one time was also a citizen of Hyblæan Megara in Sicily. He spoke of the terror of the Medes,⁵ and is therefore conjectured to have lived to see the invasion of Xerxes. He lived in a time of social and political revolution at Megara, vaguely known to us from three references in Aristotle's *Politics*⁶ and from one passage in Plutarch.⁷ His temper was embittered by the temporary triumph of the popular party,⁸ the loss of his property,⁹ and the exile,¹⁰ which was perhaps the cause of the travels in Eubœa, Sparta, and Sicily to which he refers.¹¹ To these experiences we may trace his pessimism,¹² his cynicism,¹³ his harping on the hardships of poverty that constrains a man to deeds to which his will does not consent,¹⁴ his complaint that money makes the man and that mercenary marriages corrupt the breed of men,¹⁵ his emphasis on the virtue of faith¹⁶ or loyalty to caste, club, and mates¹⁷ in times of trial, and his frequent use of 'good' and other ethical terms in the political or social sense.¹⁸

Too much has been made of this last idea by Theognis's translator J. H. Frere,¹⁹ by Nietzsche, whose own philosophy is largely based upon it, and by Grote, who, however, admits that the ethical meanings are not absolutely unknown.²⁰ Theognis is merely the chief example, the conveniently quotable *locus classicus*, so to speak, for a natural human tendency. We still speak of the better classes as they did in Aristotle's time,²¹ and Homer characterizes menial tasks as the services that the worse sort perform for the good.²² We cannot infer that the ethical idea was lacking.²³ We can only say that before Plato it was easier to confound pure or absolute ethics with prudential, conventional, tribal, caste, or political morality than it has been since. Much the same may be said of the naive inconsistency between Theognis's general commendations of truth, justice, good faith, and kindness, and his passionate prayers for vengeance,²⁴ his (per-

haps ironical) counsel to set your heel on the empty-headed demos,¹ to be all things to all men,² to adapt yourself to your environment with the protective resemblance of the polyp which takes the hue of the rock to which it is clinging,³ and to flatter and cajole your enemy well till you have him in your power and then take your revenge.⁴ The last precept appears almost as nakedly in one of the noblest Greek poets, Pindar.⁵ Plato first laid it down that the good man will not wrong even his enemy, and Plato did not apply the principle to international politics in the Tolstoyan way. Lastly, the erotic verses of Theognis—most of them, to be sure, in a separable and perhaps spurious part of the collection,⁶ dealing with themes repugnant to modern feeling—seem to us incompatible with the conception of him as a moralist and still more with the use of his elegies as a school-book. They were indeed, on the hypotheses of R. Reitzenstein,⁷ mainly banquet songs. But, however that may be, Theognis's own use of the verb 'admonish'⁸ classes them in some sort with the literature of prudential precepts and moral admonition known by the name of *ὑποθήκαι*.⁹ And no less a moralist in his own esteem than Isocrates recommends the study and excerpting of them as entirely edifying. At any rate, whether in excerpts for school use or otherwise, they were, like Solon and Hesiod, learned by heart by educated Greeks of the 5th cent., and so provide many texts for amplification in Pindar and the Greek drama, and for discussion in Greek philosophy.¹⁰ An exhaustive dissertation on this subject would be of interest, but would require the nicest discrimination. Harrison¹¹ collects the parallels in Pindar and Bacchylides, some of them perhaps overstrained. It is not easy to determine how many of the resemblances in tragedy are conscious reminiscences. The chorus in Sophocles, *Ed. Col.* 1226 ff., is clearly an expansion of the melancholy lines 425 ff.:

'Not to be born into life were the best for us, creepers on earth's face,
Never to look on the sun's burning and pitiless rays;
Happiest lot of the living is theirs who come quickest to Hell Gate
Laid out quiet and stark, wrapped in a mantle of earth.'¹²

Jebb on *Antigone*, 622, quotes Theognis, 403, as one of the anticipations of the untraced 'quem Juppiter vult perdere dementat prius.' *Antigone*, 297, echoes Theognis, 221, in the sentiment that the man who thinks that he alone is wise is himself void of wisdom. Soph. frag. 356 repeats the commonplace that health is best and justice fairest of things;¹³ frag. 525 the humorous fancy that even Zeus cannot please all, whether he rains or holds up.¹⁴ But these are only conspicuous examples of an indeterminate list. When Euripides praises the man who is as true to absent as to present friends,¹⁵ we cannot be certain whether he is or is not paraphrasing Theog. 93-95, and the same holds of the coincidence between *Phœnissa*, 438-440, and Theog. 717 f. in the sentiment that

wealth is all-powerful. Plato's saying¹ that a spirit of reverence (*aidōs*) is a better inheritance than great riches is, the present writer thinks, a distinct reference to Theog. 409. Isocrates, i. 19, equals Theog. 72, and i. 29, Theog. 105.

Among the chief commonplaces of Greek ethics expressed by Theognis² are man's dependence on the gods,³ and his ignorance of what the future has in store,⁴ his duties to the suppliant and the guest,⁵ and to parents,⁶ the doctrine of the mean,⁷ of nothing too much,⁸ of *κόρος* and *ὑβρις*,⁹ the late punishment of the wicked,¹⁰ the dangers of slander¹¹ and of light oaths,¹² the admonition that all true gains are costly,¹³ that ill-gotten gains do not abide,¹⁴ that the lust for wealth is insatiate,¹⁵ and that the boastful word (*ἔπος μέγα*)¹⁶ or the forsworn forecast¹⁷ provokes the gods and invites nemesis, the complaint that shame and reverence are exiled from a degenerate world,¹⁸ and that men value nothing but wealth.¹⁹ Other commonplaces, whether of ethics or of criticism of life, are the immortality of song,²⁰ the praise of patience,²¹ the Anacreontic, Epicurean, or Horatian 'Carpe diem,' evil communications,²² 'in vino veritas,'²³ there is no perfect man,²⁴ the ingratitude of children,²⁵ the foible of censoriousness and self-praise,²⁶ and the generalized metaphor of the 'counterfeit' man.²⁷ His convivial and social precepts, his slight anticipations of later motives of satire,²⁸ and his somewhat cynical, political,²⁹ or worldly wisdom³⁰ do not further concern us here. Lines 823 and 1181 are in apparent contradiction on the justification of tyrannicide. Theognis apparently does not mention the confounding of the innocent with the guilty, or the jealousy of the gods except as involved in the nemesis that attaches to the too confident oath.³¹

As an aristocrat he, like Pindar, emphasized nature against teaching.³² No teacher can put sense into a man,³³ or make a bad man good. Plato³⁴ finds a contradiction between this and the admonition to associate only with the good because from them you will learn good only. But it is Theognis's belief that it is easier to corrupt the good than to reform the bad. In lines 155-159 there is a suggestion of the noblest thought of mature Greek ethics, the idea that the mutability of fortune and our common frailty impose the duty of leniency and compassion upon all men.³⁵

Especially interesting are Theognis's direct appeals and protests to Zeus. He complains that the prosperity of the wicked casts doubt upon the moral government of the world.³⁶ This, however, is rather a development of the motive of Menelaus's speech in the *Iliad*³⁷ than the startlingly new thought which Croiset finds in it.³⁸ Theognis's pro-

THEOKRASIA.—See GREEK RELIGION, vol. vi. p. 421 f.

THEOLOGY.—I. Definition.—Theology may be briefly defined as the science which deals, according to scientific method, with the facts and phenomena of religion and culminates in a comprehensive synthesis or philosophy of religion, which seeks to set forth in a systematic way all that can be known regarding the objective grounds of religious belief.

According to its etymological meaning, the word 'theology' denotes 'discourse or doctrine concerning God.' In this sense it was used among the Greeks to describe the work of poets like Homer and Hesiod when they wrote of the gods and their doings, and that of philosophers like Plato and Aristotle when they speculated regarding the supreme reality or ultimate ground of all things. In early Christian literature the distinctive appellation of 'theologian' is applied to the author of the Apocalypse, probably because he maintained the divinity of the *λόγος*, asserting the identity of the *λόγος* that became flesh in Christ with God (*Θεός*). In this sense the term is applied to orthodox Greek Fathers like Athanasius and Gregory Nazianzen, who distinguished themselves in defending the personality and divinity of the *λόγος*. But doctrine concerning God—His being and attributes—is only one branch or department of theology, as that is now commonly understood. Man's knowledge of God is part of the content of that matter of human experience which is termed 'religion,' and which includes other content also, referring to the world of nature and of man, to sin and death, to salvation and immortal life. And, as science in general deals with some definite department of human experience, it is more in accordance with the proper conception of science to regard theology as that branch of science which deals with the department of human experience known as religion, from which experience man's knowledge of God and divine things is obtained. Theology is the science which, by right use of reason, in accordance with proper scientific method, correlates, systematizes, and organizes the matter of human religious experience in such a way as to reach a unified body of coherent doctrine, fitted to satisfy the mind's demand for truth and to furnish guidance for the practical life.

As the science of religion it deals not merely with the subjective contents of the religious consciousness, or the opinions, emotions, and actions of men in the religious sphere, but also with the objective grounds of religion and the ultimate truth or reality which underlies and explains the religious experience of mankind. It is not merely the science of religions dealing with the various historical religions which have developed among men (though that is a part of it), but the science of religion regarded as an important department of human experience, which claims to be no mere subjective delusion, but to have a real and rational foundation in objective reality or fact.

2. Theology and religion.—As theology is the science of religion, religion precedes and is wider

¹ 1731 f.; cf. 203-208.

² Cf. Jer 31^{29f.}; Spencer, *Principles of Ethics*, § 140; Schmidt, i. 71 f.

than theology and furnishes it with the matter with which it deals. In all departments of human life and activity experience, in which feeling, intuition, and volition are the predominant factors and reason or intellection is as yet implicit, precedes theory or science, which seeks to exhibit and make explicit the reason, thought, or principles of truth and reality underlying and accounting for the experience. Thus the use of numbers in the relations and activities of the practical life precedes the science of mathematics; the practical use of speech precedes the science of language; the use of reasoning in practice precedes the science of logic; and the sailing of the seas in ships precedes the science of navigation. So too the experience and use of religion as a practical factor in life's activities precedes the science of religion, or theology. And, as men may attain considerable efficiency and success in various departments of life without having rationalized or reduced their experience to system and exhibited its underlying principles, so men may live a truly religious life and have a rich and full religious experience without having attained to any very clear or coherent system of theology. But, while a man may be religious without being a theologian, religious experience is necessary to enable a man to be a competent theologian; and the fuller and richer his religious experience has been, the more likely is he to prove a trustworthy and satisfactory theologian.

Schleiermacher was so impressed with the importance of the part played by feeling or emotion in religion that he gave it not merely the predominant but the exclusive place. Over against the long prevailing definition of religion as consisting in 'knowing and doing homage to God,' he defined religious piety as in its essence consisting neither in knowledge nor in action but in a determination of the feeling. The root of all religion he held to be man's feeling of absolute dependence on some power or powers other than himself. But this dictum, while it emphasizes the important truth as to the large part played by feeling in religion, if strictly taken, is one-sided and exaggerated, in that it ignores the part played by the cognitive faculty in forming some conception, more or less definite, of the power or powers on which we depend, and the part played by the will in choosing and adopting means for getting into harmony with that Supreme Power or Being, which are elements characteristic of all religion.

In theology, as distinct from religion, the cognitive faculty, or reason, is predominant. It succeeds religion, and seeks by a right use of reason on the matter of experience furnished by religion to evolve out of it a system of connected and coherent truth to which the term 'science' can be properly applied.

3. **Theology and science.**—The aim of science in any of its departments is to apply reason, with its powers of analysis and generalization and its laws of inference, induction, and deduction, to the data of experience in that department in such a way as to discover the laws or principles underlying and relating the given facts and phenomena and to unify the entire content of experience in that department into a coherent systematic whole or body of truth such as may be described as knowledge of reality. Inasmuch as theology seeks to do this as regards the data of human experience in the realm or department of religion, it is rightly described as a branch of science. The instrument which the scientist makes use of in ascertaining, analysing, and systematizing the facts or data of experience in the department selected for scientific investigation is the reason with its powers and laws of perception, conception, evidence, inference,

etc. And reason is the instrument made use of by the scientific theologian in investigating the facts and phenomena of religious experience and building up a science of theology not less than is the case in other departments of science. Lack of clearness as to the place and function of reason in theology is apt to lead to confusion and disagreement as to what theology is and what are its aim and scope. Thus in some quarters it is maintained that theology differs from other sciences inasmuch as the matter with which religion is concerned is given to us by revelation and not by reason as in the other sciences. But this contrast between reason and revelation as sources of knowledge is unsound. Reason is not the source from which, in any case, we get the matter which we build up into science, but merely the instrument by means of which we grasp, analyse, classify, co-ordinate, and systematize that matter which is given to us by revelation from without in experience. This is as true of other sciences as it is of theology. As a matter of fact, the material which we build up by use of reason into the natural sciences, as they are called, such as mechanics, chemistry, biology, etc., is given to us by revelation from without in experience not less than the matter which we seek to build up by use of reason into a systematic scientific theology. The latter is just as much matter of experience, which the reason must seek to apprehend and co-ordinate into a coherent whole of knowledge of the truth, as is the former. The knowledge got by using reason to grasp, co-ordinate, and systematize the given matter of experience is of the same kind in both cases. In both cases it rests ultimately on a foundation of faith—faith in the reliability of our faculties of knowledge (perception, cognition, inference, etc.) and on the ultimate reasonableness or cognizability of all that is given to us in experience. We go on using our powers of perception, cognition, inference, etc., in reference to what is given to us from without in experience, never doubting that the knowledge thus reached is real knowledge or knowledge of truth and reality, even though we may know and realize that our knowledge in any department of experience is incomplete and leaves room for progress. Thus the physicist may realize that he does not know the ultimate nature of matter, the mathematician may be puzzled to explain what space and time are, and the biologist may feel that he does not know what, at bottom, life and consciousness are.

But the fact that there remain unsolved questions of an ultimate kind, in regard to the data of experience in various departments, does not nullify or render valueless the results of scientific investigation and systematization in those departments. It merely shows that our knowledge of what is revealed to us in experience is as yet incomplete, and that an adequate synthesis of knowledge or metaphysic of being has not yet been reached by us, not that such a metaphysic is unattainable. So too with the data of religious experience. It is the function of theology as a branch of science to collect, examine, analyse, compare, classify, co-ordinate, and systematize all that is revealed to us in this department of experience, so as to reach a whole of scientific knowledge in this sphere, as in other departments of experience and knowledge. We must use our reason as far as it will go in synthesizing or giving us rational knowledge of what is given in experience. And, if there are problems of an ultimate kind in this science, as in other sciences, which still remain obscure or inadequately solved, this does not invalidate the knowledge reached by the application of sound scientific method to the data of experience, nor deprive it of the right to be regarded as

science or knowledge of truth. It merely shows that our science in this sphere is incomplete and spurs us on to reach out towards a more comprehensive synthesis of all our knowledge in an adequate metaphysic or philosophy of being.

4. **Theology and philosophy.**—It is here that the science of religion passes over into the philosophy of religion, that highest form of knowledge which is the consummation aimed at by theology. Science in all its departments is limited and incomplete as knowledge of reality. It leaves unresolved ultimate questions as to the nature and relations of matter and mind or spirit, space and time, life and consciousness. It is the function of philosophy, as the ultimate form of knowledge, to grapple with these ultimate problems and seek a satisfactory solution of them. And it is along the lines of moral and religious experience, and the data furnished thereby, that light on such ultimate problems may most hopefully be looked for.

Kant, in his *Critique of Pure Reason*, began a movement in philosophy which has had far-reaching influence on modern theology as well as on philosophy. His contention is that in unifying the given matter of perceptive experience into an ordered and coherent world-knowledge the mind or reason of the percipient subject makes use of forms of perception and cognition which are subjective (*i.e.* belonging to the nature or constitution of the knowing mind), not objective (*i.e.* belonging to the object or reality as it is in itself apart from its being known or cognized). Kant thus concluded that the world of which we have definite knowledge, through grasping and unifying the given matter of experience by means of the subjective forms of perception and cognition, is but a phenomenal world or a world as it appears to a conscious subject endowed with powers of perception or cognition like man, not a noumenal world or thing-in-itself existing exactly thus apart from being perceived or known. Thus exact scientific knowledge, according to Kant, is limited to knowledge of the phenomenal world and cannot reach to ultimate reality. The use of those very forms of perception and cognition which give definiteness to our knowledge makes it knowledge of the phenomenal as contrasted with the ultimately real or thing-in-itself. All scientific or theoretic knowledge is thus knowledge of the phenomenal only. If there be a noumenal world of reality, and if it be in any way accessible to us, this must be in some other way than that of rational knowledge. Kant maintains that access to a noumenal world of reality is gained by us, not through the pure reason but through the practical reason or moral consciousness, by means of which we may and do reach a kind of faith-knowledge of God, freedom, and immortality, which, though not rational theoretic knowledge, such as we have in science, is yet of value for the moral and religious life. This demarcation of the limits of valid, rational, scientific or theoretic knowledge, and differentiation from it of the kind of knowledge got through moral and religious experience or through supernatural historic revelation is characteristic of many theological writers since Kant. The argument of the *Critique of Pure Reason* is supposed to be conclusive against the possibility of our ever reaching any rational metaphysic or valid theoretic knowledge of ultimate reality. Huxley and Spencer pressed Kant's conclusion into the service of their doctrine that God or ultimate reality is and must remain unknown and unknowable by man, and that therefore a science of theology is impossible. Hamilton and Mansel endeavoured to reconcile the agnostic conclusions of Kant in regard to a rational metaphysic with the acceptance of traditional Christian doctrine as grounded on

revelation, not on reason. The Ritschlian school accept Kant's conclusions as to the impossibility of a rational, theoretically valid, knowledge of God or ultimate reality, and so rule out all natural or rational theology as incompetent; but, while eliminating all metaphysic from Christian theology as untenable, they seek to retain in large measure the traditional Christian theology as grounded on a divine historic revelation culminating in Christ, of which Scripture is the record. As with Kant, they seek to find a grounding for this in the immediate deliverances of the moral and religious consciousness, which furnishes them with a basis for 'value-judgments' where valid theoretic knowledge fails. This sharp differentiation between the kind of knowledge got by making use of reason, our cognitive faculty, in grasping, analysing, and systematizing the data of perceptive experience in the sphere, say, of physics or chemistry and the kind of knowledge got by using reason in the same way—call it practical reason or what you will—in grasping, co-ordinating, and systematizing the data of moral and religious experience is arbitrary and unconvincing. The world of reality revealed to us in experience—whether the ordinary perceptive experience which grounds our common knowledge or the moral and religious experience which grounds our religious knowledge—is one whole, and our knowledge of it, however acquired, should be capable of being synthesized as one coherent whole. The attempt of the Kantians and Ritschlians to rule out all metaphysic and natural theology as going beyond the proper limits of the reason, and yet to build up a theology of value-judgments founded on the needs of the moral consciousness or practical reason or on the data of a historic divine revelation, is not satisfying to the inquiring mind that seeks for unity and coherence and consistency in its knowledge. Theology, as the philosophy of religion, is to be looked upon, not as the rival or opponent of rational science, but rather as its copestone and completion.

True theology can never come into conflict with true science. For it includes all the data and verified results of true science among its material or postulates. It seeks to co-ordinate or synthesize all our knowledge into a comprehensive and coherent whole of truth or knowledge of reality, based upon the data of human experience regarded as a whole, tested, analysed, co-ordinated, and systematized by sound scientific methods.

5. **Reason and intuition.**—Akin to the distinction which Kantians draw between the theoretic reason, which gives us definite knowledge of a phenomenal world, and the practical reason, which gives us vague knowledge of noumenal reality, is the distinction which more recent philosophers such as Henri Bergson draw between reason, or intellect, and instinct, or intuition, as sources of knowledge. Intuition, it is alleged, brings us more immediately into touch with the living flowing stream of reality, of which as individual persons we form a part, and enables us to adapt ourselves thereto more surely and satisfactorily than reason or intellect, whose forms of thought and processes of inference are adapted to matter that is fixed or static rather than to the ever-changing creative flux of actual reality or real time. But this contrast or antithesis between intuition and intellect, like that between faith and reason, is unsound. The intuitions of a rational being are just an implicit form of reason. And it is better in every way for a rational being such as man that what is implicit in consciousness should be made explicit and fitted into the comprehensive synthesis of rational cognition, which alone deserves the name of knowledge. The only supreme

authority and court of appeal for rational conscious beings is reason based on an ultimate ineradicable faith in the reasonableness of our experience, which is the underlying assumption of all science, including theology. To subject reason to intuition or instinct as instrument of knowledge is to incur moral and intellectual bankruptcy which is unworthy of a rational being such as man. It is to take a step downwards towards the brutal condition, not upwards towards the goal of true personality.

For conscious rational beings the only reality which has or can have any meaning is reality which is or may be apprehended by rational consciousness. In the case of reality of which we are, or suppose ourselves to be, dimly aware in subconscious apprehension or intuition, it is assumed that to a more perfect or adequate consciousness this would evidence itself as real. Reality for us means reality apprehended or apprehensible by a conscious being. To affirm an unknown reality may mean simply that we are dimly aware of the existence of some power or force which we have not yet been able to adjust to our incomplete synthesis or scheme of knowledge. But to affirm a reality which is, and which must ever remain, inaccessible to every conscious apprehension is to affirm a contradiction in terms or to use words without meaning.

Practical reason, faith, intuition or instinct, to which some would point as the proper guides in theology rather than what they call the pure or theoretic reason, are all forms of conscious apprehension which enable us to build up the data of experience into some more or less coherent whole of knowledge. The data to be unified and synthesized in a science of systematic theology are not indeed given to us by reason from within, but by revelation from without. Reason, however, is our only proper instrument for the apprehending, co-ordinating, and systematizing of these data.

6. Theology and the Bible.—Some theologians conceive of the task of theology as that of setting forth in coherent systematic form the content of that revelation concerning God, the world, and man of which the Bible is the inspired record. But, while this points to a very important department of theology, it is too narrow a view to take of the scope and function of theology as a whole. There are other materials or data for theological construction besides those furnished by the Bible, which cannot be overlooked or ignored by the scientific theologian who takes a wide and comprehensive view of his subject. The revelation of ultimate reality given in the natural world around us with its varied facts and phenomena, which it is the function of natural science to investigate, furnishes material which the theologian must interpret and construe. So too the course of general human history, which it is the function of historical science to present and elucidate in the light of general principles or laws, affords data of experience which are of value for theological construction. And the moral consciousness of mankind generally, the investigation of which is the special task of the science of ethics, furnishes important material to the scientific theologian to help in the upbuilding of a system of theology. But the revelation given in the history and religious experience of Israel as a nation and of the outstanding personalities among that people, culminating in the fact of Christ and the foundation of the Christian Church, is of such supreme importance and unique significance in the religious sphere that it is customary and convenient to distinguish between the general revelation to mankind as a whole in nature and history and conscience, which is treated of under the heading of natural theology, and the special

historic revelation culminating in Christ, which is treated of under the heading of specifically Christian theology, and which may be regarded not as something entirely different from natural theology, but rather as its crown and completion.

7. Classification of theological sciences or disciplines; theological encyclopædia.—Having such a vast and varied material to deal with, theological science has many branches or disciplines with aims and methods differing according to the material dealt with and the purpose kept in view. To elucidate and classify these various disciplines is the function of what is known as theological encyclopædia, which itself constitutes a branch of theological study.

Religion as an object of investigation has two aspects: (a) a historical aspect, under which it is to be regarded as a historical phenomenon appearing under various forms among various peoples with characteristics which furnish ample material for historical inquiry and investigation; and (b) a normative aspect, under which it appears as a present inner power of life making claim to truth and to the right to regulate individual and social life. This twofold aspect of religion furnishes us with guidance for classifying the branches of theology, which is the science of religion, into two main divisions: (a) the *historical or phenomenological* branches, including all those sciences which deal with religion on its phenomenological side as an actual appearance in history; and (b) the *normative or constructive* branches, including those sciences which deal with religion as a present-day reality and power, claiming to be truth by which the practical life of man should be moulded and regulated. The distinction already referred to between natural theology and specifically Christian theology furnishes ground for suitable further subdivision of the material falling to be dealt with under these two main divisions, thus affording a basis for a convenient classification of theological disciplines or branches of study.

(a) The investigation of religion in its phenomenological aspect may be conveniently subdivided into (i.) a general branch dealing with the phenomenology of the ethnic religions other than Christian that have appeared in history, which will include (1) history of religions, with a descriptive account of the distinctive features and characteristics of religious beliefs as they have appeared in history, (2) comparative study of religion, and (3) psychology of religion in so far as historical investigation can throw light on that; and (ii.) a special branch dealing with the phenomenology of the Christian religion. This will embrace, under the general heading of Biblical science, (4) linguistics, or a study of the Bible languages and the principles of interpretation and exegesis; (5) Biblical introduction, or investigation into text, date, authorship, and historical setting of the various books of the Bible; (6) Biblical history and antiquities, and (7) Biblical theology, which aims at setting forth by means of impartial exegesis the ideas as to God, man, and the world and their relations set forth in the different Biblical writings; and, under the general heading of ecclesiastical history, (8) Church history, or the history of the spread of the Church, (9) history of doctrine, and (10) symbolic, or the history of the different creeds and confessions in which Christian doctrine has been embodied.

(b) The investigation of religion in its normative and constructive aspect may be subdivided into (iii.) a general branch dealing with the presentation, defence, and application of the truths of natural religion, including (11) the apologetic of religion generally, (12) natural theology, (13) philosophic ethic; (iv.) a special branch dealing with the presentation, defence, and application of the

truth of Christianity as the highest and final form of religion; this embraces (14) the apologetic of the Christian religion; systematic theology, which includes (15) Christian dogmatic, and (16) Christian ethic; and practical theology, which includes (17) homiletic, (18) liturgic, (19) catechetical, or paediatric, (20) pastoral theology, (21) ecclesiastical polity, and (22) evangelistic theology, or the theory of missions; (v.) the final synthesis of the truths reached in the various theological disciplines, historic and theoretic or normative, which is the aim of (23) the philosophy of religion, in which theology reaches its consummation.

8. Method in theology.—The method to be made use of in dealing with the data of theological science in its various branches will vary with the matter dealt with and the purpose or end in view.

In the historical or phenomenological branches of theology the end in view is simply the ascertainment and accurate presentation of historic fact, and the methods to be made use of are those which are appropriate to historical inquiry in general.

(1) Thus in setting forth the *history of religions* the investigator must make himself acquainted as widely as possible, by observation and inquiry, with the features and characteristics of extant religions as they now appear and are practised among men. He must further acquaint himself with the historic origin and development of these religions by the study of such books, monuments, and other records of the past as are available. Careful observation and industrious inquiry and research are thus the methods most needful for success in this department of theological science.

(2) In the *comparative study of religion* the investigator must use the material furnished by the history of religions, and seek by analysis, comparison, and spiritual insight to show the relations of the various religions to one another and their grading as manifestations of the common spirit of religion. This calls for more of speculative thought and philosophic reflexion, as regards method, than the previous discipline.

(3) In *psychology of religion* the investigator must discuss the origin and form of religion generally from the psychological point of view, and seek to show what part the various mental faculties and capacities—intelligence, feeling, desire, will, imagination, etc.—have in religious experience, and how they enter into and manifest themselves in religions. The methods appropriate to scientific psychology—observation, reflexion, induction, and deduction—have proper application in this discipline.

(4) *Biblical linguistics*, which is the study of the languages in which the Bible was originally written, is just a branch of philology, and the methods of philological study and inquiry have here their proper application. Hermeneutics and exegetics, which deal with the interpretation of the text of Scripture, may be brought in under linguistics.

(5) In *Biblical introduction* the methods of the lower or textual criticism and of the higher or historical criticism have a proper place. Textual criticism investigates the various manuscripts of the Bible that have come down to us and the various readings in the texts of these manuscripts, and seeks by rational principles to get as nearly as possible at the true original text. Historical criticism investigates the evidences of compositeness in different books of the Bible and seeks with the help of tradition and of a knowledge of contemporary history to gain reliable knowledge as to the composition, date, authorship, and historical setting or circumstances of the various books of the Bible, and to estimate their place and function as elements in a progressive revelation.

(6) *Biblical history* deals with the history of the Jewish people and the rise of the Christian Church as recorded in the Bible, while Biblical antiquities has to do with the archaeology, chronology, and geography of the Bible.

(7) *Biblical theology* (including Biblical psychology) aims at unfolding and presenting in a clear and orderly form the doctrinal conceptions or ideas presented by the various writers of the OT and NT. It is the crown and completion of Biblical science, and, for those who accept the Bible as the inspired record of a divine revelation, it is of supreme importance for furnishing material towards the upbuilding of a comprehensive, normative, systematic theology. But of itself it is a purely historic discipline, aiming at the accurate presentation of historic fact and recorded thought in an impartial objective way, without meantime taking into account the bearing of that on permanent normative religious truth. The methods to be used in Biblical theology are those of sound philology and impartial scientific exegesis or interpretation, so as to make sure that the ideas or doctrines set forth are those of the various Bible writers themselves, unmodified by any subjective theological bias of the interpreter. The work of adjusting the scheme of thought faithfully gathered from the Scriptures by sound impartial exegesis to a comprehensive scheme of normative systematic theology is the important task of the Christian systematic theologian.

(8) *Church history*, or the history of the spread of Christianity, aims at recounting accurately the gradual enlargement of the area known as Christendom, the conflict of Christianity with anti-Christian forces, and the growth of the Church's constitution and cultus, showing how the polity and worship of the Christian Church developed as time went on, and how divisions over questions of constitution and government and cultus arose among Christians.

(9) The *history of doctrine* describes the dogma, or body of doctrine, accepted by the Christian Church, and traces its development along the centuries.

(10) *Symbolic* gives a more detailed attention to the various 'symbols'—creeds or confessions—that have been formulated from time to time in the Church's history than can be given in a general history of doctrine. These are obviously purely historical disciplines, aiming at the ascertainment and accurate presentation of historic facts, for the achievement of which the proper methods to be used are the methods of impartial historical research and inquiry.

(11) The *apologetic of religion* in general has as its function to inquire into the nature and essence of religion generally and to establish the truth of the religious view of the world over against all irreligious, antitheistic, or agnostic views. It aims at discussing and exhibiting (a) the nature and essence of religion in general; (b) the nature and validity of religious belief and the relation of the knowledge got thereby to the knowledge of natural objects gained through perception and rational cognition; (c) the truth and reality of what is postulated and affirmed in religious belief, as against atheism, materialism, agnosticism, and other forms of unbelief; (d) the rational proofs for the existence of God or the ways in which the human mind by valid process rises to the apprehension of supreme personal Spirit as the ultimate reality, from reflective contemplation of the changing natural world and its phenomena, of the course of human history, and of the facts of the moral consciousness; (e) the evidence contained in the general revelation given to all men for the immortality of the soul and a future state.

(12) Closely associated with the general apologetic of religion is that systematic presentation of the truths underlying natural religion to which the name of *natural theology* is usually given. Its aim is to set forth in a methodical orderly way all that may be known concerning God and the world and man, and their mutual relations, from that general revelation which is given in nature, mind, and history. It is the dogmatic of natural religion, as philosophic theism is its apologetic.

(13) Akin to natural theology is *philosophic ethic*, whose aim is to ground a science of practical conduct on the immediate deliverances of the moral consciousness and the knowledge of God and duty derivable therefrom. The ethic of Kant, associated with what he described as a 'religion within the limits of pure reason,' may be taken as illustrative of the aims and methods of philosophic ethic, defective though it may be as a presentation of the results of such ethic, even as his 'religion within the limits of pure reason' is defective as a presentation of the truths of natural theology. In this region of natural theology and philosophic ethic the aim is to reach not merely historic but permanent normative truth, in which the mind of the rational thinker can find rest and by which practical conduct can be regulated. The methods by which alone, if at all, such results can be reached are those of speculative thought and philosophic reflexion on the data of moral and religious experience—not merely of our own personal experience, but of the experience of mankind generally as far as that can be ascertained, analysed, and used as the basis of rational inference, induction, and deduction. A great accession to the material or data of experience, on which a comprehensive and satisfactory philosophical theology and ethic may be grounded, is given us when we take into account the special revelation, culminating in the fact of Christ, of which the Bible is the record. Apart from this, indeed, the data on which natural theology and philosophic ethic seek to build are so incomplete that the probable conclusions reached are lacking in fullness of content and convincing power. The new data of experience furnished by this special revelation not only add cogency to the probable conclusions reached by philosophic theism and ethic, but also bring a greater fullness of content to constructive normative theology, by which it is enriched and made more satisfying to the mind and heart of man.

(14) *Christian apologetic* has as its function to indicate the nature and essence of the Christian religion, grounded on the historic revelation of which the Bible is the record, and to set forth in order the evidences of its truth. It deals with such questions as these: (a) the idea of revelation, its spheres and modes, and the manner of its apprehension; (b) the idea of inspiration and its results; (c) the trustworthiness of the Bible as a reliable record of fact and experience; (d) the evidences of a progressive revelation of divine things given in the Bible and the significance of the fact of Christ as consummating and completing that revelation; (e) the evidences of the truth of the gospel proclaimed by Christ and its fitness to meet human need and to bring salvation and satisfaction to mankind. Christian apologetic clears and prepares the way for

(15) *Christian dogmatic*, which aims at setting forth in accurate and systematic manner, and in such a way as to show its consistency with all our other knowledge of truth, the intellectual content of the Christian life as that becomes our inward possession on the ground of divine revelation through the receptivity of faith. It presupposes and includes the conclusions reached by philosophic reflexion in the sphere of theism and natural theo-

logy, and gives added cogency and convincing power to them and greater richness and fullness of content to our knowledge of God the supreme reality, as not only intelligent personal Spirit but holy loving Father. It is usually subdivided into (a) theology proper, or the doctrine of God involving an exposition and justification of the Christian conception of God as triune, which was the prominent feature of Greek Christian theology in the 4th cent. when various forms of unitarianism (Monarchianism, Sabellianism, Arianism) were combated by Athanasius and the Cappadocian Fathers; (b) Christology, or the doctrine of the Person of Christ, to which the attention of the Church was particularly directed after the Council of Nicæa (A.D. 325) by the theories propounded by Apollinaris, Nestorius, and Eutyches, which were condemned at the Councils of Constantinople (A.D. 381), Ephesus (A.D. 431), and Chalcedon (A.D. 451); (c) pneumatology, or the doctrine of the Holy Spirit, to which attention was first prominently given by the Church when the views of Macedonius were condemned by the Council of Constantinople; (d) anthropology, or the Christian doctrine of man; (e) hamartiology, or the doctrine of sin, which first came to the front in the controversy between Augustine and Pelagius in the 5th cent.; (f) soteriology, or the Christian doctrine of salvation, which, through Augustine and Pelagius, became an important feature in Western theology, receiving fresh development at the hands of Anselm, Bernard of Clairvaux, and Thomas Aquinas, who devoted attention to the redemptive work of Christ and its application to sinful men, and engaging prominently the thoughts of theologians in the Reformation period when the doctrines of justification by faith and reconciliation with God came into prominence; (g) ecclesiology, or the doctrine of the Church and the sacraments, which first received prominence in the early Church at the hands of Cyprian of Carthage (A.D. 250), was further developed by Augustine (in his *Summa Theologiæ*), and received much attention from Lutheran and Calvinistic theologians at the Reformation and from Ritschl and Anglican High Churchmen in modern times; and (h) eschatology, or the doctrine of the last things, which has occupied a foremost place in recent theological discussion.

(16) *Christian ethic* has as its aim to set forth the content of the Christian life as it works itself out in disposition and action on the ground of the self-activity that is rooted in Christian faith. It looks upon the Christian life from the view-point of man and his duty, while dogmatic looks upon it rather from the view-point of God and His will. Both deal with the same subject-matter, viz. God and man and their relations to one another, but under different aspects or from different view-points, so that, while they belong together to systematic theology, they are most conveniently treated as separate or distinct branches of that science. Christian ethic presupposes the conclusions of philosophic ethic, just as Christian dogmatic presupposes those of natural theology. But it adds new fullness and richness of content and new power to philosophic ethic through the new data of moral and religious experience, centred in the fact of Christ, which it contributes. The first attempts to formulate Christian ethic in separation from Christian dogmatic were made by Lambert Daneau, a French Protestant, in 1557, and G. Calixtus, a Lutheran, in his *Epitome Theologiæ moralis* in 1634. Since the time of Schleiermacher this separate treatment of Christian ethic as a branch of theology has been generally followed in Germany, Britain, and America; and numerous works on Christian ethic have appeared in which:

the relevant material is dealt with under different divisions. A convenient division followed in the main by Martensen and other writers is (i.) general introduction, dealing with (a) the definition and scope of Christian ethic, its relation to other disciplines, and its place in a classification of ethical systems; (b) fundamental conceptions of the science—end, norm, and motive; (c) postulates of the science, theological, anthropological, cosmical, and eschatological; (d) the source of our knowledge of the Christian moral ideal, the content of that ideal, and the means of its realization; (ii.) individual ethic, dealing with the origin and progress of the Christian life in the individual soul and its manifestation in the virtues and graces of the Christian character; (iii.) social ethic, dealing with the realization of the Christian ideal in the various spheres of society—the family, the Church, the State or nation.

Practical Christian theology in its various departments treats of the Christian religion from the point of view of its power to expand and to build up Christian life in the Church. It includes those disciplines that are concerned with the application of Christian theology in the practical sphere. It is art rather than science.

(17) *Homiletic* deals with the art of sermon-making.

(18) *Liturgic* deals with worship and its forms.

(19) *Catechetical*, or *paideutic*, deals with the religious instruction of the young.

(20) *Pastoral theology* deals with the duties of the pastoral office.

(21) *Ecclesiastical polity* deals with Church government, law, and procedure.

(22) *Evangelistic theology*, or theory of missions, deals with the best methods of propagating the Christian religion at home and among heathen peoples abroad.

The methods appropriate for use in the upbuilding of a scientific normative Christian systematic theology, into which the content of Biblical theology as a historical discipline is taken up and adjusted, are in part the methods commonly made use of by science in general—analysis, classification, inference, induction, deduction, etc.—but partly also the less easily applied methods of philosophic reflexion and speculative thought, by means of which the philosopher must seek to bring unity and consistency into his entire knowledge of the real. The God revealed in the Bible and through Christ and Christian experience—the triune God of Christian revelation—must be related and harmonized through rational thought with the God of the theistic proofs and natural theology, if our theology is to be at once Christian and philosophic.

(23) *Philosophy of religion*, which is the highest stage or form of theology, has for its data the results reached as truth by the use of scientific method in the previously mentioned theological disciplines; and its aim is to combine these elements of truth in a comprehensive synthesis of knowledge, such as will exhibit the relations of the various aspects or parts of truth and their harmonious cohesion in an organic whole of truth or reality. Its special function is to harmonize the results reached by reflective thought along the line of philosophic theism and natural theology with the results reached through believing appropriation of the Christian revelation.

If reason is indeed the means whereby we apprehend and know truth and reality, then we should not rest satisfied until what we accept as true or real is shown to commend itself to our reason as reasonable, and so 'worthy of all acceptance.' We must therefore strive to make our theology rational or reasonable, if it is to be the expression of truth.

If, again, the Christian revelation concerning God and the world and man and their relations be true, as Christians believe it is, then the Christian philosopher must strive to make his philosophy and metaphysic religious and so adequate to embrace and express the truth of religious, and specifically of Christian, experience. Only when theology becomes rational and philosophy becomes religious can there be hope of such a union between the two as will yield a satisfactory philosophy of religion which will also be the most adequate and satisfactory metaphysic of being. To reach such a philosophy of religion is the worthy aspiration of the Christian speculative theologian who, while not ignoring the importance of faith alike in science, theology, and philosophy, strives to secure that the faith on which he rests shall be a reasonable faith.

THEOSOPHICAL SOCIETY.—I. Definition and scope.—Every great religion has two parts, an inner and an outer, a spirit and a body, 'the knowledge of God,' which 'is Eternal Life,' and its dogmas, rites, and ceremonies. The inner part, 'the wisdom of God in a mystery,' spoken of by St. Paul as known to 'the perfect,' is that which has, since the 3rd cent., been known in the West as 'theosophy'; in the East it has been known for ages under its Sanskrit equivalent, *Brahma-vidyā*, 'God-wisdom,' 'God-knowledge,' or 'God-science.' Such theosophy, or mysticism, the direct knowledge of God by man, belongs equally to all great religions, as their sustaining life, and may be possessed by any individual, even outside any religious organization. The Brahmadivins, 'knowers of God,' in Hinduism; the Gnostics, the 'knowers,' who, Origen declared, were necessary to the very existence of the Christian Church; the *shaiikh* in Islāmic Sūfism—these are typical theosophists from the standpoint of the modern Theosophical Society. No man is truly a theosophist who has not direct knowledge of God, but he may win this through any religion or by his own unaided efforts.

Theosophy, in the modern as in the ancient world, proclaims the possibility of such knowledge, as the inevitable result of the immanence of God. Man is essentially a spiritual being, his self, or spirit, being an emanation from the Universal Self, or Universal Spirit, God, as a ray is an emanation from the sun. Hence, to know himself, his deepest self, is to know God; he can sink in consciousness into the depths of his own being, beyond the body, the passions, the emotions, the mind, the reason; these are all his, but they are not he; he can pass beyond them all, and realize himself as separate from them, the pure 'I,' pure being. This is the universal experience of those who, successfully, seek the Kingdom of Heaven within, and it is followed by the recognition that this Universal Being into which the self opens transcends all the beings in which it is manifested, and is alike in all. Out of this experience, repeated for every one who becomes a knower of God, or theosophist, are built the two fundamental truths of theosophy: the immanence and transcendence of God, and the solidarity, or brotherhood, of all living beings. The realization of the first truth, man's identity of nature with God, as a fact in consciousness, and the subsequent realization of the second, his identity of nature with all around him, by a blending of his self with their self, a conscious dwelling in their forms as in his own—these sum up theosophy in its fullest and deepest sense. The man who has thus reached self-realization in God and in all beings is a theosophist; those who deliberately aim at such self-realization are also generally called theosophists.

The word 'theosophy' has further, historically, a second meaning: it denotes a body of truths, or facts, concerning God, man, and the universe; and these may conveniently be classified under three heads: religion, philosophy, and science.

On these truths is based its system of ethics, rational, inspiring, and compelling. In considering this body of truths we are not studying a system invented and published in modern days; we have to do with what has aptly been termed the Wisdom-Tradition, handed down in all civilized countries, ancient and modern, by a long succession of prophets, teachers, and writers. It may be traced in the *Upaniṣads*, *Purāṇas*, and epics of the Hindus, and in the six systems (*darśanas*) of Hindu philosophy; it underlies many of the Chinese systems, especially Taoism, and is seen in such books as *The Classic of Purity* and in the writings of Lao-tse; it is found in Egypt, as in *The Book of the Dead* and the papyri from which its religion has been re-constructed; it appears in the fragmentary records of Assyria and Chaldæa; in the *Gāthas* and other scriptures of the Pārsis; in the Hebrew Scriptures as expounded by the Kabbalā and the Talmud; in the Christian, as treated by the early Fathers of the Church, and by such Gnostic writers as Valentinus, Basilides, and a host of others; in Pythagoras and Plato, with the Pythagorean, Platonic, and Neo-Platonic schools, with Plotinus, Iamblichus, and the theurgists; it is taken up from these by the doctors of Islām and the Sūfi mystics; appears in the Rosicrucian students of alchemy and astrology, in Rosenkreutz, Paracelsus, Bruno, Eckhartshausen, Boehme, Eckhart, Vaughan, Bacon, More, Fludd—all these and scores of others have assimilated and handed on the Wisdom-Tradition; it has lent its symbols to masonry, and hidden some of its mysteries in masonic ceremonies; it peeps out of Scandinavian and Celtic folk-lore, out of the Hawaiian legends and Maori traditions, the unburied temples of the Mayas and Quiches, the magic of the Zuñis and other N. American Indian tribes. Its revival and its systematization into a coherent and inter-related body of doctrines, separated from non-essential and irrelevant teachings—this is modern, and is the work of the Theosophical Society, a modern association. But the doctrines themselves are scattered everywhere, through all times, in all places.

The test to be applied to a religious doctrine which claims to be theosophical is catholicity. 'Semper, ubique, et ab omnibus'—such is the test. For all religions come from a single source, the Divine Wisdom, and have as founders divinely inspired men—men who have climbed up the ladder of evolution till they have reached perfection in humanity, and have entered on the superhuman evolution. Such men we call 'masters,' and we regard them as the guides and directors of the evolution of humanity; the similarities in doctrines and ethics, pointed out by comparative mythology and comparative religion, we regard as due to the fact that all the founders of religions are members of the one lodge of masters, possess the same knowledge, and are guided by the same principles.

The universal—i.e. theosophical—doctrines of religion are: the unity of God; the manifestation of God as a Trinity for the building of a universe; the existence of graded orders of intelligences, a vast hierarchy of beings, forming the inhabitants, visible and invisible, of a universe, or a solar system. The doctrine of reincarnation, taught in every religion, though in some temporarily overlaid, belongs to the domain of philosophy rather than to that of religion; the immortality, or rather the eternity, of the spirit belongs also to philosophy more than to religion, when dealt with intellectually; the law of action and reaction—*karma*—falls under science, as do the constitution of a solar system and of man.

2. Religious teachings.—(a) *The unity of God*, the universal one Existence which is the source of

all existences actual and potential, the super-life and super-consciousness in which all lives and consciousnesses inhere, eternal beneath the transitory, changeless beneath the fleeting, unsupported but the support of all, all-embracing, all-containing, the One without a second—this is the central teaching of theosophy as of all religions, the first universal truth of religion.

(b) *The Trinity of the manifested God* is the second great and universal truth of religion, and therefore of theosophy. Theosophy speaks of the manifested God as the Logos, borrowing the term from Plato, Philo, and the Fourth Gospel.

'Coming forth from the depths of the One Existence, from the One beyond all thought and all speech, a Logos, by imposing on Himself a limit, circumscribing voluntarily the range of His own Being, becomes the Manifested God, and tracing the limiting sphere of His activity, thus outlines the area of His universe. Within that area the universe is born, is evolved, and dies; it lives, it moves, it has its being in Him; its matter is His breath; its forces and energies are currents of His life; He is immanent in every atom; all-pervading; all-sustaining; all-evolving; He is its source and its end, its cause and its object, its centre and circumference; it is built on Him as its sure foundation, it breathes in Him as its encircling space; He is in everything, and everything in Him. Thus have the Sages of the Ancient Wisdom taught us of the beginning of the manifested worlds. From the same source we learn of the Self-unfolding of the Logos into a threefold form; the First Logos, the Koot of all Being, the *Will* which outbreathes and inbreathes the worlds; from Him the Second Logos, manifesting the two aspects of life and form, the primal duality, making the two poles of nature between which the web of the universe is to be woven—life-form, spirit-matter, positive-negative, active-receptive, Father-Mother of the Worlds—the *Wisdom*, or Pure Reason, "mightily and sweetly ordering all things," sustaining the universe; the Third Logos, the Universal Active or Creative *Mind*, that in which all archetypically exists, the source of beings, the fount of fashioning energies, the treasure-house in which are stored up all the archetypal forms which are to be brought forth and elaborated in matter during the evolution of the universe, the fruits of past universes, brought over as seeds for the present.'

(c) *The hierarchy of beings* is the third truth universally accepted: the 'seven spirits before the throne of God'; the primary emanations of the Supreme Trinity; the ranks of secondary Logoi, who rule congeries of solar systems, down to the Logos of a single solar system. In such a system the vast hosts of spiritual intelligences (the *devas*, archangels, and angels of religions), the grades of spirits encased in human bodies, the sub-human intelligences and those not yet even awakened to intelligence—all these, with the solar Logos at their head, form the ladder of lives, and evolve within the system. The sub-human intelligences include all nature-spirits, the gnomes, fairies, etc., who play so great a part in folk-lore, the living though limited intelligences who make all nature a living responsive organism instead of a soulless mechanism, whom little children sometimes see, and who are visible to the ordinary seer.

(d) The fourth truth in theosophy is that of *universal brotherhood*, the inevitable deduction from the preceding; since there is but one life in all forms, all forms must be inter-related, linked together, and, however unequal they may be in development, they none the less make one huge family, are 'of one blood.' The universal brotherhood of theosophy differs from the political conception of 'equality,' the foundation of modern democracy, in that it postulates identity of origin and of potentiality, but recognizes varying degrees of development, the latter yielding the hierarchy of beings, or ladder of lives. In this freemasonry resembles it, with its broad division of mankind into the enlightened and the profane, and the subdivisions of the enlightened into degrees and graded officers, uniting the essential equality with a hierarchical order and due subordination. In this both theosophy and freemasonry are in harmony with nature, increasing power going hand-in-hand with increasing knowledge and increasing

1 A. Besant, *The Ancient Wisdom*.

responsibility. Wisdom, supported by strength and made manifest in beauty, rules in a true brotherhood, as in nature.

It is interesting to note that these four primary religious truths of theosophy, of universal religion, are but the intellectual formulation—for the instruction of the people—of the two primary spiritual truths directly contacted by the knower of God, the gnostic, the theosophist. The first three are religious dogmas, expressing intellectually the first spiritual truth; the fourth is the expression in the outer life of the second spiritual truth. The spiritual truths can be *known* only by individual self-realization; they may be intellectually taught and believed as the fundamental dogmas of universal religion, theosophy. A dogma is the intellectual presentation of a truth known by the spirit, and believed on external authority.

3. Philosophical teachings.—Philosophically, theosophy is idealistic; consciousness is primary, the one indubitable fact, which can neither be strengthened nor weakened by argument. 'I am' is the testimony of consciousness to itself, and naught can disprove its witness, since every disproof, every argument, must be addressed to that same consciousness, and imply its existence. To the All-Self, matter is but the limitations imposed by Himself on His thoughts; to us, evolving in a universe which is the manifestation of our Logos, matter is His thought, limitations imposed on us by His thought and activity—limitations which we cannot transcend until we can realize ourselves in Him. Human thought, though feeble and undeveloped, is of the same nature as divine thought, and increases its power over matter with its increasing growth; thought is the one creative and moulding power, and, as evolving man realizes this, and so clarifies his lower nature that this aspect of the self can work through it, he becomes the master of that lower nature and of his surroundings, the creator and controller of his destiny. By thought, mastering the science of physical nature, he bends it to his will and utilizes it; by thought, mastering the science of the emotions, he builds virtues and destroys vices; by thought, mastering the science of mind, he subdues its turbulent energies into orderly obedience; by thought, directing will and controlling activity, he brings all things, within and without, into subjection to the self, 'the inner ruler, immortal.' Only by such fit rule and due subjection can man attain perfect health of body, emotions, and mind, and reach the highest good. Hence many of the practical theosophical teachings deal with this power and control of thought.

The eternity of spirit—more loosely spoken of as the immortality of the soul—is an integral part of theosophical philosophy. It is an inevitable deduction from the identity of nature of the human and the universal Self; 'unborn, undying, perpetual,' it is eternal as God Himself. The continuity of consciousness is equally inevitable, since the self is conscious and continuous, and in the self must consequently abide all its experiences, of which a successive survey is memory. The extent to which these memories are carried on by the material sheaths, or bodies, of the self—*i.e.* the survival of the individual and the person—will be better considered under the constitution of man.

The method of the unfolding of this continuous and conscious self in the human kingdom is by reincarnation. Reincarnation is, in fact, the only doctrine of immortality that philosophy can look at, as Hume said.¹ It means that the self, having unfolded to the human stage, appropriates matter from the three worlds (see below) and builds it into bodies, suitable for life in those worlds, beginning in the stage of barbarism, as a savage of a low type. During earth-life he gathers experiences, pleasant and painful; after death he meets the results of these experiences—the lower in the

intermediate world, where he suffers in the appropriate body of matter belonging to that world, and the higher in the heavenly world, where he enjoys in the appropriate body of matter belonging to that world, and converts all these experiences into mental and moral capacities. When all are thus converted, he returns to earth-life, bringing with him these capacities wrought out of experiences, into new bodies built to express and utilize them. In these he goes through a similar cycle, gathering, suffering, transmuting, and so on and on; each birth brings the fruitage of the preceding lives to start the new pilgrimage, and this is the inborn character and temperament mental, moral, physical. Step by step he climbs the ladder, working under inflexible and inviolable laws, until he reaches the stature of the perfect man; he passes through all the classes of the school of life until he has mastered all that this world has to teach, and is *asekha*—he who has no more to learn. He is then a man, beyond birth and death, 'fitted for immortality,' ready for work in the larger life.

4. Scientific teachings.—Theosophy differs from modern science in the fact that it includes under 'science' investigations into superphysical worlds. Its methods are the same: investigation by observation of objective phenomena, reasoning on observations, framing of hypotheses, discovery of invariable sequences (*i.e.* of natural laws), repeated experiments to verify deductions, and formulation of results. It uses the senses for observation, but the senses intensified—super-senses, in fact—responding to vibrations of matter finer than that which affects the physical senses.

As with modern science, so with theosophical—'occult science,' it is usually called—there is a body of accepted facts, laid down by recognized experts and largely reverified by later experiments, and a fringe of modern discoveries, constantly added to, revised, and modified. The accepted facts have been established by generations of occult experts, and their existence is often referred to in the scriptures of various religions; the more accessible of these are being constantly reverified by occult students to-day, but the larger cosmological facts are beyond our reach. Any discoveries made by students are subject to revision and modification, as observations are repeated and the instruments of observation are improved.

(a) *The constitution of the universe.*—The broad outline of this comes from the seers of the past, and is largely confirmed in the scriptures. It appears reasonable to us, and is congruous with the observations which we are able to make. The laws of analogy and recapitulation confirm it, for we see its outlines repeated in miniature within our own range of observation, and we see sequences rapidly repeated in miniature which the seers have described as occurring in a universe—as the æonian evolution of the kingdoms of nature is mimicked in the growth of the embryo in the womb. A universe consists of seven kinds of matter, or planes, of which the densest is called physical or solid; the next finer, astral, or watery; the next, mental or fiery; the next, spiritual or airy; the next, superspiritual or ethereal; and the two finest, divine. What are called solar systems are all on the physical plane of the universe, and a solar system repeats within itself the seven kinds or states of matter, these subdivisions of the vast cosmic plane forming its planes, or worlds.

Within a solar system these subdivisions can be mostly studied by less developed seers, and we are in a field of research open to the occult student of our own day. We find in relation to our own earth: 'physical matter,' all formed by aggregations of similar physical atoms, similar except that some are positive, some negative; these aggregations are grouped into solids, liquids, gases, and three kinds of ethers; 'astral matter,' formed by aggregations of astral atoms, differing from physical atoms in shape, and grouped into states corresponding to the physical; 'mental matter,' formed by aggregations of mental atoms, again distinguishable by their form, and again grouped as before; the 'spiritual' and 'superspiritual worlds' are formed on the same plan, each having its own type of atom and its own corresponding states of aggregation. Of the 'divine worlds' we cannot directly speak.

(b) *The constitution of man* is analogous to that of the solar system, and hence the possibility of knowledge concerning it. As said, he is a fragment of the Universal Self, and he is clothed in the matter of his system. In the divine world dwells his

¹ In his Essay 'Of the Immortality of the Soul.'

true self, the monad, and his consciousness appropriates matter from each of the five worlds below in order that he may know and conquer them; as the continuing 'I,' he uses matter from the superspiritual, spiritual, and the finer regions of the mental world; this is the 'spiritual body' of which St. Paul speaks; it grows and evolves through the whole cycle of reincarnation, and beyond, but is not changed or lost in birth or death; probably St. Paul refers to this when he speaks of our 'house not made with hands, eternal in the heavens,' which he says 'we have.' It is this spirit in the spiritual body which is the reincarnating Ego, or individual, though the term is often used to indicate only the consciousness working in the finer mental matter, in what is termed 'the causal body,' a subdivision of the spiritual taken separately. When the reincarnating Ego takes a new birth, he appropriates some of the coarser matter of the mental world for his 'mental body,' some of the matter of the astral world for his 'astral body,' some of the matter of the physical world for his 'physical body'; his consciousness, in thinking, uses mental matter; in desiring or sensating, uses astral matter; in acting in the physical world, uses physical matter; these are 'the three worlds' in which his evolution goes on, and in which he is affected by birth and death, and is a personality, or person, *i.e.* the individual, as limited in expression by grosser matter; the mental body is closely related to the brain, though not dependent on it, save for activity in the physical world; the astral body is mainly correlated with the cerebro-spinal and sympathetic ganglia and nerves, and the glands; the three bodies interpenetrate each other, mutually acting and reacting throughout waking life. In sleep consciousness withdraws from the physical body, clothed still in its astral and mental garments, living then in the astral world, and sometimes, on its return, impressing on the physical brain some of its experiences in vivid and coherent 'dreams'; it keeps in magnetic touch with its physical body. In death this magnetic touch is broken off, and the consciousness dwells for a while in the astral world, called often 'the intermediate world,' in relation to those who have passed away from earth. After a while the astral body dies, and the man passes in the mental body into the mental world, or heaven, where he abides for a period extending to many centuries, the length depending chiefly on the richness of his intellectual, emotional, and artistic past life on earth. When he has assimilated all the experiences of this nature accumulated on earth, the mental body disintegrates, the consciousness withdraws to the spiritual body with all it has gathered to enrich the Ego. Then the Ego builds a set of new bodies for a new pilgrimage in the three worlds, and returns to them by birth. Thus the evolution of man is carried on in three worlds, brooded over by the spirit—himself—the spirit garnering the results and unfolding thereby; he is an inhabitant of the three during waking life; of two during sleep and for a period after death; of one during his heavenly life. The lowest, the physical body, is at present the most perfectly organized, and therefore the most capable of receiving impressions from without and transmitting them to the consciousness. The astral body is rapidly becoming organized, and its proper senses are developing, so that it is receiving and transmitting many impressions from the astral world, though generally with a lack of sharpness and accuracy; these include the phenomena of second-sight, premonitions, warnings, visions, perception of phantasms of the living and the dead, etc.—the phenomena to which modern psychology is paying so much attention. An increasing number of people are 'sensitive,' or 'psychic,' and are using the supersenses, *i.e.* the senses of the astral body, more or less consciously. The mental body is becoming well organized in educated people, but more in relation to its organ, the brain, than as an independent vehicle of consciousness, active in its own world. Consciousness, in the mental body, is in-turned rather than outward-turned. The occultist, having by the practice of special methods—meditation, concentration, etc.—artificially forced the evolution of the astral and mental bodies beyond the normal, is, as regards these, many centuries ahead of his time; he uses the supersenses for life in the astral and mental worlds in his waking consciousness, and thus carries on his investigations in them as the physical scientist does in the physical world. The dying of the three bodies, and the building of new ones for each successive life-period, is the cause of the loss of memory of past lives; that memory is in the reincarnating Ego, and is shared by the consciousness when animating the lower bodies only if, in those bodies, the man has realized himself as one with the higher.

(c) *The law of action and reaction* is universal, and exists in the worlds of emotion, thought, and spirit as much as in the physical world. Hence a man can build his character as scientifically as he can build up his body, and disregard of the mental and moral laws is as destructive of mental and moral health as disregard of physical laws is destructive of physical health. The study and utilizing of the laws, summed up as *karma*, forms an important part of theosophical work.

(d) *Evolution*.—The monad gradually unfolds his powers by coming into touch with matter and appropriating portions of it; he thus passes through the mineral, vegetable, and animal kingdoms, until in a highly developed animal the intelligence reaches the human stage; thenceforward reincarnation under *karma* is his means of unfolding. Humanity, on our globe, takes on a fresh type—more delicately organized as to the nervous system—that of a root-race, when a considerable number of reincarnating Egos are ready to develop a higher quality of consciousness. The third, or Lemurian, race, was the first to assume the really human type in the middle period of its evolution—the previous types being embryonic; the

surviving remnants of the Lemurian are the negroes and the many negroid peoples scattered over the world. The fourth, or Atlantean, race with its seven sub-races—of which the Toltec, Akkadian, Turanian, and Mongolian peoples are typical—is still the most numerous. The fifth, or Aryan, race has already five sub-races—the Aryans of India, the Mediterranean Aryans (Arahs, the later higher-class Egyptians, etc.), the Iranians, Celts, and Teutons—and has yet to develop two more. These varying types afford to the reincarnating Egos the necessary varieties for their evolution, each Ego taking birth in the races and sub-races as often as is necessary for the unfolding of the qualities characteristic of each.

(e) *Human perfection*.—By repeated reincarnations under inviolable law, each man reaping exactly as he has sown, man reaches his temporary goal—human perfection. At the present stage of evolution it is possible for him to reach this goal in advance of the evolutionary term, which will last yet for many millions of years. By strenuous exertions and noble and unselfish living, he may attract the attention of the spiritual guardians of mankind, who will teach him how to quicken his evolution, so that he may enter on 'the path of holiness,' pass through its five initiations—or stages of widening consciousness—and become a 'master,' the last of the five initiations opening the gateway of superhuman evolution. He may then pass into other worlds, or enter the ranks of the guardians of this world, as he wills. From the hierarchy of these guardians have come the founders of world-religions, the lesser prophets and teachers being their disciples.

5. *The ethics of theosophy*.—These are not definitely formulated into any code, but consist of the highest and purest teachings of the world's noblest saints, prophets, and founders of religions. All that is sweetest and most lofty in the world's Bibles, all that is most inspiring and ennobling in the writings of its philosophers and moralists, forms the ethics of theosophy. As man lives by the highest ethic he can grasp, he becomes capable of appreciating ethic yet sublimer; the theosophist strives to live by the spirit of Christ rather than by any legal code, and, cultivating love, he hopes to be enlightened by the lords of love. Broadly speaking, that which works with the Divine Will in evolution is right; that which works against it is wrong; and the best examples of that Will are found in such divine men as the Buddha and the Christ. These the theosophist looks up to as examples, and strives to reproduce their likeness in himself.

6. *The Theosophical Society*.—This association was founded on 17th Nov. 1875, in New York City, U.S.A., by Helena Petrovna Blavatsky and Henry Steele Olcott. The former was a Russian noblewoman, of extraordinary psychic endowments, and these had been trained and cultivated to the highest point by her 'master,' an Eastern occultist; she gave up social rank, wealth, and family to seek him in Tibet, and spent some years with him near Shigatze, after which, returning to the world, she gave the rest of her life to carrying out his directions. In America she met, at the famous Eddy farmhouse, a man who had won high distinction during the Civil War, Colonel Henry Steele Olcott, and he became her pupil. She endeavoured first to collaborate with the American spiritualists, but, failing in this, she, with Olcott, founded the Theosophical Society; she became its corresponding secretary, an office which she held for many years, and he its president; its organization is due to him and he remained president until his death in 1907, when the present writer was elected as his successor.

The unit of organization is a lodge, of not less than seven members; when a number of lodges, not less than seven, exist in any territory, they may group themselves into a section, or national society, which is self-governing, within the wide limits of the general constitution. The central ruling body consists of president, vice-president, treasurer, recording secretary, a general council consisting of the general secretaries, each elected by his own national society, with not less than five additional councillors, chosen by the general secretaries. It meets once a year and deals only with matters affecting the whole Society; but it may not meddle with the business of the sections, unless there be a transgression of the general constitution. The annual report of 1917 showed 19 national societies, 1074 lodges, with 28,673 active members. Round each lodge are gathered a considerable number of sympathizers and helpers, but these are not entered on the rolls. The headquarters of the Society were first in New York; in 1879 the

founders left America for India, and fixed the headquarters in Bombay; in December 1882 they moved to Adyar, a suburb of Madras, and there the headquarters have since remained. The Theosophical Society owns there an estate of 265 acres, with several fine buildings, and a library which is known all over the world of scholarship as possessing the finest existing collection of *Upanishads*, as well as some unique Sanskrit MSS.

While the Society exists for the purpose of spreading the ideas formulated above, it does not impose belief in them on its members, who, providing they accept the principle of universal brotherhood, are absolutely free to think as they will. Admission to membership is obtained on recommendation of two Fellows of the Society, and the acceptance of the following objects:

To form a nucleus of the Universal Brotherhood of Humanity, without distinction of race, creed, sex, caste or colour.

To encourage the study of comparative religion, philosophy, and science.

To investigate the unexplained laws of Nature and the powers latent in man.

The following, written many years ago by the present president, states the general position of the Theosophical Society:

The Theosophical Society is composed of students, belonging to any religion in the world or to none, who are united by their approval of the above objects, by their wish to remove religious antagonisms, and to draw together men of good will, whatsoever their religious opinions, and by their desire to study religious truths and to share the results of their studies with others. Their bond of union is not the profession of a common belief, but a common search and aspiration for Truth. They hold that Truth should be sought by study, by reflexion, by purity of life, by devotion to high ideals, and they regard Truth as a prize to be striven for, not as a dogma to be imposed by authority. They consider that belief should be the result of individual study or intuition and not its antecedent, and should rest on knowledge, not on assertion. They extend tolerance to all, even to the intolerant, not as a privilege they bestow, but as a duty they perform, and they seek to remove ignorance, not to punish it. They see every religion as an expression of the DIVINE WISDOM, and prefer its study to its condemnation, and its practice to proselytism. Peace is their watchword as Truth is their aim.

Theosophy is the body of truths which forms the basis of all religions, and which cannot be claimed as the exclusive possession of any. It offers a philosophy which renders life intelligible, and which demonstrates the justice and the love which guide evolution. It puts death in its rightful place as a recurring incident in an endless life, opening the gateway of a fuller and more radiant existence. It restores to the world the Science of the Spirit, teaching man to know the Spirit as himself, and the mind and body as his servants. It illuminates the Scriptures and doctrines of religions by unveiling their hidden meanings, and thus justifying them at the bar of intelligence, as they are ever justified in the eyes of intuition.

Members of the Theosophical Society study these truths, and Theosophists endeavour to live them. Every one willing to study, to be tolerant, to aim high, and to work perseveringly, is welcomed as a member, and it rests with the member to become a true Theosophist.¹

There have been some offshoots from the Theosophical Society which have become independent of the central organization, but which spread the same truths. There are two international societies, with headquarters in America, and some scattered independent bodies in Germany and Austria.

A. BESANT.

THEOSOPHY.—Theosophy has characteristics which relate it closely to religion, and somewhat more remotely to philosophy. It also attempts to determine man's place in the universe and to solve the riddles of life and of death. Like religion, it aims at guaranteeing to its followers a more favourable destiny by showing them the way of healing and salvation. Like philosophy, it proposes to have recourse only to the resources which nature, on the one hand, and the human intellect on the other, place at its disposal, and it is by knowledge that it saves men. But the knowledge which it obtains is not grounded on the observation of facts which are within the reach of ordinary intelligences; it is intuitive, dependent on the exceptional clear-sightedness of men on a superior level, and communicated by them to their disciples. There is then a theosophical knowledge, just as there is a religious and a philosophical knowledge. Besides, it may well be that the content is throughout materially the same. Such a concept, *e.g.*, as that of the immortality of the soul may be found in all three. By what distinctive marks then can we recognize that a doctrine is theosophical? Now we know that there is a criterion which makes it possible for us, without risk of error, to distinguish between what is philosophical and what is religious. If a doctrine has been established by means of observation, induction and deduction, it is philosophical; it is religious if there has been concerned in its origination an intuition operating under the influence of feeling and imagination; it is only at subsequent stages that the ordinary processes of the human intellect intervene. Theosophy also begins with affirmations having an intuitive basis, and its constructions may have great emotional and imaginative significance. Having once secured this foundation, it may proceed, like theology, to construct, in accordance with the demands of reason, a system of satisfying coherence. The difference between theosophy and religion lies neither in their ideas nor in their method. It is in the attitude which the religious man, on the one hand, and the theosophist, on the other, assume towards the objects presented. The one hopes to work, by fear, reverence, and adoration, upon the will of powerful beings for his own advantage; the other depends upon himself, upon the immediate efficacy of his own knowledge and action; religion is humble, whereas theosophy is proud.¹

This self-reliance the theosophist has in common

¹ It is to be noticed, however, that, though the suggestion of pride is justifiable in connexion with the esoteric tendencies, the prevailing intellectualism, and calm acceptance of grades of religious capacity noticeable in modern theosophical teaching, yet there is also an element of humility frequently to be found in the modern theosophical attitude. There is a constant reference to teachers or adepts, and it is urged that their teaching should be accepted with implicit faith. The general efficacy of knowledge in obtaining the desired results may indeed be exaggerated and become an incentive to pride, but the individual thinker is not encouraged to depend merely on his own knowledge or even on the knowledge of his contemporaries. He, and they also, must look backwards with reverence to the past and accept the teachings which have been handed down from remote ages and are rediscoverable for men of the present age when the more modern excrescences upon religious systems have been removed.

¹ *Theosophy*, p. 91.

with the magician. Both—the one more consciously than the other—admit the existence in the universe of hidden forces, for the control of which knowledge of them is sufficient. Both also show individualistic tendencies. They detach themselves from the religious community and break through the tradition officially recognized around them. But we may notice at least this difference between the magician and the theosophist: the one aims at using his power in an external way—he desires to control nature for the advantage or the disadvantage of his fellows; the other is a contemplative, who acts but little except on himself and for his own sake.¹ The theosophical spirit has left a very deep mark upon Indian thought. It is possible to trace its influence from its origin to our own day. India would be for the investigator a remarkable field for study if the chronological sequence of ideas and systems were not enveloped in a darkness which up to the present time has not been penetrated. It is impossible for us to date the most important of the texts from which we derive our information. Many of them are much later than the period when the theories which they set forth were formulated. Under such circumstances it becomes exceedingly difficult to settle the debit and credit side of the account of each school. Perhaps, however, one result may be considered to be now established: there has been in India a continuity of theosophical tendency. The systems interlace with and influence one another. The intuition on which their authors pride themselves consists in perceiving afresh the 'truths' which a kind of heredity has tended to fix in the Indian mentality. The task of the great philosophical schools has to a large extent been that of systematizing the ideas already worked out in the *Upaniṣads*. Buddhism would be unintelligible if the way had not been prepared for it, if not in these very schools, at least in antecedent groups bearing a very strong resemblance to them. And the reformers who have appeared in India in such large numbers since the Middle Ages have drunk at the same source. If, then, we cannot yet dream of giving a strictly historical presentation of theosophical speculations, it is at least not impossible to discern the order in which the principal systems have appeared. We shall follow (1) the development of this thought in circles which are, if not, strictly speaking, Brāhmanic, at least closely related to Brāhmanism (the *Upaniṣads* and the Vedānta, the Sāṅkhya, and the Yoga); (2) the transformation of theosophy into religion (into Jainism and Buddhism); (3) its incursions into popular religions of long standing, with which it has associated itself, not without a certain sacrifice of its own character and significance; and finally

¹ This statement should, however, be slightly modified when applied to modern theosophy in India. On the one hand, this shows an affinity to magic, in that it is greatly interested in the details of existence upon planes other than the physical, and so takes up a slightly materialistic attitude to those existences which are ostensibly non-material. The inhabitants of the astral and mental planes might for practical purposes be described as materializations of spiritual entities. Again, a distinct claim is put forward by theosophy to the discovery and use of hitherto unknown laws of nature, and the power which is thus put into the hands of the expert occultist who is also a theosophist is not altogether different from the power claimed by the magician. But, on the other hand, it must be frankly acknowledged that the modern theosophist in India does not, like some magicians, separate himself from the community to such an extent as to desire to use his powers for merely selfish purposes. Further, the ends at which he aims are ultimately of a spiritual rather than of a materialistic character, and in this he shows his superiority over the Christian Scientist in respect of the excessive attention paid by the latter to the claims of bodily health. It is thus undoubtedly true that the modern theosophist is a contemplative, to the extent that he places the spiritual far above the material, but he is perhaps less inclined than his forefathers in India to be interested merely in his own concerns, and he is more inclined to use for social purposes the powers which contemplation and thought-concentration have secured for him.]

(4) we shall see how modern theosophy in India is dominated by ancient philosophical tradition.

1. The Brāhmanic theosophy.—(1) *The beginnings*.—The two tendencies which characterize Hindu thought throughout its course appear early in Brāhmanic circles. The one is the spirit of tradition: the rites and formulas do not show the expected results unless they are repeated just in the way in which the 'fathers' instituted them at the beginning. Not only will every innovation and every addition be avoided, but an even more necessary requirement is that the sacred acts shall be performed only by those who are in possession of liturgical knowledge, viz. by the Brāhmins. The *dharma*, i.e. the rule, which derives its authority simply from its antiquity, thus gradually extends its domination over men's minds. It becomes systematized in one of the six *darśanas*, the *Pūrva Mīmāṃsā*. Anxious care in observing traditional forms has created the power of the priesthood. The fathers of families have been deprived of their religious importance to the advantage of the Brāhmins. The gulf between sacred and profane makes itself more and more evident.

Contrariwise, it is the spirit of novelty which manifests itself in the other tendency. During all the Vedic period the treasury of hymns and rites is taking form and being constantly enriched. If the gods have at first made use of these, it is not the gods who have revealed the knowledge of them. The *ṛsis* have 'seen' and have communicated their visions to men.¹ The gods would have preferred to have the exclusive proprietorship.

Signs of this double tendency are to be found even in the same texts. We may be sure that, in circles as yet differing slightly from one another, tradition and originality existed side by side without offence. Why should they have entered into conflict? Did not both of them find their point of departure in the same hymns? Most of the Vedic deities can scarcely be distinguished from the forces and elements in which they reveal their power. They have almost no characterization, and they represent vaguely the divine which permeates the objects and phenomena of nature. Out of this naturalism, frequently rude in character, there easily emerge the pantheistic conceptions which were so soon to dominate Indian theosophy. Besides, do not ritualists and innovators alike make knowledge the essential condition of religious efficacy? Are not both of them Brāhmins, i.e. the heirs of the magicians who were charged at the beginning with the protection of the sacred rite from the pernicious influence of evil spirits? Finally—and most important of all—do not both believe that there is in every being and in every sacred act a mysterious energy which establishes harmony and co-ordination between man and the universe? And are they not now on the earth, like the 'fathers' of ancient times and the gods in the heavens, the depositaries and the agents of this mysterious force, creator of order and of life? When there is the thought of turning the secret power of the sacrifice to the benefit of the individual, with a view to assuring him of happiness beyond the grave and guaranteeing him against a second death which would be final, there are here the essential elements of theosophic doctrine—desire for deliverance from suffering and death, hope to succeed by personal effort, confidence in the saving efficacy of knowledge.

(2) *The ancient Upaniṣads*.—Theosophical thought, which is to be found in germ in the hymns and in the *Brāhmaṇas*, obtains form and consistency in the *Upaniṣads* (*q.v.*). Certainly the authors of those old treatises were far from

¹ See art. INSPIRATION (Hindu).

having broken their connexion with the traditional cult. But they love to give the sacred actions a symbolic interpretation which will relieve them of their mechanical and formal character. A still more significant thing is that they manifest a well-marked esoteric tendency: usually a long time is spent in appealing to the master before he consents to reveal the supreme truth, and the disciple is under obligation not to transmit it himself except to a particularly dear and well-qualified person. The method of discovery is always intuition; thought proceeds by abrupt illuminations. Moving impetuously and boldly, it puts assertions side by side with one another without concerning itself about their contradictoriness. It does not demonstrate; it is content to illustrate by beautiful metaphors and arresting similes.

In an as yet vague form the idea of the essential unity of the universe was implicitly contained in the Brāhmanic theory of sacrifice. There is now posited the existence of a Being in which all that is finds its reality. This Being is called *Brahman*, the name of the energy which manifests itself in the sacred action. It is also designated the *ātman*, i.e. the self or the soul of all that lives.

'Let one worship *Brahman*, knowing that he is the reality. Let one worship the *ātman*. The *ātman* has for body the life; for form, the light; for essence space. It can take all forms according to its inclination. . . . It permeates all the world. . . . It is the essence of life; it is the essence of myself.'¹ Thus the theme is stated which the *Upaniṣads* go on to develop and repeat without intermission.

This Being is one and absolute. He has no determinations. One can say nothing of him except that he is. No definition is possible. We may at least try to name him, so convinced are we still that we know the Being of which we know the name. He is 'that,' *tat*. He is 'No, no,' for we deny every quality, which would serve only to limit him. He is the reality—the reality of realities, *satya satyasya*. Beyond the reach of all comparisons, he is bliss, a negative bliss, and, in consequence, absolute. He is without a second. He is my *ātman*, the reality of me. There is an identity between the *ātman* which I am and *Brahman*. 'I am *Brahman*.' 'Thou, thou art that.' The universal soul and the individual soul are one.

The world also is real. It derives its reality from *Brahman*, the only reality. A parallel between the psychical and the cosmo-physical is founded upon the unity between the individual soul and the world soul. The cosmos and the $\psi\upsilon\chi\eta$ are the two aspects of the same reality, and the parallel elements which constitute them sustain themselves upon each other.

Finally, *Brahman* is the reality not only of the individual and of phenomenal existence, but also of transcendental existence. For there are two forms of *Brahman*, the one corporeal, the other incorporeal; the one mortal, the other immortal; the one mobile, the other immobile; the one manifested (*sat*), the other transcendent (*tyat*).²

In its individualized form the soul could not have the bliss which is the exclusive prerogative of the Absolute Being. The limited Ego is in contact with the non-Ego, and is unhappy while experiencing the alternations of pleasure and of pain, the impermanence and the vanity of finite things. In truth, 'he who is another than himself is suffering.' This misery is born of individuality and lasts equally long. The active self, the *jīva*, is involved, through its activity, in a series of existences of which each one is determined as to its quality by the quality of the existence which has preceded it. 'According as a man acts, according as he conducts himself, so is he reborn.'³ 'Through good work a man is reborn in a good state, through evil work in an evil state,'⁴ and so on, indefinitely. If the life is evil, it is because the man in his ignorance believes himself a person and says, 'I am such and such a one, this thing belongs to me.' This error and the activities which result from it entangle him in the meshes of a life which ever begins anew. Thus the wise man yearns after repose in the Absolute, in the bosom of a Being in whom alone are permanence and truth. How shall a man succeed in quenching individuality, which is the cause of all suffering? It is not by means of action, since action on the contrary is a source of individual life. Even asceticism has only the value of a propaedeutic: it tends towards salvation, but it does not save. One way only is open to the soul desirous of deliverance, and that is knowledge. Knowledge is necessary, not now of rites and their meaning, but of *Brahman* himself. And since knowledge of *Brahman* means realization of the identity of the self and the Being who alone exists, one must be able to say to this Being: 'Thou, thou art the *ātman* of all that exists. That which thou art, I am that. . . . Thou art the Reality.' This saving knowledge can be reached only through inner vision. The individual sup-

pressing his senses destroys all contact with the outer world and finds *Brahman* in himself. 'The eye would not flash forth to meet him, nor word, nor sense, nor works, nor ascetic practices. But if the mind is calm, if the heart is pure, then one contemplates the indivisible *Brahman*. One cannot know him except in the heart.'¹ If the Absolute cannot be grasped, one may at least approach him by intense meditation directed towards the symbols of him, and very especially by meditation upon the mystic syllable *Om*, for 'in truth this syllable is *Brahman*; in truth it is the supreme existence; it is the best fulcrum of existence; it is the ultimate ground.'² United with *Brahman*, the individual self has no more a distinct consciousness. 'It is when there are two existences that one hears, sees, and knows the other, but when for any one everything has become his own proper self, how could there be anything which he could see, hear, and understand?'³ Moreover, absorbed in the Being who is altogether happiness, he shares in this infinite bliss.

(3) *The Vedānta*.—Of the six philosophical schools which claim connexion with Brāhmanism—more exactly, of the six schools which Brāhmanism has claimed as its own and which it has annexed—three only have given assistance to the elaboration of theosophical doctrine. They are the Sāṅkhya, the Yoga, and the Vedānta (*q.v.*). The last school is the only one of the three which devotes itself to an explicit continuation of the ancient *Upaniṣads*. We shall therefore begin with it, although, very probably, it did not attain its full development until after the two others.

The name Vedānta does not designate a single homogeneous school. There is a strictly monistic Vedānta: reality pertains to *Brahman* alone; all outside of him is nothing but appearance (*advaita*); this is the thesis of Śaṅkara,⁴ at the beginning of the 9th century. Other Vedāntins profess a modified monism—the Viśiṣṭādvaita of Rāmānuja (*q.v.*; 11th century). Others finally abandon monism altogether, not in the sense that they put mind and matter over against each other, but because they allow an essential difference between the individual self and the universal self; these last attach themselves to Mādhva (*q.v.*; 12th century). But, however great their differences, the three teachers all invoke the authority of Bādarāyana, the reputed author of the *Vedānta-Sūtras*, and all three have written on this older teaching a commentary which is the fundamental text of their respective schools.

Rāmānuja has more right than Śaṅkara to claim to continue the teaching of the *Sūtras*. But Śaṅkara more than the two others, more even than Bādarāyana, is in the line of succession to the *Upaniṣads*. While Rāmānuja and Mādhva are explicitly theistic and teach that God, the author of all grace, saves those who give to Him the worship of love and faith, Śaṅkara attributes to God (Īśvara) an apparent existence only, and an accessory rôle in the genesis of salvation. Consequently the history of theosophical doctrines in India is directly concerned with Him alone.

The first *sūtra* of Bādarāyana thus states the object of the Vedānta: 'Now comes the study of *Brahman*.' To know *Brahman*, it is not enough to open the eyes and the ears and search for Being in the world which surrounds us. Between the Ego and the non-Ego there is an irreducible opposition: the senses and the understanding which perceive and appreciate the non-Ego either transfer to the object the qualities of the subject or transfer to the subject that which they believe they know of the object. In either case external cognition is vitiated by error; the true name of this pretended knowledge is 'nescience' (*avidyā*). Outside of us the senses and the understanding give us only the cognition of the phenomena of 'becoming.' Now Being, in reality, does not 'become'; it is. If it were 'becoming,' it would not 'be'; for it is impossible to see how that which is not could come to be. All becoming is only an appearance, an illusion.

This Being, the only reality, retains in the Vedānta the name of *Brahman*. This is the absolute *Brahman*, without determination, or, as the Vedāntins say, without quality; beyond time and space and causation, for time, space, and causation belong to the world of appearance, of *avidyā*. 'Being is one; all plurality results from false knowledge.' As it is impossible for me to doubt the reality of myself—I could not express this

doubt except in affirming my existence—'I am *Brahman*,' provided that 'I' am denuded of every quality and of all contingency, of everything which constitutes my individuality. In this way I am *Brahman* entire, for *Brahman*, being absolute, could not have parts.

Nescience is not only a relation between the subject knowing and the object known; it is also the relation which emerges between the absolute *Brahman* and the world of names and forms. To this cosmic power, more particularly, the name *māyā* is given. *Māyā* (*q. n.*) signifies the alteration which takes place in *Brahman* and in the self as both pass from the category of the Absolute into those of time, space, and cause—an illusory alteration, which affects the ultimate Being and the self only in appearance. *Māyā* modifies on the one hand *Brahman* and thus creates the world; but it modifies also in the same way the Ego and creates the individual Egos. By the existence of *māyā* the unqualified *Brahman* becomes the qualified *Brahman*, the effect-*Brahman*, the lower *Brahman*. Śaṅkara gives to this *Brahman* also the name of God, *Īvara*; but this God, His attributes, and the world which the lower *Brahman* creates, preserves, and destroys, do not exist save in virtue of nescience; all is phenomenal, illusory. From the point of view of true knowledge, there is neither cause nor effect; neither *Īvara* nor world; neither agent nor act; but only Being unchangeable, indeterminate. Under the influence of *māyā*, the *ātman* becomes a *jīva*. The *jīva* becomes individualized through everything which serves it as a substratum, or *upādhi*—the body, the senses, the power of action, and the faculties of knowledge. But the attributes of the *jīva* have no more reality than those of *Īvara*. Truly speaking, the self is not a product; it is incorporeal, spiritual, immutable, infinite, one.

For practical purposes and provisionally, both the world and the individual exist. To both of them even Śaṅkara pays considerable attention. Both are subjects and objects of action. Their destiny is determined by *karma*. 'An act cannot be annulled; this is the universal law; or, at least it cannot be annulled except through working out the result.' Action produces life, and life produces action. The self which acts will be reborn for action, and, again, for rebirth. The chain of causes and effects has not had a beginning. How could it have an end? Fortunately, cause and effect, act and result, are the work of nescience. And what nescience has produced, knowledge will destroy. 'As long as nescience has not been abolished, the individuality of the self is not abolished, and the individual soul continues to be the sphere of good and evil.' The individual can, by a knowledge of *Brahman*, escape from *karma* and the misery of a limited life. If he has discovered how he may attain this by a severe spiritual discipline, he can, through concentrating his thought upon himself and by a kind of spontaneous effort, reach the 'perfect vision,' *i. e.*, he can perceive the *ātman* in himself and thus have an intuition of his identity with the supreme *Brahman*. This vision destroys in him the remnants of personality and dissipates the mirage of the empirical world. He is saved. He is *Brahman*, and in consequence he is, in an absolute sense, being, thought, and bliss.

(4) *The Sāṅkhya*.—The Sāṅkhya (*q. v.*) is of ancient origin, for its influence upon primitive Buddhism cannot well be disputed. The main pronouncements of the school are, however, of later date, and several centuries subsequent to the birth of Buddha. Fortunately there are other works—*e. g.*, the *Mahābhārata* and some ancient Buddhist writings—which mark out the path of development from the *Upaniṣads* to the classical form of the Sāṅkhya. As we now have it, the Sāṅkhya, realistic and atheistical, is Brāhmanical. It has no difficulty in including the Veda among the standards of knowledge. It may be that, originating outside of Brāhmanism, it was at a later date recognized by the latter, and has paid for this advantage by an adhesion, more or less nominal, to the authority of revelation. Nevertheless, as we find in works undoubtedly orthodox the antecedents of several essential doctrines of this system, it is more probable that it has originated from the same circles as those in which the ancient *Upaniṣads* were elaborated. Its genesis can be best explained if it is regarded as a product of reaction against the radical idealism which is implicit in the *Upaniṣads* and develops in the Vedānta.

The Sāṅkhya posits the absolute reality of the empirical world. If it is said that the world of things is the theatre of a perpetual becoming and that it is impossible to predicate being of that which is impermanent, its answer is that a thing is not real only at the moment when it manifests itself; it has also a subtle state, in which it exists potentially in its cause. For the effect is already to be found in its entirety in the cause: 'The effect and its cause are one.' To affirm the reality of things when they are in the subtle state is to assert that they are already substantial. The ordinary man is unable to see

them in their causes because his senses are too gross. If, by ecstasy or as a reward of exceptional merit, he intensifies his power of vision, he will perceive the subtle as easily as the gross.

Whether subtle or gross, the world is essentially composite and changing. Now every complex thing implies a simple Being for the sake of whom it is formed; everything that changes changes only for the sake of an immutable Being. Thus, ever against a substance composite and changing, the Sāṅkhya philosophy posits a simple and stable substance; with the *prakṛti*, which is the sphere of becoming, it contrasts the *puruṣa*, which is Being. Everything that acts or is acted upon, everything that changes and lives, the object known, the act and the organs of knowledge, all depend upon *prakṛti*. This includes *ψυχή* as well as *φύσις*, since, in the living being, the *ψυχή* must nourish itself like the *φύσις*, in order to sustain life and growth.

The change which emerges in the physical and psychical universe is a regular evolution, taking the form of a determination, a growing complexity, an increasing materiality. In its creative aspect evolution brings the gross out of the subtle. At the dissolution of the world the gross resolves itself into the subtle. The Sāṅkhya, which has minutely described the successive phases of the evolutionary processes, posits 24 principles (*tattvas*) which are arranged in order, from the *prakṛti*, the common foundation of all phenomenal existence, to the gross elements and their combinations. It is because the *prakṛti* is not simple that it has been able thus to produce all the things of the physical and mental world. It is threefold. It is composed of three factors, themselves substantial, which are called *guṇas*. These are *sattva*, *rajas*, and *tanuś*, goodness, passion, and darkness. It is by their presence in infinitely varying quantities that things affect men differently.

The 18 *tattvas* which in the evolution emerge between *prakṛti* at the one end and the gross elements at the other unite to form the 'characteristic body,' the *linga śarīra*. The *linga śarīra* is subtle and is to the gross body as the cause is to the effect; it explains the differences, both physical and psychical, which distinguish individuals from one another. Whilst the gross body is destroyed by death, the *linga śarīra* passes from birth to birth and constitutes the identity of the individual in the series of its existences. In every life it becomes richer or poorer according to all that a man thinks, does, or resolves. It is like capital which bears as interest the quality of succeeding existence. The characteristics of the *puruṣa*, or the soul, are directly the converse of those of *prakṛti*. The *puruṣa* is simple, immutable, inactive, unproductive, without *guṇas*. It is also multiple. Because all the souls have not the same kind of knowledge, and because some are free and others are still bound, it follows of necessity that there is an infinity of souls. But the *puruṣa* is in itself independent of all individualization to such an extent that we can always speak of it in the singular. The *puruṣa* is light and understanding; it is light without even having anything to illumine; it thinks without even having any object of knowledge.

Being and becoming, both infinite, are not placed simply over against each other. There is a relation established between them which explains creation, knowledge, and salvation. The neighbourhood of the *puruṣa* in fact causes in the *prakṛti* an excitation which leads in it to the formation of a subtle body in connexion with each *puruṣa*. But the subtle body is only the substratum of the conscious life. That emerges in virtue of the immediate presence of the soul. It is the form in which is expressed the relation between the *puruṣa* and *prakṛti*. Now this relation involves suffering for the soul. It is real, but it is not inherent in the soul. Because it is real, deliverance is necessary; because it is not inherent, deliverance is possible.

Both the *puruṣa* and the *prakṛti* have to submit to certain consequences of the relation in which they are bound. When illuminated by the *puruṣa*, the modifications which take place in the *ψυχή* of the individual become conscious. These again are reflected upon the soul, which thus becomes subject to all the interplay of the affections. It is in this roundabout way that the soul arrives at a knowledge of itself. For, though it is the subject of all knowledge, the *puruṣa* cannot know itself directly. This knowledge becomes possible through a reflexion coming from the mirror provided by the internal organ. The *puruṣa*, full of light but inactive, and the *prakṛti*, active but unconscious, stand to each other in the relation of the paralytic to the blind. Their association is discovered to be beneficial for both. In the service of the *puruṣa*, the *prakṛti* is creative, and this creation has no other end than to make knowledge possible for the soul—which knowledge necessarily eventuates in salvation.

A slow and elaborate process is necessary to break the bond and suppress suffering. This is the main intention—not to destroy actual suffering, which on other grounds would be impossible, but to make it abortive in its germ or in the persistent dispositions stored in subtle form in the internal organ. A slow internal struggle brings a man from the natural state—*i. e.* the morbid state—to absolute healing. Works and asceticism may prepare the ground, but it is knowledge which is truly efficacious. By means of study, self-contemplation, and meditation, we may arrive at an assertion of the truth: 'I am not; nothing is mine; this is not me.' One thus gets a direct perception of the distinction between the Ego and the *prakṛti*. To establish this distinction is to destroy the bond and to see the *puruṣa* in its absolute purity. Henceforth the soul has no other substratum than itself; there is no further association with the subtle body, no reflexion cast by it; the soul is healed.

The *prakṛti* also derives advantage from a deliverance which, in effect, suppresses suffering for it, inasmuch as suffering is not felt except for so long as the *prakṛti* is illumined by the soul. As it would not be creative except in relation to the soul and its salvation, it ceases to be active and returns to the original equilibrium of the *gunas*. Moreover, this healing has no value except for the liberated soul. 'Since, notwithstanding the infinity of time, there are still souls not liberated, there will be such to all eternity.'¹

(5) *The Yoga*. — It might be asked if in the history of Indian theosophy the place of the Yoga (*q. v.*) is truly next to the Vedānta and the Sāṅkhya, if its affinities are not in an altogether different direction and with the group of systems which, though they adopted many theosophical ideas, are obviously theistic and devotional in tendency. Does it not make a place for God, for that Īśvara who is a 'soul apart,' a unique Being, eternal, all-powerful, all-good, all-knowing, exposed to no suffering, to no desire or change? Does not this God show an infinitely benevolent activity on behalf of men desirous of salvation? Does He not vouchsafe spiritual vision to His elect? Does not the *yogī*, to obtain salvation, surrender himself to God with that feeling of complete abandonment which is called *pranidhāna*? Finally, is not salvation obtained by means of a discipline in which the strictly intellectual processes have little place? What have the recognized means for purifying the body and delivering the soul from the organ of thought to do with the pursuit of *jñāna*, the knowledge which brings salvation?

It is easy to answer these objections. First of all we may remark that the rôle attributed to Īśvara in the scheme of salvation is really secondary. After the preliminary process is gone through, there is no further intervention of divine assistance to second the efforts of the *yogī*, and everything happens as if he had only his own powers to rely upon. Further, the supreme end is not, by any means, as in theistic religions, eternal life in God or near God; what is desired is the absolute isolation of the individual soul. It follows that, probably, when the Yoga came to be systematized, Īśvara was merely a survival of a period when practices of asceticism and sorcery were associated with Śiva, a god whose vigorous personality might seem incompatible with an exclusively human conception of salvation. In fine, Īśvara was no more an inconvenient intrusion in the Brāhmanical Yoga than in the monistic Vedānta; it is even possible that his presence was indirectly the sign of the penetration of the Yoga by the theosophical spirit.

The Yoga, desirous of specially emphasizing the practical conditions of meditation and saving ecstasy, would naturally disregard study and reflexion, since neither of them was of service in securing the marvellous powers for which the *yogī* was ambitious. But, as in Brāhmanizing itself it had adopted very nearly in its entirety the doctrine of the Sāṅkhya, there was really no need to indicate the acquisition of knowledge as among the demands imposed by the need for salvation. This acquisition could have been considered as implicitly prescribed from beginning to end. In any case it is interesting to point out that in an *Upaniṣad* greatly influenced by Yoga ideas, the *Maitrī Upaniṣad*, the examination of reflexion had a place among the members of Yoga. Perhaps we have in this a proof drawn from a period before the Yoga became entirely allied to the Sāṅkhya.

In other characteristics the Yoga shows itself faithful to the theosophical spirit. It rests upon very ancient beliefs closely related to magic. The remarkable manifestations of patience, will-power, and intelligence reveal the presence of supernatural faculties and imply in their possessors a new acquisition of energy. Besides, the accomplish-

ment of salvation depends entirely upon personal effort. There is no possible doubt that the Yoga belongs legitimately to the same spiritual family as the Sāṅkhya and the Vedānta.

Properly speaking, the Yoga is the act by which the senses and the understanding are held in restraint; turned resolutely in one single direction, the mind acquires greater force and certain new faculties. The processes regarded as efficacious had already been employed for a long time when Patañjali formulated his theory of them. If, as is probable, the author of the *Yoga Sūtras* is the same as the illustrious grammarian of the same name, then this spiritual discipline was systematized in the 2nd cent. B.C. But, in the influence which from the beginning it exerted upon Buddhism, we have proof that it goes much farther back. The proper object of the Yoga, as supplied with doctrines by the Sāṅkhya, is, as the first of the *Sūtras* says, 'the suppression of the modifications of the thinking principle,' i.e. of the understanding. Freed from all *chitta*, the *puruṣa* regains its own nature. We are not concerned, as in the Vedānta, with recognizing by an effort of thought the identity of the Ego and the universal self; nor with distinguishing, as in the Sāṅkhya, the self from that which is not the self; the aim is to bring about the integration of the soul, in which consists her salvation.

The *yogī* pupil has difficult conditions to fulfil. A long and painful process of preparation is imposed upon him, so that he may triumph over all the obstacles inherent in the feebleness of man. It is in the first phase of this process that devotion and the practice of mortification have their parts to play. Whenever this propædeutic has fulfilled its functions, the adept may proceed to exercises which lead to the suppression of the intellectual functions and the detachment of the soul. According to the authoritative scheme, the programme of this gymnastic is divided into eight members. Five of these rubrics aim at the bringing of the body under control. They comprise interdictions and injunctions, prescriptions relative to the positions to be taken in meditation, and others which have for their aim the control of breathing, and, finally, the procedure which has to be followed in restraining the senses and destroying communications between the mind and the external world. There is special insistence upon the regulation of the breath, on the ground that individual life and thought are bound up with respiration, and that to control the one is to dominate the other. When, finally, the body has been purified, it becomes possible to exercise control on thought; three kinds of exercises lead it progressively towards unification, the destruction of individuality, and isolation.

Another method, more violent and more complicated, is founded upon a most bizarre kind of physiology. Through modifying and even stopping the circulation of the vital spirits in the channels of the body, the *yogī* succeeds in suppressing the natural functions of the understanding and in exalting the power of action and of vision. Strange phenomena accompany the last phases of this spiritual process: colours appear which are invisible to the ordinary man; sounds are heard; the *yogī* sinks into a 'mystic slumber.' Sometimes also the strain of so much effort ends in madness. The texts expatiate at great length on the manifold advantages which Yoga brings to its disciples. First of all there are benefits of an entirely mundane character: health, youth, and beauty. Especially there is obtained a 'sovereign power' which enables those who possess it to realize immediately all that they desire, to make themselves at will exceedingly small or big, light or heavy; to control the elements; to guide the will or sentiments of another; to change the nature of substances, to distribute their personality amongst several different bodies, etc. But for the *yogī* the spiritual results have more value. In seven stages the soul obtains liberation, first of all from the external world, then from the hindrances which come to it through its association with the organs of the intelligence and the will. Liberated from the world of results, the soul rejoices in pure tranquillity; dissociated from the internal organs, it tastes the ineffable delights of ecstasy, and reaches without any distraction the state of integration (*kaivalya*) in which is its salvation.

Before leaving Brāhmanic theosophy, we may point out that in more than one characteristic it is very closely connected with Western occultism (*q. v.*). Our theosophists have, like the Vedāntists, a marked tendency towards monism; their anthropology has borrowed much from the Sāṅkhya philosophy; they authorize exercises which are not without analogy to those prescribed by the Yoga.

2. Theosophy as the germ of new religions.—In

¹ *Sāṅkhya Sūtras*, i. 158.

Brāhmanism the theosophical doctrines are placed alongside of the old tradition, and religious society remains confined to the old framework. When theosophy is transformed into a religion, the conditions are altogether altered. Henceforth a man becomes a member of a community, not because of his birth, but because of his adherence to a certain belief; the idea and the group are co-extensive. Moreover, theosophy ceases to be a mere intellectual doctrine; it takes entire possession of the individual, and aims at maintaining among its adherents the unity of discipline and of life.

Two religions have sprung from the movement of thought which we find permeating the old *Upaniṣads*, viz. Jainism and Buddhism. Seeing that they are born in the same spiritual environment, it is not strange that they should have many characteristics in common. Their doctrines, their legends, their rules of life, have an unmistakable air of family relationship. The worship itself, in its outer forms, is so similar in various particulars that from the outside one might easily confuse the two systems; witness only the tale of Aśvaghosa in which one finds King Kaṇiṣka worshipping a Jain *stūpa* under the impression that it is Buddhist. Jainism and Buddhism are both products of the process of crystallization which was a feature of the period of the ancient *Upaniṣads*. Besides Brāhmins practising strict observance of rites and a solitary asceticism, India has been familiar with what one might call wandering cenobitism. The teachers, accompanied by their disciples, go from place to place, not settling down anywhere except during the months of the rainy season. These *parivrājakas*, in the course of instructing their pupils, discuss the most diverse subjects. The groups are not closed. Round about a knot of faithful disciples there gathers a numerous body of adherents and friends. If Jainism and Buddhism have been able to transform themselves into Churches, the reason is that they have understood better than some other *saṅghas* how to attach the laity by solid bonds and to organize the community by fixed rules. There is now no doubt that Jainism is prior to Buddhism. Buddhists themselves do not hesitate to admit the fact. But Jain writings are certainly posterior—and very much so—to those of Buddhism. It may well be that, if there has been borrowing, the Jains have been the debtors. If we begin with them, it is not in order to lay stress on the relative dates, but rather because, on the whole, the Jainist Church has remained more faithful to the theosophical tradition of the *Upaniṣads*.

(1) *Jainism*.—Jainism (*q.v.*) has all the characteristics of a theosophical religion. It puts at the centre of its teaching the doctrine of *karma* (*q.v.*), and shows itself chiefly interested in human destiny. It aims at delivering men from the misery of the *saṃsāra*. It demands that the individual should be the instrument of his own regeneration. It searches for the saving truth beyond phenomena and sensible perception, and, as a consequence, asserts the authority of persons endowed with exceptional faculties of vision and knowledge. It places itself outside the Brāhmanic tradition. Nothing more is heard of *Īśvara*. Jainism is a 'human' doctrine. *Śaṅkara* sees in this a reason for its condemnation. Because it opposes to Vedic tradition a new rule, this theologian accuses it of not being 'revealed.' And yet Jainism also makes it a duty for its disciples to have faith in the words of an omniscient master, who made known the way of emancipation, who has triumphed over the world of death, and who, because of this, has received the surname of *Jina* ('the Victorious').

Perhaps because the Jains appeal to omniscient teachers, they have promulgated a theory of knowledge which forbids any absolute affirmation or denial. Every proposition has a relative value only (*anekantavāda*); a thing is not thus; in a way it is this; I can say that a thing is not, that it is, and that it is not, that it 'cannot be spoken of,' etc., only if it is understood that these predicates are true merely relatively and under certain reservations (*syādvāda*). As far as one can conjecture from the examples which illustrate the various dialectic 'refractions' (*bhaṅga*), the aim of the *syādvāda* is to show that nothing can be known except in relation to the totality of the universe, where birth, duration, and death rule together, and that, relatively to this indeterminate universe, things are themselves indeterminate. 'Everything is indeterminate by the very fact of its existence.'¹ The aim of this doctrine was to destroy at one and the same time the monistic dogmatism of the Vedānta and the negations of the sceptical schools.

Everything in the universe comes under one or other of the five categories of substances (*dravya*): soul (better, life), space, merit, non-merit, and material molecules. Souls (*jīva*) and molecules (*puṅgava*) are infinitely numerous; space, merit, and non-merit are single. Merit (*dharma*) has the effect of furthering the progress of the soul; non-merit (*adharmā*) leaves it stationary. The progress of the soul is the consequence of its *karma*.

In fact, the soul is by its nature limited and active. As limited, it has the dimensions of the body, which serves as its substratum; it is lessened and increased along with the body. As active, it receives in virtue of its *karma* an influx of material molecules, which, according to their quality, are black, blue, grey, yellow, rose-colour, and white, and which affect the *jīva* by giving it various colours. This influx of karmic matter is the bond which links the soul to the *saṃsāra*. The individual who aspires to salvation has the task of purifying his soul. By asceticism he eliminates the *puṅgava* which stain it. By draining off the acquired *karma*, asceticism is the essential factor in *nirjāra*, or the burning up of the effects of *karma*. Thus one of the characteristics of Jainism is the extreme importance which it assigns to *tapas*. It is not sufficient to annul the past; it is also necessary to prevent the formation of new *karma*. And this desirable result is produced by discipline, by *saṃvara*. In its two principal forms it prevents the entrance of the karmic *puṅgava* into the *jīva*; the two forms are control (*gupti*) and good behaviour (*saṃtī*). By *gupti* the soul represses the activity of the body, of speech, and of the mind; by *saṃtī* it so behaves as not to injure or offend any one. Reflexion and meditation are also efficacious means of discipline and of defence against the pernicious influx. Right vision (*i.e.* right faith), right knowledge, and right conduct complete the way of deliverance. And, just as an elixir does not heal any one except him who knows it, has faith in it, and applies it properly, so the Three Jewels cannot produce deliverance unless they are united.

Henceforth, liberated from the *saṃsāra*, the zealous Jain is a *siddha*, a perfected being. He is disburdened of all karmic matter. He is without colour. His soul, lightened of every hindrance—like a flame which rises by its own strength—begins its course upwards towards the higher regions of the universe. There he enjoys a happy and eternal existence. *Mokṣa* has the effect of rendering the *jīvas* detached and free.

(2) *Buddhism*.—Buddhism also is a theosophy which has expanded into a religion. If the 'high priest' of Ceylon can give his approval to the catechism drawn up by Colonel Olcott, and, still more, if the communities of Ceylon, Burma, Japan, and Mongolia give their adhesion to the fourteen articles in which the same writer gathers together the fundamental beliefs of Buddhism, the reason lies in the unmistakable affinity between the tendencies of present-day Buddhism and those of Western theosophical societies. But we have no need of external proof to enable us to assert the fundamentally theosophical character of the teaching of Gautama Buddha.

'As the ocean has only one savour, the savour of water, so the doctrines which I teach and the rule which I establish have only one savour, that of salvation.'² Buddha wishes to save men, not from sin, but from suffering and death.

He summons all men to salvation. 'The gate of immortality is open for all beings. Let him who has ears come, hear the Word and believe.'³

He rejects the authority and traditional knowledge of the Brāhmins. 'In a line of blind men who attach themselves to one another, the first does not see, the man in the middle does not see, the last does not see. Such are the discourses of the Brāhmins. Their faith is without foundations.'⁴

He makes salvation a personal matter for each individual. 'Be your own lamps; be your own refuge. Do not search outside yourselves for a lamp or a refuge.'⁵ 'You must yourselves make the necessary effort. A Buddha is only a counsellor.'⁶

Finally, the framework of the building erected by Buddha

¹ *Sarvadarśana Sūtras*, p. 29. ² *Chullavajja*, ix. i. 4.

³ *Majjhima Nikāya*, i. 170. ⁴ *Ib.* ii. 169 ff.

⁵ *Digha Nikāya*, ii. 101 (= *Mahāparinibbānasutta*, ch. ii.).

⁶ *Dhammapada*, v. 276.

is constructed almost entirely from materials borrowed from the Brahmanical schools, nurtured in the teaching of the *Upaniṣads*.

The method of salvation which Buddha preaches to men includes rules of life and truths of an intellectual character. But since it is well understood that his teaching has but one savour, there is no hint that men should practise virtue because it is virtue, or search for knowledge because of the practical or intellectual satisfaction which knowledge brings. Morality and learning, in intention at least, are looked at only from the narrow point of view of salvation. Thence come the limits within which they move. In fact, Buddha did not wish to teach either morality or science, but only a therapeutic of the will and a therapeutic of the intelligence. When once a man is healed from moral evil and from error, he may work onwards towards salvation.

(a) *Therapeutic of the conduct*.—Only a soul purified by moral discipline can receive with profit the teaching of the Law. The most formidable enemy of salvation is the desire for sensual enjoyment. Sensuality figures in all the lists of depravities, infections, obstacles, and hindrances. It is against sensuality that men have chiefly to struggle. Hence the imperious necessity of exercising constant control over the senses. Of all the virtues vigilance is most characteristic of Buddhist moral teaching.

(b) *Therapeutic of the intellect*.—Knowledge is not less necessary than good conduct. Like good conduct, it has chiefly a negative value. In theosophies closely connected with Brahmanism knowledge is a working out of deliverance in a positive manner, because upon the topics of God, the world, the soul, and human destiny there is a body of knowledge directly efficacious for salvation. But the point of view of Buddha and his earlier disciples is quite different. That which they want is to deliver the mind from unfavourable thoughts which may hinder the individual or at least lead him in a false way. It can be understood how different are the conditions under which the spiritual struggle presents itself according as one admits or denies the existence of eternal and immutable beings, whether immanent or transcendent or both. Buddha's aim was to show that in the succession of phenomena no cause was revealed which was not itself phenomenal, and to deduce from this proposition the consequences affecting the moral life of the individual. The earliest Buddhism neither knew nor wished to recognize anything other than phenomena. Phenomena, both physical and psychical, constitute *dharma*. In us and outside of us we reach nothing but *dharma*, not because of our mental incapacity, but because neither in us nor outside of us is there anything but *dharma*. The constituents of *dharma* are not hung, as it were, upon a substance of which they are the momentary phases; they are themselves the whole reality. Primitive Buddhism is thus at the opposite pole from the Vedānta, which abstracts from phenomena and regards Absolute Being as the only reality.

Whether subjective or objective, phenomena are incessantly changing, and things are involved in a perpetual flux. Phenomena are just those states of individuals and objects of which the essential characteristic is complexity. Now only the simple and homogeneous can be permanent. The human individual is an assemblage of five kinds of aggregates, and this composite is modified from moment to moment. What is called the individual (*paṇḍita*) is a series, more or less lengthy, of the phases of composites continually altering. The movement of aggregates, or of combinations of aggregates, does not take place by chance, or without any system. One cause determines the condition of every new combination, and this cause is the quality of the antecedent combination. With conscious individuals, who alone are interested in the theory of salvation, the causal combination is an agent, and his action produces results of two kinds; it manifests itself externally as the immediate cause of phenomena, and internally as a modification of the doer himself of the action. *Karma* may be defined as the reaction of the act upon the subject. This reaction takes place generally at the dissolution of the body after death, in such a way that the binding force of one individual life reappears in another individual life. As Buddhism has discarded every hypothesis not connected with visible forms of existence, it does not posit a subtle body as the vehicle of *karma*, or an *īśvara* as the controller of resultants. Even at a distance *karma* is a force which works mechanically. Moreover, it fulfils in Buddhism the function of explaining the congenital differences which are found among men, and of awakening in the hearts of the faithful adherents the feeling of their moral responsibility.

Karma is far from being a doctrine specifically Buddhist. The same cannot be said of the two sets of rules the discovery of which transformed the potential into the actual *buddha*: the Four Noble Truths and the Twelve Causes. These Buddhism has always claimed as its own. The Truths are suffering, its cause, its suppression, and the way which leads to suppression. 'What is impermanent, that is suffering.'¹ 'The craving

for existence and for the cessation of existence are the causes of suffering.'¹ 'The suppression of suffering consists in the destruction of the craving by the complete suppression of desire.'² We arrive at suppression by following the Noble Eightfold Path—right knowledge, right willing, right speech, etc. The ultimate significance of the Twelve Causes is to explain suffering without having recourse to any principle except those recognized by Buddhism, viz. the aggregates, *karma*, and the Noble Truths. Through one causal link after another, the life of suffering is connected with its deepest source, viz. ignorance. In this way there is excluded the notion of a soul which would be essentially and incurably suffering. There is eliminated also the interference of a God who imposes the suffering upon His creatures; if the misery came from outside, it would not be in the power of man to put an end to it. It does not belong to the Ego as a permanent substance, and, since the older theosophy had shown that man cannot find God except in and through the Ego, Buddhism, by denying the *ātman*, is compelled also to deny *Brahman*, the original and immanent cause of the universe.

If Buddhism is a theosophy, it is much more a religion. Religion aims at satisfying much more varied needs than does an essentially intellectual doctrine. Religion is a manner of living, and not only a manner of thinking. The necessities of life and of controversy soon compelled Buddhism to extend considerably the range of its practical and dogmatic teaching.

In ethics Buddhism was far from confining itself to the limits imposed by the demands of salvation. In seeking to give the greatest possible effectiveness to its moral pronouncements, Buddhism does not take the trouble to co-ordinate systematically the lessons which circumstances suggest. When it addresses itself to the laity—as frequently happens—it disregards the special conditions of the strictly religious life, and its precepts obtain a universal significance. The exclusive interests of personal salvation are then so far from its thought that the virtues which it enjoins have a social and human value—compassion, charity, humility. Similarly there is an expansion of doctrine. Questions kept in reserve at the beginning soon had to be investigated, and the reason for this was that facility might be obtained for discussing them with rival schools. Ontological and epistemological topics soon became the order of the day. It was inevitable that, even within the limits of Buddhism, some divergent solutions would be proposed. Hence the appearance of sects in which tendencies showed themselves which had hitherto remained latent: the realistic schools of the Sarvāstivādins, the idealistic schools of the Yogācāras, the nihilist schools of the Mādhyamikas.

The later disciples of Buddha deliberately abandon the prudent agnosticism of their Master. Their speculations are concerned with the transcendental world (*lokottara*). Even the fundamental unity of the universe is affirmed (doctrine of the *tathatā*). It is noteworthy also that Buddha himself, who from the earliest times had been regarded as the perfect example of humanity, comes to represent, in the theory of the Threefold Body, at one and the same time, phenomenal existence, non-sensible existence, and absolute existence—the body of creation, the body of bliss, and the body of the Law.

But, even when considerably amplified, conduct and knowledge are not given more than a negative importance as regards salvation. Upon the soil cleared by them the problem is now to construct the properly religious life. On what plan will this building be erected? It will be no matter of astonishment that, being at once theosophical and religious, Buddhism has conceived a double ideal of life and has proposed two different methods. To become *arhats* and accomplish their own salvation was the aim of the *stharivas* of the ancient Church; they are the adherents of the Lesser Vehicle. Those of the Greater Vehicle

¹ *Saṃyutta Nikāya*, iv. 26.

¹ *Mahāvagga*, i. vi. 20.

² *Ib.* i. vi. 21.

aspire to become *bodhisattvas* and believe in religious solidarity.¹ It was enough for the first to transform a sinner into a saint; the others have more ambition; they desire that the sinner, following in the footsteps of Buddha, should become a saviour. It can easily be understood that the way of the *arhat* and the career of the *bodhisattva* separated themselves perceptibly from one another.

(a) *The way to arhatship*.—Conversion makes of the Buddhist a new man. He 'enters into the current.' By an energetic and long-continued struggle he destroys in himself the adverse principles. Two roads to the goal now open up before him. The one is through a series of spiritual exercises. Meditation and intense concentration secure in him serviceable tranquillity (*śamatha*). No more of attachment, no more of desires; the very residues of desire are destroyed. The results of the liberation of the heart are clear vision (*vipaśyanā*) and wisdom (*prajñā*). The other way is that of enfranchisement (*vimokṣa*). The path to the awakening is by ecstatic contemplation (*dhyāna*). From ecstasy to ecstasy the monk rises in eight stages (the *saṃāpatti*) to a state of being which is neither thought nor the absence of thought. It is the suppression of voluptuous ideas, of discursive ideas, of joy, of breathing—the abolition of the world of forms by that of space, and of the world of space by that of knowledge; of the world of knowledge by that of the non-existence of things, and of the last by that in which there are neither ideas nor the absence of ideas. Arrived at this already very elevated stage, the *arya* enters into possession of superior powers (the six *abhijñā*). But it is necessary to go even higher. A ninth and last *saṃāpatti* leads to the 'dissolution of all conscious perception,' to 'the awakening,' to *saṃbodhi*. When one has taken the way of wisdom or of enfranchisement, one becomes an *arhat* (*q.v.*), a saint. The *arhat* has done 'that which he had to do.' When his *karma* is drained off, he will be extinguished without his last thought or his last aggregate giving rise to a further thought or a further combination.

(B) *The way to Buddhahip*.—As the ideal is higher, the method is more complicated. The career of the *bodhisattva* (*q.v.*) demands a long preparation and solemn pledges. There must emerge in the man the 'thought of illumination' (*bodhicitta*), that he should take the vow to do everything to arrive at the goal (*prañidhāna*); that by an act of will he should 'assign' to the advantage of another his actions and the fruit of his actions (*pariṇāmanā*). Then commences the struggle properly so called. In order to obtain illumination, the *bodhisattva* must provide himself with a double equipment, merit and knowledge. The programme which has to be followed includes acts of worship, rules of conduct, and the practice of meditation. The object is to acquire successively the ten perfections (*pāramitā*), each corresponding to a spiritual world (*a bhūmi*). At the end of this long ascent the *bodhisattva* obtains finally the illumination which makes him a *buddha*, i.e. a liberator of creatures, an ultra-phenomenal being still sojourning for a time in the phenomenal world.

For *arhat* and *bodhisattva* the eventuality is the same—*nirvāṇa* (*q.v.*), extinction. What does it matter that neither Buddha nor his authorized disciples have said what *nirvāṇa* is? If one knows that it is the abolition of suffering and death, of relative and individual existence, that is enough to make it an infinitely desirable state. If Buddha has gained control over natures of the most diverse qualities, it is just because he has left them the liberty of imagining a *nirvāṇa* conformable to their needs and their aspirations.

Let us take a look backwards. We may agree that Buddhism has certainly characteristic marks of a theosophical system. It regards ignorance as the source of all the evil of living, and knowledge as the panacea of suffering. It seeks to deliver its adherents from the fear of death. It endeavours to upset the Brāhmanical methods of salvation. It denies that texts or doctrines have any direct value for salvation, and it affirms the value of 'vision,' of intuition arrived at by internal concentration and ecstatic meditation. It demands that every man should be the architect of his own salvation, and, even though it multiplies the 'saviours,' it no less emphasizes for the individual the necessity of personal effort. It teaches that knowledge is power, and that spiritual excellence manifests itself outwardly in extraordinary faculties. It breaks through the traditional framework and urges the individual to work without procrastination towards his regeneration and so to

arrange matters that this labour shall fill his whole life.

3. Introduction of theosophy into sectarian religions.—Brāhmanism in its different aspects was only one of the forms of the religious life; in every period there was also the popular current, powerful, infinitely varied, and mobile. Just as in the sacerdotal tradition minutely elaborated rites occupy the principal place, gods and demons are central in the popular religion, and the worship which is given to them, mixed throughout as it is with superstitions and gross practices, answers more fully to the idea which is generally held of devotion and of piety. These two religious contents have not existed side by side without exerting an influence upon each other. We have here to do only with the influence exerted by the theosophy of Brāhmanism. This influence is only a particular illustration of the growing preponderance which the sacerdotal caste obtained in all the moral life of India, and of which the Buddhist writings themselves give unmistakable evidence. Nothing is more natural than this primacy. The Brāhmanical families had at their disposal two powerful forces, tradition and cohesion. In a society which was crumbling to its foundations they formed a solid group, cemented by community of interest and of ambitions and reinforced by the habits of knowledge and of virtue. Popular forms of worship, legal and social rules, and secular poetry no doubt flourished to a large extent outside of Brāhmanical circles; but the influence of the latter has none the less succeeded in filtering through at every point. Just as Sanskrit, the scholastic idiom of the Brāhmins, invaded the epic and the drama, the popular style, and the literature of business, so the Brāhmins made themselves the theologians of the sectarian religions. They applied to them the methods of their systematizing temperament. They also introduced into them their conceptions of being, of the world, and of destiny, hesitating less to popularize these conceptions since Buddhism had already deprived them of their esoteric character.

We have in the *Mahābhārata* (*q.v.*) excellent evidence of the appropriation by Brāhmanism of materials which were without doubt independent. This document is all the more significant because it shows clear traces of successive accretions, and because its slow elaboration was carried through during the many centuries when the Brāhmins were gradually establishing their spiritual domination. We may regard the poem as completed, in the form in which we know it, at the time when neo-Brāhmanism was triumphant, i.e. in the 4th or 5th cent. A.D. And this voluminous encyclopædia of the traditional knowledge of the Hindus is something more than a witness; it was also one of the agents, perhaps the most effective of all, in the expansion of Brāhmanism in India. Before, during, and after the composition of the great epic, a mass of writings emerge to illuminate or supplement its evidence—sectarian *Upaniṣads*, *Dharmasāstras* (as the first of which we may regard that which bears the name of Manu), *Purāṇas*, books written in prose or in verse by the numerous reformers of Hinduism or under their influence. Unfortunately the investigation of this rich literature has not yet been completed.

By gaining entrance into works definitely popular, the ideas whose development we have hitherto followed in the texts of a school or in the monastic literature began to exert a powerful influence upon the general thought of India; and nothing proves more effectively the plasticity of religious thought than the faithfulness with which conceptions originally monistic and antitheistic persist, almost

unchanged, in sects permeated with the most ardent devotion.

As in the ancient theosophy, the soul is haunted by the thought of death: 'Every being is in fear of death.'¹ 'Some men in their fear of death have died of fear.'² 'The world is under the attack of Mṛtyu. How dost thou not think of it?' 'Do to-day that which you will have to do to-morrow: do this morning what you will have to do to-night. Death does not trouble itself with what one has done or with what one has not done. It seizes a man as a wolf carries off a lamb.'³ There is not a moment to lose: 'the days pass away; life wears to an end. Rouse yourself and run.'⁴

The new religious conceptions bring home to men the necessity and the way of salvation: 'Let a man search for a remedy through the suppression of suffering and let him apply it without murmuring. Then he will be free from misery.'⁵ It is the individual life which is full of suffering and death; it is necessary to get deliverance from it: 'Death has two syllables, for it is *mama*, everything that I consider as my own. *Brahman* has three syllables, *na mama*, for in it nothing is mine.'⁶ There is always the same hate of the body and its fugitive pleasures: 'Let one becoming an ascetic, abandon this stinking body, full of filth and urine, subject to old age and disappointment, the abode of maladies, burnt by passions and perishable.'⁷ 'All the joys which arise from contact with the world are a source of suffering; they begin: they end; the wise man does not find in them any pleasure.'⁸

How is man to be saved? The means of salvation have become more numerous and more varied. There is nothing more interesting than to mark the persistence of the ancient ideas and the traditional formulas. The new has not destroyed the old. Salvation is the result of an effort entirely personal. 'Strengthening your soul by your soul, vanquish the enemy who reclothes the forms of desire, and who is difficult to strike.'⁹ 'The *yoḡī* is he who finds within himself his happiness, within himself his pleasure, within himself his light.'¹⁰ 'Let a man establish the self by the self and suffer not the self to be overwhelmed, for no man has any other friend than himself, or any other enemy than himself.'¹¹ Salvation is still the result of knowledge, a knowledge which is acquired by concentration of thought and meditation: 'Knowledge is the best vessel (for traversing the sea of the *samsāra*).'¹² To know *Brahman* is to obtain peace 'which has as its final result *nirvāṇa*';¹³ it is oneself to become *Brahman*.

As may be seen from the last passages, it is the solution of the Vedānta which obtains most favour of all those proposed by the Brāhminical schools. Recourse is had readily to the Sāṅkhya when one wishes to analyze the universe and the soul, or to the Yoga for teaching as to the practice of concentration and ecstasy; but the theory of *mokṣa* remains essentially monistic and pantheistic. As far as the evidence gathered from the great epic is concerned, the doctrine which is adhered to is not the radical monism of Śaṅkara (which was indeed later than the centuries during which the *Mahābhārata* was finally redacted), but the monism of the *Upaniṣads* and of Bādarāyana: the world of names and forms is real, but it is *Brahman* who is the reality of its reality. The *Bhagavad-Gītā* does not leave any doubt on this point:

'Others offering me the sacrifice of knowledge, give to me worship as to a Being at once universal and individual, who, under various forms, extends himself in every direction.'¹⁴ 'The knowledge of goodness is that through which is seen in all beings the one imperishable Being, a whole in every particular being.'¹⁵ 'One portion of me has entered into the world of living beings, as the soul of the individual, the imperishable portion.'¹⁶ 'The knowledge by which thou wilt perceive all beings without exception in thyself and then in me, will for ever give thee a refuge from error.'¹⁷ 'In the Brāhmin, in the ox and the elephant, in the dog and also in the eater of the flesh of the dog, the wise man sees only one and the same being.'¹⁸ 'He who sees me in everything and everything in me, is never far from me, and I am never far from him.'¹⁹

God is immanent in all beings, but He is not confused with them; He is the principle of life which animates them, the principle of all spirituality.

Finally, He is not only immanent; He is also transcendent. Things are in Him, but He is not in them. The world of phenomena does not ex-

haust His nature. He has an inferior nature which reveals itself in names and forms, and a superior nature which is also a living soul. He is distinguished from the immortal and imperishable *Brahman* of which He is the foundation, just as He is the foundation of eternal law and perfect blessedness. Thus, without going beyond the limits of the *Bhagavad-Gītā*, we can see theism substituting itself for the original pantheism, and a personal God taking the place of *Brahman*. The evolution completes itself in the modified monism of Rāmānuja, and the spiritualistic dualism of Mādhva. The worship of the *guru*, which is so persistent a characteristic of the modern sects, has its source in the same conceptions. God, who is the essential excellence in all beings and in all the categories of being, specially manifests His adorable nature in the persons who behold and who reveal the truth.

When, in a passage from the *Bhagavad-Gītā* which has just been quoted, the god alludes to the 'others,' who offer the sacrifice of knowledge, he puts them over against those who render the worship of love. At once pantheistic and theistic, the poem places on the same level the two methods of salvation—knowledge and *bhakti*. The explanation is that in Hindu thought nothing which has once been acquired is ever altogether eliminated. Tradition and novelty, animism and ritualism, naturalism and theosophy, scholasticism and mysticism—in short, the most contrary ideas—live together in the same minds and in the same writings. In theory the *advaita* may be professed, but in fact the *dvaita*, and even a plurality of co-eternal principles, is affirmed. It is, as it were, tacitly understood that an affirmation has value in itself, and that it is not annulled by adjacent affirmation. In his everyday life Śaṅkara was a Vaiṣṇava—we could hardly imagine this in reading his commentary on the *Vedānta Sūtras*. These men duplicate themselves with wonderful ease. So it is vain to attempt to apply to the *Bhagavad-Gītā* the critical processes devised for Western works. In separating the disparate elements and the successive layers, we should succeed only in ruining the unmistakable artistic beauty of the poem. Works much later than the *Bhagavad-Gītā* exhibit a character equally composite. Theosophic conceptions and formulas are mingled with effusions of an ardent and humble piety. One marks this characteristic in many writings attributed to the founders and poets of the reforming sects, Kabir, Tulsī Dās, Chaitanya, etc. The most recent representatives of an enlightened Vedānta, Rāmākrṣṇa and Vivekānanda, also unite the *bhakti-mārga* with a phraseology which has become traditional since the period of the older *Upaniṣads*. There has been formed in India as it were a stock of words, ideas, and illustrations which belongs to every one and from which every one has the right to draw and is in the habit of drawing. One example will be sufficient to show how heavy a weight this theosophy of the past lays upon a thought which in other respects shows itself to be original and independent.

Nānak (*q.v.*), the founder of Sikhism, and his successors connect themselves with the religion of *bhakti*. They teach that a man is saved by the fervent worship of God, or by the worship of the *gurus*, the interpreters of God, and of the Book, the perpetual incarnation of the *gurus*. But the God of the Sikhs is like the *Brahman* of the *Upaniṣads*, and frequently borrows His name from the latter. In His own proper nature He is *nirguṇa*, without attributes; when He creates the world by means of *māyā*, He is also immanent in the phenomenal world and becomes *sarvagūṇa*, endowed with all qualities. In order to be saved, one must discover God in the heart; through self-concentration the mind eliminates all duality. To know God is to make oneself identical with God. God unites with Himself the man who knows Him, and this man is not reborn. As regards this life, salvation wins for him who is assured of it unbounded happiness, and death has no more terrors for him.

The great Vaiṣṇavite and Śaivite sects are, quite as much as Sikhism, impregnated with theosophy. Their appearance is in itself evidence of an individualism in revolt against the excessive pressure of a religious tradition. Those who assert the authority of the Vedas are ridiculed. The framework in which the divine is placed is broken; no great importance is any longer attached to the name which the gods bear—Śiva or Viṣṇu, the label is different, but it is always the same god. The human framework is also broken; the religious value of caste is denied, and all men are called to salvation. The distinction between the sacred and the profane is abolished. Generally the first concern of the reformers is to put Sanskrit on one side in favour of an exclusive use of the popular language.

'The whole world for me,' says Nānak, 'is a sacred enclosure. Whoever loves the truth is pure.' 'All food and drink which come from God are pure.'¹

The mechanical and the excessively ritualistic elements in the old religion are removed. Religion tends to become more human, more closely connected with ordinary life; the *Bhagavad-Gītā* has already expressed something approaching a sentiment of human solidarity, then an idea new in India. Moreover, religions tolerance becomes almost universal. Royal inscriptions prove that Brāhmanism, Jainism, Buddhism, Śaivism, and Vaiṣṇavism have their representatives in the same families, and the sovereigns extend their favours to all the communities. Is it not clear that religion has become an affair of the individual, and that the son is not in this respect bound to follow the example of his father?

Unfortunately the sects which were originally the boldest very soon fall into the old errors, or, rather, a new tradition, also altogether tyrannical, is established in place of the ancient tradition; or, still more frequently, the older safeguards are restored and most weighty concessions are made to the prevailing ideas. The popular language takes on, in its turn, a sacred character. Caste and restrictions about food recover all their influence. One returns to the old formalism and to the grosser superstitions; and the work of reform, to which men constantly address themselves, has always to be done over again.

Their admission into the popular religions was not a clear gain for theosophical ideas. They remain in the outer courts, in an altogether subordinate position. In the *Bhagavad-Gītā* everything that is merely a heritage from the past, a survival, is theosophical. The elements which are truly living and fruitful are of an entirely different origin. The religious emotion and the fervour of feeling which spring up in hearts full of adoration do not come from the *Upaniṣads* or their derivatives. Far from celebrating the triumph of theosophic ideas in India, the sectarian writings rather indicate their failure, since they make salvation depend on the love and grace of a personal and transcendent God.

4. [Theosophy and ancient Indian philosophy.

—In dealing with the introduction of theosophy into sectarian religions we have been tracing what might be described as a waning of the influence of theosophy. In the *Gītā* and in the sectarian writings theosophical elements are largely overlaid by materials gathered from other sources. But the last few decades have witnessed a remarkable revival of theosophical teaching. This is to a great extent connected with an incursion of influences from the West and especially with the teachings of Madame Blavatsky and Mrs. Besant. The authority of Madame Blavatsky has been largely discredited, but Mrs. Besant is still a living

force and her followers are numerous. Indeed India can claim a larger number of theosophists than any other country in the world. The latest available report (1917) shows 385 Indian lodges, with a total of 7344 members, among whom are some outstanding personalities. Their literary activity is great, at least in quantity, and the flow of publications from the headquarters at Adyar, near Madras, is unceasing and influential. The implicit influence of theosophical ideas is even more important than that which is explicitly allowed, and theosophical literature is frequently to be found in the hands of thinking men who would disclaim any connexion with a theosophical society. The popularity of theosophy is not, however, always due to purely theosophical causes.

Theosophy in India glories in having no creed, and thus claims to appeal to men of all creeds and to interpret for them the hidden values of their respective religions. But, though it is without a creed, theosophy has a threefold aim which is stated by Mrs. Besant, as follows:

(1) 'To form a nucleus of the Universal Brotherhood of Humanity . . . ; (2) to encourage the study of comparative religion, philosophy, and science; (3) to investigate the unexplained laws of Nature and the powers latent in man.'¹

The popularity of theosophy at the present time in India is largely due to a judicious combination of those three aims. Unless we give a very wide interpretation to the term, the two first are not particularly theosophical, but they are universally acceptable, and they thus strengthen the appeal of the third—the only properly theosophical enterprise. The first aim affords an opportunity for an easy transition from religious to political activity and a reinforcement of the former through the popularity of the latter. The second sets itself in seemingly attractive opposition to the harsh judgments of certain apologists for particular religions, and appeals to that specious liberality of mind which finds expression in the oft-repeated assertion that one religion is as good as another. It calls forth the retrospective tendency which seems to be inherent in all theosophy and thus enables theosophy to serve itself as the heir of the ages. Emphasis is laid upon the idea of a hidden tradition which is traced through the magic of mediæval Europe, through the lore of the Knights Templar and the mystics, through Freemasonry and the speculations of alchemists and astrologers, until the ultimate source is postulated in the Great White Brotherhood, a vague and indefinite society which Madame Blavatsky alleges to have existed from time immemorial in the mountains of Tibet and to have delegated one of their number to act as her Master during a period of many years. This mystic brotherhood is believed still to have operative power and to have charge not only of the education and development of the human race, but also of cosmic evolution. Their doctrines embody the truths which are said to be at the basis of all religions, but, on investigating the matter more closely, we find that they are in a very special manner the fundamental principles of Indian thought. Theosophy thus gives a universal importance to Indian philosophical speculation and in so doing inevitably enhances its popularity in India. It levies contributions from all the more important Indian systems, taking from the *Upaniṣads* the doctrine of a fundamental unknowable and characterless Unity, and the identity of the human and the divine; from the Sāṅkhya the idea that spiritual advancement consists in a gradual detachment from the processes of the phenomenal world; from Buddhism the idea of *karma* and transmigration; and from Yoga the conception of various occult methods by which freedom of thought and

¹ Cf. M. A. Macanliffe, *The Sikh Religion*, i. 243; cf. i. 43.

¹ *Theosophy* ('People's Books'), London, n.d. [1912], p. 89.

spirit may be won. Further, by an application of its ideas of graded being and of development extended over many generations, it is able to allow a moderate amount of justification even to the grosser forms of the popular religions, and thus carry farther the process of infusing theosophical ideas into the cults of the people which, as pointed out, had but moderate success in earlier centuries.

As in Indian philosophy generally, so in theosophy the ultimate Being is an unknown and unknowable ground of all things, acquiring character as a Logos with the triple functions of will, wisdom, and activity. This differentiates itself into the human monads, having a similar triplicity. The human monad descends through various grades of being until it reaches the causal body, which has also a slightly lower mental aspect, uniting it with the grades of being of which even an ordinary man may be aware, and forming the basis of personality as we know it. The mental body has as its appropriate sphere the heavenly world, but the soul as it proceeds downwards enters also the astral world or the world of emotion and desire, and finally reaches the physical world. Over and over again there is incarnation reaching downwards ultimately to the physical world, and in each incarnation new experiences are obtained, leading, if rightly used, to the development of the soul. The supreme aim of the soul is to rise upwards to its original source, and the degree of ascent will be proportionate to the use it has made of the experiences of each incarnation. The working of the law of *karma* is inexorable. A man will receive the fruit of the deeds done in the body, and according to his good or his evil will be the duration of the period spent on each plane before another incarnation takes place. The aim of the whole process is to get rid of the separating sheaths of personality and reach absorption in the Absolute.

Theosophy is thus definitely committed to the doctrine of reincarnation and transmigration, with, on the one hand, its plausible explanation of the inequalities of human life, its stern insistence on moral consequences, its distant prospect of negative salvation, and, on the other hand, its ethical weakness arising out of its tendency to fatalism and encouragement of procrastination, and its lonely outlook as it traces the succeeding phases of individual development and promises reunion with those we love only in a 'togetherness' of absorption in which the definite character which was the object of our love altogether disappears.

The doctrines of theosophy claim a scientific basis in experience, but this experience is found to be very different from the experience of the ordinary man. It is dependent on the development of our latent powers, by the use of which we may acquire that knowledge which is already possessed by the masters of the human race, the adepts or initiates, and which may give to us a wonderful penetration into the hitherto undiscovered laws of nature. It is at this point that theosophy differentiates itself most completely from philosophy. Once made the initial assumption that the operation of these powers is possible and that the latent faculties can be exercised, and all is easy. We may attain a wonderful amount of detailed knowledge about the lower at least of the super-physical planes. We may discover, *e.g.*, that even during physical life the astral body projects a few inches beyond our physical body, and that it is shaped like an egg; also that various astral bodies are formed by the vibrations of thought and desire, the vibrations of unselfish affection producing bodies of pale rose colour, intellectual effort resulting in yellow bodies, devotional feeling in blue, etc. We may discover also

facts on a higher ethical level—*e.g.*, that our prayers produce beings functioning as guardian angels and that our thoughts eventuate in actual astral existences, fulfilling the purposes into which our vague wishes would have been transformed, had opportunity waited upon our desires. In short, with an almost total disregard of the law of parsimony and of the rule against the multiplication of entities, we may explain many of the mysteries of our present life and many of the hitherto unexplained problems of nature by simply transferring the difficulty to a higher plane and 'discovering' beings personally responsible for what previously appeared to be a mysterious occurrence. It is at least doubtful whether modern theosophy in India distinguishes sufficiently between subjective imagination and the controlling power of objective facts, and this considerably lessens the force of the rebuke which it administers to our materialism, diminishes the value of its insistence upon the power of thought and prayer, and weakens its encouragement to explore farther than has yet been done the phenomena of spiritualism and telepathy as well as the more weighty experiences of the mystics of all ages.]

Conclusion.—The history of theosophical ideas, far more than that of religious ideas, allows us to establish the spiritual unity and continuity of India. Moreover, we have here an excellent field of observation for any one who wishes to know the meaning of theosophy, its principles, its aspirations, its method, and its influence upon life. With the idea that Indian theosophy is typical of this form of thought, we shall rapidly pass in review its principal characteristics.

(a) The most obvious quality is its concentration on the self, which not only occupies the first place in its scheme of thought, but also concerns itself with the Ego as if it were the only existence—as if everything else existed only for it and in reference to it. This theosophical individualism is both proud and exclusive. The vulgar intelligences, concerned with superstitions and traditional practices, are despised, and with jealous care the precious truth is guarded for a small number of the elect. 'There is nothing in common between popular religion and knowledge.'¹ As if to show clearly the existence of a double current in religious thought, a verse in the *Mahābhārata*² says that the gods, women, and the worlds have only one divinity, one *guru* only, but that the Brāhmins have two, Agni and Brahman, the god of sacrifice and the Being without a second.

(b) It is always flattering to belong to a privileged group; esotericism was an attractive element in theosophy. And there were others. Those who were terrified by threatening death and mysterious destiny, those who were shocked by the spectacle of physical and social injustice, found in the doctrine of *karma*, *saṁsāra*, and *mokṣa* just the solution fitted to give them moral serenity and courage to live. All the theosophical systems teach some way of salvation; they deliver their followers from the painful prospect of a second death, from an interminable series of lives poisoned by the expectation of death.

(c) Another advantage: truth is not arrived at slowly and patiently by study and reflexion; it is grasped by sudden internal vision. Once the premisses have been given by intuition, a rigorous dialectic can construct a system whose scientific appearance has an element of attractiveness for persistently intellectualistic minds eager to 'know.'

(d) The intuitive method is not only rapid and apparently trustworthy; it is also very fruitful.

¹ Śaṅkara, *passim*; cf., *e.g.*, *Comm. on the Vedānta-Sūtras*, p. 820.

² *Mahābh.*, i. 95. 7.

It reveals that which neither analysis nor induction could discover—the supersensible world. Theosophy thus gives satisfaction to the mystical needs in human nature. Then, when one knows that the sensible world is only an insignificant part of being, and that, side by side with the very limited realm of knowledge, there is an infinite transcendental world, one resigns oneself easily to the most glaring logical impossibilities.

(c) Finally, the laws of material nature are not valid except for material bodies. Theosophy has been also a discipline of sublimation and dematerialization. Marvellous perceptions and an indefinite enhancement of intellectual and active powers are also privileges which India has always held in the highest esteem.

If now we ask what theosophy in fact did for individual and social life in India, we shall see that it has had some results which are excellent and others which are harmful. On more than one occasion it has vindicated the rights of the individual and struggled against authorities altogether dependent upon tradition. Theoretically at least, it has placed itself outside of social distinctions. It has made salvation a personal affair of the individual. It has opened the eyes of men to the foolishness of their futile occupations and the vanity of sensual pleasures and temporal possessions. It has taught them to seek for happiness in the contemplative life and in peace of heart. But it has also taught contempt of the ordinary life and of finite existence. It has ignored the possibility of progress in human affairs. It has been a school of pessimism. Its followers have searched for the absolute and the whole, when life can give only the relative and the partial. They have thought it possible to arrive by a leap at truth, when in fact nothing has really been secured by this intuitive method and everything has to be begun over again. It has lowered the dignity of virtue by making it a means and not an end. In condemning action and individualizing salvation, it has shown itself dangerously anti-social. Frequently, it is true, these bitter fruits have not been produced, for it has, on occasion, neglected its fundamental principles. Buddhism, e.g., has preached the highest virtues without making them the instruments of salvation. This is intelligible, for in Buddhism, side by side with theosophy, there is a large dose of humanity.

[Additions in brackets by W. S. URQUIHART.]

THERAPEUTÆ.—The Therapeutæ¹ were a radical offshoot of the movement in pre-Christian Judaism which threw up an order like the Essenes (q.v.); but, unlike the Essenes, they were purely an Egyptian phenomenon, a religious confraternity, or *thiasos*, residing in the neighbourhood of Alexandria, and particularly on the low hills to the south of Lake Mareotis, leading the life of studious recluses and organized on semi-monastic lines. Outside Egypt, indeed outside this district, they are never heard of. They were a local development.

1. Source of information.—The only authority for the subject is a short treatise *de Vita Contemplativa* (περί βίου θεωρητικού ἢ ἱκετών [ἀρετών], or, better, Φίλωτος ἱκεταὶ ἢ περὶ ἀρετῶν τῶδ'), included in the works of Philo. It is first quoted by Eusebius.² The rise of the monastic movement in the Church drew his attention, and evidently the attention of others, to a tractate which offered striking precedents and parallels for the cenobitic discipline of Christians, and the general opinion came to be that the Therapeutæ were really Christian monks. This anachronism can be traced from Eusebius and Epiphanius onwards; it flourished right down to the beginning of the 18th cent., when the French scholar, B. de Montfaucon, published his *Livre de Philon de la vie contemplative, etc., traduit sur l'original grec, avec observations, ou l'on fait voir que les Thérapeutes dont il parle étoient Chrétiens* (Paris, 1709). So completely had the Therapeutæ been identified with the origin of Christian monachism that even by the 6th cent. *vita therapeutica* had become the Latin equivalent of ἀσκήτως βίος.

This unhistorical interpretation did one service; it preserved the Philonic treatise. But it was responsible for vehement discussion between Protestants and Roman Catholics—discussion which was so prejudiced that it threw next to no light upon the Therapeutæ (except, of course, to disprove the Eusebian ecclesiastical contention); it was also responsible for an avenging scepticism in the 19th century. To suppose³ on the evidence of Eusebius and Jerome,⁴ that Philo re-visited Rome c. A.D. 44, was impressed or converted by St. Peter, and returned to join this ascetic community of St. Mark's Christian converts near Alexandria, was to expose the *de Vita Contemplativa* to unjust suspicion in a more critical age. The naive theory provoked an equally naive scepticism. It is not credible, but it is hardly surprising, to find that in the 19th cent. the Therapeutæ were almost blotted out of existence. Some Jewish scholars, especially Graetz,⁵ seemed as anxious to disavow any connexion with the poor Therapeutæ as Roman Catholics were to dub them monks; they attempted to rid Judaism of these recluses by relegating them to the 3rd cent. A.D. as Christian monks, the treatise being assigned to some Eneatic, semi-heretical source. Other writers⁶ also dated the *de Vita Contemplativa* in that period, although they more prudently regarded it as a Jewish sketch of some ideal, ascetic community. It was reserved for P. E. Luciani⁷ to twist the stray threads of this scepticism into a stout denial that the Therapeutæ had ever existed except in the imagination of a Christian e. A.D. 300, who ingeniously used Philo's name and authority to create a monastic community in the first half of the 1st cent. A.D. This aberration of criticism carried away many writers great and small. French and English scholarship, however, came to the rescue, in L. Massebieau's study,⁸ Renan's decisive judgment,⁹ and F. C. Conybeare's work.¹⁰ P. Wendland reinforced the defence,¹¹ and the historical authenticity of the

treatise was finally vindicated. Whether it was composed by Philo or by some contemporary Jew is another and a subordinate question. The important point is that the treatise is a pre-Christian or non-Christian description of actual recluses in the Judaism of Egypt about the end of the 1st cent. B.C. or the opening of the 1st cent. A.D. Conybeare's edition is the standard authority on the Greek text. His translation¹ is followed in this article. Both he and Massetbian have made out a good case for the hypothesis that the *de Vita Contemplativa* originally was a sequel to the lost Philonic account of the Essenes in the *ἀπολογία ὑπὲρ Ἰουδαίων*, from which Eusebius drew his information. But their interpretation of details in the account of the Therapeutæ is sometimes open to serious criticism.

2. Characteristics.—According to Philo, the Therapeutæ are part of a movement which is known outside Egypt²—the more or less organized semi-philosophical, semi-religious retreat from cities and a corrupting civilization to the simple life of retirement. Though the movement is not confined to the environs of Alexandria, it is there that the Therapeutæ are most numerous.³

They are Jewish recluses who reside in simple huts, at a short and suitable distance from one another (*i.e.*, they resembled the cenobites of Pachomius in a later day, instead of being hermits and anchorites). Each hut has a sacred chamber (*μυστήριον* or *μοναστήριον σενείον*), reserved for their sacred books (the Law, the Prophets, the Psalms, and other writings, *ὅς ἐστι τῆς ἁγίας καὶ εὐσέβειας συναύθουται καὶ τελειούται*, 'by means of which religion and sound knowledge grow together into a perfect whole'). After praying at dawn, they devote the day to meditation upon the Scriptures; these include writings or commentaries (*συγγραμματα*) 'drawn up by the ancient founders of their sect,' by which Philo probably means the literature current under the names of men like Enoch and Abraham, whom he regarded as the primeval ascetics and recluses, the ideal progenitors of the Therapeutic movement. The method of study is allegorical interpretation (*τῆν πάτριον φιλοσοφίαν ἀλληγορούσας*), and one outcome of it is the composition of sacred hymns. Prayers at sunset close the day. Such is the life in each hut.⁴ On the seventh day the various members meet for common worship; they arrange themselves according to age, sitting on the ground with 'the right hand between the chest and the chin, but the left tucked down along the flank.' The senior recluse then delivers an address, to which all listen in silence, merely nodding assent. A partition, ten or twelve feet high, separates the men from the women, so that the latter can hear the speaker without being seen by the male recluses.

The seventh day⁵ is their day for relaxation. On the other days no one eats before sunset, and some go fasting almost entirely for three or even six days, in their contemplative raptures. But all use oil (as a physical refreshment, unlike the Essenes⁶), and on the seventh day all 'propitiate the mistresses hunger and thirst, which nature has set over mortal creatures'; the diet is simply water and cheap bread, flavoured with salt, and occasionally supplemented by hyssop. None⁷ of your drunken Greek symposia! Philo anticipates Lucian in his scorn of these rowdy gatherings.

Once every seven weeks⁸ they assemble for their supreme festival, 'which the number fifty has had assigned to it,'⁹ robed in white and with looks of serious joy. At a given sign from one of their leaders they arrange themselves in ranks, raising eyes and hands to heaven ('their hands, because they are pure from unjust gains, being stained by no pretence of money-making') and praying for a blessing on the festival. Then the senior members recline, in order of seniority, upon their cheap, rough couches; on the left side of the room the women also recline. The younger novices wait upon the older

members, for the Therapeutæ (like the Essenes)¹ decline to be served by slaves; 'they deem any possession of servants whatever to be contrary to nature,' which makes all alike free at birth. It is not a banquet of luxuries; no wine, only cold water, heated for those who are delicate; no meat—for the Therapeutæ are vegetarians, living on nothing but bread and salt, with hyssop for the more delicate palates, the hyssop being added 'out of reverence for the holy table of offering in the sacred vestibule of the temple,'² to signify that the Therapeutæ are too humble to emulate the unleavened bread reserved for the priests. But, before this Spartan meal is eaten, a quiet address or allegorical exposition of Scripture is delivered by the president. The rest listen in breathless silence; but, if the speaker does not make his meaning clear, they are allowed to indicate their perplexity by a slight movement of the head and a right-hand finger. When he is considered to have spoken long enough, all clap their hands three times. A hymn then follows, sometimes composed in honour of God by the singer (cf. 1 Co 14²⁶), 'either a new one which he has made himself, or some old one of the poets that were long ago.' Each member has to sing a hymn in rotation, while the rest join in the chorus. Only after this religious service of an address and praise—nothing is said of prayer³—does the banquet proceed.

The final act of the festival⁴ is the famous *πανυγίς*, or all-night celebration of a sacred singing dance,⁵ by men and women in two choruses, each headed by a chosen leader. Each of the choirs, the male and the female, begins by singing and dancing apart, partly in unison, partly in antiphonal measures of various metres, 'as if it were a Bacchic festival in which they had drunk deep of the divine love.' Then both unite to imitate the choral (Ex 15: 20-21) songs of Moses and Miriam⁶ at the Red Sea, sung as thanks *εἰς τὸν σωτήρα θεῶν* (cf. Rev 15³). It is a thrilling performance, this choric dance and exulting symphony; 'but the end and aim' of it 'is holiness' (the exodus symbolizing, of course, the mystical release of the soul from material bondage). Instead of being drowsy after this all-night ecstasy, the Therapeutæ are more wide-awake in the morning than they were at the beginning of their vigil; they turn to the East, 'and, so soon as they espy the sun rising, they stretch out aloft their hands to heaven and fall to praying'⁷ for a fair day, and for truth and for clear judgment to see with.' Then they separate to resume the ordinary day's contemplation in their separate cells.

Such, says Philo, is the method of life practised by these true 'citizens of heaven and of the universe.' The term 'citizens' is deliberately chosen. They abjure cities, he means, but none the less, indeed all the more on that account, these recluses belong to a higher polity.

3. Religious significance.—A complete renunciation of the world, resembling that demanded by Jesus in Lk 18²⁹, lay at the foundation of the Therapeutic society. What they abjured was money rather than matter. In the austerity of their zeal they voluntarily handed over their property to others,⁸ since absorption in money-making and the cares of life not only took up too much time and thought but also fostered injustice. Having divested themselves of their possessions, 'they flee without turning back, having abandoned brethren, children, wives, parents, all the throng of their kindred, all their friendships with companions, yea, their countries in which they were born and bred.'⁹ Philo describes this with a wistful enthusiasm, as he had described the renunciation of Enoch¹⁰ and of Abraham.¹¹ But he is careful to explain why they prefer solitude to cities. It is only because intercourse with the unsympathetic world would injure them, 'not from any harsh and deliberate hatred of mankind'¹²—a disclaimer¹²

¹ In *JQR* vii. [1895] 755-769.

² Philo is trying not only, as he does elsewhere, to show that the recluse tendency is Greek as well as Jewish, but to link the Therapeutæ to the wide-spread phenomenon of *cultores dei* (*deorum*), as their name of 'devotees' (*θεραπευταί*) permitted. In this way he seeks to interpret them to his readers, just as he had already (*de Vit. Con.* 1-2) contrasted them with the inferior 'philosophers' of Greece on the one hand, and with the silly Egyptian worshippers of animals on the other. His attempt to explain *θεραπευταί* as possibly meaning 'healers' of the soul is equally unhistorical. So far as it is not the official title of the community, it means what it meant in the case of the Essenes, whom Philo himself had called *θεραπευταί θεοῦ*. The variant title *ἰκεταί* meant 'suppliants.'

³ *De Vit. Con.* 3.

⁴ So constant is their sense of God's presence that even in their dreams they have visions of nothing but the divine *ἀπερών* καὶ *δυνάμεων*, while many men talk in their sleep of what they have been studying.

⁵ *De Vit. Con.* 4.

⁶ Cf. *ERE* v. 393^a.

⁷ *De Vit. Con.* 5-7.

⁸ *Ib.* 8.

⁹ This seems to have been a festival, partly modelled on the five weeks or pentecostal type (for here as elsewhere the Therapeutæ show distinct affinities with Palestine) but celebrated seven times a year, at the expiry of every 49 (7 × 7) days. On the resemblances between this periodical festival and the Feast of Weeks in the book of Jubilees see A. Epstein in *REJ* xxii. [1891] 14 f., 20 f., as well as on the similar institution among the Abyssinian Jews (Falasha).

¹ *ERE* v. 396^b.

² *De Vit. Con.* 9.

³ Is this omission accidental? Or was prayer regarded as a part of private devotion (cf. *ERE* x. 191^b)?

⁴ *De Vit. Con.* 10.

⁵ A trait of popular religious worship in Egypt (cf. *ERE* v. 238^a; and, generally, x. 359^a).

⁶ Miriam, in some quarters of early mystical literature, is the counterpart of Isis, and she plays an important rôle in Gnostic speculations, as Reitzenstein points out (*Poimandres*, Leipzig, 1904, p. 136 n.). Her popularity among the Therapeutæ is probably another Egyptian touch.

⁷ Lightfoot (*Saint Paul's Epistles to the Colossians and to Philemon*, London, 1884, pp. 85, 372) took this to mean sun-worship; but the Therapeutæ did not practise sun-worship any more than the Essenes did (see *ERE* v. 393^a, note 4).

⁸ Unlike the Essenes, and the primitive Christians (Ac 2⁴⁵), with whom Eusebius (*HE* ii. 17) would fain connect them on this account, the Therapeutæ did not pool their funds for the benefit of the community.

⁹ *De Vit. Con.* 2.

¹⁰ *De Priem. et Poen.* 3.

¹¹ *De Abrah.* 3.

¹² He had made the same disclaimer of misanthropy in speaking of Abraham (*de Abrah.* 4).

of the *odium humani generis* for which Jews were blamed by the outside world. Philo always protested against the people who withdrew into seclusion, simply because they lacked public spirit. He also anticipated the criticism which might be passed on the Therapeutæ, that they acted from a morbid misanthropy. Hence his defence and admiration of them. The Therapeutæ, in fact, realize for Philo what he had always dreamt of, a small (only a small) number or *θλασος* of spiritual athletes, acting from the highest of motives, carrying out a counsel of perfection, and capable of making the supreme renunciation in order to attain the highest vision of God and truth.¹ To them he applies his favourite Platonic metaphor of the wealth with eyes (*i.e.* the mystic rapture of the soul enriched with the vision of truth); no wonder, when they possess this inward treasure, that they abandon their blind wealth (*τὸν τυφλὸν πλοῦτον*)² to blind worldlings! For their renunciation does not empty life. It is not a mere negation; it is the soul surrendering to a higher passion for God (*ἵπ' ἔρωτος ἀπασθέντες οὐρανόυ*), which enriches life past dreams of avarice. The Therapeutæ are recluses and students, but their spirit is an ecstatic yearning for the positive vision of Truth. 'It is as easy to close the eyes of the mind, as those of the body,' Bishop Butler wrote;³ it is still more easy, Philo felt, to let the eyes of the mind be closed by luxury and money-making, and he applauds the Therapeutæ for sacrificing their great possessions and position in order to keep the higher vision unimpaired.

Another feature of the Therapeutæ which goes to Philo's heart is that their allegorical interpretation of the OT does not render them indifferent to the actual rites and institutions of Judaism. He disliked the ultra-spiritualists⁴ who evaporated the historical element in religion, and dropped all adherence to the forms of their faith. But he delighted in people like the Therapeutæ who, *e.g.*, attached, as he did, in his own enthusiasm, a high mystical sense to the number 'seven,' and yet not only kept the seventh day strictly but also celebrated a special festival after every 49 days, out of their reverence for that perfect number and its multiple (7×7). This appeared to him to be a healthy form of mysticism. The Therapeutæ appealed to Philo more than the Essenes did, because they were on old Jewish lines, adherents of the Mosaic law, respectful to the Temple at Jerusalem, and capable of attaining the heights of contemplative ecstasy without abandoning the lowly duties prescribed by the Torah.

A third feature which evidently pleased the gentle Philo was their freedom from angry controversy and flashy rhetoric. With his eye not only upon the quarrels of Greek sages at their symposia but also upon the rabbinic disputants at Jerusalem, he tells of the unostentatious style practised by the Therapeutic speakers, of the rapt attention shown by the audience, and of the respectful demeanour of the gathering—exalting the very virtues which Paul recommended to the showy, noisy Christians at Corinth (*cf.* 1 Co 14^{28f.}). Philo loves them for their quiet demeanour. The Therapeutæ never wasted their time over rabbinic exegesis of the letter of Scripture. They gazed placidly through that, as through a glass, into the mystical significance which held them spellbound. Their wisdom was pure and peaceable; it combined plain living and high thinking, and the sages never lost their tempers.

All this, added to their philosophic aspirations

and their distaste for luxury, moved Philo to write his panegyric. He professes that it is nothing but the bare truth. Certainly it is not a Defoe-like work of fiction. At the same time, his enthusiasm probably leads him to idealize the Therapeutæ; a disproportionate amount of space is surrendered to a scornful criticism of the Greek symposia, in which Plato as well as Xenophon is censured; and he forgets to explain how the Therapeutæ lived, if they did no work and held no property. Did they depend, like Buddhists, on charity? It is one of the questions which Philo forgets to answer. The main outline of the sketch, however, has all the marks of accuracy. Though he was not a member of the community, it was so near to Alexandria that he could easily have heard of its life and even visited it. His admiration may have heightened the colours, but it did not invent the content, of his delineation. The tone of his account resembles that in which Izaak Walton, in his biography of George Herbert, speaks of the little settlement of recluses at Little Gidding, under the spiritual guidance of Nicholas Ferrar.

The Therapeutæ were organized on lines resembling the later *lauras* of monasticism in Egypt, *i.e.* in a group or encampment of separate residences, with a common hall for special gatherings; they lived in huts, set close enough for fellowship and for mutual protection against an attack of robbers (which was a common experience of such communities). Plainly, they acted in self-defence when occasion required. The differences between them and the Essenes are patent. The Therapeutæ confined themselves to a life of contemplation; they were a small community of men and women who had been well-born and wealthy,¹ and who lived in a Chartreuse-like retreat; they were not religious communists, and they had no interest in prophecy (their dreams being not of the future but of the celestial order); they fasted, as the Essenes did not, and their relation to women was quite different. Both the Therapeutæ and the Essenes were 'holiness' movements, but the former displayed some unique features, especially the combination of individual contemplation with a periodical outburst of emotional fervour in the common song and dance.

Nothing is known of their history. They are one of the local, transient phenomena of the age that baffles modern curiosity. A single ray of light falls on this tiny community, at the bridge between B.C. and A.D., but we do not know who founded them or what became of them. Philo's description was never followed up by any subsequent writer. Gibbon² thought it 'probable that they changed their name, preserved their manners, adopted some new articles of faith, and gradually became the fathers of the Egyptian Ascetics.' This is guess-work, however. A community which was recruited like the Therapeutæ could not survive like the Essenes; so much is clear; and Therapeutism probably was an ephemeral product, an anticipation rather than an ancestor of the later Christian monasticism in Egypt. Abraham E. Harkawy, the Petrograd scholar, in his edition of Kirkišani, the 10th cent. Karaite savant,³ points out that Kirkišani includes among the Jewish sects one called the Margarites, to whom the 'Alexandrine' belonged; this sect practised allegorical interpretation, as a rule abjured laughing, and were called Margarites, or 'cave-folk.' Harkawy identifies the 'Alexandrine' with Philo, and the Margarites with the Therapeutæ, as a branch of the Essenes—a view shared by Bacher,⁴ but doubted by Poznański.⁵ It seems an interesting, if vague, recollection of the Therapeutæ, lingering in the Judaism which had surrendered its interest in these recluses to the Christian Church.

4. Compositions.—The Therapeutæ were not only ascetics but also students; yet no trace of their literature has survived. (a) The *lóγος*, or hymn, coloured by Jewish Hellenism, which is discussed by A. Dieterich,⁶ has been sometimes assigned to them. But it shows euhemeristic syncretism; there is nothing specifically Therapeutic about its language or ideas, and, although it does refer to the rescue of Israel from the Red Sea, this is too general to serve as an identification-mark for the choric song of the Therapeutæ (see above). The Therapeutæ are less analogous to the circle of this hymn than an anticipation of the Eueratites (*q.v.*) in their aversion to marriage and their avoidance of wine and animal food.

(b) Nor is the book of Wisdom distinctively Therapeutic, as some¹ thought.

The emphasis on *δύσις* and on *διδάσκειν*, rather than on the more outward *εὐσεβεία*, certainly suggests that Wisdom emanated from some inner circle or set of Jewish pietists, but there are no indications that point decisively to the Therapeutæ, not even the casual use of *θεραπεύειν* in 109.18. 313^c is not in praise of celibacy, and, even if it were, the tendency to exalt celibacy in the later Judaism was not confined to the ascetic cohabitation of the sexes among the Therapeutæ,² 47-9 simply echoes the common reflexion that life is measured by its content of wisdom, not by length of years; it has nothing particularly to do with the Therapeutic regulation³ that seniority was reckoned by the years spent within the society. The allusion in 72^b-82 to the wise man being wedded to Wisdom (*τὸν σοφία συνοικούντα . . . ταύτην ἐφίλησα καὶ . . . ἐξήγησα νύμφην ἀγαθήν ἐμαυτῷ*) resembles the description of the nun-like recluses in the *de Vita Contemplativa*, 8 (for the most part 'aged virgins, that have preserved intact their chastity . . . because of their zeal and longing for Wisdom; with whom they were anxious to live,' in order to bring forth not mortal children but 'the immortal progeny which the God-enamoured soul is alone able to bring forth of itself').⁴ But this metaphorical description applies in the one case to men, in the other to women, and it is too general and common (cf., e.g., Sir 152, Pr 217) to be confined to the Therapeutæ; in *de Vita Contemplativa*, 8, Philo is speaking as he speaks elsewhere.⁵ Finally, the Therapeutic custom of offering prayer at sunrise (see above) was not peculiar to them among the Jews, so that Wis 16²³ ('one should be before the sun in giving thanks to thee, and one should plead with thee at the dawning of light') need not be a glimpse of these recluses—the less so, that nothing is said about their eastward position by the writer of Wisdom, who is simply moralizing about the story of the manna.

5. Origin.—In view of the various Oriental and Hellenistic influences which were playing upon the later Judaism towards the close of the 1st cent. B.C., a phenomenon like the existence of the Therapeutæ, with their celibacy, their aversion to social life, their absorption in a divine *θεραπευία*, and their mystical speculations, all carried out 'in accordance with the most holy counsels of the prophet Moses,'⁶ is not altogether surprising.

'The societies of the Essenes and the Therapeutæ . . . belong, just as the mediæval and modern Hassidic asceticisms belong, to Judaism quite as much as do any of its more normal institutions.'⁷

It is still less surprising to find such a wild or monastic settlement in Egypt. The soil of Egyptian popular religion was full of 'monastic germs'; there were men and women recluses in the Serapeum at Memphis, whose *θεράπεισις* embraced both study and mystical dreams; the very name of *θεραπειρία* was connected with the worship of Isis,⁸ which also had its mystic raptures, combined with an emphasis on asceticism and celibacy; the climate itself, and the gaunt deserts, stretching away from the cities and townships, invited those who had recluse tendencies. It was in Egypt that the monastic movement of the Church first developed its varied and most distinctive forms three centuries later, and the development was no more surprising upon the basis of primitive Christianity than that of the Therapeutæ or of the Essenes upon the basis of orthodox Mosaism. One of the most suggestive parallels to the Therapeutic discipline is to be found in the contemporary account of the Egyptian philosopher-priests which is given by Chaereon, the Egyptian *λερογραμματεὺς*. It is quoted by Porphyry,⁹ and some sentences

deserve to be quoted here for the light they throw upon 'monastic' lines of development in pre-Christian Egypt.

'They chose sanctuaries (*εἰσὶν*) as the place in which to study philosophy, since to dwell with the statues of the gods was in harmony with their utter longing for vision (*τῆς θεωρίας*). Besides, this gave them security, owing to the reverence felt for the gods, since all men honoured these philosophers as if they were sacred creatures. They also lived in solitude, only mixing with other people at the sacred assemblies and festivals. . . . Having renounced every other employment and all human toils (*πόνους ἀνθρώπινους*), they gave up the whole of their existence to the contemplation and vision of things divine . . . for to be in constant association with divine knowledge and inspiration delivers men from all lust (*πλεονεξίας*), subdues the passions, and rouses life to intelligence (*σύνεσις*). They were also studious to be frugal in food and clothing. . . . Their hands were always inside their garments. . . . When they were not engaged in purification, they ate bread cut up along with hyssop, as they declared hyssop was extremely potent in purifying bread. . . . They trained themselves to endure hunger and thirst and scanty food through all their life. . . . The day they spent in the worship of the gods (*εἰς θεραπεύειν τῶν θεῶν*), singing hymns to them three or four times, at dawn and at eventide.'

The origin of the Therapeutæ lay in Jewish Hellenism, as that was specially affected by its Egyptian environment. Nothing more is required to explain the ascetic and mystical habits of these recluses beside Lake Mareotis. But it would be uncritical to dismiss this problem without some reference to the question which has repeatedly been asked: Do not several traits of the Therapeutic discipline recall Buddhistic monasticism—e.g., the combination of a cœnobitic life with study and devout contemplation, and the vegetarianism? The latter is one of the marks which sharply distinguish the Therapeutæ from the Essenes, who were not vegetarians. But there is at least one feature of the Essenes themselves which is analogous to Indian practices,¹ and it is open to conjecture whether some Buddhistic influence had not penetrated Egyptian Hellenism by the 1st cent. B.C., as it is sometimes held to have penetrated the later Gnosticism.²

Robertson Smith,³ after observing that 'in Egypt, the doctrine that the highest degree of holiness can only be attained by abstinence from all animal food, was the result of the political fusion of a number of local cults in one national religion, with a national priesthood that represented imperial ideas,' added that 'later developments of Semitic asceticism almost certainly stood under foreign influences, among which Buddhism seems to have had a larger and earlier share than it has been usual to admit.'

The Therapeutic avoidance of animal food need not, of course, be Buddhistic; the practice of the Orphic societies in Egypt or of the Neo-Pythagoreanism which affected the Essenes in other ways⁴ may account for it as well as for the stress on hymns,⁵ the *παννυχίς*, and some other features. Indeed, so far as our scanty data go, with regard to the Therapeutæ or the Essenes, the evidence does not appear to warrant any hypothesis of direct Buddhistic influence, although the Orientalism which had filtered into Jewish Hellenism, even in Egypt, by the 1st cent. B.C. may have contained some elements of Buddhistic religious tendency. The trade connexions between Alexandria and India, and the intercourse of both countries ever since the 3rd cent. B.C., make it quite possible to suppose that Indian merchants reached Egypt by the 1st cent. B.C. Rohde points this out in another connexion, detailing the Indian and Buddhistic elements in Greek fiction.⁶ But the interaction

⁴ *ERE* v. 401^a.

⁵ This again distinguishes them from the Essenes. C. A. Bugge, in his recent study of the Essenes (*ZNTW* xiv. [1913] 167 f.), argues that the Palestinian Essenes must have cultivated song and music like the Egyptian Therapeutæ; but there is no 'must' about the matter. Had hymns been a prominent feature of the Essenic cult, they would have been mentioned by Philo or Josephus.

⁹ *De Abst.* iv. 6-8.

was not marked.¹ A trait like the presence of the 'nuns' is almost sufficient by itself to justify disagreement with the verdict of Mansel:

'The Therapeutæ . . . appear to have sprung from an union of the Alexandrian Judaism with the precepts and modes of life of the Buddhist devotees, . . . in their ascetic life, in their mortification of the body and their devotion to pure contemplation, we may trace at least a sufficient affinity to the Indian mystics to indicate a common origin.'²

On the other hand, even after allowing for the Neo-Pythagorean and Orphic environment, as well as for the fact that certain phenomena of this reclusive life spring up independently on any soil at the touch of organized monasticism,³ we may leave open the possibility that the Therapeutæ and perhaps the Essenes more or less unconsciously developed features which owed their original suggestion to Buddhistic sources. One of the main reasons for hesitating to admit even this possibility is the fact that Buddhistic influence on Gnosticism, two centuries later, appears to be almost unrecognizable, although Gnosticism might be expected to show distinct affinities with this line of Indian religious practice and speculation.

LITERATURE.—Besides what has been noted in the course of the article, the following may be chronicled as among the few significant contributions which the interminable discussions of the subject have thrown up: the notes of H. de Valois (Valesius), the great 17th cent. editor of Eusebius; Thomas Browne, *Dissertatio de Therapeutis Philonis adversus Hen. Valesium*, London, 1695 (Therapeutæ=converts of St. Mark, who afterwards became the monks described by Palladius); two critical letters by J. Bonhier (*Lettres pour et contre, sur la fameuse question, si les solitaires appelés thérapeutes dont on parlé Philon le Juif, étoient chrétiens*, Paris, 1712), which Conybeare calls 'the best commentary on the *de Vita Contemplativa* ever written'; A. F. Gfrörer, *Krit. Gesch. des Urchristenthums*, Stuttgart, 1831, vol. i. pt. 2, pp. 280-299; and A. Neander, *General Hist. of the Christian Religion and Church*, Eng. tr., London, 1850-58, i. 81-85.

None of the older dictionary or encyclopædia articles deserves mention. The main help has been given by critics of Philo—e.g., H. P. Delaunay, *RA* xxii. [1870-71] 268 f., xxvi. [1873] 12 ff., and in *Moines et sabbites dans l'antiquité judéo-grecque*², Paris, 1874, pp. 10-57; B. Tideman, *ThT* v. [1871] 177-188; A. Edersehm, *DCB* iv. 368-371; L. Cohn, *JQR* v. [1893] 38-42; J. Drummond, *ib.* viii. [1896] 155-172 (reviewing Conybeare's ed.); and E. Schürer, *GVV*⁴, iii. 687-691 (still reluctant to give up his scepticism); or by writers like E. Renan, *Hist. du peuple d'Israël*, Paris, 1887-95, v. 366-380; O. Zöckler, *Aekese und Mönchtum*, Frankfurt, 1897, i. 128 f.; E. Zeller, *Die Philosophie der Griechen*⁴, Leipzig, 1876-1903, ii. 377 f.; M. Friedländer, *Die religiösen Bewegungen innerhalb des Judenthums im Zeitalter Jesu*, Berlin, 1905, pp. 197 f., 265 f.; W. Bousset, *Die Religion des Judentums im NT Zeitalter*², do. 1906, p. 636 f.; E. Réhner, *Les Idées philosophiques et religieuses de Philon d'Alexandrie*, Paris, 1908, pp. 321-324; W. M. Flinders Petrie, *Personal Religion in Egypt before Christianity*, London, 1909, p. 63 f.; O. Pfeiderer, *Primitive Christianity*, Eng. tr., 1906-11, iii. 1-8, 18 f.; and H. Leclercq, *DACL* ii. 3063-3075.

Theudas.—See MESSIAHS (PSEUDO).

THEURGY.—Theurgy (*θεουργία*)—the direct working of God—is closely connected with certain systems of mysticism and theosophy. The word itself is not often used by those who claim that supernatural effects are produced through them by divine action; they more often ascribe the miraculous effects to good 'spirits,' whom God uses for His purposes, and they call this system of divine working 'magic,' frequently 'white magic,' as distinguished from 'black magic,' which is supposed to be the work of diabolical spirits. Vaughan has given a good definition of it. He says:

'I would use the term theurgic to characterize the mysticism which claims supernatural powers generally,—works marvels, not like the black art, by help from beneath, but as white magic, by the virtue of talisman or cross, demi-god, angel, or saint. Thus theurgic mysticism is not content, like the theopathic, with either feeling or proselytising; nor, like the theosophic,

with knowing; but it must open for itself a converse with the world of spirits, and win as its prerogative the power of miracle. This broad use of the word makes prominent the fact that a common principle of devotional enchantment lies at the root of all the pretences, both of heathen and of Christian miracle-mongers. The celestial hierarchy of Dionysius and the benign demons of Proclus, the powers invoked by Pagan or by Christian theurgy, by Platonist, by Cabalist, or by saint, alike reward the successful aspirant with supernatural endowments; and so far Apollonius of Tyana and Peter of Alcantara, Asclepiogenia and St. Theresa, must occupy as religious magicians the same province. The error is in either case the same—a divine efficacy is attributed to rites and formulas, sprinklings or fumigations, relics or incantations, of mortal manufacture.'¹

Some form of belief in theurgy is at least as old as history and literature. Homer's heroes are constantly raised beyond themselves and perform deeds which seem to be done through them by the Olympian divinities who come to their aid. Oriental as well as Grecian mythology everywhere assumes theurgic powers. The eclectic Gnostics, who drew upon many popular religions and sacred books as the sources of their divine *gnosis*, also believed and taught that great divine powers became available to those who were initiated and who thus received something of the fullness—the Pleroma—of the Godhead.

The Neo-Platonists, especially in their later periods, gave new impetus to theurgy and were unwittingly the transmitters of it into Christian circles. Plotinus, the founder of the movement, was a metaphysician of high rank and a noble mystic whose influence on Christian mysticism can hardly be overestimated, but he was not interested in occult knowledge or in theurgic phenomena. His Syrian successors, however, Porphyry and Iamblichus, were concerned with the problem of discovering and applying divine powers or energies in the sphere of human action. Iamblichus, who strongly reveals Gnostic influences, turns the ideas and hypostases of Plotinus into divinities, *i.e.* personified beings, and he holds that these 'intelligences' work wonders in the macrocosm outside and in the microcosm within man. These divine powers come into the soul of the mystic on high occasions, possess it, and enable it to do works beyond human capacity. There are, according to Iamblichus, hierarchal orders of these divine powers in varying ranks, and it belongs to mystical wisdom to know how to invoke the higher and more benign powers and to gain their theurgic assistance. This theurgic system is set forth in Iamblichus' treatise *de Mysteriorum*. Proclus, the last important name among the Neo-Platonists, was a much greater philosopher than Iamblichus, but he also expounded a system of theurgy and encouraged belief in hierarchal powers, arranged in triadic orders, who work divinely and mysteriously through those who are raised into union with these higher powers.

Through the Gnostics, through the Neo-Platonists, especially through the Christian Neo-Platonist who wrote under the pseudonym Dionysius the Areopagite, and above all through contact with the pagan world and its wide-spread belief in magic, the Christian Church unconsciously absorbed a multiform faith in theurgy. Angels of many orders, saints who have been glorified, the Virgin Mary and her divine Son, can and do work wonders, it is believed, for faithful worshippers. Water and bread and wine and other elements of nature are by miraculous divine grace transformed into spiritual substances, become, in fact, the real divine presence, and supply to the recipient supernatural powers, which *work* mightily within the soul. Many Roman Catholic saints and many 14th and 15th cent. mystics believed themselves possessed of special theurgic powers. Stigmata of nail-prints were believed to be divinely produced in the hands and feet of Francis of Assisi and of Catharine of Siena. Others had the power to 'levitate' them-

¹ See G. Faber's cautious survey and verdict in his *Buddhistische und Neutestamentliche Erzählungen*, Leipzig, 1912, pp. 10-29.

² *Gnostic Heresies*, London, 1875, p. 31 f.

³ *ERR* x. 729 f.

⁴ *Homers with the Mystics*, i. 36.

selves and to soar above the earth in moments of possession. Others had the miraculous gift of shedding tears in extraordinary measure or of emitting fragrant odours from their body in periods of ecstasy, while still others underwent profound physical transformations or radiated light like a self-luminous body. The entire field of theurgic phenomena is thus intimately bound up with the psychology of hysteria and auto-suggestion. Automatism of many types is now scientifically recognized. It seems to the 'subject,' when parts of his own body perform functions without his conscious volition, as though some foreign person had entered and possessed him and were using his hands or his feet or his lips. Where the results are beneficent and constructive, it seems natural to believe that divine power has come to his assistance and is working a miraculous work through him, so that theurgy appears, to persons of this type, to rest upon facts of experience.

An immense revival of theurgy came in with the rise of humanism and during the period when science was emerging from the stage of superstition and pseudo-science. This revival was due, in large measure, to the influence of Neo-Platonism and of the Jewish Kabbālā, both of which the early humanists studied with zeal and enthusiasm. Pico della Mirandola (1463-94) gave great prominence to the symbolical, mystical, theurgical Kabbālā, and he also glorified the writings of the Neo-Platonists. W. R. Inge quotes the following passage from Pico's *Apology* which illustrates the mental attitude of the first humanists:

'One of the chief charges against me is that I am a magician. Have I not myself distinguished two kinds of magic? One, which the Greeks call *γοργεία*, depends entirely on alliance with evil spirits, and deserves to be regarded with horror, and to be punished; the other is magic in the proper sense of the word. The former subjects man to the evil spirits, the latter makes them serve him. The former is neither an art nor a science; the latter embraces the deepest mysteries, and the knowledge of the whole of Nature with her powers. While it connects and combines the forces scattered by God through the whole world, it does not so much work miracles as come to the help of working nature. Its researches into the sympathies of things enable it to bring to light hidden marvels from the secret treasure-houses of the world, just as if it created them itself. As the countryman trains the vine upon the elm, so the magician marries the earthly objects to heavenly bodies. His art is beneficial and Godlike, for it brings men to wonder at the works of God, than which nothing conduces more to true religion.'¹

Reuchlin (1455-1522) carried the study of the Kabbālā and of Neo-Platonism still farther and laid the basis for the theurgy and magic which swarm in the writings of Cornelius Agrippa of Nettesheim, Paracelsus, Valentine Weigel, and, in a distinctly less degree, Jacob Boehme. All these theosophically-minded thinkers believed that it was possible to come into possession of direct divine wisdom or light and thereby to discover the secret of the universe and to use the secret in marvellous theurgic ways. Reuchlin expressed this view, in 1517, in a passage which is translated in the appendix to the *Three Books of Occult Philosophy by Henry Cornelius Agrippa*.² He says:

'God, out of love to his people, has revealed the hidden mysteries to some of them, and these can find in the dead letters the living spirit. For Scripture consists of single letters, visible signs, which stand in a certain connection with the angels as celestial and spiritual emanations from God. By the pronunciation of the one, the others also are affected; but with a true Cabalist, who penetrates the whole connection of the earthly with the heavenly, these signs, rightly placed in connection with each other, are a way of putting him into immediate union with the spirits, who through that are bound to satisfy his wishes.'

A still better account of the theurgic operations which are believed to work through those who catch the divine secret and find the light is given in the words of 'J. F.,' who translated Agrippa's *Occult Philosophy* into English in 1651. The passage is in the 'Preface to the Judicious Reader,' and is as follows:

¹ *Christian Mysticism*, p. 269, footnote 2.

² Ed. W. F. Whitehead, Chicago and London, 1898, p. 251.

'This is true and sublime Occult Philosophy. To understand the mysterious influences of the intellectual world upon the celestial, and of both upon the terrestrial; and to know how to dispose and fit ourselves so as to be capable of receiving the superior operations of these worlds, whereby we may be enabled to operate wonderful things by a natural power—to discover the secret counsels of men, to increase riches, to overcome enemies, to procure the favour of men, to expel diseases, to preserve health, to prolong life, to renew youth, to foretell future events, to see and know things done many miles off, and such like as these. These things may seem incredible, yet read but the ensuing treatise and thou shalt see the possibility confirmed both by reason and example.'

Once more in modern times there has appeared a recrudescence of theurgy in spiritualistic and theosophical circles. The element of fact in it now, as of old in the days of humanism and of Neo-Platonism, is due to the automatism, *i.e.* to subliminal action, emerging without the subject of the action being conscious that it is initiated by him. It seems to be done through him and not by him and thus is attributed to God, or to spirits who 'possess' him.

R. M. JONES.

THIRTY-NINE ARTICLES.—See CONFESSIONS.

THOMISM.—1. Name.—Broadly speaking, Thomism is the name given to the system of philosophy and theology founded by St. Thomas Aquinas (*q.v.*). Strictly speaking, it is the name given to a group of opinions taught by St. Thomas and held by what is known as the Thomistic school, which is mainly but not exclusively composed of Dominicans.

2. Historical survey.—The foundation of Thomism is incontestably due to the personal influence of St. Thomas Aquinas. It should not, however, be forgotten that Albert the Great did much to prepare the way for the birth of the new system, so that the names of both master and pupil will ever remain inseparable in the great work. Although there were many points of contact between the minds of Albert and Thomas, the genius of the one was entirely different from that of the other. The mind of Thomas was more critical than Albert's. The latter does not possess his subject quite perfectly; there is a lack of precision in details and a certain want of synthesis necessary to unify his knowledge. On the contrary, Thomas possesses his matter perfectly; above all, he has a power for order; his precision is nicer and his analysis finer; his vision is more penetrating and more embracing; and his power of analysis is on equal footing with his power of synthesis. Albert revealed to his age an intellectual world unknown to it; Thomas with the débris of the intellectual world of the ancients created a new one. Both aimed at incorporating Aristotle into Christian philosophy and theology. Albert's endeavour has the merit of initiative, but it remained incomplete and only provisional; Thomas with a magician's hand forwarded the work and produced a masterpiece which he embellished with a finish undreamed of by Albert.

Before the time of St. Thomas several attempts had been made to synthesize the sum of human knowledge, but nothing of any great value had been the result. The work of reformation undertaken by St. Thomas was so vast and complicated that it is not surprising that he was at first a little hesitating and diligent; but, as he advanced in

years and learning, his vision became clearer, and at the age of thirty he took up a position that, with regard to most things, was definite and final. Being perfectly familiar with all the problems discussed by philosophy and theology, and having carefully weighed the value of the respective solutions and examined the systematic points of view already attempted, he saw that a perfect system necessarily demanded the unification of the whole of knowledge. This perfect ordering of the whole of knowledge which he bequeathed to the world was due to his sublime metaphysical sense. It is because St. Thomas surpassed the host of thinkers of his time as metaphysician that he produced a unique work.

In philosophy he is the first to proclaim the autonomy of reason; and he has produced his philosophic works without once having recourse to an authority other than experience and reason to establish his conclusions and defend them. Starting from the 'sensible' world as from a secure basis, St. Thomas passes to the region of the absolute, to the highest and purest intellectualism. In theology he proclaims the autonomy of revelation. At the outset he maintains the impossibility of a real conflict between the natural and supernatural orders which have the same source of truth, viz. God. Thus he synthesizes natural and supernatural, nature and grace, faith and reason. To assimilate his thought it is necessary to understand, above all, the functioning of his general synthesis, and especially of his metaphysics, which rules the whole economy of his work. Eclecticism has no meaning with regard to Thomistic doctrines; their value and strength reside essentially in the marvel of their unity and solidarity.

3. Progress of Thomism. — The Dominican order gradually took up the teaching of St. Thomas, but not without opposition; some of its members were still imbued with the doctrines of Augustinism, and these could not be converted to a new system in a day.

Robert Kilwarby, archbishop of Canterbury and a Dominican, condemned St. Thomas's theory of the unity of substantial form, on 18th March 1277. A few years later, however, the English Dominicans were among the most resolute defenders of this doctrine. In Germany Ulrich Engelbert de Strasbourg († 1277) inclined towards Augustinism and the Neo-Platonism of the Arabs. Eckhart († 1327) was much inclined towards Neo-Platonism. Thierry († towards 1315) was an Augustinist strongly influenced by Avicenna: the latter never hesitated to combat the doctrine of St. Thomas.

In France the great adversary of the new system was Durand de Saint-Pourçain. In Italy Umberto Guidi was punished by the Dominican Provincial Chapter of Arezzo in 1315 for attacking St. Thomas; and the General Chapter of Puy (1344) cautioned Thomas of Naples for opposition to St. Thomas. Many chapters of the Dominican order encouraged and promoted Thomistic doctrines. Worthy of mention are the General Chapters of Paris (1286), of Saragossa (1309), of Metz (1313), of Castres (1329), of Brive (1346). So great indeed was the attachment of the Dominicans to the *Summa Theologica* that the celebrated Spaniard Arnald de Villeneuve († 1311) wrote a work against the Dominicans in 1304 (*Gladus jugulans Thomistas*), in which he accuses the Dominicans of preferring the study of the *Summa* to that of the Bible. Two centuries later Erasmus formulated the same reproach.¹

4. Introduction of St. Thomas's writings as text-books in schools.—At the end of the 13th cent. the Bible was the principal text, and the *Sentences* of Peter the Lombard was the theologi-

cal text *par excellence*. The Dominicans introduced the reading of the *Sentences* 'in via Thomae,' i.e. according to the thought of St. Thomas. Other schools following this example taught the *Sentences* 'in via Alberti,' 'in via Durandi,' 'in via Scoti,' etc. Not until the end of the 15th cent. did the Dominicans substitute entirely the *Summa* for the *Sentences*.

5. Thomistic polemics.—The fights sustained by the Dominican order during the end of the Middle Ages in defence of their school were (1) to make a good stand against Augustinism, and (2) to defend certain doctrines special to Thomism.

(a) General.—In favour of Augustinism a great reaction was made by the Friars Minor in a work composed by William de la Mare. The Oxford Dominicans replied in a work known as the *Corruptorium*. A further work, *Correctorium Corruptorii*, was published by two Oxford Dominicans, William de Makelsfeld and Richard Knapwell. At the end of the 13th cent. another general defence of Thomism was written by Robert de Bologne, *Apologeticum pro St. Thoma*. Last of all a great work (unfinished) was written by a celebrated Thomist, Hervé Noël de Nedellec, master at the university of Paris and master-general of the Dominicans, *Defensa doctrine Sti. Thomæ Hervæus Natalis*.

Other important works written towards the end of the Middle Ages are *Defensiones theologice divi Thomæ Aquinatis*¹ by John Capreolus († 1444), who was called the 'princeps Thomistarum,' and *Clypeus Thomistarum contra modernos et Scotistas*² by Pierre Niger († 1451). Diego de Deza († 1523), the illustrious protector of Christopher Columbus, wrote two polemical works in favour of Thomism, of which the more important is: *Novarum defensionum doctrine Angelici Doctoris beati Thomæ de Aquinas super quatuor libros Sententiarum questiones profundissimæ et utilissimæ* (Seville, 1517).

(b) Special.—(1) St. Thomas formulated the theory of the unity of the human person by making the intellectual soul the only form of the human composite. Against the Averroism (taught at Paris) which held the unicity of intellect for the human species, and against Augustinism, which held the plurality of forms, several treatises were written by Thomists—e.g., by Pierre de Tarantaise, Gilles de Lessines, William de Makelsfeld, Thomas de Sutton, Jean de Faenza, etc.

The General Council of Vienne defined the Thomistic doctrine on this matter, which was further confirmed by the 5th Council of Lateran (1515), and by Pope Pius IX. in a letter to the archbishop of Cologne (15th June 1857).

(2) The question of the nature of religious poverty and its practice by Christ and the apostles was hotly discussed between the Dominicans and the Friars Minor. The discussion became so disastrous that Pope John XXII. condemned as erroneous and heretical the doctrine that Christ and the apostles did not possess anything, or did not perform acts of proprietorship, viz. buying and selling; etc. (12th Nov. 1323, *Cum inter nonnullos*).

(3) There was another theological combat between the Dominicans and the Minors with regard to the blood of Christ shed during the Passion. The Minors said that it ceased to be united to the divinity of Christ, the Dominicans that the union did not cease. Eventually Pope Pius II. forbade both parties to discuss the question further.³

(4) The Dominicans strenuously fought against the nominalism⁴ of the 14th cent. of which Durand de Saint-Pourçain and William Ockham were the leaders.

¹ New ed., 7 vols., ed. C. Paban and T. Pègues, Tours, 1900-08.

² Venice, 1481.

³ All the literature of this quarrel is to be found in a MS in the Bibliothèque de Paris (*Cat.* 12390, fol. 1-78; also cf. Benedict xiv., *de Servorum Dei Beatificatione et beatorum Canonizatione*, bk. II. ch. 30).

⁴ See art. REALISM and NOMINALISM.

¹ *Opera Omnia*, Leyden, 1703-06, iii. 515.

(5) The Averroism against which Albert the Great and St. Thomas fought was renewed again at the beginning of the 16th cent. in Italy. Thomas de Vio, called Cajetan, published a commentary on the *de Anima* of Aristotle (Florence, 1509). A few years later the Council of Lateran (19th Dec. 1513) condemned the teaching of Averroism on the point, and further exacted that professors of philosophy should solve contrary arguments, which Cajetan held only theologians could do.

(6) In the 14th cent. disputes concerning the Immaculate Conception arose. St. Thomas undoubtedly leaves the question unsolved, but he was at great pains to show that the Blessed Virgin was not excluded from the redemption. St. Thomas says that the precise moment of sanctification is unknown; he therefore never propounded the question whether Mary was sanctified at the very instant of conception. He believed it better to be silent on this point, although, had he followed his personal inclination, he had without doubt concluded in the affirmative, as his first declaration witnesses in *IV. Sent.* I. dist. xlv. qu. 1, art. 3, ad 3. But his superior theological sense did not let him, in presence of the silence of tradition and the negative position of many theologians, and in particular the reserved attitude of the Church. The endeavour to drag St. Thomas to the negative or positive side is to force his meaning, since he voluntarily abstained from either.

6. Renaissance of Thomism.—In the 14th and 15th centuries there was an intellectual decadence in philosophy and theology. Thomism could not altogether abstract itself from the influence of the time. However, even in the 15th cent. there was notable vitality among Thomists like John Capreolus, St. Antoninus of Florence, and Jean de Torquemada. At the end of the 15th cent. the intellectual life of Thomism received new vigour, which manifested itself in the 16th cent. and continued for two centuries afterwards. In 1551 the General Chapter of Salamanca ordered the text of St. Thomas's writings to be used as text-books in all its schools. Hence at this time the great commentaries began to be written. Cajetan wrote from 1507 to 1522; Conrad Köllin on the *Prima secundæ* (Cologne, 1512); François de Vittoria (whose commentaries remained in MSS) and Barthélemy de Medina from 1577 to 1578; Banez from 1534 to 1594; Sylvester Ferrariensis on the *Summa contra Gentiles* (Venice, 1534). The humanist movement of the 16th cent. had a great influence on certain Thomists. François de Vittoria took the lead; of his disciples the most famous was Melchior Cano († 1560), whose work, *de Locis theologicis*, is a tribute to the humanist movement by its purity and beauty of style. Two new doctrines issued from the humanist state of thought; Ambrose Catharin († 1553) put forward new theories on predestination and grace; and Barthélemy de Medina formulated probabilism. Thomists combated the former doctrine; whilst in answer to the desire of Pope Alexander VII. they combated strongly probabilist doctrines.

7. Thomism and the Council of Trent.—Thomists held an important part in this council. The Thomistic school had grave interests at stake on account of the dogmatic question regarding the doctrine of justification. Of the five members of the commission instituted by Paul III. to study this question three were Dominicans, of whom Barthélemy Spina, master of the Sacred Palace, was the most active. The decree on justification was not drawn up without the help of St. Thomas. The text of the decree as regards the mode of preparation for justification¹ is taken in its every

¹ Sess. vi. ch. vi.

detail from the *Summa*, III. qu. lxxxv. art. 5. The decree numbers six acts preparatory to justification. They are the same in nature, number, and order as in the *Summa* (*loc. cit.*). Also, in the following chapter of the decree the causes of justification are exactly those given by St. Thomas in the *Summa*, I. ii. qu. cxii. art. 4, and II. ii. qu. xxiv. art. 3.

The official catechism (published by the council), in which the doctrine of the Catholic Church is contained and which was compiled for the use of the clergy, was drawn up by three Thomists—Leonard de Marinis (archbishop of Lanciano), Gilles Foscarari (bishop of Modena), and François Foreiro (theologian to the king of Portugal).

As soon as the Council of Trent was finished, Pope Pius V. on 11th April 1567 proclaimed St. Thomas a doctor of the Church.

8. Thomism and Molinism.—See art. MOLINISM; also see below § 12.

9. Thomism and Jansenism.—In his posthumous work *Augustinus* (Louvain, 1640) Jansenius strove to prove that the new theology, especially that of Molina and Suarez, was against the doctrine of St. Augustine and contrary to the doctrine authorized by the Catholic Church.¹ The *Augustinus* aroused much opposition among the Jesuits. After an examination of the book, the Dominicans found that it militated not only against Molinism, but also against Thomism. Two Dominicans wrote against Jansenius—Alexander Sébille (*de Augustini et SS. Patrum de libero arbitrio interpretum thomisticus adversus Cornelii Jansenii doctrinam*, Mayence, 1652), and Bernard Guyard (*Discrimina inter doctrinam Thomisticam et Jansenianam*, Paris, 1655).

10. Thomism and probabilism.—The theory of probabilism (*q.v.*) was unfolded by Barthélemy de Medina, a Dominican, in his *Expositio in Primam Secundæ D. Thomæ* (Salamanca, 1577). The Jesuits generally adopted this new theory. But, since the ease with which any opinion could be made probable, provided the contradictory was probable, led to grave abuses, Alexander VII. asked the Dominicans to combat strongly the probabilist doctrines. This they did, and from that time no Dominican theologian has written in favour of probabilism.

11. Neo-Thomism and the revival of Scholasticism.—At the beginning of the 19th cent. Scholasticism (*q.v.*) began to revive, and there followed a revival of Thomism. The encyclical *Æterni Patris* of Pope Leo XIII. (4th Aug. 1879) set up St. Thomas Aquinas as the great model and master of Catholic philosophy and theology. From that time all schools have studied the works of the master and have endeavoured to make his thought their own. The endeavour to keep in touch with the progress of modern science, and to show that the fundamentals of Thomism are in perfect accord with the latest discoveries of science, was set on foot, not, as is sometimes supposed, by the Institut Supérieur de Philosophie of Louvain University, but by the Thomist Sanseverino, one of the most learned and vigorous promoters of the movement. This is evidenced by his work, *Philosophia Christiana cum antiqua et nova comparata*. This great movement has been fostered and developed by the Institut Supérieur de Philosophie, founded by Cardinal Mercier at Louvain. Certain *Revue*s are now published in which the teachings of Neo-Thomism and Neo-Scholasticism are consistently set forth. The *Revue Thomiste* and the *Revue néo-scholastique de Philosophie* are worthy of mention.

12. Essence of Thomism.—Thomism is above all a system of philosophy and theology. Now a

¹ See art. JANSENISM.

system necessarily implies harmony and solidarity among the doctrines of which the system is built up. In proportion as a system lacks unity, so much is it less of a system. Many philosophers and theologians have endeavoured to give systems of knowledge to the world, but on examination it is found that they lack the first essential of a system, viz. solidarity of thought in every department. If certain principles are laid down in metaphysics, no doctrine in any department of applied metaphysics (as, *e.g.*, in psychology, cosmology, natural theology, ethics, etc.) should be at variance with those principles. Moreover, if a system claims to be a system of the *whole* of knowledge, both of that attained by human reason and of that attained by revelation, then no doctrine formulated by natural reason should be at variance with the doctrines formulated by faith; and conversely. It is evident that, if there be a system of this nature, it is eminently constructive or synthetic. Every stone in the structure must be in its proper place, and, if the building is to stand firm, there must be some grand unifying principle or foundation upon which it is built up. Now, just as in any architectural building there cannot be several foundations, but only one ultimate foundation, so in Thomism there is one fundamental principle unifying the system and imparting harmony and solidarity to every department which it embraces.

13. The fundamental principle of Thomism.—An examination of the various departments of Thomist metaphysics, of applied metaphysics, and of the whole realm of Thomist theology will show that the fundamental doctrines of each department are applications to various matters of a great principle inculcated by Aristotle in his metaphysics. It is the principle of the real distinction between *act* and *potentiality*. One has not far to seek in order to understand what is meant by 'act' and by 'potentiality.' 'Act' means perfection; 'potentiality' means absence of perfection. A thing in the state of potentiality is in an imperfect state, and is therefore capable of receiving what it lacks, viz. some perfection or an act (as it is termed in scholastic language), whereby it ceases to be in a state of potentiality and is brought to a state of having some perfection. There are, as is evident, many kinds of states of potentiality and many kinds of corresponding states of act, but it is not necessary to enter into a discussion of them, since the doctrine underlying them all is one and the same. Furthermore, it is clear that the state of potentiality must be really distinct from the state of act; for, if this be not true, then 'to run' and 'to be able to run,' 'to know' and 'to be able to know,' 'to be hot' and 'to be able to be hot,' are one and the same, which is absurd. Hence there must be a real (extra-mental) distinction between the two states. This principle, then, may be formulated thus: *Between the state of potentiality and the state of act there is a real distinction.* Further, the first unfolding of this principle necessarily implies that that which is in a state of potentiality cannot cease to be in that state unless it be 'moved' from that state by something which is in the state of act; *e.g.*, cold water has the potentiality to become hot, but it is impossible for cold water to become hot unless it be 'moved' from that state by something that actually possesses heat. It will be seen that this conclusion is an immediate inference of the real distinction between potentiality and act. Hence the principle in a more explicit way may be formulated thus: *Potentiality, which is really distinct from act, can never become act unless it be reduced to act by something which is in act.*

This is the fundamental principle of the entire

Thomist system; established at the outset in metaphysics, it is applied without exception to the fundamental doctrines in every department of Thomist philosophy and theology. Whoever draws a single conclusion which is in any way at variance with this principle, although he may hold all other doctrines of the Thomist system, ceases *ipso facto* to be a Thomist.

14. The application of the principle.—(a) *In metaphysics.*—The Thomist doctrine of real distinction between essence and existence in created things, wherein essence is conceived as a potentiality and existence as an act, is an application of the principle; likewise the real distinction between substance and its accidents, wherein substance is conceived as in potentiality to the accidents which are its acts or perfections; likewise the doctrine concerning the nature of dimensive quantity, the essence of which is not that it actually extends the parts of a corporeal substance in place, *i.e.* in triple dimension, but that it distributes the parts of that substance within the substance itself (which internal parts are only potentially distributed in triple dimension by dimensive quantity), and that it has the capability or potentiality of *actually* extending those parts in place according to triple dimension. Upon this doctrine of the nature of dimensive quantity is founded the doctrine of the real presence of the whole body of Christ in a small consecrated Host; also the doctrine of the virgin birth of Christ, of His passing into a room, the doors being shut, etc. Likewise the important doctrine of cause and effect, or the principle of causality, is an application of the aforesaid fundamental principle. An analysis of 'that which begins to be (effect) must have a reason (cause) for its inception' shows the underlying great principle.

(b) *In psychology.*—The doctrine of the unity of the human composite, viz. that the intellectual soul is the substantial form of the body, and that it is the only form, is an application of the same principle. The 'prime matter,' a pure potentiality, which is informed by the intellectual soul (or act) receives from this act all that makes it body, and human body, and living. Through the same principle it follows that the faculties of intellect and will are really distinct from the substance of the soul, because they are the acts or perfections of the soul, which in regard to them is a potentiality. As a consequence it also follows not only that every faculty is really distinct from its object as potentiality to act, but also that, in regard to it *as object*, every faculty is passive, not active. Hence the important doctrine that the human intellect is a passive, not active, power or faculty, in that it receives, and does not make, its object of thought *as object*.

Further (and this is most important from the point of view of Thomism *versus* Molinism), the human will, which is the faculty of choice, must ultimately be moved to the very act of choosing by something which is in act; and the reason is that, before the act of choosing (given everything necessary for this action save this action itself), the will is in a state of potentiality and must therefore be 'moved' by something outside it to the state of perfection which is 'choosing.' Only God, the *actus purus*, can move the will to the very act of choosing; if aught else did this, the will *ipso facto* would cease to be free. This is the Thomistic doctrine of physical premotion, which is a rigorous application of the aforesaid fundamental principle.

(c) *In cosmology.*—In this department of applied metaphysics the fundamental question concerns the precise nature of body, as body. Applying the aforesaid principle, Thomism concludes that

body, as body, is a composite of two principles, one of which is substantial form and the other prime matter. Prime matter is a pure potentiality of which the substantial form is the act; and between the two, as a consequence, there is a real distinction.

(d) *In natural theology.*—The classic proof for the existence of God, viz. from the existence of motion in the world, is nothing more than a rigorous application of the same principle. Motion is here taken in its widest sense, embracing not only local motion but every kind of 'passing from potentiality to act.'¹

(e) *In ethics.*—All the doctrines concerning habits and their formation, of the passions, of virtues and vices, of laws, etc., have their mainstay in the same fundamental principle.

(f) *In theology.*—For the existence of God see above (d). It is only necessary to run through the *Summa* to see that the same principle is fundamental in the doctrines concerning revelation and concerning inspiration (in which is implied the doctrine of cause and effect, and in particular of instrumental causality). By an understanding of the same great principle it is concluded that God alone is pure act with no admixture of potentiality whatsoever, whilst everything created contains both potentiality and act. It is further concluded not only that God's essence is identically the same as His existence, but that His intellect and His will, His attributes of unity, goodness, truth, His knowledge and love are likewise identically the same as His essence. The same grand principle underlies the whole of the doctrine concerning the mystery of the trinity of persons in God. A further application is to be found in the treatise on the angels, whose existence is really distinct from their essence, whose minds and wills are really distinct from their substance, etc. Thus through the whole of the *Summa* one finds the same principle applied. It will be necessary to take only two more cases in order to show the solidarity of Thomistic doctrines. According to St. Thomas, the sacraments are the instrumental causes of grace; they are not mere channels through which grace is infused into the soul; they are real, physical, instrumental causes which produce or infuse grace into the soul. The soul in regard to the sacramental grace that informs it is a potentiality (*potentia obedientialis*), and grace is the act.

The final instance we shall take to illustrate the application of the fundamental principle of Thomism concerns the doctrine of actual grace. Just as in the natural order it was concluded that the human will is physically removed by God to the act of choice,² so in the supernatural order an actual grace is nothing more than a physical pre-motion in that order. Hence the Thomists speak of 'gratia efficax ab intrinseco,' a grace intrinsically or of its very nature efficacious, and not of grace, intrinsically indifferent, to be made efficacious by consent of the will to accept, or to remain inefficacious by refusal of the will to accept. Thus Thomism, by a relentless logic, applies the great principle to the doctrine of actual grace. To the mind of St. Thomas, in spite of the apparent difficulties, this doctrine is the only logical conclusion. For Thomism the theory of Molina or Suarez bristles with more difficulties in that the theory subverts the doctrines of God as the Prime Mover of all things, of causality, and of the great metaphysical principle: *Potentiality, which is really distinct from act, can never become act unless it be reduced to act by something which is in act.* In short, for the sake of a difficulty in applied

metaphysics (*i.e.* the freedom of the will under God's physical pre-motion), Molina and Suarez gainsay a principle already established in metaphysics, just as he who, on account of some difficulty in mixed mathematics, gainsays a principle of pure mathematics.

Any conclusion other than the one drawn above wrecks a system of the whole of knowledge in the mind of the Thomist. It is owing to the perfect consistency of application of the grand fundamental principle aforesaid to every department of knowledge that Thomas bequeathed to the world a sublime system remarkable for its perfect unity, harmony, and solidarity of thought.

LITERATURE.—For the history of Thomism generally: *Dictionnaire d'Apologétique, s.v.* 'Frères Prêcheurs, Leur doctrine' (P. Mandonnet); *CE, s.v.* 'Thomism.' For the progress of Thomism: *Acta capitulorum generalium ordinis Prædicatorum, Rome, 1893-1904, ed. B. M. Reichert, ii. 196-391* (of the Dominican order).

For the essence of Thomism: Thomas Aquinas, *Summa Theologica* and *Summa contra Gentiles*; N. del Prado, *de Veritate fundamentali philosophiæ christianæ*, Fribourg (Switzerland), 1889, new ed., 1911, *de Gratia et libero arbitrio*, 3 vols., do. 1907; art. AQUINAS and MOLINISM.

ÆLRED WHITACRE.

THRACE (Ἰθράκη, Θράκη). — Thrace was the name given in classical times to the mountainous region lying north of Greece proper. The inhabitants (Ἰθράκες, Θράκες, Θράκες) were a barbarous people, having no close affinities to the Greeks in language, culture, or originally in religion. In the last field, however, their influence on their more civilized neighbours was considerable, beginning early and continuing fairly late. In particular, they appear to have been partly responsible for the remarkable change in the spirit of Greek religion which took place about the beginning of the classical epoch or shortly before it. This change must not be thought of as something revolutionary, akin, *e.g.*, to the conversion of most of N. Europe from Roman Catholicism to Protestantism at the Reformation; for the large majority, probably if not certainly, religious beliefs and practices changed little if at all; it was rather the introduction of a new element, which rendered possible the holding by many Greeks of ideas either unknown to their fathers or existing among them in a very undeveloped form, and largely forgotten when first we hear anything definite about the Greek race.

1. Origin and history of the Thracians.—The Thracian invasion of the country which they occupied in historic times is part of a wider movement from the north into the hilly region of the Balkans and the countries west and east of that district (Bosnia and Herzegovina on the one side, the Caucasus and Armenia on the other). The invaders were of Indo-European stock, probably originally from the Carpathians. Driven perhaps by the pressure of Slovak tribes from the region of the Vistula, or possibly from sheer restlessness or desire for fresh

¹ Cf. *Summa*, i. qu. ii. art. 3, *Prima via*.

² See above (b).

territory, they occupied the country in successive waves. The Phrygians (*q.v.*) and tribes most closely related to them, together with the Armenians, occupied the Asiatic district for the most part; the Thracians seized chiefly upon the European sector. That Thracian and Phrygian were related stocks was already recognized in antiquity,¹ and modern philology, together with arguments drawn from their religious and social organization, inclines us to believe that this is substantially correct. Throughout Greek history the Thracians, or the majority of them, remained politically independent, protected both by their great courage and by the difficult nature of their country; Rome, after much trouble, succeeded in subduing them, the ferocious Dacians finally yielding to Trajan. They remained, however, an intractable people, little influenced by the civilization of their rulers. Finally, about A.D. 400, their ancient priestly tribe, the Bessoi, were converted to Christianity. Some 200 years later a Slovak invasion swept over the country, and from that time begins the history of what ultimately became the Balkan peoples.

2. *Ethnology.*—The Thracian races fall, broadly speaking, into two groups—a northern and a southern. The latter, inhabiting the region of the Haimos and Strymon, included, besides the Bessoi already mentioned, the Bissaltai, Thynoi, Bithynoi, Sakai, Dioi, Odrysai, and other tribes; the former or Getic group consisted of a smaller number of peoples, individually more important than the tribes just mentioned. Besides the powerful Getai themselves, we must count among them the still more formidable Dacians (Δάκοι, Δάκαι, Δάτοι), who are often confused with them, and the Agathyrsi, whose name seems to indicate that they were held in no great esteem by their Scythian neighbours (the first two syllables are probably to be connected with *Zend agha*, 'bad'), and who appear from Herodotus² to have practised the very primitive custom of group-marriage. On the whole, the northern group shows certain cultural affinities with the Germanic tribes, the southern with the Orientals, especially, as already mentioned, with the Phrygians.

3. *Language.*—As the Thracians seem to have had no knowledge of writing, the few inscriptions we have from Thrace are late and never in the native tongue. There remain, however, a number of glosses, some 36 of which we may take as genuine Thracian words; about 25 names of plants given as Thracian by Dioscorides, and a considerable number of proper names, both of persons (including deities) and of places. From these it appears that their tongue was Indo-Germanic, of the E. European group, having as its nearest ancient congeners Phrygian and Armenian. Traces appear of two distinct linguistic stocks, the result presumably of the blending of two races; and this we may consider along with the fact reported by Herodotus³ that the cult practised by their chieftains differed from that of the common people.

4. *Material culture.*—It has been pointed out⁴ that Homer does not consider the Thracian culture as an inferior one. In the *Iliad* the Thracians are for the most part the allies of the Trojans; Priam's treasury includes a cup of their giving;⁵ the son of Antenor was brought up in Thrace and married there;⁶ Rhesos comes to Priam's aid with a strong Thracian contingent;⁷ on the other hand, some of them at least trade with the Greeks.⁸ No hint is given that they are in any sense savages; in particular, the followers of Rhesos encamp in a soldierly manner.⁹ But there is no need to suppose, as Helbig does, that the Thracians of that day, under Phœnician or other foreign influence, were enjoying a short period of 'hothouse' culture which brought them for a time to higher levels than they ever afterwards attained. The true explanation seems to be that Homer knows nothing of the later division between Greek and barbarian, and that the Greeks of his day were not a highly civilized people themselves. A race which lived under the rule of feudal barons, practised the blood-fend, allowed wer-gelt, occasionally mutilated or otherwise ill-treated a dead foe, was not quite free from the custom of human sacrifice, and buried its dead much in the fashion of the historical Thracians,¹⁰ besides keeping up the old custom of bride-price and having only very rudimentary manufactures and handicrafts, was not much superior to the Thracians of historical times. The difference was that the Greeks developed with marvellous rapidity in the next 300 years or so, while the Thracians remained backward.¹¹

Passing to classical authors of the later periods, we find our chief account of Thrace in Herodotus.¹² His whole attitude

¹⁰ See below § 5 (*h*).

¹¹ The present writer holds the view of Andrew Lang, van Leeuwen, and other scholars that the Homeric poems are substantially the work of one man, and he would put their date about the 10th cent. B.C. For the Homeric customs above mentioned see *Il.* ix. 632, xxii. 371, xxiii. 175 (the poet clearly disapproves strongly of the sacrifice), and xxiii. *passim*, *Od.* xv. 224, 272 ff., xx. 355, and many other passages. Elaborate manufactures or works of art are regularly the work of gods (as *Il.* xviii. 468 ff.) or imported (as *Od.* iv. 615). Simple weaving and the like are done at home, as *Od.* ii. 94. Cf. the account of Thracian arts above.

¹² Chiefly *v.* 2-8. References to other passages of Herod are cited in the notes. For fuller authorities see Tomaschek, *Die alten Thraker*, i. 111 ff.

towards the Thracians, while not unfriendly,¹ is clearly that of civilized man describing interesting barbarians; and this is certainly justified. They are, he tells us, a numerous race, of little political importance owing to their lack of unity; their culture is on the whole uniform. They despise agriculture, counting it more honourable to be idle and to live by plunder. They have, however, some arts, as they can weave very good cloth of hemp fibre.² To this we may add, what sundry later authors tell us, that they showed skill in making various tools and weapons of iron.³ They were accustomed to dye their hair and tatu their skin. They were, in some cases at least, polygynous; that they lived under father-right, not mother-right, is clear from the facts that they paid bride-price and that marital jealousy was strongly developed, though the chastity of an unmarried girl was quite disregarded—*i.e.*, their women were apparently thought of chiefly as valuable property, belonging to their fathers so long as they were unmarried—hence the light view taken of their immoralities, for any children that they might bear out of wedlock would also belong to their own family—but afterwards belonging to their husbands, who had paid for the exclusive use of them. When we add that as a race they were cattle-breeders and especially famous for their horses from very early times,⁴ it is clear that we shall not be far wrong in comparing them to some one of the principal Basuto peoples, such as the Amazulu, before the latter attained unity of government under T'Chaka. Physically, however, they were at the other end of the colour-scale, being fair-skinned and yellow-haired.

Finally, four points should be noted as giving the clue to many features in their religion. According to the practically unanimous voice of antiquity, (1) the Thracians were desperately brave, having little fear of death; (2) they were excitable, and, in particular, had a bad name for unrestrained indulgence in sexual passion; (3) they were heavy drinkers; and (4) they were intensely fond of music, performing well on both flute and lyre. In addition, their country was a mountainous one, in which caves were no rarity.

5. *Religion.*—We may take as our starting-point the famous passage of Herodotus, *v.* 7: 'They worship only the following gods, Ares, Dionysos, and Artemis; but their kings . . . reverence Hermes above all other gods, swear by him alone, and say that they are descended from Hermes.' We must in the first place remember that the names in the above passage are not to be taken too literally. Whereas a modern writer, if he said that a particular race worshipped Buddha, would mean exactly what he said, and the Hebrew prophet⁵ who speaks of the name of his God as being 'great among the Gentiles' means his words to be startlingly paradoxical, a Greek always assumes that the gods of all nations are much the same as his own and never scruples to talk of the Egyptian cult of Hermes or the Roman worship of Hera, meaning thereby Thoth and Juno. We shall see that, taken as it stands, Herodotus' statement is true of one deity only.

(*a*) *Ares.*—That Ares is a Thracian deity is a fairly wide-spread opinion. As far back as Homer⁶ we find Thrace mentioned as the home of the war-god, and later writers echo Homer.⁷ Ares has, moreover, certain non-Greek features; his cult is wholly without any of those higher forms which distinguish, *e.g.*, Apollo or Athene and remains throughout that of a war-god pure and simple. Homer's whole attitude towards him is one of dislike; he supports the Trojans throughout; and in his ritual we find one feature paralleled in Thrace⁸ hard to parallel in purely Greek cult—the dog-sacrifice to him under the name of Enyalios at Sparta.⁹

At the same time it must be confessed that none

¹ Between Greeks as a whole and Thracians as a whole no bitterness seems to have existed. The references to Thracians as bloodthirsty savages are mostly in comparatively late authors—*e.g.*, *Hor. Od.* i. xxvii. 2. The writer is of opinion that the detestable conduct of certain Thracian mercenaries in the Peloponnesian War (*Thuc.* vii. 29) may have had something to do with this, while later their savage battles against the Romans prejudiced the latter against them.

² *Herod.* iv. 74, vii. 75.

³ References in Tomaschek, i. 119.

⁴ *Cf. Hom. Il.* x. 436.

⁵ *Mal* 111.

⁶ *Il.* xiii. 301 and elsewhere.

⁷ *E.g.*, *Verg. Aen.* iii. 35.

⁸ *Vita Euripidis*, i. (vi.) ταῦτον δὲ (τὴν κύνα) Θράκες, ὡς ἔθος θύσαντες ἔφαγον.

⁹ *Plut. Quaest. Rom.* 290d; *Paus.* iii. xiv. 9; *Arnob. adv. Nat.* iv. 25. Such a sacrifice, however, is not wholly unknown elsewhere in Greece.

of the above features are conclusive against his Greek origin. Among a people brave enough, but not fond of war for its own sake, the war-god might well remain 'functional'—too important to be altogether neglected, too unpopular to develop. Among the traditional friends of Troy are also Apollo, Artemis, and at times Zeus himself; not much can be made from a single feature of an obscure ritual;¹ and the references to Thrace need mean no more than that the Thracians, being warlike, had a popular cult of a war-god. And we must remember that the cult of Ares is very old in Athens and Boiotia, and that his name is not only plausibly derived from an Aryan root, which in itself proves nothing, but has a characteristically Greek formation.²

We conclude therefore, on the whole, that the Thracians did not originate the Greek cult of Ares, but had from very early times a war-god of their own, about whose ritual we must be content to remain ignorant. It is worth mentioning that Herodotos seems to speak of him as an oracular god in one rather obscure passage.³

(b) *Dionysos*.—The case of Dionysos is very different, and there is little serious doubt that here Herodotos and the numerous later authors who speak of this god as Thracian are literally correct.⁴ The chief arguments in favour of this statement are as follows:

(i) *Philological*.—The first two syllables of the name are apparently to be connected with the Thracian tribe-name *Dioi*. Further, a Phrygian inscription gives us the formula *με θεος κε ξεραω*, which almost certainly means 'By heaven and earth.' We have a god with a name of which the first part has close Thracio-Phrygian affinities, while the rest is certainly not Greek, whose mother is apparently the earth-goddess of the Thracio-Phrygian stock.⁵

(ii) *Traditional*.—Strabo definitely calls the cult of Dionysos Thracio-Phrygian.⁶ When first we hear of the god at all, it is in connexion with the Edonian king Lykurgos;⁷ and his cult is called Thracian far more persistently than that of Ares by authors of all ages. Moreover, all tradition is agreed that he is not genuine Greek. It is true that the usual birth-legend (not the 'Orphic' story; see below) makes him a Theban; but even there he is disowned by his kin and has to win his way into prominence against the vehement opposition of Pentheus;⁸ while many similar tales indicate that his cult had to force an entrance into Greece. It is true that many, if not all, of these are misinterpreted ritual tales; but that they were persistently misinterpreted in the same way, as stories of persecution, strongly suggests that a folk-memory of real opposition lies behind the interpretation if not the stories themselves.

(iii) *Facts of cult*.—On the one hand, very early Greek agricultural festivals either are not Dionysiac, like the Attic Thesmophoria, or present Dionysos as an obvious intruder, like the Anthesteria. On the other hand, the Thracio-Phrygian region is the home of all manner of orgiastic nature-cults,⁹ and one detail of the worship of Dionysos which we have good reason to suppose primitive, viz. the oracle, is Thracian and hardly Greek at all.¹⁰ He seems always to have been a wine-god

as well as a god of nature in general, and a wine-god we find him in Thrace, which was a wine-growing country very early.¹ Further, he is connected in cult with Sabazios, who is probably Phrygian.

From Thrace, then, his cult spread through Greece some time, probably not very long, before the dawn of Greek history. In Homer he is apparently a foreign god, little known and not much regarded; of the five mentions of him two² are certainly interpolations, one³ is unimportant, the others come in the story of Lykurgos. When we come to the Homeric hymns, however, he is a well-known and important deity, and all later literature is full of references to him. It would appear then that somewhere after the downfall of the Homeric (Achaian) culture, and during the period of reconstruction, of which very little is known, his worship crossed the border and was carried, it is no longer possible to say exactly how, or by whom,⁴ to all parts of Greece, meeting with considerable opposition, but finally establishing itself as part of the state religion and becoming largely civilized in the process, though recrudescences of its original barbarism, such as the well-known one in Italy,⁵ were always possible.

No detailed description of the cult of Dionysos in Thraee has come down to us from antiquity; but it is not difficult to frame one from various scattered notices,⁶ from the wilder and more savage features of his Grecian cult, from the traces of the ancient worship still to be found in N. Greece, and from what we know of similar rites elsewhere.

We learn, firstly, that the most prominent feature of the ritual was a wild orgiastic ceremony held normally, if not always, at night. In this the worshippers worked themselves up into a state of frenzy by dancing and shouting (hence the numerous names of the god, such as *Euhios*, *Iakchos*, and perhaps *Bakchos*,⁷ which are derivable from ejaculations or from words meaning 'shout' or 'cry'), to the accompaniment of savage music. They were dressed in the skins of wild animals—we hear especially of fawn- and fox-pelts (*νεβριδες, βασαρραι*)—and carried the thyrsos, a spear-like implement covered with the sacred ivy, or the *narthex* (fennel-wand). It is obvious that for an excitable people, not highly civilized, and susceptible to strong sexual emotion, and therefore to nervous emotion of all kinds, including religious enthusiasm,⁸ the violent exercise under the stimulating surroundings of their mountainous country in the clear night air would of itself produce an abnormal condition; and this seems to have been further encouraged by the free use of wine and perhaps other artificial stimulants. The result was, at least in many cases, and particularly among their women, a condition of frenzy, involving anaesthesia, abnormal strength and endurance, and other such symptoms, followed by fainting and exhaustion. The natural explanation, to any one at that stage of culture, was that the worshippers were possessed by their god (*ενοεα, κατοχα*); and therefore we find them called by his name (*βακχοι, βακχα*). That Dionysos himself was present was

¹ The odd ritual of Ares *Γυνακοθόνας* (Paus. viii. xlviii. 4, 5) may point to Amazonianism, which is not Greek. But this is exceedingly doubtful.

² The forms *Ἀρηίος* (Hom. Ionic) and *ἀρεΐος* (Alkaios) indicate a stem in *-εiv-*; cf. *πρεσβήιον* and *πρέσβυς*. The root is akin to Skr. *ras*, 'roar.' See C. A. M. Fennell in *CIR* xiii. [1899] 306.

³ vii. 76, *ἐν τούτοις τοῖς ἀνδράσι Ἀρεΐς ἔστι χρηστῆριον*. The context is corrupt, and it is uncertain who are referred to, quite possibly not Thracians at all.

⁴ The counter-theory, that he is a Cretan deity, is supported by J. E. Harrison (*Prolegomena*², ch. viii.). The arguments for it reduce to (a) the fact that a cult of a god of this type did exist in Crete from very early times and remained so powerful that Zeus himself was absorbed by it; (b) certain very primitive features of Cretan Dionysiac ritual. But, in view of the overwhelming arguments in favour of Thrace, these phenomena are of little weight. The former is common to many localities; the latter is naturally explained by supposing that the worship of Dionysos, once it was imported, found favour in Crete because it was so like the native worship, and so was but little modified.

⁵ *CGS* v. 94. The attempts to make Semele a thunder-cloud or the like are too absurd to deserve more than passing mention. The syllables *-vvoos-* are unintelligible, but possibly connected with the holy mountain *Nysa*, which is variously located but apparently Thracian in Homer.

⁶ x. 471; cf. *Plut. Alex.* 2.

⁷ *Hom. Il.* vi. 130 ff.

⁸ The best known form of the legend is that given in Euripides, *Bacchae*. Even in this the final birth of Dionysos, from the thigh of Zeus, does not take place in Thebes.

⁹ Cf. art. *PHYRGIAN*.

¹⁰ See *Eur. Hec.* 1267; *Arist. ap. Macrob. Sat.* 1. xviii. 1.

¹ *Hom. Il.* ix. 72; *Arist. loc. cit.*

² *Il.* xiv. 325, and *Od.* xi. 325.

³ *Od.* xxiv. 74.

⁴ It was an age of wandering prophets (see Rohde, *Psyche*⁴, ii. 63 ff.). The favourable reception of the women may have had a good deal to do with it also.

⁵ *Liv.* xxxix. 8 ff.

⁶ To save a multitude of quotations, we refer the reader for detailed authorities to the authors cited in the Literature at the end of this article.

⁷ The root is perhaps *Fax-* (Curtius), in both names, *Iakchos* being *Fifaxchos*. *Euhios* is derived from the well-known cry *εὐοι*.

⁸ The present writer holds religious and sexual emotion to be essentially the same; see, e.g., W. James, *Varieties of Religious Experience*, London, and New York, 1902, *passim*. The frequency of 'conversions' and the like during adolescence and the regular employment by mystics of all nationalities of erotic metaphors are among the facts supporting this view.

a commonplace, familiar to us from many literary and artistic representations of the rites, from Euripides to Titian and Keats;¹ the skins in which the worshippers dressed were those of animal *avatars* of the god; and the culmination of the rite was the tearing in pieces and devouring of one of these animals.

It is far from impossible that in some cases the victim was a man or a child. That the Getai practised a form of human sacrifice we know;² Themistokles sacrificed three captives to Dionysos *ἠμυστήης*;³ the legends of Pentheus, etc., point the same way; and in the modified Dionysiac ritual of Tenedos⁴ the cow whose calf is to be the victim is tended like a woman, and the calf when born has buskins put on it before being killed.

We have so far a quite normal ritual of a vegetation deity, of the kind familiar from the *Golden Bough*.⁵ The god visits his worshippers in early spring (the time of most of the festivals),⁶ is welcomed by them, and is joined to them by a sort of primitive sacrament. Of the death or expulsion of the worn-out god, later in the year, we do not hear so much, but there are traces of it. In the legend of Lykurgos already referred to the king pursues the god into the sea—the throwing of the vegetation-spirit into water is a very common rite; there was a strong tradition that he had died, and was buried at Delphi;⁷ and there is also a legend of his descent into Hades to fetch up Semele.⁸ We are therefore, in view of these facts and on the analogy of all similar ritual elsewhere, justified in supposing that his death was part of the ceremonial of his cult; and this belief is strengthened by the curious relic of Dionysiac worship found in Thrace by R. M. Dawkins,⁹ in which the death of one of the characters in the nummers' play is a prominent feature. Closely allied with this went the ceremony representing his birth and cradling in the *λίκνον*, or winning-fan. The last detail, however, marking him definitely as a corn-god, is Greek rather than Thracian.¹⁰

In the ritual of Dionysos the forms of the god change bewilderingly. We have reason to suppose him to have been conceived as bull, goat, kid, sheep, serpent, stag, and even pig,¹¹ for all these animals, besides the fox and perhaps others, were sacred to him, and, as he is at times said to have taken the forms of some of them, notably bull and serpent, we may conjecture that he was more or less identified with the others as well. But in iconography he is always human, and he had human *avatars*, as might be expected from the human sacrifices.

(c) *Divine kings; Lykurgos, Pentheus, Rhesos, Orpheus*.—Several of the legends seem to indicate that in Thrace, as elsewhere, there existed kings of the type familiar from the investigations of J. G. Frazer—i.e. incarnations of the local god, who ended by being sacrificed, possibly devoured. As the Greeks probably never had had this sort of king—certainly had forgotten it—they naturally misunderstood the legends. Thus none of the

⁹ Described in his art. 'Archæology in Greece (1906-1907),' in *JHS* xxvii. [1906] 284 ff.

¹⁰ Hence Dionysos' title *λεικνίτης* (Plut. *loc. cit.*); cf. Serv. on Verg. *Georg.* i. 166.

¹¹ A selection of the relevant passages will be found in *CGS* v. 303 f.

above mythological figures exactly correspond to the Frazerian type. Lykurgos persecutes Dionysos; but the form which his persecution takes is a pursuit (probably originally ritual) of the god and his attendants and the flogging of them with the *βουπλήξ*, by which is possibly meant, not an ox-goad, but a whip of bull's hide, a fertilizing *februum* like the hide thongs of the Roman Luperci. He is not torn in pieces by the god's followers, but in one way or another (the legend varies in detail) is punished, by blindness or otherwise, and imprisoned in a cave.¹ Pentheus opposes the Bakchai and is torn in pieces by them. Orpheus is a royal priest of Dionysos and is torn in pieces by the Mænades—an act for which late mythologizers assign sundry fanciful reasons.² Rhesos is a vague figure, but it has been urged that his name may be connected with *rex* (Gothic *raiks*) and the royal Thracian name Rhescuporis. After his death he appears—the exact sense and reading are matters of dispute—to be represented by the author of the play bearing his name as becoming an oracular deity or semi-deity (*ἀθροποδαίμων*) of somewhat Dionysiac type.³ Add to all this the facts that the Getic priest-king was called 'god'⁴ and that we get as a royal name of frequent occurrence the word Kotys, which is a by-form of Kotyto, and it becomes at least plausible that the cult of Dionysos and other gods of the same kind in Thrace had at its head in early times⁵ a priest-king who was the incarnation of the deity and ended by being violently put to death to make way for a fresh incarnation.

(d) *Orphism*.—Of the persons mentioned in the last section one is of such importance as to deserve separate treatment, viz. Orpheus. Concerning this priest-king the tradition of antiquity is fairly constant. He is a more or less historical figure;⁶ he existed some time before the Trojan War;⁷ he was a Thracian,⁸ son of King Oïagros and a Muse, usually Kalliope, sometimes Polymnia. He was a priest of Dionysos, founder of Dionysiac mysteries, public and private, and originator of the Orphic *βίος*, i.e. way of life.⁹ He was also a seer, a magician, a 'theologian' in the Greek sense of the word,¹⁰ a marvellous musician. His home, when exactly localized, is generally said by our earlier authorities to have been Mt. Pangaion, the site of an ancient and famous Dionysiac shrine, while later writers locate him on the coast of Thrace, near the mouth of the Hebros. After various adventures, the most notable of which was the descent into Hades, familiar in later literature from Vergil's handling of it in the *Georgies*, he was

¹ See Soph. *Ant.* 955 ff., and Jebb, *ad loc.*

² For examples see Serv. on Verg. *Georg.* iv. 519.

³ See Rohde, i. 161, who rather too confidently assumes Rhesos to have been a faed god. W. Leaf (*JHS* xxv. [1915] 1 ff.) goes too far in the opposite direction. On the whole the present writer is of opinion that Rhesos may really have been a half-forgotten king of some Thracian tribe, who after his death was supposed to give oracles. The ancient evidence is to be found in *H. x.*; [Eur.] *Rhes.* 955 ff.; Polyæn. vi. 53.

⁴ Strabo, vii. 298.

⁵ Presumably not in historical times, as one can hardly suppose that none of our authors would have mentioned it in that case.

⁶ For an isolated expression of doubt see Cic. *de Nat. Deor.* i. 28 (108), 'Orpheum poetam docet Aristoteles nunquam fuisse,' which from the context is almost certainly a denial of Orpheus' existence. But Aristotle may merely have meant to deny his authorship of the 'Orphic' poems.

⁷ Contemporary with the Argonauts, according to most versions of their story—e.g., Pind. *Pyth.* iv. 176, and Apollonios Rhodios.

⁸ 'Thracius Orpheus' (Ver. *Ec.* iv. 55) is his stock epithet.

⁹ *βίος* is perhaps the nearest Greek equivalent of 'sect' or 'persuasion' and greatly resembles the NT use of *δῶς* (Ac 9²). It signifies a form of life depending on certain religious or philosophical principles and is applied especially to the Orphic and Pythagorean bodies.

¹⁰ I.e., not a writer on the theoretical basis of religion in general, or of any particular religion, but one who describes the nature, relationships, etc., of deities. In this sense Hesiod, e.g., is a 'theologian' (θεολόγος).

torn in pieces by a band of women, possessed by real or pretended Dionysiac frenzy.¹

From what is said above it is clear that all this may have some historic foundation—i.e., that the legends regarding him go back to some real happenings in connexion with the ritual of Dionysos. The death of an Orpheus, and consequently his descent into Hades, and presumably also his resurrection in a new incarnation, may have taken place, not once but many times.² But tradition crystallized all these forgotten personalities into one picturesque figure, the founder and Messiah of a religion of mystical other-worldliness.

The chief tenets, so far as we can reconstruct them, are as follows.³ At the end of a long succession of deities⁴ comes Dionysos-Zagreus, the son of Zeus and Persephone.⁵ This god, while an infant, was beguiled by the Titans, who gave him a mirror and other toys and then tore him in pieces and devoured him, all but his heart, which was saved by Athene. The god was re-created by his father, who swallowed the heart and re-bore the child; the Titans were destroyed by the thunderbolt, and from their ashes sprang man. Man is therefore a creature of mixed origin, containing a divine principle (Dionysos) and an evil one (the Titans). The main object of his existence is to get rid of the latter element—a task which cannot be completed in one lifetime. To further it, however, it is necessary to live in strict ritual purity, avoiding the use of meat, wearing white garments, shunning the polluting presence of corpses and of women in child-birth,⁶ and practising chastity,⁷ all these being observances well known in ancient ritual and not peculiar to Orphism. In addition, it seems that the higher class of Orphics practised a more or less definite ethical code.⁸ Side by side with all this went, as might be expected, a lower, popular form, in which a sort of begging friars drove a thriving trade in indulgences, so to call them, 'persuading not only individuals but cities,' says Plato,⁹ 'that their sins can be purged with sacrifices and pleasant merry-makings'; i.e., performing quasi-magical rites, effective *ex opere operato*, quite independently of the moral condition of the person concerned, at prices proportioned to the wealth or superstition of their clients.

To return to the higher forms of Orphism. After a life spent in moral and ceremonial purity the soul of the Orphic believer was rewarded in Hades, apparently for 1000 years,¹⁰ or ten times the supposed maximum length of a human life, while those who had sinned, but not beyond remedy,

were punished for the same period. After this came reincarnation, not necessarily in human form. Next came another period in Hades, and so on, the process being known apparently as the *κύκλος*, or cycle of reincarnations.¹ Release from this could be obtained by a series of good lives on both sides of the grave—for apparently each world was the heaven or purgatory of the other. After a triple good life on either side—three on earth and three in Hades—the soul had purged itself from the stain of 'original sin' and was free to enter a permanent paradise, with no more prospect of reincarnation, and in the enjoyment of divine or heroic² rank.

This theology, and much besides, was embodied in a large literature, attributed either to Orpheus himself or to his pupil Mousaios,³ the oldest parts of which probably date from the 6th cent. B.C., while the latest representatives, the *Hymns* and Orphic *Argonautica*, are about 1000 years later.⁴ Of this the greater part has perished, and especially the earliest and most valuable part; and we have of undoubted and fairly early Orphic origin only one set of documents, the so-called Petelia Tablets, gold plates found in Orphic graves in S. Italy. It appears from these that a pious Orphic was in the habit of burying with his dead friend directions for his conduct in Hades, to aid him to secure final bliss, since no doubt it was charitable to suppose that the life just completed was the last of the series of good lives required to qualify for escape from the circle.⁵

The tablets present the following picture of Hades. The soul, apparently after long and thirsty wanderings, travels along a road flanked on either side by springs. Avoiding the left-hand spring,⁶ it addresses the guardians of the right-hand one, declares itself to be of divine race, and begs for a draught of 'the cold water which floweth forth from the lake of Memory.' The request is granted, and the soul is hailed as having 'endured that which aforesaid it had never endured.' It addresses Persephone and the other deities of the under world and is admitted into their society.

The poem to which all these tablets go back is of unknown authorship and date, but it is evident that it or something like it stands behind the passages of Pindar and Plato already cited and also behind much that is to be found in other authors, mostly late. The connecting link is to be found in Pythagoreanism, which, it would seem, found Orphism already established in S. Italy, and incorporated much of its teaching. This results in a confusion between the two systems so complete that it is practically hopeless, with our imperfect documents, to say definitely with regard to any eschatological passage that it is purely Orphic or purely Pythagorean. Through the Pythagorean exiles who reached Greece proper after the dispersion of their communities in Magna Græcia the higher forms of the doctrine became known to Plato, in whom consequently we find side by side strong Orphic-Pythagorean influence and hearty contempt for Orphic charlatanism. Not dissimilar is the attitude of Aristophanes, who, on the one

¹ For full authorities, and variants of the myth, see Gruppe. We give a few of the leading references: priest and founder of mysteries; Eur. *Hipp.* 952 ff.; Aristoph. *Ran.* 1032; Herod. ii. 81; Plut. *Quest. Con.* ii. 635f; seer: Plat. *Prot.* 316b; magician: Eur. *Alc.* 966 (973), *Cycl.* 639; musician: Pind. *loc. cit.*, and Verg. *loc. cit.*

² Cf. Proclus, in *Plat. Remp.* 398: 'Ὁρφεὺς ἄτε τῶν Διονύσου τελετῶν ἡγεμῶν γενόμενος τὰ ὅμοια παθεῖν λέγεται τῷ σφετέρῳ θεῷ. The details varied (see Rohde, ii. 115 ff.; Gruppe, col. 1121 ff.). The Orphic writings being largely lost, much has to be patched together from various sources, many of them obscure.

³ The theology does not differ from the Hesiodic in essentials; the chief departures are the insertion of the World-egg laid by Night and of two vague deities, Phanes and Erikiapais.

⁴ I.e. sky-god and earth-mother. Persephone = Zemejo = the Semele of the Theban myth. The source of the name Zagreus is doubtful.

⁵ See esp. Eur. *Κρῖτες*, frag. 475a Dindorf, and *Hipp.* 952. ⁶ See *Hipp.* 1002. Hippolytus is apparently represented as the ideal Orphist.

⁷ For reference to this see *Hipp.* 992 ff., and Pind. *Ol.* ii. 76. ⁸ Condensed from Plat. *Rep.* ii. 364 E.

⁹ This is the figure given by Plat. *Rep.* x. 615 A, B; cf. Verg. *Æn.* vi. 748; of these the former is probably Orphic-Pythagorean, the latter contains the Orphic-sounding phrase *rotam uoluerit*. For other Platonic myths containing similar eschatology see J. A. Stewart, *The Myths of Plato*, London, 1905; cf. A. Dieterich, *Nekyia*, p. 84 ff. In Pind. frag. 98 (110) the soul spends only eight years in Hades (i.e. an *oktaeteris*; cf. art. CALENDAR [Greek], § 3) before its final earthly life, after which it attains heroic rank.

¹ The word is found in the Petelia Tablets and elsewhere in Orphic literature. This account of Orphic eschatology is put together largely from Pind. *Ol.* ii. and frag. 98-110. In the latter we take the disputable words *ποιῶν παλαιῶν πένθεος* as meaning 'atonement for her (Persephone's) ancient grief' (at the murder of Zagreus).

² The tablets have *ἄλλοισι μεθ' ἡρώεσσιν ἀνάξει* and also *ὄλβιε καὶ μακαριστέ, θεὸς δ' ἐστὶ ἀντιβροτοῖο*. The confusion is natural enough in a religion which has much to say of the beatified dead (*ἡρώες*) and also claims divine ancestry for all men. Ordinarily, a Greek sharply differentiated between a god, who did not die at all, and a hero, who had been an ordinary man but continued to live in some way after bodily death.

³ Plat. *Rep.* ii. 363 C, 364 E, and commentators. ⁴ Onomakritos edits and interpolates Mousaios in the time of Hipparchos, son of Peisistratos, Herod. vii. 6; Orphic writings falsely called pre-Homeric, Herod. ii. 81.

⁵ Text and tr. by G. Murray in J. E. Harrison, *Proleg.*, appendix. ⁶ Probably Lethe, of which a soul drinks before reincarnation. The finally purified soul has no need to forget.

hand, parodies private mysteries of the Orphic type in the *Clouds* and, on the other, draws in the *Frogs* on the same type of ideas for his half-serious picture of the other world.

Another problem which we cannot solve with any great exactness is the amount of non-Thracian thought which goes to the making of Orphism as we know it. The very name of the founder is in doubt, for, while to some it appears a Thracian name,¹ others point to the occurrence of Greek cognates² as indicating it to be Greek. As to the doctrines, it is unreasonable to suppose that the Thracians produced so elaborate and quasi-philosophical a system of reincarnation; this is rather the result of Greek reflexion on Thracian Dionysiac material. Thrace, on the other hand, is the likeliest claimant for the grotesque myth on which the whole system rests; but here again we do not know how much was contributed by obscure superstitions from backward corners of the Greek world. The asceticism we may not unfairly call Thracian, though the details of it are not definitely non-Hellenic.

Exactly what form the Orphic religion took, in its externals, and how long it remained a potent force, cannot be very precisely determined, still less what proportion of the Greek peoples was seriously affected by it. With regard to the first point, however, it would appear that Orphism had but little organization. There was, and could be, no Orphic state anywhere, and, though there was no doubt a considerable number of Orphic congregations (*θλασσοί*), there was no central authority to connect them, nor have we any right to suppose that they were identical with each other in doctrine and practice. It was as if there existed a form of Freemasonry in which each lodge was a law unto itself, and there was no very definite common ritual and no recognized means of communication between the various lodges. Also, though many of the greatest individual minds, notably Pythagoras and Plato, and probably Socrates also, were at one time or another affected by the cult, we have no evidence that it was a particularly numerous body. Pythagoreanism, which seems to have been much more organized and had decided political leanings, was still the faith of a minority, as is seen by its helplessness when popular feeling in Italy turned against it; Orphism, being non-political and probably still more the religion of the few, was not persecuted. As to the length of its existence, we have seen that Orphic documents were still being written in the 4th cent. A.D., but, like other productions of that epoch, they show unmistakable traces of syncretism, and of Orphism we have little or nothing outside of literature. Therefore, on the whole, we are disposed to attach less importance than Dieterich does to the undeniable coincidences between Orphic imagery, *e.g.*, and that of certain Gnostic and Christian writings; we would look for the source of that imagery, and the many common points of ritual and belief in Christian and non-Christian cults, to the numerous Hellenized Oriental faiths rather than to Orphism proper, holding that the language which once was chiefly, if not peculiarly, Orphic had become common property,³ while Orphism itself had become very unimportant. This, however, cannot be considered as settled beyond reasonable doubt.

¹ See Tomaschek, ii. 52.

² Orphe, given as a Laconian name in Serv. on Verg. *Buc.* viii. 29; the Boeotian name Ὀρφῶνας; ὄρφος, the name of a fish in *Æt. Nat. Anim.* xii. 1; and the root of the adj. ὀρφναίος.

³ Thus the 'cold water' of the formula above quoted is found again on Osirian tombs (G. Kaibel, *IG Siciliæ et Italiæ*, Berlin, 1890, nos. 1488, 1705, etc.), and on at least one which is traditionally Greek in its wording, *ib.* no. 1342; finally appearing as the Christian *refrigerium*; cf. the 'water of life' of the NT.

We may now consider briefly the moral value of the Dionysiac and Orphic cults. That they were immoral in the obvious sense is not likely. It is true that Livy,¹ *e.g.*, makes out Dionysiac orgies to have been horrible riots of lust and violence; but he is speaking of a late form of the worship, far from its native place, and has all the Roman prejudice against any secret conventicle—the same prejudice which later gave rise to the same tales about the early meetings of the Christians. But in a broader sense we may say that all such cults were immoral, for they were untrue to Hellenism, replacing its clear envisagement of the facts of life with a misty other-worldliness, sure to lead to intellectual decay, however brilliant the first flowerings of its mysticism might be in such a mind as that of Plato. Not till the monage of the ancient world did such doctrines really become prevalent; and the overthrow of the Pythagorean communities, primarily political, may be thought of as also an unconscious revolt against a force traitorous to Greek civilization.²

(e) *Artemis*.—Here we need have no doubt that Herodotos is not to be taken too literally. All we have any reason to believe—since of a Thracian origin of the cult of Artemis properly so called we have not the faintest trace—is that some great nature-goddess was worshipped in that country. We can give at least two names of such deities. Kolyto, or Kotys, though generally spoken of as Phrygian, was also Edonian.³ Another deity, who was to some extent naturalized in Greece in fairly early times,⁴ was Bendis, whose cult is mentioned together with that of Kolyto by Strabo.⁵ Of the details of her worship we know but little; the torch-race mentioned by Plato⁶ fits well enough with any deity equated with the torch-bearing Artemis, but is by no means peculiar to her; and of the native worship of her we hear chiefly that it was noisy.⁷ Probably enough there were a score of such female personifications of the fertility of nature, worshipped with orgiastic rites not unlike those of Dionysos himself, possibly in connexion with him.⁸

(f) *Hermes*.—With regard to Herodotos' statement that the Thracian kings especially venerate Hermes, we are not aware that any very convincing explanation has been offered, but, in view of the facts mentioned in the next paragraph, we suggest that he means Hermes Chthonios and identifies with him some one of the deities after the pattern of Zalmoxis.

(g) *Zalmoxis*.⁹—Our chief authority for this deity is again Herodotos, who informs us¹⁰ that the

¹ xxxix. 10, and elsewhere in his description of the Bactrian affair.

² The above account of the origin and progress of Orphism, while in our opinion the correct one, has been controverted by R. Eisler (*Weltenmantel und Himmelszelt*, Munich, 1910, ch. v.). He endeavours to prove that its origin is due to Asiatic, particularly Persian, influences, and this theory is accepted by some later writers (*e.g.*, Mrs. A. Strong, *Apotheosis and After Life*, London, 1915, p. 274). We hold that, with all deference to Eisler's great learning and industry, his arguments are wholly insufficient for the Orphism of the times of Pythagoras or of Plato, whatever light they may throw on the mongrel system which at the beginning of the Christian era went by that name.

³ *Æsch.* Ἡδωνοί, frag. 55 Dindorf: *σεμνά Κότυς ἐν Ἡδωνοίς*; cf. the common royal name Kotys.

⁵ *Loc. cit.*

⁶ *Loc. cit.*

⁷ *βαρβαρικός κλύδων*, Procl. in *Tim.* 26c.

⁸ Or in conjunction with some of the other Dionysiac deities, such as Sabazios (Thrace-Phrygian).

⁹ Also called Gebeleizis (Herod. *loc. cit.*). The name is generally written *Σάλμοξις*, but with one exception the MSS of Herodotos give *Σάλμοξις*. As σ and ζ are often confused in Thracian, both forms may be correct.

¹⁰ iv. xciv f. Part of this passage, xciv. 4, runs: οὗτοι οἱ αὐτοὶ Θρηῆκες καὶ πρὸς βροντῆν τε καὶ ἀστραπὴν τοξεύοντες ἀνω πρὸς τὸν οὐρανὸν ἀπέλκυσαι τὸ θεῖον, οὐδένα ἄλλον θεῖον νομίζοντες εἶναι ἐκ μὴ τὸν σφέτερον. This has been oddly misunderstood,

Getai worshipped him, and so exclusively that they regarded no one else as a true god, even the heavens themselves. What his nature was we can gather in part from the rationalistic story told of him, that he was a slave of Pythagoras, who, returning home, taught a variant of his master's philosophy, insisting especially on the immortality awaiting the faithful. To prove this, he disappeared for a time, hiding in an underground room; after three years he returned, and so made every one believe that he had been in Hades and was come again. It is noteworthy that the same story is told of Pythagoras himself,¹ and it smacks strongly of the tales, Greek and other, of superhuman persons who live in caves or under mountains and thence return occasionally or in some way intervene in human affairs.² With this story we must join the decided suspicion of Herodotus himself³ that Zalmoxis is a local divinity, not a mortal at all, and the statement of Strabo⁴ that he was worshipped in an *ἀντροῦδες χωρίον* in Mt. Kogaionon. He is clearly, like Dionysos himself, a god belonging to the under world, but not excluded from the surface of the earth, on which, we may perhaps suppose from the myth, he was thought to appear every year, as Dionysos frequently did every second.⁵ As an infernal deity, he received a curious sacrifice, if sacrifice is the proper term to apply to what seems to have been rather a sort of fantastic messenger service. Once every four years the Getai chose a man by lot, whom they tossed in the air and caught on spear-points. If he died, he was deemed to have become immortal;⁶ if not, the god had rejected him, and he was disgraced. Before being tossed, he was charged with the messages of the people to the deity—a curious form of the idea, found among many races, that the dying can take to the dead the mandates of the living.⁷

(b) *Other religious practices.*—Besides the cult of definite gods, we have a few facts relative to the general religious attitude of the Thracians. In particular, we have Herodotus'⁸ description of a funeral ceremony, which sounds oddly like Homer's account of the funeral of Patroklos. The corpse, if of an important man, lies in state three days, during which mourning and sacrificial feasts go on; finally there comes the actual funeral, when the body is buried or burned, a mound raised, and games of various kinds, the principal one being a single combat, are celebrated. This was the usual rite, and it indicates at any rate high honour paid to the dead.⁹ The duel especially as if *τῷ θεῷ* meant 'their god,' which would involve a contradiction in terms: 'They threaten the god they believe in because they don't believe in him.' The correct translation is of course 'Heaven' or 'Zeus'; cf. lxxix. 1 f.: *ἐπεθύμησε Διονύσῳ Βακχείῳ τελευτήσαι . . . ὁ θεός* (Zeus, not Dionysos) *ἐπέσκηψε βέλος*, and many other passages in which *ὁ θεός* means 'sky' or 'heavenly bodies.'

¹ Hermippus, *ap.* Diog. Laert. viii. 41. This story is perhaps imitated from the one in Herodotus, which probably is an invention of the Greeks of the Pontos.

² Examples in Rohde, i 111 ff.

³ *iv.* 96. ⁴ *vii.* 298.

⁵ His festivals were regularly trieteric, *i.e.* in alternate years, by the Greek (inclusive) method of counting. Did this originate in a custom of shifting the cultivation every other year, vouched for by Horace, *Od.* iii. 24, '*ne cultura placet longior annua*,' as occurring among the Getai? Among a people backward in agriculture the practice may well have varied, the period of cultivation lasting for one, two, or three years in different districts according to the richness of the soil. The author owes this suggestion to Farnell.

⁶ *iv.* 93: *Γέτας τοὺς ἀθανάτιζοντας* (this becomes their stock epithet); v. 3.

⁷ The idea is particularly common in modern Greek ballads.

⁸ v. 8.

⁹ The exact interpretation given to these facts depends upon the view taken of the origin of *ἀγῶνες* in general. The present writer holds that they do not originate in funeral ceremonies, or connote divine or quasi-divine honours, though they are often associated with both. The duel, however, is, like the Etruscan gladiatorial shows, definitely a sacrificial rite in this case.

may reasonably be thought to be a form of blood-sacrifice. This, in some of the wilder tribes, was no mere form; beyond Krestone, we are told, lived a race which practised *sati*; the favourite wife, chosen, it would seem, after careful examination of the claims of the whole *harim* by the surviving relatives, was sacrificed by her next-of-kin at the tomb and then buried with her husband.¹ The Trausoï again made a death a subject of rejoicing, and mourned at a birth.² We see, then, that the whole of Thracian religion was permeated by the idea of the vast importance of the future life.

(i) *Summary: general characteristics of Thracian religion.*—We find in Thrace a religion of a barbarous kind, but by no means incapable of development into something higher and more spiritual. The chief marks of barbarism, besides the revolting character of some of the rites, were (a) the largely magical character of much of the ceremonial, unconnected with anything either ethical or spiritual, and tending rather to excite than to elevate; and (b) the materialistic conception of the future life. Gods such as Zalmoxis live underground, occasionally intervening for the bodily good of their worshippers³ and rewarding the faithful departed with drunken feasts; or so one gathers from the rationalizing story of Zalmoxis already quoted, in which he is represented as feasting the Thracians, and the taunt of Plato that the inferior sort of Orphics considered eternal drunkenness the highest possible felicity.⁴ This is not to say that Thracian religion was always of a sensual character. It is noteworthy that the northern races, or some of them, had a reputation not only for courage but also for virtue and even for superhuman powers.

Thus the Getai are the 'bravest and most righteous' of the Thracians; the holy Hyperboreans live somewhere near the Thracian region; in and near the neighbouring Scythian country are the sacred and ascetic Argippaioi, the just Issedones, and the Neuroi, who are all magicians, besides the Saoumatali, who are of Amazonian stock; while the glorified shade of Achilles haunts various localities of the Black Sea region.⁵

A great part at least of this persistent attribution of saintly or magical distinction to the northern districts may well have for its justification the natural complement of the strong sexuality of those races—asceticism, which, as we have already seen, was a strong feature of Orphism. Another reason no doubt is simply the fact that many of these peoples were distant and unknown.⁶ Yet another is, quite likely, the existence, not of whole nations, but of castes, which were priestly. We have already seen that the Bessoi certainly, and other tribes probably, had divine kings, and this often enough, as in Egypt, means the domination of a sacerdotal clan or caste.

To sum up, therefore, Thrace had, so far as we can learn from the observations of its nearest civilized neighbours in classical times, a religion predominantly chthonian, other-worldly, orgiastic, gloomy, often cruel and barbaric, but not unspiritual—a sharp contrast with the brightness of the characteristic Greek cult of the Olympian deities.

TIBET.—The Tibetans are entitled to be regarded as one of the most 'religious' peoples in the world, if by 'religion' is understood not only 'the belief in spiritual beings,'¹ but also the *binding* influence of that belief, as formulated by their Church, for the better regulation of their worldly actions in everyday life, and for procuring for them by pious observance of the inculcated maxims the satisfying hope of a higher position in the life after death. Not only is the proportion of the population in Tibet which devotes its life to religion greater than that in any other country, being at least about one to eight of the population²—monks, nuns, non-celibate priests, and neophytes—but the life of the laity is also dominated and pervaded by their religion to an exceptional extent.

1. Climatic environments.—The peculiarities in the climate and physical character of Tibet, and its topographical position, between the two great civilizations on either side, the Indian and the Chinese, from both of which it has derived the elements of its composite form of Buddhism, explain to a considerable extent the peculiarities of its religion. The vast awe-inspiring solitudes with the rigorous nature of the climate have impressed themselves visibly on the religion of the country. And Nature has contributed, by the massive physical barriers she has erected against access to that land, to maintain to the present day the isolation of that country from the rest of the world, and thus to preserve the more ancient and archaic forms of religion and superstitions.

Perched on the summit of the great plateau of Central Asia, and stretching across over twenty-two degrees of longitude, in the paleartic region, from the Himalayas to the Kuen-lun mountains and Western China, it includes the loftiest tableland on the surface of the earth. Although generally called a plateau, it is in fact covered with innumerable hills and mountains, cut up by ravines, the stretches of level land being relatively few and far apart. The general elevation of the permanently inhabited tract seldom falls below 11,000 feet above sea-level, while a very great extent of the country exceeds 16,000 feet, which is about the limit there of perpetual snow. Its highest border lies along the Himalayas, rising in mountains, the highest on the globe, from which its surface slopes gradually eastwards into China—a feature explained by the fact that in not very remote geological times the land of Tibet formed part of the bottom of the China Sea of the Pacific; and the writer has picked up fossil shells on the Tibetan side of the Himalayas which were of the same species as those he obtained from similar strata.

¹ E. B. Tylor, *PC* 3 i. 424.

² The census of the population hitherto taken was that by the Chinese in 1737, which gave the proportion of the Lamas as one to three of the total population. At the present day about one to eight appears to be near the mark, in accordance with the present writer's own observations and those of W. W. Rockhill.

formations on the outskirts of Peking. This also explains why the Mongolic racial elements and the Chinese forms of civilization predominate in Tibet, and why China has maintained for so long its suzerainty there.

Geographically, it is usual to divide Tibet latitudinally into North (Chang) and South (Kham), the North-land comprising all the Northern and Central and much of Western Tibet, and the South comprising South and South-Eastern Tibet. This division is also generally followed by the Tibetans themselves, though they erect Central and South-Western Tibet (U-Tsang), with their twin centres of Lhāsaism, at Lhāsa and Tāshilhunpo, into a separate, and for them the chief, division of their country, which they call Bod (pronounced Pöt). The former division they call sTod-Bod (pronounced Tö-Pöt), or 'Upper Bod,' which is the origin of our modern name 'Tibet,' derived from the phonetic spelling of mediæval European travellers to whom only this northern division was accessible, and latterly applied by Europeans to the whole of Bod, though wrongly so. This is also the source of the Chinese name for the country of T'u-Fan, or 'the land of the T'u barbarians of the West.'

The northern division, or Chang, through its extreme altitude, has a terrible climate and is uninhabited for the greater part of the year, being mostly used as summer-grazing grounds by nomad shepherds and traversed by miners and occasional caravans of merchants at that season. It consists of a series of parallel mountain-ranges running east and west, with muddy valleys intervening. In these depressions lie a great number of lake-basins, many of which have no outlet, so that their water is salt, and some of their shores are white with borax crystals. It is an altogether treeless region, interspersed with grassy tracts used for summer pasturage. On the other hand, Central and more especially South-Eastern Tibet, which are of considerably lower elevation, are traversed by the Brahmaputra, and upper reaches of the Irrawady, Mekong, Salween, and Yangtse rivers and their tributaries are for a considerable part wooded, enjoy a less rigorous climate, and are the seat of most of the settled population. But the total population of the whole country is probably not more than 3,500,000¹—i.e. a little less than the entire population of Scotland. Snow falls more or less, even at Lhāsa, in every month of the year.

2. Popular religion.—Living in such a rigorous climate and isolated amidst such severe surroundings, the Tibetan builds his daily fears and hopes on his religion, and, despite its inveterate devil-worship, it is not without its elevating and inspiring influence. The current of Buddhism which runs through its tangled paganism has brought to the Tibetan most of the little civilization which he possesses, and has raised him correspondingly in the scale of humanity, lifting him above a life of semi-barbarism by setting before him higher hopes and aims, by giving milder meanings to his demonist mythology, by discountenancing sacrifice of animal lives, and by inculcating universal charity and tenderness to all living things. Their Buddhism, unlike that of the Burmese, is not, however, an educational factor in secular teaching or in the mysteries of their religion; for the Lamas, while living on the laity by their ministrations as priests, restrict their learning to themselves, like the Brāhmins and most priestly orders of old, and they contemptuously call the laity 'the dark (ignorant) people' (*mi-nag-pa*) and 'the worldly ones' (*hji-g-rten-pa*), though they condescendingly

¹ This is the estimate of W. W. Rockhill (*Land of the Lamas*, p. 296), and it generally agrees with that of the present writer.

also call them 'the givers of alms' (*shyinbdag*), at the same time making it understood that it is the donors who benefit most by the exercise of this charity. And certainly the last epithet is well deserved, for the Tibetans, the most priest-ridden people in the world, are among the most lavish in their religious gifts.

Notwithstanding the large amount of non-Buddhist elements in Lāmāism, derived from the pre-Buddhist shamanism of the Bon-cult,¹ it is surprising to find how deeply the everyday life and notions of the laity are leavened by the Buddhist spirit. The doctrine of metempsychosis and its *karma* and the potency of acquired merit by good deeds enters into the ordinary habits and speech of the people to a remarkable extent. Their proverbs, folk-lore, songs, and lay dramas are full of it; and they explain human as well as animal friendships on this principle. Even practices which are clearly dishonest and sinful are at times justified on the same principle, or rather by its abuse. Thus the more sordid Tibetan reconciles cheating to his conscience by naively convincing himself that the person whom he now attempts to defraud had previously swindled him 'in a former existence,' and that justice demands retribution. Congenital defects, even such as blindness, dumbness, and lameness, and also accidents are viewed as retributions due to the individual having in a previous life abused or sinned with the particular limb or organ now affected. Indeed this is the orthodox dogma of Buddha's own teaching and forms the basis of the *Jātakas*, or tales of the previous births of Buddha, which are diffused by itinerant or friar Lāmas, and greatly impress the people; a few of the better-known *Jātakas* in manuscript copy or in block-printed booklets form, with the manuals of ritual and divination, the chief books of those Tibetan laity who are able to read; and they also form the subject of the chief dramas enacted by the laity.

This wide-spread belief in metempsychosis also influences the people in the treatment of their cattle and other dumb animals. They treat these exceptionally humanely, and life is seldom wantonly taken. The taking of animal life unnecessarily, even for food, is largely prohibited, and, although in such a cold climate animal food is an essential staple of diet, the professional butchers are stigmatized as sinners and are the most despised of all classes in the country. Yet human prisoners are at times cruelly tortured and mutilated, possibly in some measure after the example set by the Chinese, and possibly in some measure as a deterrent from crime among a rather lawless people. But nearly every crime, even the most heinous, the murdering of a Lāma, may be condoned by a fixed scale of fines; and, when the fine is not forthcoming, the punishment is inflicted, and the prisoner, if not actually killed, is set free, mutilated or maimed (as there are no prisons), to serve as a public warning to other evil-doers. Many of the maimed and blind beggars who swarm around Lhāsa are criminals punished in this way.

The tolerant spirit of Buddhism has, however, stamped more or less distinctly the national character, the mildness of which contrasts strongly with the rough and semi-barbarous exterior of the people. Testimony to this trait is afforded by the experiences of all intimate observers of the people in their own country, as recorded by the present writer and others. Huc, writing of the lay regent of Lhāsa, describes him as a man whose 'large features, mild and remarkably pallid, breathed a truly royal majesty,' while 'his dark eyes, shaded by long lashes, were intelligent and gentle.'²

Similarly Rockhill and others have described many of the headmen and leading Lāmas with whom they came into intimate contact.¹ The spirit of consideration for others expresses itself in many grateful acts of genuine politeness and kindness. Tibetans usually present a stirrup-cup of wine to the departing visitor or traveller, bidding him God-speed and adding, 'May we be able to present you with another as welcome on your return.' The seller of an article other than eatables usually gives his blessing to the buyer in terms such as these: 'May good come upon you,' 'May you live long,' 'May no sickness happen,' 'May you grow rich,' to which the buyer replies with 'Thanks'—'*Thug-rje-chhe*,' literally 'Great mercy,' which recalls the French *merci* tendered on similar occasions.

The personal names of both boys and girls are largely borrowed from mystical Buddhism—*e.g.*, Dor-je-tshe-ring, 'the thunder-bolt of long life,' Dolma (spelt *sg.Rol-ma*, the Tibetan translation of the Sanskrit name Tārā, the Indian goddess of mercy); and the influence of this religious habit is also seen in the names of various places.

The common oaths or plights of asseveration are mainly Buddhist in character. The oath most commonly used by merchants and the laity as an asseveration in ordinary conversation is, 'By the Powerful Saint' (Śākyamuni, *i.e.* Buddha), or 'By the three Holiest Ones'—the Buddhist Trinity.

The non-Buddhist features and practices of the Tibetan religion, however, are also conspicuous, and reflect their pre-Buddhist cult, the shamanistic Bon. The physical environment of their life, in their rigorous climate where they see Nature in her roughest mood, in pitiless fury of storms and cold, terrorizing the brave as well as the timid, has impelled them to worship the more obvious forces of Nature as malignant demons which seem to wreck their fields and flocks, and vex them with disease and disaster. Their inveterate craving for material protection against those malignant gods and demons, as they thought them to be, has caused them to pin their faith on the efficacy of charms and amulets, which cherished objects are seen everywhere dangling from the dress of every man, woman, and child, not even excepting the Lāmas themselves. These charms, as we have seen,² are mostly sentences of Sanskrit texts borrowed from mystical Indian Buddhism, and they are supplemented by bodily and other relics of holy Lāmas, such as bits of their dress, crumbs dropped by them, nail-parings, etc.; and by these charms the Tibetans believe that they muzzle or bind or banish the devils.

A more cheerful and graceful side to their worship is seen in their popular practice of planting the tall inscribed 'prayer-flags,' which picturesquely flutter in the breeze around every village, and in the strings of inscribed flaglets which flaunt from house-tops, bridges, sacred trees, and passes, and from other places believed to be specially infested by malignant spirits or sprites.

As the people live in an atmosphere of the marvellous, no story is too absurd for them to credit, if only it is told by Lāmas. They are ever on the outlook for omens, and the everyday affairs of life are governed by a superstitious regard for lucky and unlucky days and the influences of unpropitious planetary portents. Although special divinations are sought from professed astrologer Lāmas in the more serious events in life—in birth, marriage, sickness, and death, and often in sowing, reaping, building, etc.—each layman determines for himself the auguries for the more trivial matters

¹ See, *e.g.*, the description by the present writer of the regent of Tibet (*Lhāsa and its Mysteries*, p. 401 f.).

² See art. CHARMS AND AMULETS (Tibetan).

¹ See below, § 3.

² *Travels in Tartary, Thibet, and China*², Eng. tr., ii. 168.

of his ordinary business, for travelling, buying and selling, mending, etc.¹ And yet we are apt to forget that Confucius and Cicero—to mention only these instances—believed in astrological auguries.

Pilgrimages to sacred shrines are very popular,² and little is thought of the hardships and expenses of long journeys for this purpose. Every opportunity is seized to visit celebrated shrines and to circumambulate the numerous holy buildings and sacred spots.

Prayers ever hang upon the lips of the people in the intervals of their work and even during their work. But the prayers are addressed chiefly to devils, threatening them with punishment through the saints and deified Buddhas, or imploring them for freedom or release from their inflictions;³ or they are plain, naive requests for aid in obtaining the good things of this life. At all spare times, day and night, the people ply their prayer-wheels (*q.v.*), and tell their beads and mutter especially the mystic Sanskrit six-syllabled spell, *Om ma-ni pad-me Hūm!*, 'Om! the jewel in the lotus Hūm,'⁴ the sentence which, they are led to believe, gains them their goal, the glorious heaven of eternal bliss, the paradise of the fabulous Buddha of Boundless Light (Amitābha) or 'the Boundless Life' (Amitāyus [*q.v.*]). Yet with all their strivings the Tibetans seem never to obtain real peace of mind in religious matters.

3. **Bon or pre-Buddhist religion.**—The aboriginal pre-Buddhist religion of Tibet is called by the people *Bon* (pronounced *Pön*); and those who profess it are called *Bon-pa*, i.e. 'the Bons.' The meaning of the word is unknown. It is essentially a shamanist, devil-charming, necromantic cult with devil-dancing, allied to the Taoism of China, and, like the latter, has become largely intermixed with Buddhist externals. But it still retains its essentially demonist character. It was actively suppressed and its establishments were destroyed by the Tibetan rulers on their conversion to Buddhism from the 7th cent. A.D. onwards, at the instigation of the Lāmas, as it indulged freely in animal and human sacrifices; and it is still strictly forbidden by the Lāmaist hierarchy which holds the temporal rule in Central and Western Tibet. But it is still largely and openly professed over the greater part of Eastern and South-Eastern Tibet, the most populous part of the country, which for many centuries has been under Chinese rule and outside the domination of the Grand Lāmas. Indeed it was an appeal by the people of these provinces to China to protect them and their Bon religion that induced the Chinese to administer these provinces on behalf of the Bons. This unsuspected fact of the wide prevalence of the Bon religion there was brought to light by W. W. Rockhill in his extensive travels in these provinces,⁵ where he found it to be much more popular and prevalent than Lāmaism. It was especially popular among the settled agricultural people, whilst the nomads, whose business led them into the territory of the Grand Lāmas, were more attached to Lāmaism. So numerous were its adherents that Rockhill estimated that about two-thirds of the population of Tibet were Bons. In Central and Western Tibet, where the repressive policy of the Lāmas prevents the profession of the Bon cult, it is rare to meet with any Bon priest. The present writer has met only a few itinerant priests who were clandestinely performing their demonist rites for villages in remote places; they were wholly illiterate and uncouth-looking men, exceptionally dirty, with long shaggy hair, and bedecked with little

tufts of wool and tiny flags; and they indulged in devil-dancing antics and incoherent chants.

In Eastern Tibet, however, where they are free to practise their cult, the Bon priests live in large flourishing monasteries, which they call *gom-pas*, like the Lāmaist establishments; and they have many images of gods and saints and demons generally resembling in appearance those of Lāmaism, but bearing different names. Their chief god they call *gShen-rabs Mi-bo*, who is reputed to be a deified priest analogous to the Lāmaist Padma Sambhava. They have bulky printed and MS books of ritual, which Rockhill found to consist of a Sanskritic jargon for the most part interspersed with other meaningless words. The present writer observed that the words in some of their MSS, which are written in the Tibetan script, were the Lāmaist Sanskritic words spelt backwards: the lotus-jewel formula of the Lāmas¹ was spelt 'Muh-em-pad-ni-mo,' thus, while attesting their borrowing from Lāmaism, emphasizing their anti-Lāmaist character. The *swastika* also, which they use extensively, is invariably figured with its ends or 'feet' turned in the reverse direction to that of the *swastika* proper (the feet of the latter turn to the right in the direction of the sun's course), and thus indicate the Bon cult to be of a lunar character, which is evident not only from the bloody sacrifices, but also from the predominance of the dragon-worship therein.

A significant glimpse into the original character of the Bon cult is obtained from the Chinese annals of the 5th and 6th centuries A.D. (i.e. before the introduction of Buddhism into Tibet), where the rites of the Tibetans are described:

'The officers (Tibetan) are assembled once every year for the lesser oath of fealty. They sacrifice sheep, dogs, and monkeys, first breaking their legs, and then killing them afterwards, exposing the intestines and cutting them into pieces. The sorcerers having been summoned, they call on the gods of heaven and earth, of the mountains and rivers, of the sun, moon, stars and planets, saying: "Should your hearts become changed, and your thoughts disloyal, the gods will see clearly and make you like these sheep and dogs." Every three years there is a grand ceremony, during which all are assembled in the middle of the night on a raised altar, on which are spread savoury meats. The victims sacrificed are men, horses, oxen, and asses, and prayers are offered up in this form: "Do you all with one heart and united strength cherish our native country. The god of heaven and the spirit of the earth will both know your thoughts, and if you break this oath, they will cause your bodies to be cut into pieces like unto these victims."²

Even in the Buddhist period, in the 8th cent. A.D., similar bloody rites were celebrated by the professing Buddhist king of Tibet in concluding a treaty with the Chinese.³

The attire of the Bon priest in his special celebrations⁴ is a coat of mail armour, from the shoulders of which project small flags, and a high-crowned hat bordered by effigies of human skulls and ornamented by flags and tufts of wool; a sword and shield are in the hands to fight the demons. (The black-hatted devil-dancers are of the Bon sect.) On ordinary occasions they wear a red robe, and occasionally have human skulls embroidered on their dress. Their hair is worn shaggy, and not tonsured like the Lāmas. They offer on their altars wool and yak hair, and images of men and animals made of dough, presumably, as shown by the present writer, instead of the sacrificed animal of the primitive cult.

Whilst the present-day Bon religion has acquired many of the externals of Lāmaism, many of the elements of the old Bon religion have been incorporated into the latter, just as so many of the pagan rites of Roman and Celtic heathendom have

been incorporated into the later Christianity. The reformed Lāmaist Church of the Yellow-hat sect employ many rites which are transparently Bon, such as the necromantic expelling of the death-demon and the demons of sickness, and much of their divination-ritual. The unreformed Red-hat sects practise the old Bon rites to a much greater extent, including the erection of masts attached to dogs' and sheep's skulls, to 'bar the door' to the earth- and sky-demons.¹

4. Lāmaism and its sects and rites.—The various aspects of Lāmaism and its sects and rites have already been described in previous articles.²

TIME.—I. Introductory.—Temporal characteristics are among the most fundamental in the objects of our experience, and therefore cannot be defined. We must start by admitting that we can in certain cases judge that one experienced event is later than another, in the same immediate way as we can judge that one seen object is to the right of another. A good example of the immediate judgment in question is when we hear a tune and judge that of two notes, both of which come in our specious present, one precedes the other. Another direct judgment about earlier and later is made in genuine memory. On these relations of before and after which we immediately recognize in certain objects of our experience all further knowledge of time is built.

It must be noticed that the relation, as given in experience, connects what we may call protensive events, *i.e.* events that have some duration, and not momentary events or moments. We are not directly aware of events without duration, still less of moments of empty time, and therefore are not directly aware of the relations between such objects. Momentary events, moments of time, and the relations which order them in a series are all known only after a long process of reflexion, abstraction, and intellectual construction. This does not necessarily imply that they do not exist in nature, still less that they are subjective and arbitrary; all that is meant at present is that they are not the objects of direct awareness. Again we must notice that the relations of before, after, and simultaneous with, as given in experience, are not mutually exclusive. Protensive events may very well overlap, and therefore we must recognize that the most general relation between them is that of partial precedence or consequence. Of course, when we become familiar with the conception of momentary events and see how convenient it is, we tend to define partial precedence in terms of them and their relation of total precedence. But the opposite direction must be followed if we want to start with the experienced facts and trace the logical development from them of the scientific

notion of time. We must take the experienced relation of partial precedence as fundamental and define momentary events, moments, and the relation of total precedence in terms of partial precedence and events of finite duration.

That such a course is possible is shown by the fact that it has recently been followed to a satisfactory conclusion by Norbert Wiener in the *Transactions of the Cambridge Philosophical Society*, and by A. N. Whitehead in his *Principles of Natural Knowledge*. We may compare the duration of experienced events with the extension of visible and tangible objects, and the relation of partial precedence with the partial overlapping of two extended objects in the field of vision. The problem of defining momentary events, moments, and the serial relation of before and after in terms of protensive events and partial precedence is closely comparable to that of defining material points, geometrical points, and the relations of before and after on a straight line in terms of extended objects and their partial overlapping. The problem for time is, however, easier than that for space, because in the former we have only to deal with a relation that generates a one-dimensional series, whilst with the latter the experienced facts force us to define a three-dimensional manifold.

2. Time and space.—The analogy between time and space has long been recognized; and it will be useful to consider at this point just how far it goes and where it is supposed to break down. Let us consider the likenesses and the alleged differences.

(a) *Likenesses*.—(1) Most objects of immediate experience possess a kind of magnitude called extensity, and such objects stand in certain immediately recognizable relations to other objects of the same sense experienced along with themselves. Also the parts of any one such object have relations of this kind to each other. Similarly the objects of our experience have another kind of magnitude called protensity or duration. Such objects have to others of the same kind the relation of partial (or, in special cases, total) precedence, and this relation can be recognized immediately. Likewise the parts of a single specious present can be seen to have this relation to each other.

(2) The relations in each case have magnitude. Just as one object in the field of view can be more to the right of another than a third, so one event in the field of memory or in the specious present can precede another event by a longer interval than some third one.

(3) In each region there is the same close and peculiar connexion between the kind of magnitude possessed by the terms and the kind possessed by the relations. It is possible to say that the interval between two events *A* and *B* is as long as the duration of some event *C*, just as it is possible to say that the distance between two sticks laid in the same straight line is the same as the length of some third stick.

(4) It is commonly believed that, when the analysis is made into moments and momentary events, all the events in the history of the world fall into their places in a single series of moments. So too it is supposed that, when the analysis is made into material and geometrical points, all the points in the world take their places in a single three-dimensional series of geometrical points.¹

(b) *Alleged differences*.—(1) It is commonly held that all events have temporal relations to each other, but that psychical events have no spatial relations. This is denied by a small number of philosophers, notably by Samuel Alexander.

¹ We shall consider later what the Theory of Relativity has to say as to the impossibility of separating time and space and as to the notion of one single time-series.

Without questioning the possibility of correlating psychical events with positions in space, we must hold that this alleged difference is a genuine one. If in introspection we do contemplate our states of mind in the same sense as in perception we contemplate other objects, it seems clear that our states of mind show no trace of being extended or standing in spatial relations, but do have duration and stand in temporal ones. Alexander would, however, deny that we can contemplate our states of mind. If this be so, it would of course be quite possible that we should fail to become aware of the spatial characteristics of our mental states, even though they possess them; but of course we have no right to pass from this merely negative position to the conclusion that they actually do possess them. Alexander's positive reasons are bound up with a large and complex metaphysical theory into which we cannot here enter. In any case the present difference is merely an external one, and would not affect the essential similarity of space and time.

(2) A much more important point is that time is said essentially to involve the distinction between past, present, and future as well as that between before and after. Now nothing in space obviously corresponds to these distinctions in time.

(3) Closely connected with this alleged difference are a number of rather vague statements often made—*e.g.*, that parts of space co-exist, but that only the present moment exists.

These two supposed differences between space and time may be treated together. They rest largely on confusions into which it is very natural to fall. The distinction between past, present, and future is not one which, like that between before and after, lies wholly in the experienced objects, but is one that rests on the relations between experienced objects and the states of mind in which they are experienced. To begin with, the distinction between present and not-present at any rate may be usefully compared with that between here and elsewhere in space. Here means near my body; elsewhere means distant from my body. If we want an analogy to the distinction between past and future, we can find one in the distinction between things before and things behind our body. It is true, however, that this analogy is incomplete, and that for an important reason, though one extraneous to the nature of time. The reason is that our practical and cognitive relations towards the future are different from those towards the past. We know a part of the past at any rate directly by memory, but we know the future only indirectly by probable inference. There is no analogy to this in space; our knowledge of what is behind our body is of the same kind and of the same degree of certainty as our knowledge of what is in front of it. But we may imagine that a distinction like that between past and future would have arisen for space also, if we had been able to see straight in front of us but had never been able to turn our heads or our bodies round.

The distinction is sometimes drawn that the past is fixed and unalterable, while the future depends, in part at any rate, on our volitions. In what sense is this true?

Without involving ourselves in controversies about free will and determination, we may at least assume that the laws of logic apply to propositions about the future. Hence any proposition asserting the occurrence of any future event must be true or false, and cannot be both. In that sense the future is as determinate as the past. But two points have to be noticed. (1) However much I may know about the laws of nature, I cannot make probable inferences from the future to the past, because I am not directly acquainted with the future, but I can make probable inferences from the past to the future; *i.e.*, although every possible proposition about the future is even now determinately true or false, I may be able to judge now, from my knowledge of the past and present and of the laws of nature, that some propositions about future events are much more likely to be true than others. (It must of course

be remembered in this connexion that a proposition that is actually false may be much more likely to be true on my present information than one that is actually true.) (ii.) I know with regard to certain classes of events that such events never occur unless preceded by a desire for their occurrence, and that such desires are generally followed by the occurrence of the corresponding events. But the existence of a desire for x does not increase the probability that x has happened. If it did we might be said to affect the past in exactly the same sense in which we are said to affect the future. Thus the assertion that we can affect the future but not the past seems to come down to this: (a) that propositions about the future can be inferred to be highly probable from a knowledge of the past and present, but not conversely, because of our lack of direct acquaintance with the future; and (b) that the general laws connecting a desire for x with the occurrence of x always contain x as a consequent and never as an antecedent.

3. Relation of time to logic.—This brings us to the very important question of the relation of time to logic. If we say of any event e that it is present, this proposition will generally be false, and will be true only at one moment. It seems, then, as if the truth of the proposition altered with time. Any other proposition asserting the occurrence of an event—*e.g.*, Queen Anne is dead—seems to be equally at the mercy of time. Then again there seem to be other propositions that are totally independent of time—*e.g.*, $2 \times 2 = 4$. These are sometimes called eternal truths; they always state relations between universals, and all our *a priori* knowledge is of such propositions. Lastly, there are propositions which essentially involve time, but claim to apply to any time; *e.g.*, whenever it rains and I am out without my umbrella, I get wet. Thus, on the face of it, there seem to be three kinds of propositions as regards relation to time: (1) eternal truths, which are independent of time because they deal with the timeless relations of timeless objects; (2) hypotheticals asserting temporal relations between classes of events—these contain an essential reference to time, but not to any particular time; (3) propositions which assert the occurrence of particular events, and which *seem* to be true at certain times and false at all others, though this is not really so.

There are two points to notice about the last class of propositions. (a) All propositions about events essentially contain a reference to time, and all propositions about particular events essentially contain a reference to the particular time at which the event happens. This reference is not always made explicit; but, until this has been done, we cannot say that the verbal form stands for any definite proposition. (b) We have to distinguish between the time at which a judgment is made and the time involved in the proposition that is judged. When the latter is not made explicit in the verbal expression of the judgment, it is a convention of language to assume that the time in the proposition is intended to be that at which the judgment is asserted. Thus, if I say 'It is raining,' this verbal expression, since it clearly intends to refer to a particular event, is incomplete and stands for no definite proposition; for it says nothing about the time at which it rains. It therefore seems to be sometimes true and sometimes false. But, as actually asserted, the words would be taken to express my judgment of the proposition, 'It is raining at the time at which I say "It is raining."' And this proposition is timelessly true or false, subject to a further correction which we shall add in a moment. In fact, whenever we are told that a proposition is sometimes true and sometimes false, we know that we are dealing with an incomplete statement about an event, and that the real state of affairs is that a propositional function of the form ' e happens at t ' gives true propositions for some values of t and false propositions for other values. But the propositions themselves are timelessly true or false.

It is important to notice that in practice there is always the possibility of any verbal statement about events, no matter how carefully put, being sometimes true and sometimes false. We are not directly aware of moments of time, and so can date events only by other events. And the persons who read or hear our verbal expressions may know only by some description the event which we use for purposes of dating. Now we can never be certain theoretically that only one unique event answers to any description however complicated, and often there is real ambiguity in practice. Take, *e.g.*, the amended expression offered above: 'It is raining at the time at which I say "It is raining."' To any reader of this article the

expression remains ambiguous, because he knows the event that is used for dating only by the very ambiguous description, 'The writer's statement of the words "It is raining"'—a description which applies to dozens of different events. In practice the difficulty is solved in conversation by the fact that all the manifold circumstances under which the particular conversation takes place go into the description and make it practically unambiguous. In writing, the difficulty is solved practically by using as the origin of dates some event, such as the birth of Christ, whose full description is so complicated that it is almost certain that only one event answers to it. But the theoretical difficulty remains, and so we are tempted to say that any proposition about events is sometimes true and sometimes false. But the proper thing to say is that any verbal expression referring to events, no matter how carefully put, always runs a theoretical risk of ambiguity—*i.e.*, it might with equal propriety make one reader think of one proposition which is true, and another of another proposition which is false.

We can now apply these general results to the special case of events being sometimes future, and then present, and finally past. The statement '*e* is present' is essentially incomplete and ambiguous, for, as we loosely say, it is sometimes true and sometimes false. The first thing, then, is to fill in the special time involved in the proposition. We then get '*e* is present at *t*,' where *t* is some definite moment fixed by some system of dating from a well-known and presumably unique event. What does this statement mean? Assuming that there are such things as moments, it means that *e* is at the moment *t* in an analogous way to that in which an object is at a position in space. The statement '*e* is present at *t*' may be compared with the statement 'Mr. Asquith is present at the meeting,' which means that his body is in the place where the meeting is held. In all complete statements of the form '*e* is at *t*' we must understand the word 'is' as standing for a timeless copula, and distinguish it from the 'is' of the present tense, which is contrasted with 'was' and 'will be.' Let us denote the 'is' of the present tense by 'is now.' Then the statement '*e* is now present' is an incomplete statement which is interpreted in use to mean '*e* is at (or occupies) the same moment as my assertion that it is now present'; '*e* is now past' = '*e* was present' = '*e* is at a moment earlier than my assertion that *e* is now past.' Similarly, '*e* will be present' = '*e* is now future' = '*e* is at a moment subsequent to my statement that *e* is now future.' The laws of logic are of course concerned with the timeless copula, and they presuppose that statements containing tenses are reduced in the way suggested above.

4. Past, present, and future.—We see, then, that the real source of the distinction between past, present, and future, and of the difference here between time and space, is that our judgments as well as the events judged about are in time, whilst our judgments about things in space are not in any obvious sense in space. These three distinctions correspond to the three possible temporal relations between our judgments and the events which our judgments are about. These distinctions are important, and they have been enshrined in language because they are correlated with important epistemological and psychological differences. Some states of mind are essentially contemporary with their objects—*e.g.*, the immediate awareness of visual sense-data when I open my eyes.¹ Other

¹ It is better for the present not to call these states of mind either perceptions or sensations, because the object of a perception is generally supposed to be a physical object or its state, and this may exist millions of years before the perception—*e.g.*, the perception of a distant star. Similarly, to call these states

states are essentially later than their objects—*e.g.*, memories. If we exclude the possibility of prophecy, we may state the important epistemological proposition that all states of mind which give us an immediate knowledge of existents are either contemporary with, or later than, their objects.

It is important to notice that these statements are not merely analytic. There is a psychological difference between memories and awarenesses of contemporary sense-data which is open to introspection (though, of course, there may be marginal cases where the difference falls below the threshold of distinguishability), so that the statement that the former succeed and the latter are contemporary with their objects is a synthetic proposition.

We must, moreover, take into account the facts described in psychology as the specious present. In the first place, we must say that, if an object be known directly by a state of mind which succeeds it by more than a certain short time *t*, which seems to be fairly constant for a given individual, the state counts introspectively as a memory, and the object is judged to be past. If the period between the object and the direct awareness of it be not greater than *t*, the awareness does not count for introspection as a memory, and the object is judged to be present. To say, then, that an object has been present and is now past means that (a) it is (timelessly) the object of an immediate awareness which succeeds it by less than *t*, and (b) that my statement 'It is now past' succeeds it by more than *t*. We have still, however, to consider what is meant by the presentness of a state of mind. This seems to mean that, if a state of mind be the object of an act of introspection which succeeds it by less than a certain short period, the state presents a certain peculiar characteristic which it does not present to any later act of introspection.

We can now deal with such statements as that only the present exists, or that the present is a mere transition from one infinite non-existent to another. These phrases are mere rhetoric rooted in confusions. It is perfectly true, of course, that the whole history of the world is not a complex of co-existing parts (in the sense of parts existing at the same time), as a table is. But this does not mean that it is not a whole, or that one part of it exists any less than any other part. To say that *x* no longer exists, or does not yet exist, simply means that it occupies a moment before or after my statement about it. At another moment I may make another statement of the same verbal form about *x*, and, since this no longer stands for the same proposition, it may no longer be true (*i.e.* no longer stand for a true proposition). But this involves no change in *x* itself. That *x* exists at a certain moment simply means that *x* occupies that moment, and this is timelessly true. Similarly, the fact that this moment has a certain temporal relation to any definite assertion that I may make about *x* is timelessly a fact. That it has different and incompatible temporal relations to various assertions of the same verbal form made by me is also timelessly true, and is not merely compatible with but also a necessary consequence of *x*'s existence at its own moment. An event must continue to be, if it is to continue to stand in relations; the battle of Hastings continues to precede the battle of Waterloo, and therefore both these events must eternally be at their own respective moments. That both have ceased to be present merely means that they precede any assertion that I or my contemporaries can make about them; that both were once present merely means that both are contemporary with some assertions made about them.

of mind sensations would lead to misunderstandings, owing to the ambiguities of that word and the widely held belief that sensations do not have objects.

The fallacy which we have to avoid is that of confusing two different senses of co-existence. In one sense the parts of any related whole co-exist; in another only those events that occupy the same moment of time co-exist. It is clear that the whole course of history does not co-exist in the second sense, and it is thought that this prevents it from co-existing in the first. Yet this is necessarily false, since it is admitted that events do have and continue to have temporal relations, and therefore they must form a related whole all of whose parts have being. The confusion is increased by the belief that past, present, and future are essential characteristics of objects in time in the same way as before and after are, instead of being analysable into the temporal relations of states of mind and their objects.¹

When it is once recognized that the whole course of events is in a certain sense a *totum simul*, it becomes easy to see the answer to the famous theological problem: How can God's foreknowledge of men's actions be compatible with the freedom of men's wills? The answer is as follows. Whether men's wills be free or not, every man's future actions are as completely determinate as his past ones; this is a mere consequence of the laws of logic. If indeterminism be true, then no amount of knowledge about events previous to a moment t , and about the general laws of nature or the particular habits of a man, will enable us or even God to infer with certainty what the man's volition at t actually is, although it is eternally perfectly determinate. These two statements are clearly quite compatible. Finally, in spite of the fact that God cannot *infer* the man's volition at t , He may at any and every moment be directly aware of it in precisely the same way as we are aware directly (and not merely inferentially) of certain events through memories which are themselves later events. The facts that at a certain moment t_1 God can have a state of mind whose immediate object is the volition of a man at some later moment t_2 , and that no amount of knowledge of events before t_2 would enable Him to *infer* the volition at t_2 , are perfectly compatible; and they cease to be even paradoxical when we compare the case of memory and note that there is no essential difference between past, present, and future.²

5. Reality of time.—A great many philosophers have been concerned to deny the reality of time. Their arguments fall into two groups: (1) those that depend on the supposed infinity and continuity of time, and are therefore equally applicable to space; and (2) those that depend on the supposed peculiarities of time—*e.g.*, on the distinction of past, present, and future. Before considering the arguments in detail, it will be useful to make some quite general reflexions.

(i.) It is a matter of direct inspection that the immediate objects of some of our states of mind have temporal characteristics. It is as certain that one note in a heard melody is after another in the same species present and that each has some duration as that some objects in my field of view are red or square and to the right or left of each other. It is then quite certain that *some* objects in the world have temporal characteristics, *viz.* the immediate objects of some states of mind. Now it is also certain that these objects exist at least as long as I am aware of them, for, in such cases, I am obviously not aware of *nothing*. Hence there cannot be anything self-contradictory in the temporal characteristics found in these objects, for otherwise we should have to admit the existence of

objects with incompatible characteristics. Hence there is no obvious reason why temporal characteristics should not also apply to what is not the immediate object of any state of mind. It follows, then, that criticism cannot reasonably be directed against temporal characteristics as such, but only against the descriptions that we give of the temporal characteristics of experienced objects, and the conclusions that we draw from them or the constructions that we base on them. And arguments that refer to the infinity and continuity of time are really directed against a construction based on what we conceive to be the essential characteristics of the time element which is undoubtedly present in the objects that we experience; for we are not directly aware of infinite duration or of the continuity—in the mathematical sense—of time. If we suppose that such criticisms are successful, the conclusion ought not to be either that reality has no temporal characteristics (for it is quite certain that at least some parts of it have), or that time, as an inference or construction extending the temporal characteristics of experienced objects to others, is unreal (for this goes much too far). The only justifiable conclusion would be that one particular way of describing and extending the temporal characteristics of experienced objects is unsatisfactory, and that it behoves us to look for a better one. This point has not commonly been grasped by philosophers who claimed to disprove the reality of time.

(ii.) It is thus obviously of importance to be clear as to what is the particular view of time that is attacked by special arguments. The important distinction for us to make is this: it is possible to hold (*a*) that there is a series of moments of time, and that events occupy some of them but are distinct from them, and have temporal relations to each other in virtue of those which subsist between the moments that they occupy; or (*b*) that there are no such things as moments distinct from events, but that events really do have direct temporal relations to each other; or (*c*) that there are no moments, and that even events only *appear* to have temporal relations to each other. It is clearly possible to deny (*a*) without denying (*b*). To do this can hardly be called denying the reality of time; it should rather be called denying the absolute theory of time in favour of the relative theory. It is only philosophers who deny both (*a*) and (*b*) and support (*c*) who can strictly be said to deny the reality of time. It is quite possible, however, that some arguments might be equally fatal to (*a*) and to (*b*).

It will be well at this point to say what we can about the controversy between absolutists and relativists. The absolute theory strictly means that temporal relations between events are regarded as compounded out of two relations—(1) that of an event to the moment of time which it occupies, and (2) the relation of before and after between moments of time. The relative theory holds that there are no moments, but that temporal relations hold directly between events. Its most important philosophical upholder is Leibniz, though he goes a good way farther in the direction of (*c*); it is also held, with a good deal of misunderstanding and confusion, by many modern physicists of a philosophical bent. We may say that the relative theory stands at one remove, and the absolute theory at two removes, from what we find in the objects of immediate experience. Here we find, as we have seen, events of finite duration and relations of partial precedence. The relative theory replaces these objects by series of momentary events of no duration, and the relations by those of total precedence and simultaneity. The absolute theory takes the farther step of introducing a new set of entities, *viz.* moments which have no duration and stand in relations of total precedence but never of simultaneity, and a new relation, *viz.* that between a momentary event and the moment which it occupies.

Neither theory has been very accurately stated by most of its supporters; *e.g.*, Newton, the chief upholder of the absolute theory, was mainly concerned with the measurement of time and the desire for a constant rate-measurer. But the two theories, when thought out, may be reduced to what has been stated above. We may say at once that we know of no way of deciding conclusively between the two. But, although moments and momentary states *may* exist, we now know that all their

¹ The point can perhaps be made clearer by reflecting that a tune has a pattern in time in exactly the same sense as a wallpaper has a pattern in space.

² We can, of course, remember much that we could not infer.

work can be done by certain logical functions of nothing but events of finite duration and their relations of partial precedence. Hence both theories may be said to sin by assuming entities which are not necessary to science and cannot be either directly or indirectly verified (viz. momentary events in the relative theory, and moments in the absolute theory), and the absolute theory is the worse sinner of the two. As certain logical functions of what actually exists (viz. certain classes of classes of events), moments do exist; but whether there also exists anything having the same logical relations but of the type of individuals and not of that of classes of classes it seems totally impossible to determine. It is, however, often convenient to continue to speak in terms of moments, and this is harmless for the reasons given above.

We can now deal with the special arguments against time.

(1) Those based on its supposed infinity commonly confuse infinity with endlessness. They generally proceed on the assumption that what is meant by the infinity of time is that it has neither a first nor a last moment. But this would be perfectly compatible with the whole course of time lasting for no more than a second. The fractions between 0 and 1, arranged in order of magnitude, have neither a first nor a last term, and yet the interval between any two of them is less than unity. But all attempts to prove that time or the series of events must have an end fail. So do attempts to prove that they cannot have ends. The most celebrated argument on both sides of this question is contained in Kant's first antinomy. His argument against the endlessness of time, interpreted as charitably as possible, comes to the statement that, because there are definite points in the time-series—in particular, the point which we have reached when we read Kant's argument—therefore the series must have a definite beginning point. Otherwise, Kant says, the series of events could never have reached the definite point which it admittedly has reached. The argument is, of course, a complete *non-sequitur*, for it practically amounts to saying that a series cannot have *any* definite term unless it has *end* points. And this is sufficiently refuted by considering that the number +2 is perfectly definite, although the series of numbers with signs has neither a first nor a last term.

Arguments to prove that time or the series of events in time cannot have a beginning are perhaps more plausible. It is difficult for us psychologically to imagine a first event or a first moment, because all the events that we can remember have been preceded by others. Also there are special difficulties connected with causation in the notion of a first event, which do not apply to a first moment or to a last event. A first event is one which no event precedes, though there may of course be moments that precede a first event. Now, the only plausible general proposition about causation seems to be that, if the whole universe were completely quiescent for a finite time, it could not begin to change.¹ This means that, if the universe be in the same state at any two moments t_1 and t_2 , and at all moments between them, it will be in the same state at all moments later than t_1 . Now, to say that a change happens at t_1 means that, if the state of the universe at t_1 be s_1 , and if it also be s_1 at any later moment t_2 , then there is a moment between t_1 and t_2 at which its state is different from s_1 . It follows from this definition that to say that a first event happens at t involves that the universe has been in the same state for a finite time before t . And this is contrary to our proposition about causation. If, then, we accept this proposition as an *a priori* truth, there cannot be a first event, though there might be a first event in certain isolated parts of the universe (*e.g.*, the creation of the world) provided that there had never been a first event in

¹ The universe here must be taken to include God, if there be one.

other parts (*e.g.*, in the mind of God). But, of course, there remains the doubt whether our axiom about causation be not a mere prejudice masquerading as an *a priori* law.

It must be carefully noted that, if there be a first event, there need not be a first moment of time, and that, if there be a first moment of time, there need not be a first event. Again, if there be a first moment of time and no first event, either there might be no moment, except the first, that was not occupied by an event, or there might be a duration unoccupied by events. These consequences follow from the continuity of time, and have often been overlooked by philosophers ignorant of the mathematical theory of continuity.

Leibniz based his main argument against the absolute theory of time on the fact that, if it were true, there might be a period, finite or infinite, before any event happened. This period must be definite; and yet, the moments of time having no intrinsic difference, there is no reason why it should be ended or limited by one moment rather than another. If, on the other hand, we avoid this by assuming that there is an event at every moment of time, there is no reason for assuming *both* events and moments, for the series of events will suffice.

This argument is a sound one against assuming that there *are* moments, though it certainly cannot disprove that there *may* be moments. If there were moments, they would doubtless have intrinsic differences, though we could not discover them; we must further recognize some ultimate facts, and one of these might be that the course of events is preceded by such and such a duration of empty time.

We may sum up our conclusions as follows. Arguments to disprove the reality of time from its infinity and continuity either confine themselves to criticizing infinity and continuity as such or introduce considerations about causality. Arguments of the first kind would be equally fatal to *any* infinite or continuous series, and therefore prove too much, for they would destroy the series of real numbers. And we now know that all such arguments do rest on confusions and on an insufficient analysis of the notions of infinity and continuity. There is therefore no reason why the series of moments at any rate should not be either (a) endless or (b) of infinite length. The second set of arguments can apply only to events and not to the supposed series of moments, because causation is concerned with events and not with empty time. We saw that, if a certain plausible axiom about change be true, there cannot be a first event. This would not, however, prove that the whole series of events has lasted for an infinite time, though the present writer knows of no objection to such a possibility. There is no more objection to the series of events being endless than to any other series being endless—*i.e.*, there is none at all. The result is that all danger of a valid antinomy against time vanishes. (i.) Whether the axiom about change be true or not, it is equally possible that the series of moments shall be (a) endless or terminated, and (b) of finite or of infinite length. (ii.) If the axiom about change be true, the series of events cannot have a beginning, but may (a) have an end or not, and (b) be of finite or of infinite length.

(2) Arguments against the reality of time which turn on the distinction of past, present, and future may be dealt with shortly. One argument asserts that the past and the future do not exist, and that the present is a mere point without duration. It is then supposed that what occupies no finite duration cannot be real, and this disposes of the present. An argument of this kind is used

by Leibniz against absolute time, though it would presumably apply to events just as well. It is met, of course, by the consideration that past, present, and future are all always equally real, and that these characteristics do not belong to events as such, but in virtue of the temporal relations between them and certain psychical events.

A somewhat different argument against the reality of time has been produced by J. M. E. McTaggart.¹ His argument is that every event is past, present, and future; and that the attempt to avoid the incompatibility of these predicates by saying that the event has been future, is present, and will be past involves a vicious circle or a vicious infinite regress. The answer is that, whenever we consider any definite statement about the pastness, presentness, or futurity of an event, we can see that there is no contradiction. Take a definite statement by McTaggart that Queen Anne's death is now past and has been present and future. Suppose we interpret this to mean that Queen Anne's death is not the direct object of any awareness (even a memory) which is contemporary with McTaggart's statement, but that it is contemporary with some states of mind (*e.g.*, Lord Bolingbroke's) which precede McTaggart's statement; and that it is later than some thoughts about it (*e.g.*, William III.'s), which also precede the statement. Then those three propositions seem to be timelessly true, perfectly compatible, and to contain all that is meant in the assertion by McTaggart that Queen Anne's death is past and has been present and future.

We may conclude, then, that no satisfactory proof has been offered even that absolute time is unreal, still less that the series of events and their direct temporal relations are unreal.

6. Measurement of duration.—It seems to have been the question of a rate-measurer that led Newton to the theory of absolute time. Newton considers a number of periodic events which are roughly isochronous, and compares their rough isochronism with 'absolute time, which flows uniformly.' It is an unfortunate way of introducing absolute time. In the first place, it is of no practical use to any one. Whether absolute time flows uniformly or not, we can only observe events and must use them, or processes based on them, as our rate-measurers. Again, the statement that absolute time flows uniformly is thoroughly obscure. Time cannot be said to flow, for this seems to imply that time changes; and this would make time consist of a series of events in time. Nor is it at all clear what Newton meant by uniformity in this connexion. Presumably the meaning must be that the moments of time form a series like the real numbers. What we really want to know is whether we can find any periodic process such that the time that elapses between corresponding stages in each repetition is the same. But no essential reference to absolute time is involved here. We must beware of confusing the two statements: (1) there are definite intervals of a certain determinate duration, and this duration is independent of our methods of measurement; and (2) there are absolute moments of time, and the interval between any two of these has a definite magnitude. The latter implies the former, but not conversely. The real problem is: Granted that there is a definite interval between pairs of events, how are we to measure it?

There is a special difficulty in measuring intervals of time between events which is not nearly so much felt in measuring the distance between things. This difficulty is in the temporal analogue to superposition. We may carry a rod about with us in

space, and we may have fairly good reasons to believe that it has not altered in length. The corresponding procedure in time-measurement is to find some process which can be started and stopped at any moment and can be assumed to have the same period whenever it is repeated. Such processes may be called isochronous. But, even when an isochronous process has been secured, it cannot be used to measure time in the same direct way in which a rod can be used to measure length. A rod will not as a rule fit an exact number of times into what we want to measure; it is therefore divided into a number of equal parts. Similarly we want an isochronous process that can be divided into equal subdivisions which can be easily recognized; *i.e.*, we want a process which itself consists of a number of similar processes which all occupy equal times. Now, it is not nearly so easy to be sure that a process takes the same time whenever it is repeated as to be sure that a rod keeps the same length wherever we use it; and it is much less easy to divide a process into parts that occupy equal times than to divide a rod into parts that have equal lengths. The recognizable divisions in a process of change are largely fixed for us, while divisions on a rod can be fixed by us with marks without affecting the rod as a whole.

Nevertheless the assumptions that have to be made, and the peculiar mixture of observation and convention that is involved, are the same in principle for the measurement of time and of space. The fact is that we can make immediate comparisons both of length and of time with a certain amount of accuracy. We believe that these judgments are the more accurate the nearer the objects to be compared are in time and space, and the more similar the circumstances under which each is inspected. Trusting to these immediate judgments, we see reason to believe that both the lengths of rods and the time taken by processes may vary when the rods are moved or the processes repeated. But we believe that the variation always depends on the fact that change of position in space or time involves change in the relations of the rod or the process to pieces of matter, and that mere changes of position in absolute time and space—if such could be—make no difference. We have learned by experience what are the most important factors that determine change of length or of period, and we can allow for them. It is found that the periods of recurrent processes are, on the whole, more largely affected by changes in the surroundings than are the lengths of such bodies as steel rods.

Our method of determining an ideal rate-measurer is somewhat as follows. We begin with some process which is sensibly isochronous—*e.g.*, the swing of a pendulum, or the time taken for a complete rotation of the earth on its axis. We can judge of this isochronism with a certain amount of accuracy by direct comparison in memory, just as we can compare lengths by looking at them. We can go farther than this. Just as we are greatly helped in our comparison of lengths by putting the objects to be compared side by side, so we can use expedients to help our judgments of the isochronism of processes. If we start two pendulums together and their periods be not exactly the same, the divergence will become more and more marked the longer they swing. If no divergence be noted after many swings, we may conclude that each swing of one takes the same time as the corresponding swing of the other. This does not prove that the successive swings of either are isochronous; for the period of each may be varying according to the same law. But, if we also find that the period of one of these processes synchronizes with the corresponding period of some other

¹ 'The Unreality of Time,' *Mind*, new ser., xvii. [1908] 457-474.

sensibly isochronous process which is physically very different, it becomes very improbable that there should be any law by which the successive periods of two such very different processes alter in precisely the same way. We are therefore justified in concluding *tentatively* that the successive periods of these sensibly isochronous processes are actually isochronous.

The next step is to state all the laws of nature which involve time on the assumption that equal intervals of time are measured by complete periods of such processes. We find, *e.g.*, that, if it be supposed that the successive rotations of the earth on its axis are isochronous, the laws of motion can be very simply stated and are very nearly verified by all the mechanical phenomena that we can observe. So far we are entirely in the region of what can be experienced or rendered very probable from what we experience. But now a conventional element enters. We shall probably find that, when time is measured by an actual physical process and when our laws have been stated in terms of time so measured, a closer investigation shows that there are slight divergences from the laws which cannot be accounted for by mere experimental errors. The last stage in the determination of the equality of times now begins. We argue that the suggested laws are so simple and so nearly true that the most reasonable plan is not to keep the same time-measures and complicate the laws, but to suppose that the laws are rigidly true but the time-measurer not perfectly accurate; *i.e.*, that successive periods of this physical process are not perfectly isochronous. We therefore erect the laws into principles, define equality of times by them, and apply the necessary corrections to our old time-measurer. There is nothing particularly arbitrary about this. We believed, to begin with, as the result of direct judgments assisted by the use of such expedients as have been described above, that a certain periodic process is isochronous. We admitted, however, that deviations from isochronism so small as to escape the notice of any direct method are possible. We then stated our laws in terms of time as measured by this process, and found them to be simple and very nearly true; but, if they are to retain their simple form and become quite true, a small correction must be made in the assumed isochronism of the process. This contradicts nothing that we have deduced from our experience; for we admitted all along the possibility of errors too small for direct detection. The procedure has the least trace of arbitrariness if, as is often the case, we can see the physical cause of the lack of complete isochronism in our time-measurer and can fully explain this lack in accordance with the laws which we have erected into principles. This has happened, *e.g.*, with the earth as a time-measurer, where we can explain its small defect from isochronism, when once we have to assume it, by the frictional effect of the tides acting according to the laws of mechanics. Even when no physical cause can be detected for the presumed lack of isochronism, it is always possible to suggest a hypothetical one. But, in so far as this has to be done, our procedure does become more arbitrary; and a point may be reached where a full explanation of all the phenomena demands a real change in the form of the laws with or without a change in the time-measurer. This has happened in recent years to the laws of motion, mainly through investigations on the movements of small electrically charged particles with a velocity comparable to that of light.

7. Theory of Relativity.—The next point to be considered is the criterion of beforeness, afterness, and simultaneity among events which are not the objects of any one experience. We have seen that

in favourable cases we can immediately judge that one event that we experience is after another that we experience. Other people can make similar judgments about events in their experience. But we cannot directly judge of the temporal relations of events which we do not directly experience. Matters are on exactly the same footing with spatial relations. I may be immediately aware that one object in my field of view is to the right of another in the same field, and another man may be able to make similar judgments about his visual sense-data. But it remains to be seen what is meant by saying that an object which *A* experiences is at the right of one which *B* experiences; or again what is meant by the statement that of two objects which no one experiences—*e.g.*, two atoms—one is to the right of the other. What is wanted is to be able to date events in a time-series which is neutral as between *A*'s experience and *B*'s, and shall contain events that do not fall into the direct experience of any one. In this problem we must carefully distinguish between two questions which are liable to be confused: (1) How do we come to understand the nature of the relations in the neutral time-series?, (2) How do we know with regard to any two definite events, e_1 and e_2 , whether e_1 is before or after or simultaneous with e_2 ?

The answer to the first question is that the relations in the neutral series are regarded as having the same logical properties as those which we directly experience, or at any rate as being capable of definition in terms of the logical properties of these relations. Possibly a temporal relation as experienced by *A* has a sensuous particularity different from that possessed by one experienced by *B*; just as it is impossible to say whether the quality of what *A* sees and that of what *B* sees are precisely the same when they say that they perceive the same colour, and no available test can detect any discordance between their experiences. But, of course, the sensuous particularity is what is shed when we consider a neutral time-series, and only the logical properties of the relations (*e.g.*, transitivity, asymmetry, etc.) are important.

The distinction between the space and time of each man's experience and a neutral space and time runs parallel with the distinction between the immediate objects of each man's experience and neutral (or, as we call them, physical) objects. However we suppose physical objects to be constituted, and whatever we suppose to be the relation between our minds and them, it must be assumed that physical objects are in the neutral space, and that their changes take place in the neutral time and make themselves known to us by correlated changes in the immediate objects of our experience.

It is not necessary here to consider how a number of people, $M_1 \dots M_n$, come to agree that certain events, $e_1 \dots e_n$, in their respective sense-data are all correlated with the same physical event. But it is necessary to notice that they will find, first of all in the case of sound, that, if their physical laws are to give at all a simple and complete account of what they may expect to hear under given circumstances, they must assume that the sounds heard by various people, and all correlated by them with a single physical event, are not in general contemporary with each other. The greatest accuracy and simplicity is introduced into the laws of sound by supposing that the hearing of the sounds by the various people takes place at times dependent on the positions of their bodies in physical space and on the spatio-temporal position of the single physical event correlated with all these sounds. This example brings out three very important points. (1) The determination of the temporal

relations between events in the minds or in the immediate objects of the minds of different people can be accomplished only when these events have been correlated in some definite way with supposed neutral physical events; (2) the temporal relations then assigned are such as to make the laws telling us what sensations to expect in given circumstances as simple and accurate as possible; (3) it follows from these considerations that the determination of a neutral time-series and of the positions of physical objects in a neutral space must proceed *pari passu*.

Suppose, e.g., that we say that the velocity of sound is v centimetres per second: (1) we want to connect all the known facts about the sounds which people hear under circumstances that can be directly experienced; (2) we want to do this compatibly with the assumptions which have already been made as to what heard sounds are to be classed together as connected with one physical event; and (3) we want our laws which sum up the known facts and anticipate experience to be as simple as is compatible with accuracy. We find that these ends can best be accomplished by supposing that A 's hearing of sa and B 's hearing of sb (sa and sb being both correlated with the single physical event S) take place at times $t + \frac{x_a}{v}$ and $t + \frac{x_b}{v}$ respectively, where t is the date of S in the neutral time-series, and x_a and x_b are the respective distances between the place where S happens in physical space and A 's and B 's bodies as physical objects. We must remember that the correlation of several sounds heard by different people with a single physical event and the assignment of positions in neutral space to physical events are themselves carried out on the same general principles as the dating of events in neutral time and as the measurement of duration already described; i.e., we start with instinctive judgments of rough accuracy, and then proceed to a more accurate determination of our terms, guided by the general motive of maximizing the accuracy and simplicity of scientific laws.

As we have seen, sound is the first and most obvious case where it is necessary to assume different dates for different members of a group of sense-data which are all correlated with a single physical event. The more accurate researches of science necessitate a similar process for dealing with the sense-data of sight, and so the notion of a velocity of light is introduced. These velocities, once determined, furnish a criterion of before and after among physical events, and, through them, for events in different minds.

Let us denote any moment at A by the symbol a_{tr} , and an event which happens at the point A at the moment a_{tr} by a_{er} . Let us use the same notation for events and moments at B . Then we can say: An event a_{er} precedes an event b_{es} if a disturbance leaving A at a_{tr} reaches B not later than b_{ts} . Now it is found that we have no reason to believe that any disturbance travels faster than light. It can be shown that, if the above be our sole criterion for before and after between events at different places, there will be pairs of such events of which we have no reason to say that one is either before, after, or contemporary with the other.

To see this, consider the following case. Let a_{e1} happen at A at a_{t1} . A signal which leaves A at a_{t1} cannot reach B before a certain moment b_{t0} . Again, a signal that reaches A at a_{t1} cannot have left B after a certain moment b_{t0} . On our criterion, therefore, a_{t1} is before any moment that is after b_{t0} and is after any moment that is before b_{t0} . But how are events at B which happen between b_{t0} and b_{t2} related in time to the event a_{e1} ? Take an event b_{e2} such that b_{t2} is between b_{t0} and b_{t2} . You cannot say that it is before a_{t1} ; for a disturbance leaving B at b_{t2} would reach A later than a_{t1} . But you also cannot say that a_{t1} is before it; for a disturbance leaving A at a_{t1} would reach B later than b_{t2} (viz. at b_{t0}). Hence on our criterion we can neither say that b_{e2} is before a_{e1} nor that a_{e1} is before b_{e2} . Moreover, there is an infinite number of events at B of the form b_{e2} where x is between 0 and 2. Thus we cannot cut the knot by saying that, since they are neither before nor after a_{e1} , they are contemporary with it. For they are not contemporary with each other. Thus one and only one of the class of events b_{e2} can be taken to be contemporary with a_{e1} , and the rest, so far as our criterion goes, must be held to be neither before, after, nor simultaneous with a_{e1} . We are thus compelled to recognize that we may have no means of deciding whether a pair of events at different places in physical space are contemporary or not in physical time.

We can, if we like, accept this result, and build up our physics on the assumption that physical

time really is non-connexive; i.e., that, though all events have temporal relations to some events, none have temporal relations to all events. This has recently been done very fully and ably by A. A. Robb.¹ Or we may take the more usual course of assuming that physical time really is connexive, but that in certain cases all criteria fail to determine the actual temporal relations which subsist between events in different places. We then must simply make a convention (to return to our example) that one particular event of the class of events at B , whose temporal relations to a_{e1} are left doubtful by our criteria, is contemporary with a_{e1} , and that whatever precedes this one precedes a_{e1} and whatever follows it follows a_{e1} . It is customary to assume that the event at B which comes midway between b_{e0} and b_{e2} is contemporary with a_{e1} ; but it must be noticed that this is a mere convention, though doubtless the most reasonable one to make. (On our notation this event would naturally be b_{e1} .)

We must notice further that, for this convention to be determinate at all, we must assume that we know that the time-measurer at B goes at the same rate as that at A , and that both go uniformly. Now, if the time-measurers cannot be moved about, their synchronism can be determined only by sending signals from one to the other—e.g., light-signals. And, even if they can be moved about, our only test for the continuance of their synchronism, when they have been moved apart and are no longer in view together, is by light-signals. On the other hand, the question whether our tests for synchronism by light-signals are genuine tests (i.e. involve synchronism in physical time) depends on whether the velocity of light relative to the system containing the time-measurers is constant in time and the same in all directions. And this last point cannot be determined until the time-measurers in two places have been synchronized; for it is obvious that to measure a velocity we need to know the time in two places. We see, then, that the possibility of synchronizing time-measurers and the uniformity of the velocity of light stand and fall together, and that neither can be proved independently of the other. If we allow that the velocity of light relative to the system is constant and uniform in all directions, our tests for synchronism and uniformity in our time-measurers are valid; if we allow that the criteria ensure physical synchronism, the physical velocity of light (as distinct from its numerical measure on our convention) will be constant and uniform. But neither question is or ever will be capable of independent settlement; and therefore we simply have to make a convention that the meaning to be attached to synchronism in different places is agreement with the tests based on light-signals, and another convention that distances shall be so measured that the measure of the velocity of light relative to the system is independent of time and of direction.

Suppose now that the people on a system S determine their spatio-temporal co-ordinates in this way, and that the people on another system S' , moving with uniform translational velocity relative to S , determine their spatio-temporal co-ordinates similarly. Let them arrange, as they can do, that the time-measurers at the origin of each go at the same rate; and further let them arrange their units so that the velocity of light as measured by each from experiments with sources and mirrors fixed in their own system shall have the same numerical measure. Then (a) it can be proved that each will find the same numerical measure for the velocity of light, even though the sources and mirrors be in uniform motion relative

¹ *A Theory of Time and Space.*

to the two systems. (b) It is possible to find equations connecting the spatio-temporal co-ordinates which the people on S give to any momentary event which they observe with those which the people on S^1 give to the same event. These are the celebrated transformations of the Theory of Relativity. They are, as we should expect, perfectly reciprocal, since the relative motion of S and S^1 is a perfectly mutual phenomenon. But (c) they lead to certain rather startling results. (1) Lengths along and at right angles to the direction of relative motion which are judged to be equal by the people on one system will be judged to be unequal by those on the other. The ratio depends on the relative velocity and on the value of the velocity of light which is common to the two systems.¹ (2) Events in different places which are judged to be contemporary by the people on one system will be judged to occur at different times by those on the other system, and the difference of time will depend on the distance apart parallel to the direction of relative motion.

Although the observers on the two systems thus differ, they cannot criticize each other. Each has pursued precisely the same plan in setting out his co-ordinates and synchronizing his time-measures. And it would be quite futile for one to claim that his results are the right ones because his system is at rest and the other is in motion. For the relative motion is completely reciprocal, and neither absolute motion nor any consequence of it can be observed. Lastly, it is equally futile for one to say that he is at rest 'relative to the ether,' while the other is in motion; for we know that no experiment whatever has been able to demonstrate motion 'relative to the ether,' and this motion may fairly be dismissed as a fiction. The upshot of the matter is that there is nothing to choose between their respective judgments, and that all the laws of nature can be stated as truly and will have precisely the same form, no matter which of an infinite number of systems in uniform translational motion be taken as the basis for spatio-temporal co-ordinates. This result, with the mathematical consequences that flow from it, is known as the Theory of Relativity. Its philosophical importance is that it enables us to see the tacit assumptions that are made when we talk of events at different places being contemporary; and the fact that measurement of distance is entangled with time, since the distance between two objects at any time involves a decision as to what is meant by the same time in two different places. Though it no more completely refutes the possibility of absolute space and time than does any other argument (for after all it only deals with our numerical measures and leaves it open whether one system of time-measures is physically uniform and synchronous and one system of space-measures directly represents distances in physical space), yet it helps to render the notions of absolute space and time still more spectral and remote from all possible experience than before. For it enables us to see that there are a certain indeterminateness and conventionality even in the measurement of the distance between physical objects and of the lapse between events; and that therefore what we can know is even at a farther remove than we had thought from the points of absolute space and the moments of absolute time.

The Theory of Relativity sketched above was first fully stated by Einstein in his classical paper, 'Über das Relativitätsprinzip und die aus demselben gezogenen Folgerungen,' which appeared in the *Jahrbuch der Radioaktivität und Elektronik* for 1907. This may be called the restricted Theory of Relativity. It may be briefly characterized as

¹ This is the famous Lorentz-Fitzgerald contraction.

consisting of an experimental fact and a philosophical principle suggested by a great number of facts. The philosophical principle is that, since we can never observe absolute time, space, or motion, even if there be such things, the laws of physical phenomena as learned from experiment and observation must retain the same form for acts of observers in uniform motion relative to each other. This persistence of form (or *covariance*, as it is technically called) in the differential equations that express the laws of nature does not in general imply that the actual magnitudes measured by two observers in uniform relative motion will be the same.

E.g., an observer moving with his instruments relative to an electrically charged body will detect magnetic as well as electrical forces, whilst one who is at rest with his instruments relative to this body will observe only electrical forces. But the differential equations connecting the effects noted by one observer with each other and with his x, y, z , and t co-ordinates will be precisely the same as those connecting the effects noted by the other observer with each other and with his x, y, z , and t co-ordinates.

This principle by itself, however, would be of little use, since it does not enable us to say what connexion exists between the co-ordinates of the two observers. But, if there be some physical magnitude, which is not merely covariant but also *invariant* as between different observers in uniform relative motion, the transformations connecting the two sets of co-ordinates can be found. Now the velocity of light *in vacuo* is found to fulfil this condition; its actual numerical value is found to be the same by all observers. The mathematical consequences of this fact lead to Einstein's set of equations connecting the x, y, z, t co-ordinates of one observer with those of another who is moving relative to the first. The precise significance of Einstein's principle of the 'Constancy of Light Velocity' has been indicated above, and shown to be connected with the way in which we are forced to lay out a system of co-ordinates and to define simultaneity between events in different places.

Einstein's restricted theory has gained many triumphs. It explains at once what is known as Fresnel's dragging-coefficient for light passing through matter that moves relative to the observer. It also accounts for the change of mass with velocity which is observed when small particles move with speed comparable to that of light. The principle necessitates slight changes in the previously accepted form of some of the laws of nature. Maxwell's equations and the equation of continuity in hydrodynamics do indeed at once and without modification fulfil the condition of covariance. But the laws of mechanics, as they stand, are not in accord with the principle and need modifications which only become practically important in dealing with the motion of matter with velocities comparable to that of light.

Considerable philosophic importance, in connexion with the nature of time, attaches to the work of Minkowski.

On the ordinary Newtonian mechanics the form of the laws of nature is unchanged if the three spatial axes be twisted in space about their origin as a rigid body. Now Minkowski showed that the Lorentz-Einstein transformation is equivalent to a twist of the same nature performed on a set of four mutually rectangular axes in a four-dimensional space. Three of these axes are the ordinary spatial ones, the fourth is the time axis multiplied by c , the velocity of light, and c , the root of -1 . So far the theory must be regarded as a merely elegant mathematical device, since the fourth axis is imaginary in the mathematical sense, and the angle of solution is also imaginary. But, if we do not assume that the geometry of the four-dimensional 'space-time' is Euclidean, a much more important meaning can be attached to Minkowski's interpretation of the relativity transformations. If we suppose the geometry of 'space-time' to be hyperbolic (i.e. the geometry of Lobatschewski), the relativity transformation corresponds to twisting a set of four real axes as a rigid body through a real angle about the origin. The axes are now x, y, z , and ct , and c simply depends on the different units that we use in measuring time and space; so that really we are dealing with a four-dimensional

manifold in which space and time are homogeneous with each other, but whose geometry is not Euclidean but Lobat-chewskian.

The work of philosophical mathematicians since Minkowski's death has consisted largely in developing the notion that the ultimate data in the world are events in space-time, *i.e.* events extended both in space and in time. The content of a specious present forms an example of such data. Space and time as used in the sciences only emerge at the end as elaborate mathematical constructions built on the immediately perceptible relations between extended events.

The best exposition of this point of view is contained in A. N. Whitehead's *Principles of Natural Knowledge*, which begins with a severe criticism of the concepts of classical physics and proceeds to elaborate the notions of space, time, and matter from the crude data of sense and their immediately given spatio-temporal relations. It seems hardly possible to doubt that this is the right path for further research, but it demands a combination of philosophical and mathematical abilities of so high an order that few can tread it successfully. Alexander in his *Gifford Lectures* at Glasgow has developed the notion of space-time with great fullness from the purely philosophic side, but, at the time of writing, his lectures have not appeared in print, and it is impossible to give a fair account of his views from the short synopses which are alone available.

It remains to say a few words about the generalized Theory of Relativity. So far we have only considered observers in *uniform* relative motion and have laid down a principle of relativity for them. Einstein has occupied himself in the last few years in removing this restriction and thus bringing gravitation, which fell outside the older theory, into the scope of the Theory of Relativity.

A particle is said to be under the action of no force if it move uniformly in a straight line. But the question whether it moves in a straight line and whether it moves uniformly is clearly relative to our spatial axes and to our measure of time. If, *e.g.*, a particle moves uniformly in a straight line relative to the rectangular axes x and y , it will not do so relative to axes which rotate about the origin in the xy plane. Accordingly, relative to one set of axes it will be said to be under the action of no force, whilst relative to the second set it will be said to be under the forces needed to produce the observed accelerations. Now the 'forces' introduced by these mere changes of our axes of reference are in one respect very much like the force of gravitation. They, like it, affect all forms of matter indifferently and depend only on the mass, not on the special nature of the matter. On the other hand, a genuine gravitational field cannot be altogether transformed away by a suitable change of axes, as a purely geometrical field can be. For any one particle this can be done by choosing axes fixed in the particle, but relative to these axes the other particles in the field will still be accelerated. Now it seems clear that a mere change of axes could not make any difference to the form of the laws of nature, and thus, if gravitation were capable of being transformed away merely by a suitable change of axes, the principle of relativity would assert that the presence of a gravitational field makes no difference to the form of the laws of nature. For the reason mentioned above the principle of relativity cannot be taken in this unrestricted sense. It may, however, be taken to assert that the form of the law of nature is unaltered in a gravitational field up to a certain (as yet undetermined) order of differential coefficients.

It is now necessary to see the bearing of these results on the constitution of the 'space-time' of nature.

It has been proved by Riemann that the metrical geometry of any space is completely determined when the 'linear element,' *i.e.* the interval between any pair of infinitely near points, is expressed as a known function of the differentials of the co-ordinates. Thus a three-dimensional Euclidean space is completely defined by the equation

$$ds^2 = dx^2 + dy^2 + dz^2$$

for the linear element. Now the metrical properties of four-dimensional space-time will be completely determined when ds^2 (the interval of any pair of adjacent points in it) is expressed as a known function of $dx^2, dy^2, dz^2, dt^2, dx dy, dx dz, dx dt, \dots$ etc. In space-time, therefore, the ten coefficients of dx^2, dy^2, \dots must be known in order to determine ds^2 . In general these coefficients will be functions of x, y, z, t ; they are denoted by the letters $g_{xx}, g_{yy}, g_{zz}, \dots$. Any transformation of axes corresponds to a change in these g 's and therefore to a change

in the form of the linear element. It follows that, as regards forces introduced simply by changes of axis, it is a matter of perfect indifference whether we say (a) that the geometry of space-time is such and such and that such and such forces are acting, or (b) that the geometry of space-time is such as to produce the appearance of these forces. The g 's can be regarded either (a) as completely determining the forces on a given assumption about the geometry of space-time; or (b) as determining the metrical properties of space-time itself. The extended Theory of Relativity prefers to take the second view of them and to drop all reference to forces; on the first view the g 's are of the nature of potentials. Now, in theory, any function whatever might be chosen for the g 's. But, in fact, all parts of nature are subject to gravitation. This means that the choice of g 's is not absolutely unrestricted, but that in every permissible system of axes for describing nature the g 's will be subject to a set of differential equations connecting them with each other and with the x, y, z , and t of that system. These equations then express the law of gravitation and at the same time express it as a fundamental property of space-time.

It is extremely difficult to render Einstein's theory intelligible without mathematics, and the mathematics needed is somewhat formidable. It is hoped, however, that the above slight sketch may illustrate that extreme entanglement of time with space and with matter which undoubtedly occurs in our crude sense-data and is now seen to persist even in the most refined speculations of mathematical physics. It may perhaps be added that Einstein's generalized theory, as distinct from the special philosophic interpretations which may be put on it, is not a mere idle speculation, but has already explained the anomalies in the perihelion of Mercury, and has correctly foretold the amount of deviation in a ray of light due to its passing near a heavy body like the sun.

8. Historically important speculations about time.—Our knowledge of time as of space owes more to the labours of mathematicians and physicists than to those of professed philosophers. The sharp distinction between time and what changes, and between space and what moves in it and is extended, is largely due to the development, first of mechanics, and latterly of electrodynamics.

To the Greeks we owe much less with regard to time than with regard to most matters of philosophic or scientific speculation. This may perhaps be ascribed to the late development of dynamics; the Greek approach to the problems of time was mainly by way of astronomy. Of course, Zeno's celebrated arguments have an important bearing on change and continuity, and, whatever may have been the real intention of their author, they remained the best discussion on these subjects so closely related to time until the final treatment of infinity and continuity by Dedekind and Cantor in the latter part of the 19th century. Time plays an important part in the *Timæus* of Plato; and, although his treatment cannot be called satisfactory, it has the merit of distinguishing time from what is in time.

Plato says that God wished the created world to resemble the intelligible one as far as possible. Now, it was not possible for it to be eternal, and the nearest analogue to eternity which He could provide was to make 'a moving image of eternity.' This is time, and it is closely connected with the motions of the heavens; eternity 'rests in unity,' but the image 'has a motion according to number.' Before the heavens were created, there were no days, years, etc.; but, when God created the heavens, He created these divisions of time also. Time was thus created *with* the heavens, and, if one were to be dissolved, so would the other be. But Plato does not appear to identify time with the motion of the heavens, though it is difficult to see what he supposes it to be in itself. According to Plato, past and future are created species of time which we wrongly transfer to the eternal essence; strictly 'was' and 'will be' are to be asserted only of generation in time, for they are motions. The analogy of the moving image to the eternal

is that the created heavens have been, are, and will be in all time. This view has something in common with that of Spinoza, who makes things as they really are for *ratio* timeless, but holds that this timelessness cannot be grasped by *imagination*, which represents it confusedly as duration through endless time.

Aristotle defines time as 'the number of motions relative to before and after.' Number here appears to mean what is numbered. The now is borne along with the movable as a point may be regarded as moving and making up a line. So in a sense there is only one now, though in another sense there are many nows. This is obviously a very unsatisfactory metaphor, and there seems no reason to think that Aristotle was really clear as to the distinction between time and motion.

The Schoolmen in the main adopted Aristotle's views, though with certain modifications. St. Thomas Aquinas, in the tract *de Instantibus*, discusses time and change with some fullness. He draws a distinction between the time in which angels perform their acts and that in which men and matter operate. The time of angels is discrete, that of men continuous; the difference arises from the fact that continuity is essentially connected with matter, while angels are separated substances. An instant for an angel is the time occupied by a single act; it may thus correspond to a long period in our time. This may be compared with Royce's views about the varying lengths of the specious present in various beings.

In modern philosophy the men who have most concerned themselves with time are Leibniz and Kant. Leibniz argued strongly for the relative view of time in his letters to Clarke, who represented Newton and the absolute theory. His arguments turn mainly on the identity of indiscernibles and the principle of sufficient reason. Leibniz carefully distinguished duration from the relation of before and after, and he compared duration to the extension of matter. Leibniz's view is that time is a system of possible positions of possible events related by before, after, and simultaneous with. He holds that all possible worlds must be in time, though, of course, the particular temporal relations of the actual world are contingent. To make Leibniz's theory coherent, it would be necessary to be much clearer than he is as to the relation between the time-series of each monad and the time-series of the universe. He attempted to explain the relation between successive states of the same monad by saying that the earlier ones have the quality of being desires for the later ones. As an attempt to replace relations by qualities this clearly fails, since 'desire for' anything is clearly a disguised relation. And as an attempt to *define* before and after it also fails; for it is clearly a synthetic proposition that desire for X precedes X . Then again it seems essential to Leibniz's doctrine of the reflexion by one monad of the states of another that we should have some account of the temporal relations between corresponding states in different monads. The state of a monad at a given moment in its own time-series is presumably the reflexion of the *contemporary* states of other monads; but we are not told what is meant by a time-series common to the monads, nor is it clear that this would be consistent with Leibniz's dislike of relations.

The absolute theory of time has never had much philosophic support; there can be little doubt that Leibniz had the better of Clarke. Perhaps the best arguments for absolute time and space are to be found in Bertrand Russell's *Principles of Mathematics*. They do not seem to the present writer to be conclusive, and their author has latterly taken a much more relativistic view.

Locke, Berkeley, and Hume insisted that the notion of time comes from the succession of our ideas. But they never made it clear how their temporal relations are connected with the time that is used in physics. Berkeley and Hume in particular fail to give any reasonable account of the distinction that we certainly make between the temporal order of our ideas and the temporal order of the objects which we claim to know by them. It is a great merit of Kant to have seized on the importance of this point in his 'analogies of experience,' though the distinction will certainly not bear the superstructure which he built on it. He attempted to prove that the distinction involves the permanence of substance (which he seems to identify with the chemical law of the conservation of mass) and the law of causation among experienced objects. But his arguments are entirely inconclusive even to prove that, in order to make the distinction, we must *believe* in these principles; much less to prove, what the transcendental method always tends to confuse with this, that the principles are true.

Time plays perhaps more, and more important, parts in Kant's philosophy than in any other.

(1) In the *Aesthetic* he tries to prove that it is a form of intuition, the form appropriate to the internal sense. This seems to mean that, just as we can only perceive physical objects as being in space, though there is no reason to think that things-in-themselves are spatial, so we can only perceive ourselves and our mental states in introspection as being in time, though there is no reason to think that we really are in time. This certainly seems to raise the special difficulty that, unless we know ourselves as we are and not merely as we appear, we cannot know what our forms of intuition are, but only what they appear to be, whilst Kant's argument certainly assumes that we know what they are. (2) In the *Dialectic*, as we have seen, Kant has an antinomy about time. This apparently would, if valid, overthrow not merely absolute time but also the temporal character of events and the temporal relations between them. We have already seen how grave are the difficulties in the way of any such conclusion, and how entirely powerless Kant's arguments are to prove it. (3) In the *Analytic* time plays an important part in the difficult doctrine of the schematism of the categories. The position seems to be that the categories as pure conceptions of the understanding cannot be applied immediately to the manifold given in sense, even after that has been synthesized by imagination. They have to be mediated through time; thus the category of ground and consequent, which is purely logical, can be applied to the world of sensible experience only after it has been schematized into the temporal form of cause and effect. The whole argument here is confused and weak to a remarkable degree; the principle appears to be that the manifold of sense is provided with temporal characteristics by intuition; that these remain and are elaborated by the syntheses of imagination; and that then the categories can be applied if they be first schematized so that they and the synthesized manifold share the temporal characteristic in common. (4) Kant's critical solution of his own antinomy is that the infinity involved in time is not an actual infinite, as it would have to be if time applied to things-in-themselves, but is only the power that we have of always synthesizing farther than we have yet gone in constructing a temporal series. To this Lotze makes the very pertinent criticism that it surely depends on the nature of things-in-themselves whether we shall be indefinitely supplied with material to synthesize.

The modern development of our knowledge about time is due mainly to two sets of people: (1) philosophical mathematicians, like Dedekind and Cantor, who have given a satisfactory analysis of infinity and continuity, and thus finally refuted all antinomies based on these; (2) mathematical physicists who have been led by their studies in the optics of moving systems to elaborate the Theory of Relativity. The pioneer in this work is Lorentz; the theory itself was first formulated by Einstein; and the mathematical and philosophical consequences have been drawn and elaborated by Einstein, Minkowski, Robb, Whitehead, and others.

It is also necessary to mention among recent philosophers Bergson, in whose works time, nominally at any rate, plays an important part. Bergson holds that the attempt to treat time as similar to space is a perverse one philosophically; it may work very well in dealing with dead matter, but it

shows its falsity in biology, psychology, and philosophy. He also falls foul of the mathematical theory of the *continuum* as applied to time; he admits that it is internally consistent, but denies that it describes what anybody really means by change and motion. Bergson's arguments seem to rest partly on a comparison between change as a sense-datum (e.g., the peculiar characteristic of what we see when we look at the second hand of a watch as distinct from the hour hand) and physical change, and partly on the erroneous view that a whole of related states cannot be a change unless each of its terms be a change. Again, in some of his remarks about memory he seems to suppose that, because a memory-act is a later awareness of an earlier event, the earlier event and the later awareness must somehow be contemporary. Finally, he seems to think that the ordinary view of time is refuted by the facts, of which he is strongly convinced, that no two total states of mind at different times can be exactly alike, that there are not, strictly speaking, distinct elements which can recur as parts of different mental states, and that no amount of knowledge about earlier states will enable us to foretell later ones completely. But Bergson's most characteristic doctrines belong to the subject of change rather than to that of time.

TIPITAKA.—See LITERATURE (Buddhist), vol. viii. p. 85^b.

TIRUPATI.—Tirupati, vulg. Tripetty (Tel. Tirupati, *tiru*, Skr. *śrī*, 'venerable,' *pati*, 'lord'), a town in Chittoor District, Madras (lat. 13° 38' N., long. 79° 24' E.), is a famous place of pilgrimage, situated on the Tirumalai or sacred hill, usually known to Europeans as Upper Tirupati, in contrast to the lower town at its base. The whole area is considered sacred, and up to 1870 had never been visited by Europeans. Mark Wilks states that he was on duty for eighteen months in the neighbourhood, and, though he frequently climbed the adjoining hills, he could never catch even a distant view of the pagoda.¹ The belief that much crime was committed without detection in the holy town led to the issue of an order by Government that it should be thrown open to the District officials. This at first produced considerable local opposition; but European visits now cause little sensation. The sanctity of this hill-range rests on the legend that it forms part of the sacred mountain Meru. The range has seven principal peaks, each of which is sacred and has a name and legend of its own. One of the peaks, known as Seshāchalam, 'serpent hill,' takes its name from the belief that it was torn from Meru by Ādi Śeṣha, the primordial snake, who contended in a trial of

strength with the wind-god, Vāyu. Vāyu raised so great a tempest that the peak was blown away and fell to earth in its present position. Near this peak the great temple stands. Little can be seen of it, and no European has been allowed to enter it. It is a building of little architectural beauty or importance, but the cultus of the deity is interesting as an example of the amalgamation of local non-Aryan beliefs with orthodox worship. Within a small chamber lighted by lamps is the idol, a stone image of Viṣṇu, seven feet in height. It represents the god as Chaturbhujā, 'four-armed,' one of the right hands holding the discus (*chakra*), one of the left the conch-shell (*sankha*), the second right hand pointing to the earth to draw attention to the miraculous origin of the holy hill, while the remaining left hand grasps a lotus. The deity possesses 1003 titles, the most common of which are Śrīnivāsa, 'dwelling with Śrī or Lakṣmī,' goddess of prosperity, and Venkaṭachalapati, the title of the sacred hill, which has been adopted into Sanskrit from the Tamil *ven*, 'white,' *kadam*, 'hill slope,' thus showing that the deity was adopted into Brāhmanism from a Dravidian cult. By visitors from the Deccan and N. India he is generally known as Bālāji, which, according to Monier-Williams,¹ is the name of a human incarnation of Viṣṇu or Kṛṣṇa of whom little is known, save that he was remarkable for many extraordinary qualities, and that he lived in the neighbourhood of the sacred hill. Hence visitors to the shrine generally invoke him by the title of Govinda, 'cow-keeper,' one of the names of Kṛṣṇa. It is remarkable, however, that, according to common belief, the image worshipped was originally one of Śiva. The transformation of the Śaiva cult to that of Viṣṇu is traditionally ascribed to the reformer Rāmānujāchārya (born c. A.D. 1017). It is said that he procured a conch-shell and discus of gold, which he placed before the image and closed the temple doors. When the shrine was opened next day, it was found that these emblems of Viṣṇu were grasped in the hands of the image, and therefore it was really Viṣṇu. The tangled hair (*jata*), the cobras carved upon the body, and various other peculiarities indicate that it was intended to represent Śiva, and the priests, who are Dikṣhita Brāhmins, admit that they belong to the Śaiva sect. The god is provided with a consort, Padmāvatī, said to be the incarnation of a mortal woman, and the offerings are believed to have been originally collected to provide for the marriage of the pair. In an ante-room there is a brass vessel with a bag hanging in it, into which money and jewels are placed. On the other side are two gongs, one of which, when struck, utters the name Govinda, the other Nārāyaṇa—both titles of the god. Many pious persons observe the custom of collecting in their homes monthly contributions which are placed in a money-box and finally offered at the shrine.² The anthropomorphism of the cult is shown in the belief that the deity annually announces to certain persons that he needs shoes, which they make and present.³ Various rites indicate the non-Aryan character of the worship. Thus a feast called *Gangājātra*, 'Ganges festival,' is held in the early spring, when a figure is made of clay or straw, before which animals are sacrificed—a custom quite opposed to true Vaiṣṇava beliefs. Even Brāhmins, who will not attend personally, send victims. When the sacrifices are over, the image is burned, and much rude merriment follows. Some votaries carry on their heads a structure made of bamboo, resembling a car, adorned with coloured paper, and supported by iron nails that

often pierce the flesh of the bearer, who submits cheerfully to the torture. At the *Gangammā* festival held at the temple 'language truly filthy and obscene' is used to the goddess herself.¹ The explanation of this custom is obscure.

'Abusive language is believed in certain circumstances to bring good luck to the person against whom it is directed.'²

On this theory the obscenity may possibly be regarded as a form of mimetic magic intended to repel the powers of evil from the deity, and thus advance her powers of promoting fertility.³

Again, on the road leading up to the temple 'small stones heaped up in the form of a hearth, and knots tied in the leaves of the young date palms may be seen. These are the work of virgins who accompany the parties of pilgrims. The knots are tied in order to ensure the tying of the *tālī* string on their necks [at marriage], and the heaping up of stones is done with a view to ensuring the birth of children to them. If the girls revisit the hill after marriage and the birth of children, they untie the knot on a leaf, and disarrange one of the hearths. Men cause their names to be cut on rocks by the wayside, or on the stones with which the path leading to the temple is paved, in the belief that good luck will result if their name is trodden on.'⁴

The hope of recovery from sickness and the desire for male offspring are the chief causes of vows being made to the god. The vow need not be performed immediately on receipt of the blessing. Death merely transfers the obligation to the heir, and it is said that the god is never defrauded. A common offering by women is the hair of their heads, which is shorn off by barbers, more than half the women who visit the temple returning with their heads clean shaven. J. A. Dubois⁵ describes a custom of binding the idol in chains of silver, apparently with the object of preventing him from leaving the temple. The same writer⁶ speaks of the custom of women who desire children passing a night in the temple. He also alleges that at the festival, when the image is taken in procession, the Brahmins select the most beautiful women as wives of the god; they are branded with a hot iron, and, after serving for some years, are dismissed with a certificate of good conduct which ensures that, as they wander through the country, their wants will be abundantly supplied.⁷ By other accounts, when such a woman becomes too old to please the deity, the priests make a mark on her breast, the emblem of the god, and give her a patent certifying that she acted for a certain number of years as one of his wives, that he is now tired of her and recommends her to the charity of the public. H. A. Stuart, however, denies that any dancing-girls attend the god; but he admits that the state of morality among priests and pilgrims has deteriorated, even celibate Bairāgis and priests taking their paramours with them up the sacred hill. In the Deccan it is very common for a woman to make a vow that, if she is relieved from sickness or other trouble, she will shave her head to the god at Tirupati. After being shaved, she walks thrice round the temple, worships the image, pays a fee to have lighted camphor waved round the idol, receives a pinch of the sugar offered to the god, distributes food to the poor and to the monkeys which swarm round the temple, offers charity, and returns home.⁸ The tonsure of children is also performed at the temple.⁹

W. CROOKE.

TITANS.—The Titans, like the Giants (*g.v.*), are potencies belonging to an early pre-Olympian stage of Greek mythology. The two tend to be confused by late authors, but in origin they are distinct. The Titans are distinguished from Giants by the following well-marked characteristics: (1) they are gods (*θεοί*), and as such immortal, whereas the Giants are mortal; in *Τίτῆνες θεοί*, 'Titans, gods,' is a fixed formula in Hesiod's *Theogony*; (2) they are sky-potencies (*Οὐρανῶνες*)¹ as contrasted with the Giants, who are earth-born (*γηγεγείς*); Titans and Giants alike are to Hesiod the offspring of Earth and Heaven, but the Titans tend skywards, the Giants with their snake-tails earthwards. To Shakespeare Titan is the sun.

'And Titan, tired in the mid-day heat,
With burning eye did hotly overlook them.'²

To Pausanias³ Titan, according to the local legend of Titane, is 'brother to the sun,' and Pausanias himself held that Titan 'was great at marking seasons of the year.' Empedocles holds a less specialized and perhaps juster view; he places side by side

'Gaia and billowy ocean and air with its moisture,
And *Æther*, the Titan, embracing the All in a circle.'⁴

The Titan Phaethon is the sun and sun's charioteer; the Titaness Phoebe is the moon; the Titans Atlas and Prometheus are the sky-pillars supporting Ouranos. The Titans are an integral part of that primeval cosmogony of earth and sky, ousted in Greece by the anthropomorphic Olympians, but remembered as part of their Indo-European heritage by the Northern Muses who came to Helicon and taught their lore to Hesiod.

The etymology of Gigas, 'giant,' is uncertain; that of Titan is happily secure, and it throws a flood of light on the function of these sky-potencies of older date and explains in a flash the two Titan myths—(α) the Titanomachia, (β) the rending of Zagreus, which, but for this etymology, must have remained obscure. Three glosses of Hesychius make it certain that *Titan* means simply 'king.' They are as follows: *τιτῆνας βασιλίδες* (the word glossed is from a lost play of Æschylus); *τιτῆνη* (for *τιτῆνη*) ἡ βασιλισσα, and *τίταξ* ἔρτιμος. ἡ δυνάστης. ὁ δὲ βασιλεύς. Titan is king, 'honoured one,' but—and here is the interesting point, or rather series of vitally interconnected points—he is the king of the old order, the king-god or divine king, and as such he is a sky-potency, for one main function of the old king-god was to order the goings of the heavenly bodies and generally to control the weather. Here we have that odd blending of physical phenomena with human and social potencies which lies at the back of most gods and certainly of Zeus himself.

The Titanomachia is at once clear. For on the physical point of view it is, as described in Hesiod,⁵ just a half-humanized thunder-storm, Zeus, the new sky- and thunder-god, fighting the old sky-potencies; from the theological point of view it is the new anthropomorphism against the old religion of the king-god or medicine-man who controls the weather. The Olympian religion naturally regarded these old Titan kings as criminals, rebels against high heaven, condemned to Tartarus for their sin of *ἵβρις*; they are the counterpart of the arch-Titan Prometheus.

The second Titan myth, the rending of Zagreus, is less transparent, but in the light of the Titan kings even more illuminating, for we catch the king in his earliest stage of all, when he was tribal elder or medicine-man, not yet fully developed into kingship. The Titans, according to a version of the story as early as Onomakritos,¹ lure away the infant Zagreus, dismember, and (in some versions) cook and eat him. The story is an initiation myth based on the familiar initiation ritual of the mock death and resurrection of the initiate. The initiators are the elders or dynasts of the tribe, the embryo-kings.² The Titans as old-world kings are well in place; as a form of giant they are absurd. The name Zagreus takes us to Crete, and in Crete we find the Titans in a connexion that again points to initiation mysteries. The Cretans, according to Diodorus,³ said that in the time of the Kouretes those who were called Titans ruled over the region of Cnossos, where were shown the foundations of the house of Rhea and a sacred cypress-grove of hoary antiquity. These Titans again must have been the old king-medicine-men, contemporary with the Kouretes and, like them, initiators into the 'men's house' of the Mother Rhea.⁴ On a red-figured *hydria* in the British Museum⁵ Zagreus is depicted as actually devoured by the Titans, and these Titans wear the characteristic dress of Thracian chieftains. We may safely infer that the Titan myth of the rending of Zagreus was known from Thrace to Crete, and we may suggest that it arose in that early stratum of 'satem'-speaking population known to the later Greeks as 'Pelagian'—a stratum specially addicted to the mystery-cults of the son of Semele.

LITERATURE.—M. Mayer, *Die Giganten und Titanen*, Berlin, 1887. For the Titans as Ouraniones, J. E. Harrison, *Themis*, Cambridge, 1912, pp. 453-460. The right etymology of Titan from the root *tī*, 'honour,' was first seen by L. Preller, *Gr. Mythologie*, Leipzig, 1894, p. 44. Its meaning as 'king' was made clear by F. Solmsen, in *Indogermanische Forschungen*, xxx, [1912] 35. The full significance of the 'king' meaning in relation to the mystery-rite of the *omophagia*, as practised in Crete and by Thracian chieftains, was established by A. B. Cook, *Zeus*, Cambridge, 1914, i. 655 ff., in relation to his republication of the British Museum vase in pl. xxxvi. The previous literature of the subject will be found in Cook's notes. On p. 655, note 2, he rightly points out that the present writer's former derivation (*Prolegomena to the Study of Greek Religion*², Cambridge, 1908, p. 493, and *Themis*, p. 15) of the word 'Titan' from *Τίτρος*, 'white-clay man,' is erroneous. As initiators the Titans probably were daubed with white clay, but the name is not derived from the disguise.

J. E. HARRISON.

TITHES.—I. Origin and purpose.—Tithes are connected, on the one hand, religiously, with offerings of firstfruits (*q.v.*); on the other hand, politically, with tribute and taxation. While taxation often took the form of a tenth, the amount might vary, less or more, though the name 'tenth' (*decima*, *δεκάτη*) was retained. Voluntary offerings to a deity soon became customary, and even necessary, especially where kings began to impose taxation and tribute, and where a god was now thought to be a divine monarch. To keep up his sanctuary was as much an obligation as to keep up the royal person and court. An early example shows this. The people of Tyre paid tithes to Melcarth as king of the city, and the Carthaginians similarly sent their tithes to Tyre.⁶ W. K. Smith⁷ shows that in this case the tithe was as much political as religious. The voluntary offering necessarily became tribute also, as the ritual of a sanctuary became more elaborate, the sanctuary itself more splendid, and the attendant priests more numerous. Why a tithe or tenth should have been fixed on so

generally is not clear, but probably it is connected with primitive views about numbers, or with methods of counting—*e.g.*, by fingers and toes.¹

In Babylon, whether the tithe was native or borrowed, its use is found in the time of Nebuchadnezzar II. Earlier evidence is so far lacking, and there is no trace of it in the Assyrian period. It was a due paid to the temple of a god from the land, and was paid by all, including the king, who assigned to temples founded by him an annual amount from cultivated lands and from the treasury. Numerous tablets concern tithes, and show that the people were taxed for support of the temple. Tithe was of the nature of a fixed charge on the land and even became negotiable. Such tablets may be regarded as of the nature of a receipt for payment of tithe, which was generally paid in kind—corn, oil, sesame, dates, flour, oxen, sheep, and asses—though this might be commuted for a money payment. One man sometimes paid it collectively for a group of men, and possibly this signifies a systematic collection of tithe in one district by an authorized person.² At the same time Babylonian kings had a tithe of all imports, as had also Persian satraps.³ In S. Arabia tithes were used for the erection of sacred monuments.⁴ Cyrus, on the advice of Croesus, caused his soldiers to devote a tenth of their booty to Zeus.⁵ The tithe as a tax on land was well known in Greece and Rome, and the payment of a tithe to temples on special occasions was not uncommon. Pausanias gives many instances of this—*e.g.*, a tenth of war-booty being set aside to make an image or a vessel for a temple.

In Egypt there was apparently greater freedom. Temples were usually provided with lands for their upkeep, but the gods expected to receive a share of the produce of fields, vineyards, orchards, and fish-ponds. The kings in time of war dedicated a tenth of their booty to the temples, as well as of tribute levied on vassal states and of prisoners who were made slaves of the conqueror.⁶

Zoroastrian literature refers to the fourth rank of men—traders, artisans, market dealers, etc.—who should pay a tithe to the high priests and to the king.⁷ Chinese sacred literature mentions a tenth of the produce of 'the fields' being annually levied; whether as a religious tribute or not is not clear.⁸

The *Confucian Analects*⁹ tell how 'the Duke Gae enquired of Yew Jō, saying, "The year is one of scarcity, and the returns for expenditure are not sufficient. What is to be done?"' He desired to take two tenths, instead of the usual statutory single tithe, from the allotments cultivated in common, against which Yew Jō protested.¹⁰

2. Tithe in the Old Testament.—Among the Hebrews the relation of tithes to firstfruits¹¹ is complicated, and opinions differ as to whether they were distinct or not. Firstfruits would naturally vary in quantity. Tithe expresses more or less a fixed proportion. Perhaps the tithe represents firstfruits made systematic, or different names may have been favoured at different times and in different localities. The tithe is called 'an heave offering' in Nu 18²⁴, but the two are apparently separate in Dt 12^{5ff.} In the later legislation firstfruits and tithes appear to be distinguished.

The tithe, which is not mentioned in the Book of the Covenant, appears first in the Northern

Kingdom in the time of Jeroboam II. as the material given for a feast at the sanctuary (Am 5¹¹; cf. 4⁴), though the feast was one for the rich at the expense of the poor. Here it appears as a fixed tribute. In Gn 28²² (E) Jacob promises a tenth of all to God—perhaps a reflexion of later custom, though not necessarily so—and Melchizedec receives a tenth of all (14²⁰). In 1 S 8^{15, 17} tithe is paid to the king, and perhaps he devoted this to the upkeep of some sanctuaries. The tithe in the Deuteronomic Code is not a forced tribute. The tithe of corn, wine, and oil, with the heave offering, free-will offering, and firstlings of herd and flock, are to be brought to the sanctuary and eaten there as a feast with servants and Levite (Dt 12^{6, 17}). Here the connexion with firstlings suggests that the tithe was the firstfruits of produce, or perhaps included these. This was a private feast at the sanctuary, and may have been a reform due to the fact that the ruling classes, as in Am 5¹¹, secured the best for themselves. It was not a direct due for the priesthood or for public religious services. If, however, the distance to the central sanctuary was too great for the offering to be taken there, it might be commuted for money, and this would furnish the material for the feast at the sanctuary as before (Dt 14²²). Every third year the tithe was to be laid aside to furnish a feast or feasts at home for the Levite, stranger, fatherless, and widow (14²⁸ 26¹²).

Does the tithe here referred to form the equivalent of the firstfruits, the ritual of which, as perhaps forming part of the tithe, is detailed in Dt 26¹⁴? Probably they are ultimately the same, including an offering of part as firstfruits, and a feast for Levite and stranger, just as in 18⁴ firstfruits are to be given to the priests. If so, the words in 26¹¹, 'Thou shalt rejoice in all the good which the Lord thy God hath given unto thee, and unto thine house, thou, and the Levite, and the stranger,' would refer to the feast and be equivalent to the feast on tithe of 14²², while the earlier part of ch. 26 would refer to the offering of part as a firstfruits offering.¹

Is the third year's tithe additional to the tithe given each year, or is it a special form of treating tithe in the third year? Here again opinions differ, but most regard it as a diverting of the usual tithe for the benefit of the local priesthood, who would be deprived of the tithes through the new custom of feasting at the central sanctuary. Others regard it as a second tithe, and this is supported by the LXX, which reads for 'the year of tithing' 'the second tithe,' τὸ δεύτερον ἐπιδέκατον. But two tithes in every third year would mean a large amount, and it is unlikely that such demands would be made, or, if made, carried out.

In the Priestly Code tithe assumes the form of a fixed due. A tithe of the produce of the land, of fruit, and of the herd and flocks (i.e. of their yearly increase) is 'holy unto the Lord.' If commuted for money, one-fifth part of the value is to be added (Lv 27³⁰). This is probably the tithe of produce referred to in Nu 18²⁴, which was to be given to the Levites, they in turn giving a tenth of it to the storehouse for the support of the priests (cf. Neh 10³⁷), who received now also firstfruits of corn, oil, and wine (Nu 18¹²). The tithe of cattle and sheep in Lv 27³², which is to be 'holy unto the Lord,' may represent the firstlings used at the Deuteronomic tithe-feast, but claimed later by the priests (Nu 18¹⁵) as apart from the Levites, but it is not referred to in

Neh 10³⁷, where the tithe is described (cf. 12⁴⁴ 13^{5, 12}), and may be a later addition. It is, however, mentioned as paid to the priests in To 1⁹, by Philo,¹ and in the *Book of Jubilees* (32¹⁵). Rabbinic authorities regard it as furnishing, along with a second tithe of produce (Lv 27³⁰)—additional, therefore, to the tithe of produce in Nu 18²¹—a feast for the tither and guests at Jerusalem, as ordained in Dt 14²². The purpose of the Priestly Code was probably to abrogate the law of the tithe in Deuteronomy, but later harmonizers did not take this view and spoke of two tithes, and even three, the third-year tithe of Deuteronomy being regarded as an additional one.² The law of P is reflected in Hezekiah's legislation, which ordered that firstfruits and tithes of produce, sheep, and oxen should be brought for the priests and Levites (2 Ch 31⁴); hence, if the tithe of animals is in addition to the original law of Lv 27³⁰, it may have come into force after Nehemiah's time.

In Neh 10³⁴ firstfruits and firstlings and firstfruits of dough were for the priests, and tithes of produce for the Levites—the latter collected by the Levites under the supervision of a priest, and a tithe of the tithe being given to the priests (cf. 12⁴⁴). The tithe, however, was not always paid to the Levites, as Nehemiah discovered, and they had to cultivate their own land. At Nehemiah's remonstrance it was paid (13¹⁰). At a later time the priests themselves collected the tithe,³ and the subsequent history of the Levites in connexion with it is obscure, while they no longer shared in the tithe, either from the time of Ezra⁴ or from that of John Hyrcanus.

The Pharisees, as well as the regulations of the Talmud, considered minutely the things to be tithed (Lk 11⁴²), the former even paying tithes of garden herbs—mint, anise, cumin.

Under the Rabbinic system of three tithes referred to above, the first was collected yearly; the second was due in the first, second, fourth, and fifth years; the third in the third and sixth years. Two were thus taken every year, except in the seventh year, when the land lay fallow. The poor's tithe suggested tithing of earnings, all of which was given to them. Extravagant claims were made for the virtue of tithe; e.g., through it Israelites escape the twelve months' punishment in hell which is the lot of the wicked.⁵

In Ezekiel's proposed legislation, which marks the transition to P, the first of all the firstfruits of everything is reserved for the support of the priests. There is besides a tax paid to the prince for the support of ritual and feasts out of wheat, oil, and flocks (44³⁰ 45¹³; cf. 20⁴⁰). No mention is made of tithes, nor are the payments to be made to the priests as in P.

3. Early and mediæval Church usage.—In the Christian Church the need of supporting the clergy, who were early withdrawn from secular business, was recognized, but the system of tithe was not generally resorted to for several centuries. Once it did become general, tithe was regarded, on the analogy of its use in the Jewish Church, as *de jure divino*, and supported by such passages as Mt 10⁹, Lk 10⁷, 1 Co 9⁹.—an argument which Selden was the first to show groundless, in his work on the subject. Until the 4th cent. little is heard of it, and some writers regard the matter from a totally different point of view from that which was later adopted. Irenæus, referring to tithes in the Jewish system, says characteristically that Christians, as 'those who have received liberty, set aside all their possessions for the Lord's purposes, bestowing joyfully and freely not the less valuable portions of their property.'⁶ Origen

¹ Cf. S. R. Driver, *Deuteronomy* (JCC), Edinburgh, 1895, *in loc.* The passage in Dt 18⁴ assigning firstfruits of corn, wine, and oil, and of wool to the Levites is out of harmony with the other Deuteronomic legislation, if firstfruits and tithe were one and the same.

regards tithes as something to be far exceeded in Christian giving,¹ and Epiphanius says that tithe is no more binding than circumcision.² Augustine regards the tithe as something due by Christians to God, though he and others are prompted also by the finer ideal of freedom in all Christian giving. It was inevitable, however, that, as the Church spread far and wide, circumstances should make it necessary to fall back upon rule, based upon legal provision, and the old standard of a tenth was set up, and the Christian priest was compared in this matter to the Jewish priest and Levite. Ambrose and many other Fathers accordingly maintain that tithes should be given, but their views were not generally accepted in the Eastern Church. Even in the West there is evidence that 'this species of ecclesiastical property was acquired not only by degrees, but with considerable opposition.'³ The moral duty of paying tithe was now generally taught, but, even after it was made a matter of law, tithe was paid reluctantly and irregularly. In A.D. 585 the Council of Mâcon ordained its payment, while priests were to use it in helping the poor and in redeeming captives. He who refused to pay it was to be excommunicated. Other councils enjoined it, but it was not until the time of Charlemagne that it became matter of law. In one of his capitularies he ordained it to be paid to churches and clergy. Preachers had already exhorted strenuously towards its payment as tending to Christian perfection, and doubtless it was now more generally rendered. At the same time it has to be remembered that, apart from ecclesiastical law, under Roman law colonists had to pay a tenth to the State as rent from the *ager publicus*. This had already in large measure fallen into the hands of the Church. While the ecclesiastical tithe was usually paid to the bishop, who apportioned it, Charlemagne's capitulary regulates its division into three parts—for the bishop and clergy, for the poor, and for the support of church fabrics. In later times tithe was often appropriated to particular churches and to monastic foundations. Once the payment of tithe became a matter of legal due, excommunication or temporal penalties were decreed against those who refused to pay it. Meanwhile abuses had risen in connexion with the appropriation of tithe. Sometimes, instead of appropriating it to a church, monastery, or diocesan treasury, a proprietor would appropriate it to his own uses or even sell it. It had also become common for ecclesiastics to grant tithes to laymen as an award for service or in recognition of their protection. These were now regarded as evils, and it was set forth as a legal maxim that all tithes are of ecclesiastical origin. Where they had been appropriated by laymen, they were withheld from the Church only by robbery or by feudal grant (*decimæ infeudate*). No layman could possess tithes without risking his salvation. Hence the Third Lateran Council of 1179 forbade detention of tithes by laymen as well as transference of them to other laymen. The Council also declared that any one who violated this decree endangered his soul, and would be deprived of Christian sepulture. As a result of this, many tithes were restored to ecclesiastical use. Towards the 13th cent. tithe was also extended from the fruits of the earth, or predial tithes, to all kinds of profit and wages. It was divided by the canonists into (1) predial—derived from the fruits of the ground; (2) mixed—of things nourished of the soil, or those due partly to its productiveness, partly to human skill and labour; (3) personal—

from the profits of trade and merchandise. But generally the second division is included in the first. Ecclesiastical law in the Middle Ages laid down precise rules regarding what was tithable and what was not, those who were exempt, the sale or transference of tithe to laymen (a custom which gradually came into use), the superiority of tithe to State taxes, and the like.

4. English law and practice.—In England legislation on the subject seems to date from the latter part of the 8th century. Pope Adrian in A.D. 785 enjoined payment of tithe on the Anglo-Saxon Church. This was confirmed in later ecclesiastical councils and synods, sometimes by royal orders. The idea that the civil grant of tithes dates from an alleged charter of Ethelwulf (A.D. 855) is now abandoned; and in any case it appears to grant a tenth of the land, not of produce.¹ In King Edgar's reign failure to pay tithe was made legally punishable (A.D. 950). Towards this time the growth of parish churches was attended by their endowment with part of the tithe paid by the landowner, who was usually the founder of the church, to the diocesan or monastic treasury. In course of time, and with the extension of the parochial system, it became a matter of legal presumption that the local tithe was the property of the rector. In many places rectories with their tithes were the property of monastic establishments, a vicar being appointed to perform the duties of the charge. The Reformation brought about great changes, and, where the rectorial tithes belonged to monasteries, at their dissolution the tithes became the property of the crown. They were now frequently granted to lay improPRIATORS, thus being completely dissociated from their original purpose. The rectorial tithe was the 'greater' tithe, and such tithe or part of tithe as was paid to vicars was the 'smaller.' The greater tithes were generally predial; the smaller were mixed and personal. These distinctions were practically wiped out by the Tithe Commutation Act of 1836, although long before that date commutation of tithe paid in kind for a money payment had been general. By the Act of 1836, tithe, with a few exceptions, was now commuted for a fixed rent-charge, based on a seven years' average of the price of corn—wheat, barley, and oats—the amount being that which formed the legal tithe at the date of the Act. With the difference in values since 1836, the result has not been for the benefit of the recipient of tithe. Further legislation has modified details in procedure. The Tithe Act of 1918 amends the Acts, 1836 to 1891, and orders that the sum payable under these Acts in respect of tithe rent-charge on or before 1st Jan. 1926 shall be the sum payable, as ascertained by the septennial average prices under the Corn Returns Act, 1882, in January 1918. Tithe rent-charge is thus fixed up to 1st Jan. 1926, at £109, 3s. 11d. But the Board of Agriculture and Fisheries shall, after 25th Dec. 1925 and in succeeding years, compute in the same manner as for this septennial average the average price of corn for the preceding fifteen years. The sum payable as tithe rent-charge after 1st Jan. 1926 shall be ascertained on this fifteen years' computation.

5. Teinds in Scots law.—In Scotland tithes are known as teinds, and are almost entirely predial, including *decimæ mixtæ*, and only in exceptional cases personal. They were divided into parsonage and vicarage teinds, the former being leviable from grain (wheat, oats, and barley), the latter from natural grass or bog-hay, certain vegetables, butter, cheese, calves, lambs, herring, etc. Where an incumbent was appointed by the patron, he

¹ In Num. hom. xi.

² Her. 50.

³ H. Hallam, *View of the State of Europe during the Middle Ages*¹¹, London, 1855, ii. 145.

¹ Hallam, ii. 263.

received the whole teind. In other or 'patrimonial' parishes the teind belonged to the bishop, or to a religious house, and the vicar who served the parish received stipend out of the teinds, sometimes a small part of the vicarage teinds. When teinds first began as such in Scotland is not known with certainty, but they are frequently mentioned in charters of the 12th cent., as well as in writs of that period to enforce their payment. Canons of provincial councils in the pre-Reformation period regulate this payment and appropriation. Many abuses arose regarding teinds, and the decrees of the Lateran Council were often ignored. Certain ecclesiastical lands (*i.e.* lands which were the property of monastic orders) were granted freedom from payment of tithe by papal privileges. When such lands were feued to laymen, this exemption also passed to them. In view of the coming Reformation, ecclesiastics frequently made grants to landowners, called titulars, conferring heritable rights to teinds by feu or by long lease. At the Reformation church lands passed into the hands of laymen by grant from the crown or otherwise, but payment of teind still continued, though the stipends of ministers were entirely at the will of proprietors and were of the scantiest amount. In 1537 the General Assembly petitioned the Privy Council to make permanent provision for the maintenance of ministers. The Council thereupon decreed that one-third of all ecclesiastical revenues should be divided between ministers and the crown. On the rent-rolls being made up, this sum was found to amount to over £6000. But, as a result of imperfect returns, remission, and refusal of payments, much less than half of this sum was available. In 1567 Parliament, under the scheme known as the 'assumption of thirds,' ordered that 'the hail thrids of the hail benefices of this realme' be paid now and for all time coming to ministers until 'the Kirk come to the full possession of their patrimonie, quihilk is the teindes.' This third was never paid in full, but the system remained in force until 1633. While Parliament thus recognized the right of the Kirk to teinds—a proprietary right fully enjoyed by the pre-Reformation clergy—that right was nullified, and teinds had been 'evicted from their former owners, diverted from their former use, and acquired and dealt with by the crown and nobles as their own property.'¹ An Act of 1617 appointed a commission authorized to augment stipends out of teinds, and a number of stipends were so treated. In 1627, as a result of Charles I.'s intention to receive surrenders of alienated church lands and teinds, and of the opposition which this roused, a commission was appointed to deal with the subject and to make provision for churches. Submissions were made to the king by those who had benefited by grants of teinds or were interested in them, and as a result he issued his 'decreets-arbitral,' which were confirmed by Act of Parliament in 1633, and commissioners were appointed to deal with the whole matter. Teinds were to be valued at 'the fifth part of the constant rent which each land payeth in stock and teind where the same are valued jointly,' or, if valued apart, the commissioners were to declare their value. Titulars of teinds were to sell them to heritors at nine years' purchase, but only so far as not already devoted locally to the minister of the parish. The valuation thus made fixed the amount of teind for all time coming, and the minister's stipend was to be paid out of the commuted teinds as a permanent endowment, with a further possible augmentation. Stipend thus forms a paramount claim upon teind. These decrees were confirmed by Act of the Scots

¹ J. M. Duncan, *The Parochial Ecclesiastical Law of Scotland*, p. 230.

Parliament in 1633, and still continue to regulate the right to teinds and the payment of stipends of ministers of the Established Church. The whole matter of teinds was vested in commissioners, but was transferred under the Union of 1707 and subsequent Acts to the Lords of Council and Session, acting as a Court of Commission of Teinds. This Court of Teinds deals with all matters regarding teinds, and in particular hears all claims for augmentation of stipend out of the unexhausted or free teinds, where such exist in the possession of the proprietors after payment of stipend. Such claims can be preferred only twenty years after a previous claim has been upheld.¹

In valuing teinds under the Act of 1633, the valuation was made either in grain or in money. Where stipend is payable according to value of grain, it is valued according to fiars prices of the county, as determined by a local court who strike the value for the crop and year.

TITHES (Greek).—It is difficult to separate tithes (*δεκάτη*) and firstfruits (*ἀπαρχή*), since the tithe is only a special form of firstfruit. Many nations and tribes, if not nearly all, have had the custom of setting apart a portion of their goods for the gods; and when, as was sometimes the case, the king or chief was a sort of god, he took his share by compulsion. It seems to have been a wide-spread belief that some sacrifice was due to the local spirits whenever men broke new ground, built a settlement, or bridged a river; and it was certainly common in very early times to leave a portion of the new land to the possession of the old divinity. Perhaps for the same reason portions of the fruits of the earth were left, or otherwise given to the gods. It is not likely that this portion was always the same fraction of the whole; but the tenth was found to be a convenient fraction early and in many nations, among them the Jews. No doubt the decimal numeration had something to do with this choice.² In Greece a few traces are known of the early custom just mentioned—*e.g.*, the sacred groves of Artemis, with game that no men might kill except in a sacred hunt.³

The Pelasgians are said by Stephanus to have offered the tithe, which in later days they dedicated at Delphi;⁴ and Herodotus⁵ tells how the Hyperboreans used to send their annual tithe to Delos. The tithe is not mentioned in Homer; and the earliest records come with the inscriptions, although legendary tithing is spoken of earlier. When Agamemnon conquered Mycenæ, he is said to have dedicated a tenth to the gods.⁶ An epic poem, the *Euroopia*, two lines of which are quoted by Clement of Alexandria,⁷ mentions the dedication of tithes at Delphi. The Liparians, on conquering the Etruscans, dedicated a tithe of the spoils at Delphi.⁸ After the Persian invasion the Greeks took an oath to tithe all those cities which

had sided with the enemy.¹ Tithes of that great struggle are also mentioned as being upon the Athenian Acropolis.² A helmet exists that was part of a war-tithe, dedicated by Hiero probably from the spoils of Cumæ.³ Tithes of spoils are recorded also from the battle of the Eurymedon.⁴ Tithe is a certain restoration in the inscription that records how the Cnidians built their *θησαυρός* at Delphi.⁵ Statues on the Sacred Way at Branchidæ bear the inscription of tithe.⁶ Two colossal figures were purchased with the tithe of Plataea;⁷ the Clitorians also dedicated another as a 'tithe from many cities.'⁸ A bronze Apollo in the Pythium at Athens belongs to the 4th cent.;⁹ and an archaic bronze figure of the 'Apollo' type bears the word 'tithe.'¹⁰ Even the private person speaks with pride of the tithes that he offered to Athene, to the amount of more than half a talent.¹¹ Most of the dedications of arms and spoils are without the distinctive word; but the war-tithe is recorded from the following places: Apollonia,¹² Athens,¹³ Beotia,¹⁴ Branchidæ,¹⁵ Crete,¹⁶ Mantinea,¹⁷ Megara,¹⁸ Sparta,¹⁹ Thesaly;²⁰ at Delphi by Athenians,²¹ Caphyes,²² Cnidians,²³ Liparians,²⁴ Spartans,²⁵ and Tarentines;²⁶ at Olympia by Clitorians,²⁷ Eleans,²⁸ Messenians,²⁹ Spartans,³⁰ Thurians.³¹

Other tithes are mentioned in Anaphe,³² Arcadia,³³ Argolis,³⁴ Athens,³⁵ Beotia,³⁶ Calabria,³⁷ Calymna,³⁸ Crete,³⁹ Cyrene,⁴⁰ Delos,⁴¹ Delphi, Didymi⁴² and Epidaurus⁴³ in Argolis, Halicarnassus,⁴⁴ Ithaca,⁴⁵ Megara,⁴⁶ Naxos,⁴⁷ Pestum,⁴⁸ Paros,⁴⁹ Rhodes,⁵⁰ Samos,⁵¹ Thera,⁵² Siphnos.⁵³ They are dedicated by men or women, or by groups of persons, to Apollo, Artemis, Athene, Demeter, Heracles, Zeus. The articles tithed are all kinds of produce, corn and the fruits of the earth, hunting, fish, gotten minerals, or the profits of trade and industry. Thus we find the Siphnians tithing the output of their mines,⁵⁴ the Coryreans their fish,⁵⁵ the Samian merchants their profits.⁵⁶ Before the Persian invasion the farmer offers a tithe of his farm;⁵⁷ other early dedications of tithes are made by fullers⁵⁸ and shipwrights.⁵⁹

W. H. D. ROUSE.

TLINGIT.—The Tlingit, who occupied the coast of Alaska from Portland Canal to Copper River, were organized into two main phratries and one subsidiary phratral group, and the phratries were subdivided into clans. The character of their country and their manners and customs were almost the same as those of the Haida (*q.v.*), though the northern towns had not adopted the elaborately carved poles so characteristic of the latter, and their potlatches were conducted in a somewhat different manner.

i. Cosmological beliefs.—The outlines of Tlingit belief were like those of the Haida and indeed of the other tribes of the North Pacific coast, but in details there were considerable divergences. Like the Haida, they believed that the earth was flat and the sky a solid vault hung above it like an inverted cup and tenanted by various supernatural beings. The stars were supposed to be towns and their light the reflexion of the sea. The sun and moon were also occupied by special beings, and more regard was paid to the sun than by the Haida. Shooting stars were supposed to be live coals thrown down by departed spirits, and the northern lights were those spirits at play. Under the earth was an old woman called Old-woman-under-the-earth, who supported a great post, on which the solid land rested. According to one story, she was the sister of four brothers, who were favourite heroes of Tlingit mythology, and who in early days travelled all over the world killing harmful animals, putting things in order, and establishing customs for future generations. One of these brothers, Kashkatik, was a powerful shaman who succeeded where his brothers had failed, and was frequently called upon to restore them to life, while another, Hlkayak, was always getting them into trouble by his impetuous and trifling character. He was suspected of an amour with his own sister, and, when his brothers discovered that their suspicions were well founded, they drove him away, and he became the wielder of the thunder. His sister, overcome with shame, went down into the earth at a place where the extinct crater of Mt. Edgecombe now is, near Sitka, and became Old-woman-under-the-earth. The remaining brothers and their mother were turned into rocks while trying to cross the Stikine River, and they may be seen there at the present day. According to the version of this story told at Wrangell, the sister was also turned into rock at that place and Old-woman-under-the-earth was an entirely different person. Old-woman-under-the-earth liked to receive food and prayers from human beings, and she was especially fond of girls because they made the fires on earth which warmed her. When she did not get enough attention from mankind, she became angry and moved her pole, causing an earthquake. Others said that the earthquake was caused by her anger at some persons who were teasing her, and Veni-

aminoff¹ was told that it was because Raven was angry with mankind and was trying to drive her away in order that the earth might fall into the sea. Though Ilkayak was said to cause thunder, it was more often ascribed, as in the case of the Haida, to a huge bird; the flapping of its wings produced the thunder and the opening of its eyes the lightning; it lived principally on whales, which it carried up into the mountains, and their bones were often found there. Still another story relates that several brothers became wizards in order to rescue their sister from a giant slug which had dragged her up on the side of a steep cliff, and, having learned to fly, afterwards became thunder beings. When a peal of thunder was heard, people shook themselves and jumped into the air, crying, 'Take all my sickness from me.'

2. Supernatural beings.—Except in the general way common to all American tribes, we do not hear much of sky-beings. The 'above-people' of the Haida were said to have been first heard of through the Tlingit, however, and the conception of Tāxēt's house also originated with them, although they did not recognize any special being of that name.

The four brothers have been referred to as the originators of culture and customs, but they by no means supplant Raven, whose personality, functions, and attributes were the same here as on the Queen Charlotte Islands.² It is ethnographically important to note that he began his career on the Nass River, and, according to some accounts, returned to its head as his final home.

In connexion with Raven we have the nearest approach to a supreme deity that the Tlingit seem to have possessed, for the heaven-god of the Haida appears to be entirely wanting among them. This personage was called Raven-at-the-head-of-Nass (Nashakiyehl), and it was from him that Raven obtained the sun, moon, stars, and eulachon to distribute all over the world. Some of the more thoughtful Indians at the present day elevate this being to a position far above that which he occupied aboriginally, but there is no doubt that he always had a real existence. He was called in some stories 'the king of birds,' and Raven was therefore subordinate to him. Up to the present time, however, no account of him has been obtained in the northern Tlingit towns—a fact which may indicate that Tsimshian and Haida influence has been instrumental in creating him.

Although held in considerable regard, killer-whales did not receive a tithe as much attention as among the Haida, nor do they appear to have been associated with points and reefs. Land-otters, however, and the land-otter men (*kushhtaka*)—the Tlingit equivalent of the *gagihit*—played a great part in Tlingit mythology and in the rites of shamans, and were viewed with even greater terror. We also find a counterpart of the Haida Property-woman called Tlenahidak, and a counterpart of Master-carpenter. The increased importance of hunting is shown by the conception of Mountain-dweller, who lived far back among the mountains and had a house always abundantly stocked with game. Mountains generally were called upon for a fair wind. Other patron-deities were undoubtedly believed in, but the tendency in this direction does not appear to have been as strong as among the Haida. Another belief peculiar to the Tlingit was in a race of seal-men. When one of these was seen, they poured a bucket of fresh water into the ocean. The grizzly bears and mountain-sheep, which are wanting in the Queen Charlotte Islands, were naturally held in greater regard than there, and, when bears were killed,

their skins were hung up and adorned with eagle-down and red paint, being addressed meanwhile with soothing words. If this were not done, it was feared that the bear's relatives would be angry and would kill the hunter. Favourite among Tlingit myths was that of a hunter named Kats, who was captured by a female grizzly bear that killed her bear-husband in order to marry him. His children by her were a famous race of bears known as 'Kats's children.' They destroyed many people and committed great depredations, but were at last killed, and in later times figures of them served as heraldic crests in many of the most prominent families. There were also special tabus regarding mountain-sheep and the handling of their skins.

People obtained good luck by grasping at the sun's disk and pretending to put it upon anything that they desired to be lucky. Like the Haida, the Tlingit gave food to any thing or any being that they wished to help them, and called to it, mentioning their wants. Everything was believed to have a spirit connected with it—there was one in every trail that a person followed and in everything that he did.

3. The dead.—The regions of the dead are said to have been three—one below and two above the plane of earth. The first was the country of the killer-whales, and was for those who had been drowned, and the third, or highest, was for those who had died by violence, corresponding to the Tāxēt's house of the Haida. The approach to this place was through a hole reached by a single log, and this was guarded by a person who admitted only such as had perished in the prescribed manner. The trail thither was infested by grizzly bears and other animals. All other persons passed after death to the lower sky-country Sagi-kawu-ani ('souls' home'), which corresponded closely to the Gieltigai of the Haida. The person who was to go thither found himself on a trail, and, following it, came to a fork. One of the two paths had been much trodden upon, while the other was very faint. The former came out on the bank of a river, beyond which were the houses of the departed, but, however loudly the new-comer shouted to the other souls to carry him across, they paid no attention until by chance he yawned, when they exclaimed that a soul had arrived, ferried him over, and gave him food. This river was said to be formed by the tears which women shed over the departed, and therefore it was not good to weep much until one's friend had crossed the river. A story recorded by Krause¹ adds the important fact that only the souls of those who had friends among the spirits got to the other side, the remainder being forced to wander about miserably, and also that the river itself was as green and bitter as gall. The souls were dependent for their food on what their friends put into the fire for them, and all had to do their own work except those for whom slaves had been killed. Cremation, which was well-nigh universal among the Tlingit, was accounted for by the belief that only those whose bodies were burned could go near the fire in the spirit-world, the others being forced to shiver near the doors of the houses. According to Veniaminoff,² the path of those whose friends wept much was muddy and watery, but for those whose friends wept less it was smooth and even. A world for wicked persons was sometimes spoken of, called Yehkiwakawo ('Raven's home'), and would seem to be in the place where Raven lived, but it is possible that the belief was due to missionary influence.

4. Rebirth.—As among the Haida, belief in rebirth was general—so much so that it is said

¹ Ap. A. Krause, *Die Tlinkit-Indianer*, p. 263 t.

² See *ERE* vi. 473.

¹ P. 280.

² Ap. Krause, p. 282.

that a poor person would wish to die in hope of being reborn in a higher position in life. If a pregnant woman dreamed of some dead relative, it was believed that her child would contain his soul, and in consequence the child was given the relative's name. A belief in four rebirths followed by annihilation has also been recorded, but this was perhaps a distorted rendering of the Haida idea of reincarnation.¹

5. **Shamanism.**—Shamanism reached its highest development among the Tlingit, and nowhere on the coast were shamans of such exalted social rank, so well thought of, or so powerful. When performing, the Tlingit shaman was dressed much like his Haida counterpart, but he also assumed a wooden mask, and, besides being possessed by one principal spirit, he was, if not possessed, at least accompanied, by several subordinate ones. The latter were represented on the masks by small figures round the eyes, jaws, ears, etc., of the principal figure, and were supposed to strengthen the corresponding features of the shaman. Still other spirits had charge of his rattle. With each of the masks went a certain number of songs. One of the most popular spirits was the wood-worm, which enabled the shaman's mind to pierce through anything just as the wood-worm cuts through wood. In addition to his other neck ornaments, the shaman sometimes had a bird's head tied in front. He had an assistant, who took charge of his paraphernalia, beat time for him, and told the other people what to do. This assistant was generally the man who was to succeed to his office. According to Veniaminoff,² the successor was a son or sister's son, but for a son to succeed to his father's position seems to have been the exception. The right to certain spirits might be inherited, and in saying that this seldom happened Krause has gone decidedly too far.³

Not infrequently the spirit came to a novice shaman on the death of his predecessor, but often he was compelled to stay as long as two weeks in the mountains and woods before it showed itself. When it finally made its appearance, it usually sent him the land-otter, the tongue of which he wrenched out, catching the blood on a little bundle of sticks. Krause⁴ says that the shaman killed this land-otter by exclaiming 'Oh!' four times very loudly, each time in a different tone of voice. He also notes that none of the sticks in his bundle were retained except those on which the blood had fallen. As the shaman drew out the tongue, he exclaimed, 'May I be skilful in my new calling,' 'May I be able to charm and dance well,' etc. The tongue was afterwards concealed in the bundle, which was then kept in an out-of-the-way place, for, if an uninitiated person were to come upon it, he would lose his reason. The skin he removed carefully and preserved as a visible mark of his calling, but he buried the flesh in the earth. The part played by land-otters in shamanism and in mythology generally inspired the Tlingit with such respect and dread that, before the coming of the Russians, they would not shoot one of them.

If a person could not otherwise succeed in becoming a shaman, he might go at night to the grave of some dead shaman and take from the body a tooth or the end of one of the little fingers, and place it in his mouth. A shaman who did not observe certain regulations carefully might be killed by his own spirits, and, on the other hand, he could throw them into one who did not believe in him and destroy him.

The great exhibitions or performances of the shamans were undertaken only during the new or

full moon. Shamans then called upon their spirits to bring good fortune and health to their town and people. From the morning of the day before that appointed until the following morning none of the relatives of the shaman who were to assist him might eat or drink. They cleansed themselves internally by drinking water and introducing a feather into the throat to bring on vomiting. At sunset all entered the appointed house, which had been thoroughly cleansed and provided with new floor-planks. Then the shaman came out from behind a screen and began to run round the fire, his friends singing all the time, until the spirit came to him.

Veniaminoff¹ divides the spirits that spoke through shamans into spirits from above, land-spirits, and water-spirits. The first were the souls from the above-country already referred to. The land-spirits appeared in the form of land-animals, but were said to be the spirits of those who had died a natural death and who had their dwellings in the distant north. The water-spirits appeared in the forms of sea-animals, and were in fact the spirits of those animals. According to Krause,² every Tlingit, whether shaman or not, had his own protecting spirit, but this belief does not seem to have assumed the importance which it bears among the inland Indians.

6. **Witchcraft.**—As shamanism had reached its highest development with the Tlingit, so also had witchcraft, which might almost be described as a diseased shamanism. A wizard accomplished his object by obtaining some portion of the person or clothing of the victim and laying it by an unburned body, among the ashes of a burned body, or on the body of a dog. When a person was suspected of being a wizard, his hands were bound behind his back and he was imprisoned in an empty hut without food and with nothing to drink but sea-water. There he was kept until he confessed, lost his reason, or died, unless his friends were powerful enough to liberate him. The person who confessed to having bewitched any one was forced to wade out into the sea with the medicine or compound which had caused the illness and to scatter it upon the water, accompanying his actions with certain formulae. Instead of being imprisoned, a suspected wizard was sometimes bound hand and foot and exposed on the beach for the rising tide to cover him. Sometimes he was dealt with in a still more summary manner. Among other accomplishments, wizards and witches were universally believed to possess the power of flight.

7. **Charms, etc.**—The principal families and many in humbler circumstances kept charms to bring wealth and good fortune. They believed in all sorts of signs, which they extracted from, or rather read into, natural phenomena, and they thought that natural phenomena would be affected by the breaking of this or that tabu. After a person had died, his body was carried through a temporary hole in the side of the house, and a dog, dead or alive, was thrown out after it, either that the spirits might follow it out of the house or that the dead man might be protected in his journey to the spirit world.

LITERATURE.—The monumental work of A. Krause, *Die Tlingit-Indianer*, Jena, 1855, is the authority on the subject. Most of the important mythological material contained in I. Veniaminoff and other early writers has been gathered into it. See also J. R. Swanton, 'Social Condition, Beliefs, and Linguistic Relationship of the Tlingit Indians,' in *36 RBEW* (1908), p. 391 ff., and 'Tlingit Myths and Texts,' *Bull. 59 BE* (1903); F. Boas, report v. 'On the North-Western Tribes of Canada,' in *Report of the British Association for the Advancement of Science*, 1839, p. 801 ff. JOHN R. SWANTON.

TODAS.—The Todas are a small community, about 700 in number, living on the undulating plateau, about 7000 ft. above sea-level, of the Nilgiri hills in Southern India. They are a purely pastoral people who eschew all other occupations. They are provided with the products of agriculture by the Badagas, a Canarese tribe who also live on the plateau, while the Kotas, allied to the jungle peoples of Southern India, furnish their metal-work and pottery. Except for these commercial relations, the Todas form a wholly separate community and have few other relations with the Badagas or Kotas. With the Kurumbas, a jungle tribe living on the slopes of the Nilgiris, the Todas have even less frequent relations, and these arise chiefly out of the Toda belief that the Kurumbas are sorcerers.

1. **Social organization.**—The people are divided into two sections called the Tartharol and the Teivaliol, each of which is strictly endogamous, though irregular unions are allowed between men and women of the two. Each section is divided into a number of exogamous clans. Each clan owns a number of villages, or *mad* (commonly called *mand*), and takes its name from the *etudmad*, or chief of these villages. The villages are small settlements, sometimes consisting of only one or two houses with a dairy and buffalo-pen. They are scattered over the hills, but most of the villages of a clan are near one another. Each clan is divided into two divisions called *kudr*, 'horn,' which should properly be, and usually are, only two in number. These divisions are of importance only in ceremonial. Another division of the clan is the *polm*, by which the sharing of communal expenses, such as those incurred in the repair or rebuilding of the chief dairies of the clan, is regulated. The Todas recognize the existence of the family, or *kudupel*, as a social unit, and this often corresponds with the *polm*. One clan, the Melgarsol, has an exceptional position in that, though belonging to the Tartharol, it shares many duties and privileges with the Teivaliol.

Descent is always patrilineal. A man belongs to the clan of his father. The effect of fatherhood is not determined by marriage, however, but by a ceremony of giving a bow and arrow which takes place at the seventh month of pregnancy. This ceremony is not performed at every pregnancy, but a person is regarded as the child of the man who was the last to perform this ceremony with his or her mother.

The Todas practise polyandry, nearly always of the fraternal type.¹ Formerly this practice was possible in a pure form owing to the existence of female infanticide. Though girls are probably sometimes killed at birth, the practice is now less frequent. There is still a considerable excess of men, but polyandry is often combined with polygyny, producing a state which may be regarded as a variety of group marriage.² In addition to orthodox marriage there is a regular system of unions in which a woman has connubial relations with one or more men called *mokkthodvaivol*. This kind of union may take place between a Tartharol man and a Teivaliol woman or *vice versa*, thus differing from marriage proper, which is confined to members of one section. The orthodox marriage is between cross-cousins, and this institution is reflected in the nomenclature of relationship which in several respects resembles that of the Tamils. The cross-cousin is classified with the spouse, the mother's brother with the father-in-law, and the father's sister with the mother-in-law. Betrothal in infancy is customary, and this practice is probably responsible for a custom of transferring wives from one man to another which

has now become very frequent. The custom seems to have been originally one by means of which a widower could obtain a wife in a community where, through the practice of infant betrothal, every woman is already bespoken, but it has now become a process set in action whenever one man desires the wife of another.

The people are governed by a council of five called the *naim*, one of the members of which should properly be a Badaga. This council is chiefly engaged in settling disputes arising out of the transference of wives. It is also the business of the *naim* to arrange when ceremonies shall be performed, especially those of the more important dairies. There is a headman called *monegar*, but he is chiefly concerned with the payment of the assessment to the Government, and the institution is almost certainly recent. On the other hand, the headship of the clan is certainly an old institution. Its functions are not especially important, and this also holds good of the headship of the *kudr* and *polm*.

2. **Religion.**—The Todas believe in certain superior beings who may be regarded as gods, and speak of them as 1600 or 1800 in number, but these are the customary Toda expressions for an indefinitely large number. The two most important are On and Teikirzi. On is a male deity who presides over Amnodr, the world of the dead. He is believed to have created the Todas and their buffaloes and to have been himself a dairyman. More important in the minds of the people is Teikirzi, a female deity, who is believed to have lived on the Nilgiris and ruled the people. Most of the Toda social and ceremonial laws are ascribed to her ordinance. These two deities are not especially connected with hills, but nearly all the others seem to be hill-deities, each being associated with a special hill-top. Two are river-gods, associated with the two chief rivers of the district.

The ritual of the Toda religion is concerned almost exclusively with the buffaloes and the treatment of their milk. The dairies are the temples; the dairymen are the priests; and various incidents in the lives of the buffaloes, such as their movements from one grazing ground to another, the first milking, and the giving of salt, have become the occasion of ceremonial which has a religious character. This ritual stands in a definite relation to the gods, for these beings are mentioned in the formulas of the dairy ritual, the general character of which indicates that they must be regarded as prayers. The names used for the deities in these prayers differ from those used in ordinary speech, and form part of a series of expressions called *kwarzam*, in which special names of deities, buffaloes, dairy utensils, and other objects are uttered, preceded by the word *idith*, said to mean 'for the sake of.' The dairies and the buffalo-herds form a somewhat complicated organization, especially among the Tartharol. Every village has a number of buffaloes devoid of any element of sanctity, and their milk is churned in a dairy, also devoid of sanctity, with no special ritual. Most of the buffaloes, however, belong to herds with special names with varying degrees of sanctity, and in correspondence with these there are great differences in the elaborateness of the ritual with which the milk is treated and in the ceremonial regulations of the lives of the dairy-priests. This complicated system is confined to the buffaloes of the Tartharol, the Teivaliol having only one variety of sacred buffalo, but the most sacred kinds of dairy of the Tartharol must be tended either by Teivaliol men or by men of the Melgarsol clan, which occupies an intermediate position between the two main sections.

¹ *ERE* viii. 427.

² *Id.*

The lowest grade of Tarthar dairy is called *tarvali*. Its ritual is comparatively simple and is confined to the evening milking and churning. When the dairyman enters the dairy, he bows down and touches the threshold with his forehead, touches certain dairy vessels ceremonially, lights the lamp, and utters a prayer before beginning to churn. After churning he holds the churning-stick to his forehead, uttering the sacred syllable 'Oñ.' He also repeats the prayer of the dairy after milking.

The dairy next in order of sanctity differs in the possession of a bell (*mani*). The dairyman is not allowed to put his food on the ground; both curd and milk are put on the bell with the utterance of the sacred syllable; and the chief milk-vessel is beaten three times with the bark of the sacred *tudr* tree (*Meliosma pungens* and *Wightii*), the same syllable being uttered. The dairymen of this grade are allowed to sleep in the ordinary hut only on certain days of the week. Ordinary people are not allowed to drink the milk of buffaloes tended at this dairy.

Certain villages have dairies with special features of ritual, but the next kind of dairy in order of sanctity which occurs in every Tarthar clan, except the Melgarsol, is the *wursoli*, the dairyman of which must be taken either from the Teivaliol or from the Melgars clan. The restrictions on his conduct are more numerous and the ritual of milking and churning is more complex, special features being that he wears his cloak in a particular way, and that the proceedings of both morning and evening have an equally ceremonial character. In many dairies of this rank there are two rooms, the inner of which contains the more sacred dairy vessels. The dairyman, or *wursol*, is allowed to sleep in the village and have intercourse with women only on two nights of the week.

All these dairies are situated at the villages where the people live, though they may be at some distance from the dwelling-houses. The highest kind of dairy, called the *ti*, on the other hand, is situated far from the villages. Each herd has several dairies, all of which are remote from the dwelling-places of the people. The dairyman, called *palol*, must be of the Teivaliol, and his attendant, the *kaltmokh*, must come either from the Teivaliol or from the Melgars clan. The *palol* is not allowed to visit a village or have intercourse with any persons other than dairymen of his own rank, his *kaltmokh*, and men of the Melgars clan who are privileged to visit the *ti* dairy and drink buttermilk. Intercourse with women is entirely forbidden except on one occasion after the *palol* has held office for eighteen years. The ritual of the *ti* is far more complex than that of any village dairy. In this dairy the vessels are more numerous and have special names different from those of the less sacred forms of dairy. The more sacred vessels, viz. those which come directly into contact with the milk of the buffaloes, are always kept in an inner room, together with the bell or bells, and are not allowed to come into contact with the vessels which, being used to contain the products of the churning, are regarded as less sacred. The details of milking and churning are more elaborate and more strictly regulated than in the village dairies, and the prayers are longer and more frequently repeated.

The proceedings when the buffaloes move from one grazing ground to another have a definitely ceremonial character. This is especially elaborate in the case of the *ti* dairies. The more sacred vessels are carried by the *palol*, while the others are taken by the *kaltmokh*, assisted by a man of Melgars, who leads the way. There are elaborate ceremonies of purification of the dairy which is about to be occupied, and a special prayer for the welfare of the buffaloes is offered before going to rest. On the following day there is a ceremony in which the *kaltmokh* takes a leading part. His head and body are rubbed with a mixture of milk and clarified butter, and he is given a ball of a special kind of food larger than he can possibly eat, the remainder of which he has to leave on the spot where the ceremony has taken place. An invocation is uttered that evils of many kinds may afflict the boy, and this is followed by another invocation that these evils may be averted. At some dairies milk and butter are rubbed on certain stones.

Before entering upon office every dairyman undergoes certain ceremonies which may be regarded as a kind of ordination. These increase in complexity with the increasing sanctity of the dairy, but the chief feature common to all is a process of purification by drinking and washing with the water of a stream which is used only for ceremonial purposes. The ceremony is named either after this process or after the act of lighting a lamp, this being the first duty of the newly ordained dairyman. An important part of the ceremony is the use of certain leaves to rub the body and as drinking vessels. The ordinary dairyman uses the leaves of a bramble for this purpose, while the *wursol* and *palol* use the leaves and bark of the sacred *tudr* tree. Another feature is the use of the special kind of cloth which is worn by the *palol*. A fragment only is used by the lower grades, while the *wursol* and *palol* assume a complete garment of this material. The village dairyman of the lower grades touches the various vessels of the dairy, beginning with the

less sacred, as the final stage of his ordination, while the *wursol* and the dairymen of certain other villages touch a buried vessel, called *mu*, specially disinterred for the occasion. The ordination of the *palol* is preceded by a qualifying ceremony in which after certain purifying rites the candidate in a state of nudity receives food from an old woman. Though the woman must be past the age of child-bearing, the original object of the rite is probably to test whether the candidates are likely to submit successfully to the abstinence which is incumbent upon the holder of the office of *palol*. In the ordination ceremony proper of the *ti* dairy the rites of purification last for a whole week, and in the later stages of the ceremonial the candidate drinks water from the sacred *tudr* leaves three, seven, and nine times seven times. The *palol* touches a bar of the opening into the pen in which the sacred buffaloes are enclosed at night as the final act with which he enters into office.

An important ceremony of another kind is named after the buttermilk, called *pep*, which is put into the milking-vessel before milking is commenced. A vessel called *mu* is kept buried in the buffalo-pen of the chief village of each clan, and, if this has been tampered with, or if a dairy has been defiled or the bell of the dairy has been taken to a funeral, a new vessel has to be procured and consecrated, the ceremony, however, being called the consecration of the buttermilk. The chief feature of the ceremony is the sanctification of the new vessel with the earth of a buffalo-pen taken from the footprints of one of the buffaloes.

Another ceremony is performed about the fifteenth day after the birth of a calf to one of the sacred buffaloes, and still another when salt is given to the buffaloes. There seems to be little doubt that the great ritual development of the business of the dairy is connected with a belief in the sanctity of the milk of the sacred buffaloes. At the present time the buffaloes themselves are not regarded with any special veneration, and it would seem as if this had been transferred to certain cattle-bells called *mani*, so old that their tongues have been lost, and to the vessels which come directly into contact with the milk of the buffaloes, while another specially sacred object is the vessel, called *mu*, which is buried in the buffalo-pen of the chief village of each clan (see above).

3. Sacrifice and offerings.—An important ceremony is one in which a male buffalo-calf is killed and its flesh eaten, this being the only occasion on which a Toda should eat the flesh of a buffalo. At the *ti* dairy the ceremony, which may be regarded as sacrificial, takes place three times a year; at the other dairies it should probably be annual, but now takes place more frequently. After a prayer in which the calf is asked to appear to certain deities, and after it has been stroked with leaves of *tudr*, the animal is killed by being struck with a log of the *tudr* tree, the bark and leaves of which are prominent in the dairy ritual. The right fore-limb is of especial importance, being placed near the middle of the fire at which the flesh is roasted and eaten together with the pelvis, feet, and head by the dairyman.

There is an annual ceremony in which a fire is lighted by the *palol* at the foot of certain hills, the summits of which are believed to be occupied by gods. Clauses are added to the ordinary prayer asking that fruit may ripen and honey abound.

The ceremonies which have been described are performed regularly, and their occasions arise chiefly out of the necessary events of the pastoral life, the last described standing alone in its reference to vegetation and means of subsistence other than those provided by the buffaloes. The cere-

monies now to be described are more occasional and depend on the commission of some act which has offended the gods and thus brought illness or some other misfortune upon the offender. In these cases the central feature of the ceremony is an offering to the gods of either a buffalo or a buffalo-calf, a piece of the cloth worn by the more sacred dairymen, or a ring.

The simplest kind of offering, often made when some mistake has occurred inadvertently in a ceremony, is to undertake not to kill or part with a buffalo, but allow it to die a natural death. In this case there is little ceremony, the donor simply stating that he is giving the buffalo to the gods while he salutes an elder. A more ceremonial offering of a buffalo-calf is made if a misfortune is ascribed to some serious offence against the dairy, such as stealing milk or its products, quarrelling in the dairy, or going to it in an impure state. In this case the calf is given by the offender to the people of the other *kudr* of his clan. All members of the *kudr* of the offender have to leave the village for a month, at the end of which, after purification with fasting, the calf is driven across certain ceremonial stones to be received by members of the other *kudr*. For minor offences a piece of cloth or a ring is offered with similar rites, the offering passing in every case from the *kudr* of the offender to the people of the other *kudr* of the clan. In all cases prayers are offered, which include in some cases supplications for the health of the people and their buffaloes.

4. **Divination.**—The offerings just described are made as the result of the finding of diviners called *teuol*, or god-men. The decisions are given when the *teuol* are in a state of frenzy and in a language which is said to be Malayalam. It is believed that they are the utterances of some of the gods. The diviners are often consulted at funerals, usually to discover the cause of death or illness either of men or of buffaloes, or the cause of any harm which has happened to a dairy or its contents. In the case of illness they usually find either that the patient has committed some offence against the dairy or that he is the victim of the sorcery of the Kurumbas.

5. **Birth and childhood ceremonies.**—Two ceremonies are performed during pregnancy; in the first the wrists of the woman are burnt while she is undergoing seclusion, while the second ceremony is that already mentioned in which the presentation of a bow and arrow determines the fatherhood of the child. Various ceremonies occur at the end of a period of seclusion which follows childbirth. Until a child is three months old no one but the mother is allowed to see its face, and at that age a ceremony is performed in which the face is uncovered and the child is allowed to look at the sun. Ceremonies are also performed when the name is given, when the ears are pierced, and when a lock of hair is cut, the last ceremony only taking place on the day after the second funeral (see below) of a Tarthar man.

6. **Death.**—The funeral ceremonies are very elaborate and take place on two different occasions often separated by many months. At the first ceremony the body is cremated on a pyre, the orthodox position being face downwards. Several rites are performed before cremation, among them being one in which a cloth is given by a near relative of the deceased to men who have married into the family, the cloth being then placed on the corpse by the wives of these men. In the case of a man the cremation is preceded by a ceremony in which earth is thrown three times into a buffalo-pen by the Teivali dairymen at a Tarthar funeral and by the relatives if the dead man is one of the Teivaliol. In most Tarthar clans the body is

placed before cremation in a special three-roomed dairy. Buffaloes are killed, varying in number in different clans. In each case the right hand of the dead man is made to clasp one of the horns, and lamentations are uttered in which each person addresses the dead buffalo by the same term of relationship as he would use to the deceased. Immediately before the body is burned, it is swung three times over the fire upon a representation of a bier. When the body is consumed, a piece of the skull is recovered from the ashes and kept, wrapped with some of the hair in a cloak, for the second funeral ceremony. In the interval these relics are kept in a special village, where they are saluted by any Todas who visit the place. Formerly the body was smoke-dried, after it had been eviscerated, if the cremation ceremony was delayed.

At the second funeral ceremony the earth-throwing rite is repeated. At a Tarthar funeral a ceremony is performed in which the relics are sprinkled with the blood of a buffalo mixed with the bark of the *tudr* tree. This is done by a Teivali man, wearing the cloak in which the remains have been wrapped, after which he touches the remains with a bow and arrow. Buffaloes are killed, as at the first ceremony, and the men dance with a tall pole obtained from Malabar. During the following night the final ceremony takes place, in which the relics together with a number of other objects are burned within a stone-circle. The ashes are interred at an opening in the circle, and the grave is covered with a stone. A bell is then rung and a new pot broken on the stone, after which all go away without turning back to look at the resting-place of the ashes.

The dead are believed to go to a place called Amnodr in the west and below the earth. The god *On* presides over this world of the dead, where the people live much the same kind of life as on earth. The dead travel to Amnodr by a definite route, which differs in some respects for Tartharol and Teivaliol. In each case the dead perform acts on the way by which they lose their love of the earth and regain the vigour of health. They have also to cross a bridge of thread, running the risk of falling into a river full of leeches. Those Todas who have offended against the dairy or have been selfish and jealous are thus delayed in their journey to Amnodr. One of the Tarthar clans, that of Taradr, has an Amnodr, distinct from the rest, at Perithi in the Wainad, where there are still some Toda settlements.

7. **Sacred days and numbers.**—Many Toda ceremonies must be performed on definite days of the week, and this is probably connected with an institution in which each clan has one or more days on which a large number of activities are forbidden. Thus, on the *madnol*, or village day, neither dairymen nor women are allowed to leave the village, and nothing may be sold or taken away. There are various restrictions on conduct, and funeral and other ceremonies may not be held. Among the Tartharol there are similar restrictions on days sacred to each kind of dairy, so that in a village which has dairies of several different kinds few days of the week are left for the performance of the ordinary activities of life.

Sacred numbers are very prominent in the ritual, three and seven being the most important. Many ritual acts are performed three times, a threefold rite being usually associated in the dairy ceremonial with the utterance of the sacred syllable 'Oñ.' This number is also prominent in the funeral rites, especially in connexion with the ceremonial throwing of earth and the swinging of the body over the pyre before it is burned. The sevenfold performance of ceremonial acts only occurs in the

dairy ritual and is especially prominent in the ordination ceremonies. Several of the most ancient lamps of the dairy are said to have had seven cavities or seven wicks.

8. **Sorcery.**—Two kinds of sorcery are practised, in one of which an incantation is uttered over some hair, preferably that of the person it is designed to injure. This is then hidden in the thatch of the proposed victim's hut. In the other form the sorcerer uses a bone or lime, which is then buried near the village of the proposed victim. In each case the incantation resembles the ordinary form of prayer, but with less explicit reference to the gods. It consists mainly of an enumeration of the misfortunes which it is hoped may fall upon the victim. The trouble is removed or averted by a corresponding formula as the result of negotiations with the sorcerer to whom the misfortune has been ascribed by one of the diviners.

There are many points of similarity between the ceremonial of the Todas and that of the Hindus, the sanctity of the milk-providing animal being an important feature common to both. There is reason to believe that the two main sections of the Todas differ in origin, and it is probable that the Teivaliol represent the earlier settlers and that they mixed with an indigenous people who practised interment of the dead preceded by some kind of mummification. The Tartharol seem to be later comers, who either brought the practice of cremation or accentuated its importance. The complexity of the dairy ritual is probably due to their influence, and they seem to have adopted the practice, so frequent in India, of employing the earlier settlers as their priests.

A point of especial interest is the relation of the Todas to the stone-circles and other megalithic structures on the Nilgiri hills. The people at present take little interest in these monuments, and this is intelligible if they were erected by the older stratum of the population represented by the Teivaliol, whose beliefs have been put into the background by the greater influence of the purely pastoral Tartharol. Stones of various kinds enter into the ritual of the dairy. The burial of the ashes at the entrance to a stone-circle at the end of the second funeral and the ritual throwing of earth into the buffalo-pen at both funeral rites suggest that the body was once interred in a buffalo-pen, and this is perhaps confirmed by the burial of the dairy-vessel called *mu* in a pen and by the sanctification of this vessel with earth taken from this spot. These features of ritual point to the circular pens as part of the culture of the older people, and in this connexion it is noteworthy that the most ancient dairies are circular and afford characteristic examples of the round house with conical roof. It may also be noted that these dairies are surrounded by stone walls, in one case by two such walls.

TOKEN.—In its broadest sense a token is any portable object serving as a sign or proof of authenticity or credit, by which the issuer guarantees that the claim indicated by the token will be satisfied on its presentation in the proper quarter. In numismatics it signifies a coin-like piece of metal or other material representing money of much more than its intrinsic value, for which money the issuer undertakes to redeem the token when presented; it is also loosely applied to tickets admit-

ting to certain privileges, such as the holy communion, or serving instead of letters of recommendation or other forms of credential.

1. **Antiquity.**—Many vague statements have been made as to the use of tokens or *tesseræ* (*symbola*, *synthemata*) for identifying persons who had been initiated into mysteries, but nothing of the kind has been identified. *Tesseræ* were largely used in Roman times for giving admission to shows or entitling to share in the distribution of grain (*tesseræ frumentariæ*), and some of these bear Christian symbols (one is extant in ivory bearing an anchor, two fishes and ΑΩ). No Christian *tesseræ hospitalitatis* (memorials of hospitality for which a return might be claimed when they were presented) have been identified as extant. *Tesseræ* were also used as credentials, serving instead of *litteræ commendatitiæ* or *commendatorie*.¹ Such *tesseræ* would have been used when persons were sent to confessors in prison to minister to them. *Tesseræ* may also have been used to identify the faithful when they desired admission to religious gatherings. Such use is *a priori* possible and probable, but it is important to remember that nothing of the kind, so far as is known, has survived from antiquity bearing a specially Christian character. Even among pagan *tesseræ*, those relating to religious bodies are rare. A certain number are extant bearing the names of the *magistri* and other dignitaries of the *sodalitates* who made distributions at festivals, such as the *magistri Minervales*; there are also *tesseræ* inscribed 'Sacra Lani(vina) iuven(alia),' which were used at the festival of the college of Iuvenes at Lanuvium.

As regards Byzantine times, a certain number of *tesseræ* of churches, convents, confraternities, and other pious institutions have been described; they may have served, as in the West, for the distribution of alms and also for the control of various payments due to the personnel of churches and religious bodies. Such are, e.g., an anonymous bronze *tessera* with the busts of the Virgin and St. Demetrius, and another with God the Father (inscr. ἄγιος ἄγιος ἄγιος) and a bunch of grapes on the reverse, which, it has been suggested, may have been used for the remuneration of cantors. The pieces used for charitable distributions are inscribed (in Greek) with such texts as 'He that hath pity upon the poor lendeth unto the Lord,' 'Blessed are the merciful, for they shall obtain mercy.'

2. **Méreaux of the Roman Catholic Church.**—The token, or *jeton de présence*, issued to the clergy in collegiate churches as a record of their presence at mass, at the canonical hours, and at other offices, in order that they might claim the statutory payment for their services, was most commonly known as a *méreau*. The Latin word *merellus* (*merallus*, *maralus*, etc.) is of uncertain derivation. Other names met with are: *plomb* (*plonc*, *plommet*, *plumbus*, etc.), even when made of other metal than lead (*plonmez de cuyvre* at Aire in 1527), *enseigne*, *signum*, *marque*, *manuel*, *palot* (*pallotus*), *moneta capituli*, *symbolum*, etc. Many of these terms, signifying merely distribution-token, on the presentation of which a share in funds or privileges could be claimed, were not confined to the tokens of religious bodies, but extended to all kinds of corporations. It is uncertain when *méreaux capitulaires* were first introduced; the mention in a charter of the cathedral church of Tours (1216) of a *distributio nummorum matutinalium* does not necessarily refer to such *méreaux* as distinct from ordinary coins, and the *méreaux* which are mentioned in charters of 1167 and 1173 are passes, or *tesseræ* of identification,

¹ Cf. the phrase of Tertullian, *de Præscript.* xx.: 'dum est illis [i.e. ecclesiis] communicatio pacis, et appellatio fraternitatis, et contesseratio hospitalitatis.'

without any special connexion with religion. The earliest undoubted documentary reference to their use in churches seems to date from 1375, when Charles v. granted to the canons of the collegiate church of Langeac (Haute Loire) the right of having struck at the Royal Mint of St. Pourçain *merelli* for distribution to clerks and canons present at offices; they were to be of copper, lead, or tin, and to be carefully distinguished by their types, which are specified, from coin of the realm. None of these seems to have been identified. Next in date comes a reference in 1401. In a clause of his will Charles VI. ruled that the distributor of the Sainte Chapelle 'ne baille les *méreaux* jusqu'à la fin des heures de Notre Dame.' In a letter of 18th July 1401 he announces his intention of carrying out during his lifetime the new system outlined in his will; no one of the clergy who misbehaved or absented himself was to receive *méreaux*. A 15th cent. statute ordered that on every Saturday all the canons, chaplains, and clerks of the Sainte Chapelle should attend in the pay-room and bring their *méreaux* to show what each had earned. But there are extant church-*méreaux* which by their style must be earlier than the documents referred to, and the substitution of these for the custom of paying in actual money at the time, or for pricking in, or for tallies, may date from early in the 13th century. In 1557 the canons of Mâcon claimed that they had had for 'more than three or four centuries' the right of distribution of leaden *jetons* for the payment of choristers and other priests serving in the church; what foundation their claim possessed is not known. Nearly all the examples known come from France or the Low Countries, where *méreaux* were also used by abbeys, convents, hospitals, infirmaries, parish churches, and confraternities. The popular English term 'abbey token' for what are really reckoning-counters must not be taken to prove the existence of the custom in England; there is no evidence for such use in this country.¹

Such tokens were cashed from time to time by the receivers of the various funds on which they were issued; sometimes they could be exchanged by the cellarer for victuals; and they often had a modified circulation. As long as this did not extend outside, so as to encroach on the currency of the realm, no objection was raised to any body issuing such *méreaux*. But, when it was the custom, as it was at Saint-Amé (Douai) or at Arras (where *méreaux* were used inscribed 'merellus mandati pauperum'), for the clergy to give away such tokens, entitling to portions of victuals, as alms to the poor, it is easy to see how the circulation might extend outside. In 1577 the Cour des Monnaies had to forbid the use of *méreaux* issued by the chapter of Autun except for distributions to the clergy; they had got into circulation in the town. In the case of certain pieces, especially of places in the Low Countries, it is matter of dispute whether they are really church-*méreaux* or base coins, of which the circulation was enforced by local authorities; such are the lead *deniers* of the Abbesses of Maubeuge, which circulated throughout Hainault until they were forbidden in 1541, the copper *deniers* of Notre Dame de Termonde, the 'yellow-money' of the chapter of Notre Dame de Cambrai. The rare *méreaux* of Carthusian foundations, such as the Certosa at Pavia or St. Mary Magdalen at Louvain, were used not for the remuneration of the clergy, but for alms-giving. A similar subsidiary use of *méreaux* is illustrated by the custom at Lembeke (near Eecloo, E. Flanders), where *méreaux* were used for the distribution of alms under the foundation of G. Kerremans (1717); tokens of the value of two *patards*

were given to each of the poor who attended at catechism in preparation for communion, and of one *patard* to children who were zealous in preparation for their first communion.

The metal of which church-*méreaux* are made is usually lead, copper, or brass; the ruder specimens in the baser metal may be cast in moulds, but a large proportion are struck from engraved dies. The slate moulds used for casting the *méreaux* of the parish church of St. Julien at Ath, mentioned in letters-patent of 1478, are still in existence. Non-metallic substances such as leather or paper could also be used, but specimens in such material, if they survive, are very rare; a find made in demolishing a wall of the cathedral of Limoges seems to indicate that *méreaux* of leather were used there.

A few typical inscriptions and types found on *méreaux* may be mentioned. The St. Omer pieces are inscribed 'Mo(neta) Ecc(lesiae) Santi Audo(n)ari,' with the arms of the chapter, and 'Presentibus dabitur'; those of St. Martin des Champs read 'Distributio pro beneficiatis.' The series of the Ste. Chapelle dating from after 1448 reads 'Capella Reg(n)alis Palacii Parisiensis.' An ordinance of that year shows that those used for prebendaries and cantor bore a long cross with the crown of thorns on it, those for chaplains and clerks had a royal crown; other kinds then in use were ordered to be withdrawn: such were pieces marked with a cross, lance-head, and nail, representing relics in the chapel. Some series bear the names of the various offices for which they were used, as *matines*, *prime*, *tierce*, *missa*, *sext*, *nonne*, *vespres*, *complies*. Dates do not appear before the 16th century. The value in money which the pieces represent is frequently expressed as 'VI. D. T.' ('six deniers tournois'). A series mentioned in the archives of St. Pierre d'Aire (Artois), and described by Rouyer,¹ may be given as typical.

There were (a) *plombs des matines* or *deniers Marchant*, worth one *denier Parisien*, distributed daily after matins, and paid from the fund known as *du Marchant*; these occur from 1484 to 1637; (b) *plombs de la Croix* or *de la procession du vendredi* and the *plombs Lambert* or *du trésorier*; these represent particular foundations, and were of different values, given to canons, cantor, or other clergy; they are not mentioned after the 17th cent.; (c) *plombs obituaires*, i.e. *monetae anniversariorum*, given to those who assisted at anniversary obituary services; (d) *plombs des heures canoniales*, instituted 20th June 1571, distributed to each canon present at the canonical hours; (e) *plombs des revêtus*, distributed in the 17th and 18th centuries at the masses said at the high altar to the canons who assisted the celebrant as deacons or sub-deacons; (f) *plombs des jours capitulaires*, for ordinary meetings of chapter, from 1571 onwards; (g) *plombs des chapitres spirituels*, from 1758, for chapters dealing specially with matters of cult; (h) *plombs des vicaires*, poor priests or clerks employed by canons to take their more arduous duties, as early as 1465; (i) *plombs de la confrérie de Notre Dame Panetière*, or *plombs du Salve*, from about 1520 down to 1790, for offices of the confraternity.

Some specimens of the *moneta anniversariorum* have survived; one belonging to St. Pierre d'Aire has on the obverse a death's head, on the reverse a bone and a key in saltire between three stars. Another inscribed 'Moneta anniversariorum' has a crowned A between two lilies; on the other side 'Requiescant in pace,' the mark of value 'XII,' and three lilies. Yet another is inscribed 'Obit solenel' and dated 1585; and there is a pair of *méreaux* inscribed 'Orate Deum pro vivis' and 'Orate Deum pro defunctis' respectively.

A subsidiary use of tokens, more or less corresponding to the use as communion passes,² has at times prevailed in the Roman Catholic Church. There is a tradition that Cardinal Pole in Queen Mary's time made use of such tokens in order to distinguish those who conformed from those who did not. Communion certificates in the shape of tokens or tickets were given to those going to communion at St. Andrew's, Glasgow, from 1840

¹ *Rev. num. fr.* xiv. [1849] 363 ff.

² Described in § 3 below.

to 1850. At certain churches in Rome communicants at Easter receive them after they have been present.

3. **Tokens of the Reformed Church.**—The earliest mention of *méreaux* (*marreaux*, *marrons*, *marcs*) in the Reformed Church abroad is in the registers of the Geneva Council; on 30th Jan. 1560 Calvin advised their introduction, but there is no evidence that they were actually used at Geneva before 1605. On the other hand, the French Protestants immediately adopted Calvin's suggestion, and there are tokens of the Walloon Church at Amsterdam as early as 1586. These tokens (which in the first Helvetic Confession are called *tesseræ*) were used for quite a different purpose from that of the *méreaux* of the Roman Catholic Church; they were certificates, issued to all persons considered after examination to be satisfactory in regard to religious knowledge and moral character, admitting them to partake of the sacrament of the Lord's Supper. In 1584, e.g., Mme. Duplessis-Mornay and all her household were refused tokens for communion at Montauban because she dressed her hair in the court fashion instead of wearing the Huguenot hood. Extant specimens of these French Reformed Church tokens seem to be not earlier than the 17th cent.; they bear appropriate types, such as a chalice, or a shepherd feeding his flock, and the initials of the names of the churches, and sometimes dates; such inscriptions as 'Ne crains rien, petit troupeau' also occur. Copper *méreaux* with an angel-shepherd, and the inscription 'In unum conducam reliquum Israel, Mich. 2,' or 'Christ est le pain de vie,' of good 17th cent. workmanship, were probably made for Protestants in Paris. Another similar piece reads 'Christ habite en nos cœurs par foy,' and bears a flaming heart transfixed by two arrows.

The first French church to employ this kind of *méreaux* was at Nîmes (before 1562). Except at Sedan and Troyes (where it was introduced in 1564), none of the Reformed churches of the East is known to have used it. It was especially popular in Poitou, no fewer than 45 churches in that district being represented. Such pieces are commonest from 1740 to 1840, and are often very rude, being the handiwork of the elders themselves. The material is usually lead, tin, or a mixture, and they are most commonly cast (five moulds are extant), though some are struck. The French Reformed church at Erlangen in Bavaria began to use *méreaux* in 1639, and the same mould has remained in use down to present times.

In England the books of St. Saviour's Church, Southwark, show that communion tokens were used as early as 1559. It was the custom at Southwark to collect Church dues by 'selling the communion'; thus, in 1596, 2000 tokens were sold at 2½d. each; and a similar practice prevailed at St. Peter Mancroft, Norwich. At Durham and elsewhere in the 17th cent. it was the custom to take Easter reckonings of such people as partook of the holy communion, and account with them and deliver and receive tokens. The names of communicants were written down, and they received tokens which at the time of the administration of the sacrament were demanded again, so that it might be known who had paid their Easter offerings and who had failed to do so. The use of tokens in Presbyterian churches in England was derived from Scotland towards the end of the 17th cent., but the earliest actually bearing a date is of 1724 (Etal). Tokens are known of the Established Church of Scotland, the Independent Presbyterian party, the Reformed Presbyterian Church, or Cameronians, the English Presbyterian Church, or the Associate Secession Congregation, the Relief

Church, the General Associate Congregation, the United Associate Congregation, the United Presbyterian Church, and the Free Church of Scotland. Printed cards have now, as in Scotland, generally ousted metallic tokens.

But it was in Scotland that the sacramental token was most generally used. By the law of the Church of Scotland, no one was permitted to come to the Lord's Supper unless he or she had been provided with a communion token, which was issued after examination had shown the would-be communicant to be of good character and properly instructed. The tokens were sometimes kept as certificates of character, serving the same purpose as ancient *tesseræ*. The Scottish tokens were at first probably written or stamped cards; such 'tickets' were in use as early as 2nd May 1560 at St. Andrews, and continued often to be used after metal tokens were introduced; the word 'ticket' is frequently used indifferently of either. Written tickets were used as late as 1656. The date of the introduction of metal tokens has not been determined. The use of them has continued in both the Presbyterian Churches and in the Scottish Episcopal Church down to the present day, although in the larger towns they have been almost entirely superseded by printed cards. Recently established denominations, such as the United Free Church and the Free Presbyterian Church, appear to use only the latter. The metallic tokens are most often made of lead, tin, or a mixture, but brass, iron, copper, and even leather (the last only at the Secession congregation at Ceres, 1743) have been employed; the Crown Court Chapel, London, and the Presbyterian Church at Charleston used silver tokens, and for the first Reformed Presbyterian Church of New York they were made of ivory. They are generally cast in stone moulds, but are sometimes struck from dies. The oldest extant dated piece is of 1648, but a dated one of 1588 is recorded (Glasgow). At first they were distinguished merely by the initials of the parish (and this occurs as late as 1866); later came the initials of the minister, with 'M.' prefixed. Incuse numerals sometimes indicate the table to which a communicant was admitted when the number was very large. Religious symbols (heart, burning bush, vine, lily, chalice and bread) appear towards the end of the 17th century. The Covenanters' conventicle tokens bear simple texts, such as 'Holiness to the Lord,' without indication of parish or date; and texts are common from the beginning of the 19th century. The cross, which is common on Episcopalian tokens, also occurs on some of Presbyterian origin. In some large towns we find the burgh arms and the initials of the deans of gild. Views of churches first appear in the 18th century.

From Scotland the Presbyterians naturally carried the usage, not only to England, but to other countries such as Ireland, where the oldest dated token known to have been struck is that of the Old Presbyterian Congregation of Larne, of the year 1700. Stamps and moulds for many of these Irish tokens are illustrated by G. R. and D. Buick.¹

4. **Monnaies des innocens et des fous.**—A curious phase of Church life is illustrated by satirical 'coins' issued by the bishops and other dignitaries (including archbishops, cardinals, and even popes) who were elected by the clergy at the ecclesiastical saturnalia known as the *fêtes des innocens* or *fêtes des fous*. Such festivals flourished, according to documentary evidence, from the 13th to the 17th cent., especially at Amiens, but also at other places such as Chartres, Reims, Laon,

¹ See reference under Literature.

Senlis, St. Quentin, Roye, Péronne—chiefly therefore in the north of France, but also as far south as Besançon. These dignitaries issued tokens struck in lead, bearing such inscriptions as 'Joha. Fournier eps. S. Aug. 1560,' 'Moneta nova Adriani Stultorum Pap(e),' 'Moneta epi(scopi) innocen(tium),' as well as texts such as 'Homo non in solo pane vivi(t),' 'Iudica Domine nocentes me,' 'Stultorum infinitus est numerus.' The types are sometimes saints, as on Jean Fournier's piece just mentioned, which was struck by the Augustinians at Amiens and bears St. Augustine. Rebus are also in common use. Most of these pieces come from Amiens, and bear dates from 1499 to 1583. The custom of issuing tokens on these occasions also prevailed at Théroüanne, Lille, and perhaps Aire, but in those places no attempt was made at humour, and the types are religious or allegorical.

5. The boy-bishops.—The boy-bishops who were elected at certain churches in England on St. Nicholas' Day and held office for a week are also supposed to have issued leaden coins. The extant specimens, which seem all to come from Bury St. Edmunds, all bear a head of St. Nicholas or a mitre and are modelled more or less on the groats and pence of the 15th century. They are usually inscribed with an invocation to St. Nicholas on the obverse; on the other side we find inscriptions such as 'Ave rex gentis,' 'Ave rex gentis Anglor. Mile,' 'Ecce nova facies quia, Ecce reges Angelorum.' The words 'Ave rex gentis Anglorum miles Regis angelorum' are the beginning of an anthem for the Feast of St. Edmund. The constant association of these pieces with St. Nicholas suggests that they were issued by the boy-bishops. On the other hand, it has been argued that they were used for the same purpose as the *méreaux* or *jetons de présence* described in § 2. It would, it is true, be strange if such a method of distribution were confined in this country to a single chapel (that of the Hospital of St. Nicholas) in St. Edmundsbury; but this argument cuts both ways. Another Bury piece inscribed 'Siglum Gilde Sci. Nicho(lai)' round the bust of the saint on the obverse, and on the reverse 'Congregacio Duooe' round the letters 'S T N,' appears to be connected with the Guild of the Translation of St. Nicholas; but from the published description it may perhaps be a seal and not a token.

6. Church tokens of the Near East.—The right of coinage by sacerdotal authorities has always existed in the Levant and is revived in periods of stress. During the Russo-Turkish War the churches and convents and the Jewish communities of Constantinople issued much token-money for small change. After the Peace of San Stefano the Turkish authorities called in from the provinces all the metallic token-money issued in the first half of the 19th cent., but the custom still persists. Silver, copper, and lead were issued for the metallic tokens, but many of these issues took the form of small cardboard tickets of different colours. Typical examples are the silver 'obol of St. Irene' (from Smyrna), the copper of St. George's (from Smyrna), dated 1775, and the cardboard pieces of the churches of Maronia (20, 10, and 5 paras, 1894), of St. George at Apolloniada (Apollonia ad Rhyndacum, 10 and 5 paras), of St. Michael at Goulion near Apollonia (10 and 5 paras, 'legal tender inside the church'), of St. John the Divine at Yeronda (Didyma, 5 paras); while the Sefarite synagogue, the synagogue of Akrida, and other Jewish communities are represented by both copper and cardboard.

LITERATURE.—(1) *Antiquity*.—F. X. Kraus, *RE* ii. [1896], s.v. 'Tessera'; G. Schlumberger, 'Monum. num. et sphrag. du moyen âge byz.,' *RA*, new ser., xl. [1880] 193-212, and 'Méreaux,

G. F. HILL.

TOLERATION.—I. The policy.—The word 'toleration' in its legal, ecclesiastical, and doctrinal application has a peculiarly limited signification. It connotes a refraining from prohibition and persecution. Nevertheless it suggests a latent disapproval, and it usually refers to a condition in which the freedom which it permits is both limited and conditional. Toleration is not equivalent to religious liberty, and it falls far short of religious equality. It assumes the existence of an authority which might have been coercive, but which for reasons of its own is not pushed to extremes. It implies a voluntary inaction, a politic leniency. The motives that induce a policy of toleration are various, such as mere weakness and inability to enforce prohibitory measures, lazy indifference, the desire to secure conciliation by concessions, the wisdom to perceive that 'force is no remedy,' the intellectual breadth and humility that shrink from a claim to infallibility, the charity that endures the objectionable, respect for the right of private judgment.

However lamentable the fact may be, it should not surprise us that greater intolerance has been found in Christian nations than among any other peoples. Polytheism allows of an indefinitely enlarging pantheon. Its theology admits the existence of separate national gods among the various nations. But monotheism not only denies the existence of any such divinities; it regards the homage offered to them as a derogation from the worship due to the true God. Christianity, therefore, as well as the Judaism on which it is based, is necessarily intellectually intolerant. The same idea applies to Muhammadanism, which is always an intolerant religion as regards doctrine, even when it is not actively persecuting alien faiths. Then both Christianity and Muhammadanism claim to be universal religions; they are essentially aggressive; and the positive missionary work which this fact implies easily passes over into overt acts for the repression of idolatry and polytheism, contrary as they are to the genuine Christian temper. Add to this the fact that moral earnestness, at its best mounting to enthusiasm, in extreme cases degenerating into fanaticism, urges the devotees of a missionary religion towards a militancy which the hereditary adherents of non-aggressive religions have less inducement to adopt. When paganism is not tolerant, this is generally due to resentment against those who have attacked it, unless political motives are the real grounds of action. The persecution of Elijah and the adherents of Jahweh by Jezebel was occasioned by the prophet's vehement opposition to the introduction of the rites of the Phœnician Baal into Israel. The persecution of the Jews by Antiochus Epiphanes was due to their refusal to admit Hellenizing practices into their national life.

2. **Indian toleration.**—It has been asserted that Hinduism is the most tolerant of religions. This may be true as regards others than Hindus, because, being entirely racial and hereditary, it cannot proselytize. Judaism is also racial and hereditary, but not exclusively so, because it can admit proselytes. Hinduism has no opening for such. Accordingly, it must tolerate alien faiths, unless, like Tibetan Buddhism, it forbids immigration. Asoka, the Constantine of Buddhism in India (3rd cent. B.C.), had monuments of his legislation cut in stone expressing his liberal treatment of religion as follows:

'The king, beloved of the god, honours every form of religious faith, but considers no gift or honour so much as the increase of the substance of religion, whereof this is the root—to reverence one's own faith and never revile that of others.'

The Muhammadan invasion put an end to toleration in India by introducing cruel persecution of Hinduism with a wholesale destruction of the temples; but this was intermittent, the incursions of Turks, etc., taking the form of raids, from the 11th till the 17th cent., when the Mughal empire was established in Delhi. Akbar, the most famous of the Mughal emperors, aimed at combining all the inhabitants of his religion in his own eclectic theism. He held disputations in his palace every Friday when Brāhmins, Buddhists, and Parsis expounded their views as freely as Muhammadans.

3. **Greek toleration.**—The toleration of the Greeks for great varieties of religious beliefs may be attributed to their intellectual breadth, but also to the syncretism which admitted a plurality of divinities into its pantheon. Accordingly, as Adam remarks,

'There was comparatively little persecution for religious beliefs in Greek antiquity. Religious institutions and ceremonies were carefully guarded; but in respect of dogma the limits of toleration were very wide. We may infer from a remark of the Platonic Socrates that the Athenians in general cared little what a man believed, so long as he did not attempt to proselytise.'¹

The Orphic believers, who, as the same authority states, were 'analogous to modern dissenters,' were tolerated since they showed no sign of abstaining from the religious services which the city ordained. The Pythagoreans, on the other hand, were attacked because they used their religious organization for political ends.² The death of Socrates appears to have been due mainly to animosity against the philosopher on account of his friendship with proscribed leaders of the aristocratic party. He was seventy years old at the time, and his daring teaching had long been tolerated without any interference on the part of the authorities.

4. **Roman toleration.**—It was a principle of Roman state policy to allow conquered nations to continue the practice of their indigenous religious rites ('*Cujus regio ejus religio*'). The old Latin cults were not propagandist, and they admitted of alien rites for alien peoples. Nevertheless difficulties arose, imposing limits on this easy toleration in several ways: (1) by provincials coming to Italy and even to Rome with a claim to bring their own religions with them; (2) by missionaries of these alien faiths propagating them and by Roman citizens adopting them; (3) by the enforcement of the new state worship of the emperor throughout the empire; (4) by the dread of dangerous magic and the suspicion of immoral and cruel proceedings among the adherents of the foreign cults; (5) by a notion that public calamities might have been caused by neglect of the worship of the old divinities ('atheism').

² See Adam, p. 355.

But there were differences. The Twelve Tables had forbidden the introduction of new gods into Rome. Nevertheless for commercial reasons the Jews had a dispensation granted them to practise their religion in various parts of the empire, including the imperial city. But they were supposed to be confined to their own quarters in each locality—the ghetto. They spread their ideas, however, especially among women of the upper classes—in particular in Rome and Damascus, where it became the fashion to 'Sabbatize.' At first the Christians obtained toleration on account of their Jewish origin, and it was not till their separation from the Jews became marked that they were interfered with by the authorities; nor was that the case at once even then. The Acts of the Apostles shows us Christians protected by Roman magistrates and police when attacked by Jewish mobs. By the time of Nero, however, in Rome the distinction between the two communities had become evident, and then the Christians were no longer sheltered by the licence for Jews. Christianity was not a *religio licita*. It is true that many unlicensed cults were winked at, in particular the religions of Syria and Egypt—the worship of Mithra, the Dea Mater, Serapis, etc. This was due to their great popularity. Christianity was not popular; it was too stern on the vices of paganism. W. M. Ramsay has shown reason for thinking that the toleration of the Flavian emperors did not secure the protection of the Christians from local outbreaks. Nevertheless, on the whole, previous to the great Decian persecution the authorities were not disposed to initiate active measures against them. When Pliny wrote to Trajan expressing his perplexity at the Christianity of Bithynia and the consequent desertion of the pagan altars, the emperor replied ordering him (1) not to seek out the Christians, (2) to discourage informers, but (3) to punish convicted persons who had been brought before him for judgment. This rescript has been described by some as a persecuting order and by others as a decree for the easing of the case of the persecuted Christians. In fact it was both. Evidently Trajan was opposed to active persecution and favoured a policy of leniency; but his clear pronouncement requiring the punishment of definitely convicted Christians left no alternative but sentence of death for such people. This was the first formal order to that effect. Previously Christianity was implicitly illegal; henceforth it was to be explicitly illegal. In this respect the rescript was a limitation on the Roman policy of toleration. The persecution which had been carried on with exceptional ferocity at Lyons and Vienne under the gentle Marcus Aurelius was stayed by his worthless son Commodus owing to the intercession of his concubine Marcia, who appears to have been a Christian catechumen. This act of toleration cannot be raised to the level of state policy. It was purely personal in its origin, and it emanated from an unprincipled character.

When the emperor Valerian was captured by the Persians, the persecution which he had instigated was brought to an end by his son Gallienus, who issued a rescript in A.D. 260. It has not been preserved. But Eusebius¹ quotes a letter from this emperor to the bishops of Egypt written in the following year, in which he gives directions in accordance with his rescript. He there states that he has issued an order throughout all the world encouraging all to come out of their religious retreats and ordering that no one may molest them. Eusebius adds that there is another ordinance addressed to other bishops in

¹ HE vii. 13.

which the emperor grants them permission to recover their cemeteries in which they worshipped (*τόποι θρησκευτικοί*). Gallienus's rescript has been claimed as the first Roman edict of toleration; but Uhlhorn and Harnack have shown that our knowledge of it does not indicate that Christianity was now made a *religio licita*. Two things only are ordered: the Christians are not to be molested; their property is to be restored. Since the churches had registered themselves as burial clubs and mutual benefit societies (*collegia fratrum, collegia tenuiorum*), it was in their social relations and with regard to their possession of property that Gallienus was now protecting their rights. Nevertheless, although Christianity was still illegal, in point of fact, since it was not to be molested, this was a policy of toleration. It cannot be justified on grounds of consistency; but practical politics are often guilty of inconsistency and prove themselves all the more humane for their freedom from legal pedantry. In the line that Gallienus was taking we see the exact opposite to his father's calculating measures of repression, devised with the deliberate, but now hopeless, design of stamping out Christianity. Gallienus's mild policy by no means gave to the Christians the legal rights which could assure them against future persecution. They enjoyed in consequence a whole generation of immunity from attack; but all along this was in a condition of unstable equilibrium, since nothing had been done to settle it on a sound legal basis. We might compare the situation to that of the Stuart 'Indulgences.' Christianity was not yet a *religio licita*.

Legalized toleration did not appear till after the last and greatest persecution. It was then seen in two stages. The first of these was spasmodic, insincere, and illogical, but still definite and effective. Galerius, the fierce instigator of the persecution which bears the name of the senior emperor Diocletian, who had been his reluctant associate in it, seized with death-bed terrors, issued the most extraordinary decree ever conceived by a Roman emperor (April, 311). Galerius first takes credit to himself for endeavouring to bring the Christians back to the ancient laws and discipline of the Romans, and, after a jibe at their divisions, for which he suggests he has supplied a wholesome corrective, he gives orders that his subjects may again be Christians ('ut denuo sint Christiani') and hold their assemblies, 'provided they do nothing contrary to the discipline.' Galerius concludes with the remarkable sentence, 'and for this indulgence the Christians will make the prayers of loyal subjects to their god.'

Toleration was not yet the settled policy of the empire. Where it was practised, it was too much subject to the caprice of the individual ruler. Maxentius at Rome was openly anti-Christian and Maximin Daza elaborated subtle devices for the destruction of Christianity; even later, during part of his period of government, Licinius favoured the pagans to the detriment of the Christians. The final stage was reached in the Edict of Milan. That magnificent Magna Charta of religious liberty issued from a meeting of Constantine with Licinius at Milan towards the end of the year 312, after the defeat of Maxentius. Maximin's evasion of the order of toleration granted by Galerius was the occasion which gave rise to it, but the new edict was much more statesmanlike than its curious predecessor, resting on a broader basis, breathing a nobler spirit, and establishing a surer policy. It was issued throughout the whole empire in the year 313. The Edict of Milan is the work of the great emperor Constantine, who induced his colleague Licinius to join him in it.

There can be no doubt that Constantine was thoroughly convinced by the enlightened principles that it contains. His colleague's assent must be ascribed to political necessity, and subsequent events showed that Licinius was by no means loyal to it except under compulsion. Unfortunately the original rescript has been lost, but Licinius's edition of it, sent out a few months later, has been preserved, both the original Latin by Lactantius,¹ and a Greek translation, slightly differing verbally, by Eusebius.² The toleration granted is absolute and unconditional. It is expressly applied to the Christians, for whose benefit it clearly shows that it was primarily intended. But it also includes devotees of all other religions. This went far beyond the spirit of the ancient world, and indeed only occasionally and in the teaching of exceptional and rare minds has such toleration reappeared until quite modern times, when it has been seen in Cavour's dictum of 'a free Church in a free State.'

Constantine did not live up to his own principle. No sooner did he adopt Christianity than he began to patronize it, and his patronage soon took the form of interference and control. The Christian emperors were rarely more tolerant than the Church of their day; and, as this Church was stern in the denunciation of heresy and schism, too often the imperial government stepped in to give effect to the ecclesiastical sentence. Sometimes it went farther, the emperor taking sides and enforcing his own will, if for orthodoxy against the heretics, if in favour of heresy, as in the support of Arianism by Constantius and later by Valens, against the Catholics. Later emperors interfered in the Christological controversies with the Nestorians and the Monophysites. The iconoclastic emperors were regarded as persecutors of the Church when they took strong measures to put down image-worship. Therefore, while Christianity is not only tolerated but legalized as the religion of the State, the policy of toleration so brilliantly anticipated by Constantine is now buried out of sight, like an untimely birth. The tables are turned, and paganism, ceasing to persecute, comes to be itself persecuted. First magical rites are prohibited as dangerous to the State and the citizens; then the worship of the old gods is prohibited and their altars and temples are demolished. Theodosius II. is the most conspicuous figure in this anti-pagan crusade. On the other hand, it is to be noted that the Christian emperors never went the lengths in murderous violence to which the persecuting pagan emperors had gone. There was nothing approaching the devastating Decian and Valerian persecutions. On the rare occasions when the death penalty was inflicted this was nearly always for magic and sorcery, not as the suppression of a false doctrine but for the extirpation of a dangerous practice. The persecution of paganism naturally led its champions to preach toleration. Libanius argued for the principle of absolute toleration. The pagan reaction under Julian was based on a profession of tolerance, but the emperor was not entirely true to his profession.³

5. Early Christian toleration.—The early Christian Fathers advocated toleration, not merely in self-defence, but on principle. Tertullian was most emphatic in asserting this principle:

'Humani juris et naturalis potestatis est unicuique quod putaverit colere, nec alii obest aut prodest alterius religio. Sed nec religionis est cogere religionem, quae sponte suscipi debeat, non vi: cum et hostiae ab animo libenti expostulentur.'⁴

Lactantius maintained the inherent wickedness of persecution.⁵ The bigotry which appeared among the Fathers of the 4th cent. was not allowed to prevail without protest. Athanasius advocated a conciliatory attitude for winning heretics back to the faith. While Augustine denounced heretics and schismatics—especially Pelagians and Donatists—Hilary of Poitiers was a thoroughgoing advocate of toleration. Ambrose condemned the persecution of the Priscillianists, and Martin of Tours denounced it as an atrocious crime because it went so far as killing. The Fathers were slow to sanction the death penalty for heretics; Augustine, while advocating milder measures of persecution, was opposed to this extremity.

6. Mediæval toleration.—During the early part of the Middle Ages persecution was comparatively rare, even in the case of sorcery, which, it was thought, could be counteracted by the more potent

¹ *De Morte Pers.* 48.

² *HE* x. 5.

⁵ See *Div. Inst.* v. 20.

influence of the rites of the Church. But with the rise of the Inquisition in the 13th cent. a greater rigour of ecclesiastical discipline crushed out the spirit of tolerance.

7. Toleration in the Renaissance and the Reformation.—The irreligious and pagan habits that accompanied the Renaissance issued in an easy indifference which favoured an unprincipled tolerance. But the intellectuality and breadth of view that it engendered went farther and gave rise to a reasoned doctrine of toleration. Sir Thomas More, while sanctioning persecution, admitted the abstract excellence of the opposite course. Montaigne's scepticism and liberal idea of life made for tolerance. On higher grounds Erasmus laboured incessantly for the same end, combining inimitable wit with immense learning, exposing the folly as much as the wickedness of ignorant, narrow-minded persecution. The duty of absolute toleration was insisted on by Castello, a Frenchman, who had been a friend of Calvin when the Reformer was a professor at Basel. Denouncing the execution of Servetus, he argued that, if the end of Christianity be the diffusion of a spirit of beneficence, persecution must be its extreme antithesis, and that, if persecution can be the essential element of a religion, that religion must be a curse to mankind.

Most of the Reformers were not advocates of universal toleration; but Zwingli regarded error as not inherently blameworthy and held that it should be tolerated. He went farther and showed a comprehensive appreciation of human excellency apart from religious differences.

Laelius Socinus was a pronounced advocate of religious liberty, and a clear assertion of the principle is put forth in the Socinian Catechism of Rakow. The German Anabaptists and the Dutch Arminians also advocated this principle.

8. The German settlement.—The Peace of Augsburg (1555) was arranged between the Roman Catholics and the Lutherans; it excluded the Reformed Church, both Zwinglian and Calvinistic, as well as all the minor sects. Further, this arrangement left it to the princes of the several states to decide which of the two permissible types of religion should be adopted and imposed on their subjects. Disagreements between the two parties concerned and the exclusion of the Reformed Churches led to the Thirty Years' War. This was concluded with the Peace of Westphalia (24th Oct. 1648), to which there were three parties—the Roman Catholics, the Lutherans, and the Reformers. It made provision for none of the minor sects. The princes were allowed to pass from one of the three religions to the other and to require their selected religion to be imposed on their subjects to the exclusion of all other religions, or to admit other religions, as they saw fit. This right was called the *jus reformandi*. It implied a limited and optional toleration.

Subsequently two influences arose to widen the conception of religious liberty: (1) pietism, which, as both non-dogmatic and charitable, tended towards universal toleration; and (2) the effect of the school of natural law. Pufendorf maintained that no one could be compelled to embrace a given religion and held it to be a fatal necessity that dissensions should exist within the Church. Christian Thomasius, the typical illuminist, bases the principle of religious liberty on his fundamental conception of law. He distinguishes morality from law, on the ground that law is coercive while morality cannot be coerced. Much more is this the case with religion. The difference between the spheres of the prince and the clergy is that it is the duty of the prince to coerce and the duty of the clergy to teach. The clergy should fight heresy with instruction, not by appealing to the secular arm. While urging these principles in all his works, Thomasius devotes three treatises especially to the exposition of them, viz. the two 'Programmata,' *Programma de tolerantia dissidentium in controversiis religionis* (1693) and *Programma varia testimonia Martini Lutheri de tolerantia dissidentium in religione complectens* (1697), and the more popular work in the vernacular entitled *Das Recht evangelischer*

Fürsten in theologischen Streitigkeiten (1696). In these works he maintains that all dissidents are to be tolerated so long as they do not disturb the public peace. Frederick William I. of Prussia used the *jus reformandi* in favour of allowing Roman Catholics to live in his Protestant state, and his son Frederick the Great adopted a policy of toleration for all religions with the cynical idea that, since they arose only from the ignorance of the people, they were equivalent in the region of dogma and to be distinguished only by their greater or less ethical import. Thus, since morality is independent of articles of faith, absolute religious liberty should be conceded. In a rescript of 15th June 1740 he says: 'All religions are equal and good so long as those who profess them are upright people.' There was a temporary reaction under Frederick William II., after which the right of religious liberty spread first through Prussia and then through the other German states, although the territorial state recognition of the three favoured religions remained—a policy of general toleration, but not of religious equality.

9. England and America.—In the 16th cent., under the Tudors, the extreme Puritan party, which had shared with other Protestants in the persecutions of Roman Catholic times, did not obtain religious liberty. But the principle of toleration was maintained by the Baptists and the Congregationalists, although there were some limits to the applications of it. The early Congregationalists would exclude from its privileges both Unitarians and Roman Catholics, the latter as themselves a persecuting party and a danger to Protestant liberty. But John Robinson, a large-minded man of liberal views, drew up a covenant for the Pilgrim Fathers who sailed in the 'Mayflower' and founded New England. The first instrument of this covenant conferred equal civil and religious rights on every member of any commonwealth. A little later the colony of Maryland, founded by a charter from Charles I., granted toleration to Roman Catholics as well as to Protestants. Its first law runs as follows: 'No person professing to believe in Jesus Christ shall be in any way molested or discountenanced for his or her religion, or in the free exercise thereof.'

The Pilgrim Fathers, who had claimed liberty at home, have been blamed for the inconsistency of intolerance in their own colony when they were settled in America. The defence is that the exclusive theocracy that they established implied that they regarded themselves as a Church rather than as a State, and as such would refuse membership to unfit persons in accordance with a fundamental Congregational principle. But they have often been unfairly accused of narrowness through a confusion of two different positions—that of the early settlers in New England who had come from John Robinson's church in Holland and were the real Congregationalist immigrants, and that of the Puritans who settled later in Massachusetts. The latter were Presbyterians who had never adopted the principles of religious freedom. It was not until the separation from England that complete equality in religion was established in the United States.

10. The English problem.—In the 17th cent. neither the bulk of the Presbyterians nor the Episcopal party as a whole had any idea of toleration. Under the early Stuarts Laud and the High Church, having the upper hand, persecuted the Presbyterians. Under the Long Parliament the Presbyterians tried to force the Covenant on the whole nation. Cromwell took a wider view and ordered his 'triers' not to molest Protestant godly men who preached the gospel, whatever their ecclesiastical principles might be, and he gave the Jews a legal footing in England.

At this time the Baptists, the Congregationalists (then known as Independents), and the Quakers maintained the principle of religious liberty—the last-named body basing it on their doctrine of the inner light, which excluded all ecclesiastical and official interference with the individual soul. The protest of the five Independents at the Westminster Assembly (1643), which was mainly Presbyterian

in composition, maintained the right of religious liberty.

Later, on the Presbyterian side, Richard Baxter laboured for large measures of comprehension, and John Goodwin, generally regarded as a Congregationalist, but described by Rufini as 'a Puritan *sui generis*—a rationalist Puritan,' maintained that every religion, sect, or schism should be tolerated so long as there was no attempt to interfere with the security of the State. Milton, claimed by both Presbyterians and Congregationalists, but not wholly committed to either party, in triumphantly vindicating the freedom of the press, pleaded eloquently for religious toleration. In the *Areopagitica* he showed that persecution was both unnecessary for the preservation of truth and a hindrance to the discovery of truth. He would tolerate all Protestants, including Socinians, Arminians, and Anabaptists, but not Roman Catholics. On the Anglican Church side the more liberal-minded writers were in favour of toleration and comprehension. Chillingworth affirms that Protestants are inexcusable if they do violence to the consciences of others. He holds it to be a great sin to force on other people our own interpretations of Scripture, arguing that this was the cause of all the schisms and discords of Christianity. John Hales took a similar line in his tractate *Schism and Schismatics* (1636). Jeremy Taylor, in his famous *Liberty of Prophesying* (1646), was contending for freedom of speech against the tyranny of the Covenant under the Long Parliament.

The reaction at the Restoration and the passing of the Act of Uniformity (1662), followed by the Conventicle, Five Mile, and Test Acts, narrowed the State Church position and imposed great disabilities on Nonconformists; these were to some extent relieved a little later by James II.'s Indulgences, but at the expense of the rights of Parliament. Legal toleration did not appear till the Revolution. In the Declaration of Breda Charles II. promised to respect tender consciences; but, when well established on the throne, he had not the moral courage to stand to his word.

William III. obtained his invitation to England mainly as the champion of religious liberty. His aim was to bring about an agreement between the Church of England and Protestant Dissenters. While in his own country, he had been profoundly affected by the ideas of the Dutch Arminians. In England his most trusted adviser, Bishop Burnet, had adumbrated the policy which the king afterwards adopted in a *Modest and Free Conference between a Conformist and a Nonconformist* (1663). William first aimed at comprehension in 'A Bill for Uniting their Majesties' Protestant Subjects.' The failure of this measure to pass in the House of Commons necessitated another line of action.

II. The Act of Toleration.—The Act of Toleration, which was passed in the year 1689, gave relief to Nonconformists from their chief disabilities; but it did not grant complete religious liberty; much less did it establish religious equality in the eyes of the law. It exempted Nonconformists from the pains and penalties of the Act of Uniformity, the Conventicle Act, and the Five Mile Act; at the same time it required people who desired to avail themselves of its privileges to take the oaths of allegiance and supremacy and make a statutory declaration against Romish superstitions, and it ordered Nonconformist ministers to subscribe to the Articles of the Church of England with the exception of three—those referring to the traditions of the Church, to the homilies, and to the consecration of bishops and priests, a fourth exception, that of the article on infant baptism, being allowed for Baptist ministers. Further, it enacted that every Nonconformist place of worship should be

certified by a bishop, an archdeacon, or a justice of the peace. Quakers were allowed to make a solemn declaration instead of taking the oaths and were required to declare their belief in the Trinity and in the inspiration of the Bible. Neither Roman Catholics nor Unitarians were included in the concessions allowed by this Act, and even orthodox Nonconformity was still illegal, the persecuting laws remaining on the statute-books, and only the exaction of their penalties being forbidden. While this measure was logically inconsistent, it was practically serviceable as far as it went. It secured a considerable amount of toleration.

The same year (1689) saw Locke's first *Letter Concerning Toleration* published anonymously in Holland in Latin. It was translated into English immediately. A second and longer letter, and a third longer still, followed in reply to answering letters. Yet a fourth letter completes the series in Locke's work; this is not finished. The collection has become a literary classic on the subject of toleration. Locke bases his argument on the ground that the rightful sphere of the State is wholly confined to externals and does not extend to religion, which is internal. He holds that not only the doctrines and 'articles of faith,' but also 'the outward form and rites of worship,' are out of the province of the civil magistrate. Such a position goes beyond toleration. Logically it involves disestablishment, because, if the State is not competent to deal with religious matters at all, it follows that it should not patronize or support a favoured religion any more than persecute a religion of which it disapproves. With regard to persecution, Locke holds that it is anti-Christian, since love of our fellow-men is of the essence of Christianity, and it cannot be maintained that persecutors are actuated by love to their victims in the cruelties which they perpetrate. But, while on these principles Locke would tolerate Jews as well as all Protestant sects, his toleration does not extend to Roman Catholics or atheists. With regard to the former, though he does not name them in his argument on the subject, he says:

'That church can have no right to be tolerated by the magistrate, which is constituted upon such a bottom, that all those who enter into it, do thereby, *ipso facto*, deliver themselves up to the protection and service of another prince.'¹

He would also exclude persons who hold views subversive of society and atheists, who, he considers, are to be included in that category.² Thus he regards both these parties as obnoxious to the State and to be excluded from toleration on political grounds, not for their religious views. Locke carries his idea of toleration beyond the political sphere to the ecclesiastical, arguing for liberty of thought within the Churches themselves. He writes:

'What think you of St. Athanasius's Creed? Is the sense of that so obvious and exposed to every one who seeks it; which so many learned men have explained so different ways, and which yet a great many profess they cannot understand? Or is it necessary to your or my salvation, that you or I should believe and pronounce all those damned who do not believe that creed, *i.e.* every proposition in it? which I fear would extend to not a few of the church of England; unless we can think that people believe, *i.e.* assent to the truth of propositions they do not at all understand. If ever you were acquainted with a country parish, you must needs have a strange opinion of them, if you think all the ploughmen and milkmaids at church understood all the propositions in Athanasius's Creed; it is more, truly, than I should be apt to think of any one of them; and yet I cannot hence believe myself authorized to judge or pronounce them all damned: it is too bold an intruding on the prerogative of the Almighty; to their own Master they stand or fall.'³

Under Queen Anne the toleration that had been obtained by the accession of William and Mary was threatened by the Schism Act, which made it illegal under heavy penalties for any one to keep a

private school or teach in a seminary unless he signed a declaration of conformity to the liturgy of the Church of England and obtained a bishop's licence to teach on production of a certificate that he had taken the communion according to the rites of the Church of England during the preceding year. The queen's death stayed the execution of this drastic measure, and it was repealed in the reign of her successor, George I. From this time onwards toleration with regard to religious views and practices was firmly established; but its limitations were still numerous. It was the minimum of concession to those who had previously been the victims of persecution. Active persecution was no longer allowed. But the negative policy of exclusion and prohibition left galling grievances long unrelieved. Toleration is far from religious equality. The very practice of it involves an exalted position of power enjoyed by the people who tolerate as opposed to an inferior position in which the tolerated are living. It is not inconsistent with the monopoly of privileges by the one class and the refusal of them to the other. If those privileges are rights of citizenship, toleration is even possible side by side with serious injustice. The tolerated may be denied political power, the parliamentary and municipal franchise, the opportunity of election as members of Parliament or of corporations, access to public schools, colleges and universities, whether as pupils or as teachers, and a host of other national rights and privileges. So it was that under the Georges, and even throughout much of the 19th cent., Nonconformists, Roman Catholics, Unitarians, Jews, and others suffered from various forms of exclusion. The abolition of the Corporation and Test Acts, Catholic Emancipation, the admission of Jews to Parliament, the permission to dispense with the member's oath extracted in order to meet the case of Mr. Bradlaugh, the throwing open of the universities to Nonconformists, the enlarged foundation of grammar schools, and the extension of popular education generally, irrespective of ecclesiastical distinctions, were all steps beyond mere toleration towards the goal of religious equality—a goal which in several directions its advocates have not yet completely attained.

12. Toleration in France.—The fight for religious liberty which was waged principally in Germany, Switzerland, Holland, and England during the 16th and 17th centuries passed on to France in the 18th century. The Edict of Nantes (1598) had conceded toleration for Protestants; the revocation of that Edict (1685) restored and aggravated persecuting intolerance. Bayle established the intellectual basis of toleration in his *Dictionnaire* and in a work entitled *Commentaire philosophique sur ces paroles de Jésus-Christ : Contrain-les d'entrer*—a refutation of the misuse of a text popular with persecutors from the time of Augustine. He holds it to be immoral to compel men to profess religion in which they do not believe, and also irrational, because it discourages the discovery of truth. No one, he maintains, has a right to claim such complete possession of truth as not to need to compare his ideas with those of other men. Montesquieu, in *De l'Esprit des lois* (1748), argues for religious liberty and exposes the futility of coercion. Rousseau, in his *Contrat social*,¹ affirms the complete liberty of individual beliefs; nevertheless, holding that intolerance is inherent in Christian dogma, he would abolish this and establish a civil profession of faith in truths indispensable to a well-organized social life, including that of the existence of God. But it was Voltaire who by his scathing sarcasm did more than any other man in France during the 18th cent. to put an end to persecution and secure tolerance for the Protestants.

¹ Bk. iv. ch. 8.

The ideas of these champions of religious liberty powerfully moulded the course of the French Revolution in regard to religion and the universal toleration that has since prevailed in France.

13. The present situation.—A policy of toleration now obtains throughout Western Europe, North America, the British, French, and Italian colonies, and India, where it is a safeguard of peace and good order under British rule. It is established in Japan and practically observed throughout the provinces of China. It is also practised generally throughout S. America. Eastern Europe and Western Asia are still excluded from its privileges. The exclusiveness of Tibet is national rather than religious in character. Thus it is apparent that the policy of toleration has been adopted throughout the greater part of the civilized world.

Apart from the liberalizing of legislation, great progress has been made by means of Modernism in Roman Catholic countries and by the general spread of Christian charity, culture, knowledge of history, scientific methods of criticism, and the study of comparative religion, by the softening of manners, by scepticism, and by religious indifference, all tending to cool the ardour of the persecuting spirit and so to establish toleration. The champions of liberty now resent the use of the term as representing a gracious concession on the part of the privileged and claim to go far beyond it in their demand for the abolition of all theological and ecclesiastical privileges and the establishment of absolute religious equality.

Cf. also artt. PERSECUTION.

LITERATURE.—The literature of toleration is immense. A few of the more important works are Tertullian, *ad Scapulam*; Lactantius, *Divinae Institutiones*; Vincentius, *Epistolae*, 93, 17; Marsilius of Padua, *Defensor Pacis*, 13th cent.; Faustus Socinus, *Opera*, 2 vols., Irenopolis, 1656; Milton, *Areopagitica*, London, 1644; John Goodwin, *Plea for Liberty of Conscience*, 1644; Locke, *Epistola de Tolerantia*, Gouda, 1689, Eng. tr., London, 1689; P. Bayle, *Commentaire philosophique sur ces paroles de Jésus-Christ : Contrain-les d'entrer*, 2 vols., Cantorbéry, 1686, *Supplément du Commentaire*, etc., Hamburg, 1688; S. Pufendorf, *De habitu religionis Christianae ad vitam civilem*, Bremen, 1687, Eng. tr., London, 1698; C. Thomasiaus, *Disputatio an haeresis sit crimen*, 1697; Rousseau, *Contrat Social*, Paris, 1762; F. M. de Voltaire, *Traité sur la tolérance*, do. 1763, etc.; J. S. Mill, *On Liberty*, London, 1859; Jules Simon, *La Liberté de conscience*, Paris, 1872; J. C. Bluntschli, *Gesch. des Rechtes der religiösen Bekenntnisfreiheit*, Elberfeld, 1867; P. Schaff, *The Progress of Religious Freedom as shown in the Hist. of Toleration Acts*, New York, 1889; H. Fürstenau, *Das Grundrecht der Religionsfreiheit nach seiner geschichtl. Entwicklung und heutigen Geltung in Deutschland*, Leipzig, 1891; M. W. F. ADENEY.

TOLERATION (Muhammadan).—Muslim toleration may be considered under two distinct aspects, with respect to (i.) the faithful themselves, and (ii.) non-Muslims.

(i.) Within the circle of the Muslim Church the basis for toleration is found in the saying traditionally attributed to Muhammad: '*Ikhtilāfu ummati rahmatun*,' 'Difference of opinion in my community is a (manifestation of divine) mercy.' In accordance with this principle, it has been possible for the four schools (*madhhab*) of theologians and legists into which the Sunnis are divided, viz. Hanafi, Maliki, Shāfi'i, and Hanbali, to exist side by side, and for each of them to permit difference of opinion even in its own midst. There has been

abundance of controversy between these schools, but instances of open violence have been rare.¹ A similar basis for toleration was found in the traditional saying of the Prophet: 'My community will become divided into 73 sects,' and rendered possible the ample sectarian development in the Muhammadan world. Instances have occurred from time to time of the persecution of one sect by another,² but a more characteristic feature of the Muslim Church has been the freedom allowed to the exposition of religious doctrine, and the common sentiment of princes and people has generally condemned intolerance on the part of professed theologians.³

(ii.) The recognition of rival religious systems, as possessing a divine revelation, gave to Islām from the outset a theological basis for the toleration of non-Muslims. Judaism and Christianity are represented in the Qur'ān as forms of the primitive faith given to man and taught by a series of prophets from Adam onwards:

'Men were of one religion only; then they disagreed with one another.'⁴ 'Mankind was but one people; then God raised up prophets to announce glad tidings and to warn, and He sent down with them the Book with the truth, that it might decide the disputes of men.'⁵

But Jewish and Christian teachers had corrupted the purity of this primitive faith, which Muhammad as 'the seal of the prophets'⁶ came to proclaim anew.

This recognition of a common God is put forward in the Qur'ān as the basis for friendly relations with the followers of rival creeds, in the following verses:

'Say to those who have been given the Book and to the ignorant, Do ye accept Islam? Then, if they accept Islam, are they guided aright; but if they turn away, then thy duty is only preaching.'⁷ 'Those who have inherited the Book after them [i.e. the Jews and the Christians] are in perplexity of doubt concerning it. For this cause summon thou [them to the faith], and walk uprightly therein as thou hast been bidden, and follow not their desires; and say, In whatsoever Books God hath sent down do I believe; I am commanded to decide justly between you; God is your Lord and our Lord; we have our works and you have your works; between us and you let there be no strife; God will make us all one, and to Him shall we return.'⁸ 'Dispute ye not, save in kindest sort, with the people of the Book; save with such of them as have dealt wrongly [with you], and say ye, "We believe in what has been sent down to us and hath been sent down to you. Our God and your God is one, and to Him are we self-surrendered."⁹

Muslim theologians have found a sanction for the toleration of religions other than Judaism and Christianity in passages such as the following:

'To every people have We appointed observances which they observe; therefore let them not dispute the matter with thee, but summon them to thy Lord: Verily thou art guided aright: But if they debate with thee, then say: God best knoweth what ye do.'¹⁰ 'If any one of those who join gods with God ask an asylum of thee, grant him an asylum in order that he may hear the word of God; then let him reach his place of safety.'¹¹ 'They who had joined other gods with God say, "Had He pleased, neither we nor our forefathers had worshipped aught but Him, nor had we, apart from Him, declared anything unlawful."¹² Thus acted they who were before them. Yet is the duty of the apostles other than plain-spoken preaching?'¹³

The clearest injunction of toleration is in the verse, 'Let there be no compulsion in religion,'¹⁴ and forcible conversion is condemned in the words:

'But if thy Lord had pleased, verily all who are in the world would have believed together. Wilt thou then compel men to become believers? No soul can believe but by the permission of God.'¹⁵

In harmony with the injunctions of the Qur'ān is Muhammad's letter to the bishops, priests, and monks of Najrān promising them the protection of God and His apostle for their churches, their re-

ligious services and monastic institutions, and freedom from disturbance or any interference with their rights, so long as they remained faithful to their obligations.¹ He permitted the Jews in Medina to practise their own faith, until their implacable hostility led to their expulsion from the city, and he gave instructions to Mu'adh b. Jabal, whom he sent on a mission to Yaman in 10 A.H., that he was not to compel any Jew to abandon his religion.²

The teaching of the Qur'ān and the practice of the Prophet thus served as a clear basis for toleration of the Christian and Jewish faiths. As mention is made of the Sabians in the Qur'ān,³ they also were considered to have received some divine revelation and therefore to be entitled to toleration;⁴ it is possible that the Harranians (q.v.) and Mandæans (q.v.) claimed to be Sabians in order to enjoy the same toleration.⁵ Their practice of heathen rites naturally gave offence to orthodox Muslim feeling, and the Khalifah al-Qāhir (932-934) is said to have consulted the jurist Abū Sa'īd al-Istakhrī as to whether the Sabians should continue to be tolerated or not, and was told that, as they were neither Jews nor Christians, but worshipped the planets, they ought to be exterminated; however, the Khalifah allowed the Sabians to buy themselves off and disregarded the decision of this pious theologian.⁶ About forty years later his successor, Tā'īh al-Murīrah, promulgated a fresh edict of toleration in favour of the Sabians, guaranteeing to them protection for themselves, their wives, and property, and free access to their temples and places of prayer, and the undisturbed performance of the rites of their religion.⁷ Their last temple was not destroyed until 1230, and then by the heathen Mongols.⁸

Political expediency, and the desire of the jurists of the 2nd cent. of the Hijra to make the religious law tally with the accepted practice, prompted the extension of a similar toleration to such faiths as were not mentioned in the Qur'ān, but were found to have adherents in the rapidly growing Muhammadan empire; e.g., when Arab rule was extended into Persia, it was ascertained that Muhammad had given directions that the Zoroastrians were to be treated exactly like the Ahl al-kitāb ('people of the Book').⁹

The Zoroastrians appear to have been but little disturbed in the exercise of their cult up to the period of the fall of the 'Abbāsīd dynasty.¹⁰ There is even an account of a Muhammadan general (in the reign of Mu'tasim, 833-842) who ordered an *imām* and a *mutadhdhin* to be flogged because they had destroyed a fire-temple in Sughd and built a mosque in its place.¹¹ In the 10th cent., three centuries after the conquest of Persia, fire-temples were to be found in almost every province.¹²

Even the Manichæans (q.v.), though not entitled to toleration according to Muhammadan law, survived as a separate sect until the end of the 10th cent.; in the reign of Ma'mūn, Yazdānbakht, the leader of the sect, held a public disputation with the Muslim theologians in Baghdad.¹³

The severe condemnation of idolatry in the Qur'ān¹⁴ seems to have made any toleration of idol-worshippers impossible for a Muslim ruler, but already in the reign of Harūn Muslim law had granted the privilege of paying *jizyah* to idolaters—worshippers of idols, fire, and stones—and thus gave them a place among the tolerated cults.¹⁵ The Khalifah 'Uthmān, in dealing with the heathen Berbers, followed the precedent of 'Umar in regard to the Zoroastrians, and allowed them to pay *jizyah*.¹⁶ In India the Brāhmins appear to have paid *jizyah* from the earliest days of Arab domination,¹⁷ and to have been allowed to retain their faith undisturbed, but the building of new temples was held to be illegal.¹⁸ Though during the later Muhammadan conquests there was a considerable destruction of Hindu temples, the settled Muhammadan governments appear often to have respected the state endowments granted by the former Hindu rulers to religious foundations, as was done in the case of the temple of Brahmanābād in the province of Sind, where Muhammadan rule was first established in India. At a much later date, in the 16th cent., the Muhammadan government of Bengal is said to have raised the large sum of £100,000 a year by licensing the worship of Jagannāth in Orissa,¹⁹ and even Haider 'Alī and Tipū Sulṭān, usually so notorious for their

intolerance towards their Hindu subjects, made grants of money to the monastery of Srīngēri, one of the most famous shrines in S. India.¹ The same tradition survives in present Muhammadan states in India, such as Haidarābād and Bahāwalpūr, which still assign revenues for the support of Hindu temples.²

Even in such a barbarous country as Baluchistān the Hindus enjoyed religious toleration in consideration of their payment of *jizyah*. 'They were free from persecution and molestation; in any dispute with the tribesmen they could appeal to their protector or the headman for a fair hearing and a fair settlement; the honour of their women was respected; their religion was tolerated; no one tampered with their customs.'³

The non-Muslim living under a Muhammadan government was styled a *dhimmī* (lit. 'one with whom a compact has been made'), and the conditions under which he lived were supposed to be regulated by the agreements made with the Muslim conquerors as they extended their dominion over various cities and districts. As an example of such an agreement, the conditions may be quoted that are said to have been drawn up when Jerusalem came under Muslim rule in A.D. 638:

'In the name of God, the Merciful, the Compassionate! This is the security which 'Umar, the servant of God, the commander of the faithful, grants to the people of Aelia. He grants to all, whether sick or sound, security for their lives, their possessions, their churches and their crosses, and for all that concerns their religion. Their churches shall not be changed into dwelling-places, nor destroyed, neither shall they nor their appurtenances be in any way diminished, nor the crosses of the inhabitants nor aught of their possessions, nor shall any constraint be put upon them in the matter of their faith, nor shall any one of them be harmed.'⁴

The theory was that the *dhimmī*, in return for tribute paid and in consideration of good behaviour, received protection from the Muslim government and immunity for life, property, and religion. Tradition attributed to the Prophet a warning against the disregard of this compact: 'Whoever wrongs one with whom a compact has been made [i.e. a *dhimmī*] and lays on him a burden beyond his strength, I shall be his accuser.'⁵ 'Whoever torments the *dhimmīs*, torments me.'⁶ A similar consideration for them was shown by the khalifah 'Umar, who in his testament enjoined on his successor: 'I commend to your care the *dhimmīs* of the Apostle of God; see that the agreement with them is kept, and that they be defended against their enemies, and that no burden be laid upon them beyond their strength.'⁷ Similarly, 'Alī, when he appointed Muḥammad b. Abī Bakr governor of Egypt in 36 A.H., bade him do justice to the *dhimmīs*.⁸ In a like spirit, the Turkish code ordains that the *dhimmīs* are not to be disturbed in the exercise of their religion.⁹

The actual practice appears to have varied according to local conditions and the character of the local government; and by the 2nd cent. of the Hijra, when some codification was made of the law relating to the *dhimmīs*, more harsh and intolerant regulations had come into force than those of earlier times. But in the first century of Arab rule the various Christian churches enjoyed a toleration and a freedom of religious life such as had been unknown for generations under the Byzantine government. We have the contemporary testimony of the Nestorian patriarch, Iṣhō'yabh III. (A.D. 650-660), who, writing to the primate of Persia, says:

'The Arabs, to whom God at this time had given the empire of the world, behold, they are among you, as ye know well; and yet they attack not the Christian faith, but, on the contrary, they favour our religion, do honour to our priests and the saints of the Lord, and confer benefits on churches and monasteries.'¹

Indeed, the Church to which this ecclesiastic belonged exhibited a remarkable expansion under Muhammadan rule; missionaries were sent from Persia to China and India, both of which were raised to the dignity of metropolitan sees in the 8th cent.; about the same period the Nestorians gained a footing in Egypt, and later spread the Christian faith right across Asia, and by the 11th cent. had gained many converts from among the Tatars.² But by the 2nd cent. of the Muhammadan era the condition of the Christians had become less tolerable. The victorious armies that established Arab rule over Syria and Persia appear to have been little swayed by religious considerations, and under the rule of the Umayyads the Christian and other non-Muslim religious communities seem to have been little regarded except as sources of revenue; but under the 'Abbāsids a change in the attitude of the government made itself felt. The orthodox reaction which supported this dynasty and the union of the spiritual and temporal power which characterized it tended to make the administration of the existing laws more oppressive. In the course of the long struggle with the Byzantine empire the khalifas had had occasion to distrust the loyalty of their Christian subjects, and the treachery of the emperor Nikephoros was not improbably one of the reasons for the harsher treatment initiated by Hārūn al-Rashīd (786-809), who ordered the Christians to wear a distinctive dress and give up to Muslims the government posts which they held. But the prescriptions of the jurists and theologians³ were often more intolerant than the actual practice of the government, and it would be rash to assume that the treatment meted out to the non-Muslim population corresponded exactly with the principles which they laid down. Hārūn's great jurist, Abū Yūsuf,⁴ leaves no alternative to the Arabs of the Riddah (i.e. the Defection, after the death of the Prophet) or to the idolatrous Arabs, except death or the acceptance of Islām, but Catani⁵ has proved that the early conquerors had no power to enforce such a principle, and historical facts do not show that any such alternative was actually imposed on the heathen Arabs.

But protests against cruelty towards the *dhimmīs* are not wanting in the works of Muslim legists themselves; e.g., Abū Yūsuf⁶ claims for the *dhimmīs* gentle treatment; they are not to be beaten when called upon to pay *jizyah*, or to be made to stand in the sun, or to be tormented in any way; and he makes an earnest appeal to his patron, Hārūn, on their behalf:

'It is incumbent on the commander of the faithful (may God grant thee his aid!) that thou deal gently with those that have a covenant with thy Prophet and thy cousin, Muḥammad (the peace and blessing of God be upon him!), and that thou take care that they be not wronged or ill-treated and that no burden be laid upon them beyond their strength, and that no part of their belongings be taken from them beyond what they are in duty bound to pay, for it is related of the Apostle of God (the peace and blessing of God be upon him!) that he said, Whosoever wrongs one with whom a compact has been made [i.e. a *dhimmī*] or imposes a burden on him beyond his strength, I shall be his accuser on the day of judgment.'⁷

Ibn Qāsim al-Ghazālī († 1512) maintains that the majority of Muslim jurists hold that the *dhimmī* must be treated with kindness and consideration and not with contempt, when he comes to pay the

jizyah.¹ Commenting on this passage nearly two centuries later, al-Birmāwī († 1694) enters a protest against such fanatical glosses on *Qur'ān*, ix. 29, as are referred to in art. PERSECUTION, and holds that the phrase 'being humbled' implies only conformity to the regulations of Islām in regard to the *dhimmīs*, and that these words give no justification for the rough treatment sometimes inflicted on a *dhimmī* when he paid *jizyah*—e.g., that he should be made to stand with bent head and back before the collector of the tax, who should slap his face and pull his beard—for (as he rightly says) there is no evidence that the Prophet or any one of the khalifahs acted in such a manner.²

A powerful influence in the direction of toleration in a period when feeling was acerbated against the Christians, and when the disorder in Muhammadan administration made their position more precarious and exposed them to the tyranny of local officials, was the extension of the religious orders, especially that of the Qādiriyyah, and the popularizing of that mystical presentation of religious thought in which devout Muslims found consolation after the devastations of the Mongol conquests. 'Abd al-Qādir al-Jilānī († 1166), the founder of the order referred to, emphasized the virtues of charity and meekness, and his attitude and that of his followers towards the Christians was kindly and sympathetic.³ The tendency of Persian mysticism was opposed to any emphasizing of religious differences, and the teaching of the poets who wrote under the influence of this mystical movement often made for tolerance; a well-known example is the story of Abraham in Sa'dī's *Būstān*,⁴ in which the patriarch is rebuked by God for refusing his charity to an aged fire-worshipper on the ground of his infidelity. But in the present article attention may rather be drawn to instances of toleration in contrast to the fanatical usage of legislation; e.g., though the so-styled Pact of 'Umar⁵ forbade the building of new churches, there was considerable variation of opinion among the Muslim legists themselves on this question, from the more liberal Ḥanafī doctrine, which declared that, though it was unlawful to build churches and synagogues in Muslim territory, those already existing could be repaired if they had been destroyed or had fallen into decay, while in villages where the tokens of Islām were not apparent new churches and synagogues might be built, to the intolerant Ḥanbalī ruling that they might neither be erected nor be restored when damaged or ruined. Some legists held that the privileges varied according to treaty rights: in towns taken by force no new houses of prayer might be erected by *dhimmīs*, but, if a special treaty had been made, the building of new churches and synagogues was allowed. But, like so many of the lucubrations of Muslim legists, these prescriptions bore but little relation to actual facts. Schoolmen might agree that the *dhimmīs* could build no houses of prayer in a city of Muslim foundation, but the civil authority permitted the Copts to erect churches in the new capital of Cairo. The fact that 'Umar b. 'Abd al-'Azīz (717-720) ordered the destruction of all recently constructed churches, and that more than a century later the fanatical al-Mutawakkil (847-861) had to repeat the same order, shows how little the prohibition of the building of new churches was put into force; and both Christian and Muhammadan historians

record numerous instances of the erection of new churches, some of them buildings of great magnificence.¹ Al-Muqtadir (908-932) even gave orders himself for the rebuilding of some churches at Ramlah in Palestine, which had been destroyed by Muhammadans during a riot.²

Muslim law made death the punishment for apostasy (*q.v.*), and the convert to Islām was not allowed to return to his former faith, but instances are not unknown of a more tolerant view vindicating freedom of conscience in such cases.

Even the mad Ḥakīm (996-1020), whose persecutions caused many Jews and Christians to abandon their faith, ordered the churches that had been destroyed to be rebuilt, and the property settled on the churches that had been taken from the Christians to be restored to them, and allowed the unwilling converts to return to their old faith.³ It is stated by more than one Muhammadan writer that Moses Maimonides under the fanatical rule of the Almohads in Spain feigned conversion to Islām, but fled to Egypt and there openly declared himself to be a Jew; that towards the end of his life a Muslim jurist-consult from Spain denounced him for his apostasy and demanded that the extreme penalty of the law should be inflicted on him for this offence; but the case was quashed by al-Qādi al-Fāḍil 'Abd al-Rahīm b. 'Alī (one of the most famous of Muslim judges and prime minister of Saladin), who authoritatively declared that a man who had been converted to Islām by force could not rightly be considered to be a Muslim.⁴ Jewish writers, jealous for the honour of their great co-religionist, have disputed the accuracy of this story, though the first who narrates it, Ibn al-Qiftī, was himself a contemporary of Maimonides;⁵ but in reference to Muhammadan toleration it is of interest to note that the decision of al-Qādi al-Fāḍil is reported without contradiction or condemnation. In the same spirit, when Ghāzān, ilkhān of Persia (1295-1304), discovered that the Buddhist monks who had become Muhammadans at the beginning of his reign (when their temples had been destroyed) only made a pretence of being converted, he granted permission to all those who so wished to return to Tibet, where among their Buddhist fellow-countrymen they would be free once more to follow their own faith. J. B. Tavernier⁶ tells a similar story of some Jews of Ispahan who were so grievously persecuted by the governor 'that either by force or cunning he caused them to turn Mahometans; but the king (Shāh 'Abbās II. [1642-1667]), understanding that only power and fear had constrained them to turn, suffer'd them to resume their own religion and to live in quiet.' The Yazīdīs who were forced to accept Islām under the oppressive rule of Badr Khān Beg in 1844, were permitted by an imperial firman to return to their own creed three years later.⁷

The practice of Muhammadan governments seems, generally, to have been to leave to each separate protected community the management of its internal affairs, and to permit the religious leaders to administer the laws as to marriage, inheritance, etc., in accordance with the ordinances of the particular faith as accepted by the persons concerned, in some instances in criminal cases also,⁸ though, according to Abū Hanifah, there was no obligation resting on the Muhammadan government to recognize the decisions of such a judge or on the *dhimmīs* to conform to them.⁹ But, if an appeal was made to the Muslim judge, he would decide the case on the basis of the *Qur'ān* and Muslim law, and some jurists held that the State could even insist on the application of Muslim law in cases of inheritance in which the public treasury would thereby derive more benefit than if the special law of the *dhimmīs* concerned

were applied.¹ It is recorded of Khayr b. Nu'aym, a judge in Egypt about the middle of the 8th cent., that, after hearing the cases of the Muslims inside the mosque, he would sit on the steps outside the gate in the afternoon and hear the cases of the Christians and Jews, testing the value of the evidence of the witnesses by inquiring into their credibility among their co-religionists.²

An important testimony to the toleration of Muslim rule is the fact that persecuted Christian and other sects took refuge in Muhammadan lands, to enjoy there the undisturbed exercise of their several cults. When the Byzantine emperor, Leo, in 714, instituted a persecution against the Monastans and the Jews, forcibly compelling them to submit to baptism, while some burnt themselves alive rather than suffer the loss of religious freedom, others fled for safety into the neighbouring Arab territory.³ The persecuted Spanish Jews at the end of the 15th cent. took refuge in Turkey in enormous numbers.⁴ The Calvinists of Hungary and Transylvania and the Unitarians of the latter country long preferred to submit to the Turks rather than fall into the hands of the fanatical house of Hapsburg;⁵ and the Protestants of Silesia in the 17th cent. looked with longing eyes towards Turkey and would gladly have purchased religious freedom at the price of submission to Muslim rule.⁶ The Cossacks, who belonged to the sect of the Old Believers and were persecuted by the Russian State Church in 1736, found in the dominions of the sultan the toleration which their Christian brethren denied them.⁷

Of toleration in the Muhammadan world generally it may be said that it was more operative in the earlier centuries of the Hijra than in the days of the decline of the khalifate or the unhappy period of the Mongol conquests or in modern times when the pressure of Christian Powers exasperated Muslim feeling. The civil government has as a rule been more tolerant than the clergy, and the regulations of jurists have seldom been put into force with all their rigour; though practice has varied with time and place, the persecutions⁸ that have occurred have been excited by some special and local circumstances rather than inspired by a settled principle of intolerance. The judgment of A. de Gobineau is on the whole justified by the facts of history:

'Si l'on sépare la doctrine religieuse de la nécessité politique qui souvent a parlé et agi en son nom, il n'est pas de religion plus tolérante, on pourrait presque dire plus indifférente sur la foi des hommes, que l'Islam. Cette disposition organique est si forte qu'en dehors des cas où la raison d'Etat mise en jeu a porté les gouvernements musulmans à se faire arme de tout pour tendre à l'unité de foi, la tolérance la plus complète a été la règle fournie par le dogme. . . . Qu'on ne s'arrête pas aux violences, aux cruautés commises dans une occasion ou dans une autre. Si on y regarde de près, on ne tardera pas à y découvrir des causes toutes politiques on toutes de passion humaine et de tempérament chez le souverain ou dans les populations. Le fait religieux n'y est invoqué que comme prétexte et, en réalité, il reste en dehors.'⁹

To this sober conclusion of the historian may be added the eloquent outburst of one of the Spanish Muhammadans who was driven out of his native country on the occasion of the last expulsion of the Moriscos in 1610:

'Did our victorious ancestors ever once attempt to extirpate Christianity out of Spain, when it was in their power? Did they not suffer your forefathers to enjoy the free use of their rites at the same time that they wore their chains? Is not this the

absolute injunction of our Prophet, that whatsoever nation is conquered by Musalman steel, should, upon the payment of a moderate annual tribute, be permitted to persevere in their own pristine persuasion, how absurd soever, or to embrace whatever belief they themselves best approved of? If there may have been some examples of forced conversions, they are so rare as scarce to deserve mentioning, and only attempted by men who had not the fear of God, and the Prophet, before their eyes, and who, in so doing, have acted directly and diametrically contrary to the holy precepts and ordinances of Islam which cannot, without sacrilege, be violated by any who would be held worthy of the honourable epithet of Musalman. . . . You can never produce, among us, any bloodthirsty, formal tribunal, on account of different persuasions in points of faith, that anywise approaches your execrable Inquisition. Our arms, it is true, are ever open to receive all who are disposed to embrace our religion; but we are not allowed by our sacred Alcoran to tyrannize over consciences. Our proselytes have all imaginable encouragement, and have no sooner professed God's Unity and His Apostle's mission but they become one of us, without reserve; taking to wife our daughters, and being employed in posts of trust, honour and profit; we contenting ourselves with only obliging them to wear our habit, and to seem true believers in outward appearance, without ever offering to examine their consciences, provided they do not openly revile or profane our religion: if they do that, we indeed punish them as they deserve; since their conversion was voluntarily, and was not by compulsion.'¹

TOLSTOY.—I. Early life and manhood.—Lev Nikoláevich Tolstóy (1828-1910), novelist, social reformer, and religious mystic, was born on 28th Aug. (O.S.), 1828, at Yásnaya Polyána ('Bright Glade'), the home of the family, in the government of Tula, about 130 miles south of Moscow. Lev was the youngest of four sons. His mother having died when he was three, and his father five or six years later, the boy went in 1840 to the university town of Kazán in eastern Russia, where he lived under the charge of an aunt, whom he held in grateful remembrance. After two years' study he left the university without a degree. The blame is usually laid upon the professors, but some portion of it must be attributed to Tolstóy's own dissipated and irregular life. Returning to his estate, he interested himself in the life of his peasants, with the disappointing results recorded some years later in his *A Morning of a Landed Proprietor* (1856). He admits that he did not really know their life, and that he was aiming at their betterment only from the outside. It was, however, the beginning of that interest in 'the people' which led him at last to throw in his lot with the peasants and the poor. In 1851, to escape from the idle dissipation of his class, he fled to the Caucasus, where he wrote his earliest works—*Childhood*, *A Morning of a Landed Proprietor*, and *The IncurSION*—and planned *The Cossacks*, sold ten years later to pay a gambling debt.

(1876) form an autobiographical fragment, thinly disguised under fictitious names. Here, as elsewhere, Tolstóy doubles himself, to bring out the dual nature, the natural and the spiritual man of which he was always conscious in himself. Irténev represents the lower nature, his friend Nekhlyúdiv the higher. The latter reappears in the *Landed Proprietor* and in *Resurrection*, just as in *War and Peace* Pierre Bezúkhí, and in *Anna Karénin* Konstantín Levin, are Tolstóy himself in that struggle between flesh and spirit which ended only with life. There is truth in Leo Wiener's statement that even the Christ of his religious writings is still the image of the author, and that 'it is Christ-Tolstóy that becomes the final and lasting stage of his spiritual evolution.'¹ This autobiographical fragment reveals Tolstóy as an awkward child, morbidly sensitive to his appearance; a boy, confessing frankly every shade of evil in his heart, such as the rise of sexual feeling; and a youth 'in search of an ideal,' whose one faith was in the possibility of virtuous perfectibility. Beyond this, his creed, though retaining the forms of the Orthodox Church, had become dust, ready to crumble at a touch. Yet we see the beginnings of many things which appear and reappear in his writings to the end—a shame of being rich while others want, a deep hatred of injustice, and the clear poetic vision of Nature and her loveliness.

The Cossacks (1863) represents Tolstóy's revulsion from the artificial and vicious life of cities and his class. The natives had their vices, but they sinned naturally and frankly, and thus escaped the deeper corruption of hidden immorality. In contrast with their bold outdoor life, Tolstóy saw himself (the Olénin of the story) as a degenerate weakling.

Joining the army in 1851, Tolstóy commanded a battery at Sevastopol; and in his three sketches—*Sevastopol in December, 1854*, *Sevastopol in May, 1855*, *Sevastopol in August, 1855*—we find the seeds of thought that were to fructify in his *War and Peace*, and many an indignant denunciation of the violence by which nations are governed. The conviction of the sheer wickedness and brutality of war sank deep into his soul and grew with the years. The sketches probably saved his life; by the emperor's orders the young man was removed to a place of safety. On the fall of Sevastopol in 1855 he was sent with dispatches to St. Petersburg, and his career as a soldier came to an end.

Of this period, and up to his marriage in 1862, Tolstóy could never afterwards think without shame. Between 1857 and 1861 he travelled in Germany, France, Italy, Switzerland, England, and Belgium, to study their educational methods, wrote many books on education, and started schools for peasant children on his estate. Yet alongside this generous interest in 'the people' the tides of the passions of the natural man never ceased to flow. His own words in his *My Confession*² frankly reveal this moral duality:

'I cannot recall those years without dread, loathing, and anguish of heart. I killed people in war and challenged to duels to kill; I lost money at cards, wasting the labour of the peasants; I punished them, fornicated, and cheated. Lying, stealing, acts of lust of every description, drunkenness, violence, murder—there was not a crime which I did not commit, and for all that I was praised, and my contemporaries have regarded me as a comparatively moral man. Thus I lived for ten years.'

On 23rd Sept. 1862 Tolstóy married Sófiya, second daughter of a Dr. Behrs of Moscow, who bore him thirteen children, several of whom died in infancy. Fifteen years of unbroken domestic happiness followed. Tolstóy was busy with his schools, his works on education, the management of his estate, and, above all, the writing of his greatest novels, *War and Peace* (1864-69) and *Anna Karénin*

(1873-77), in which appear all the problems round which his mind never ceased to work—war, the peasants, the land and the serfs, education, the universal duty of manual labour, and, at the root of all, religion and the ethical duties flowing therefrom. Then suddenly, to the dismay of the literary world, Tolstóy cast aside the art in which he was acknowledged the greatest living master, and devoted the remainder of his life to moral and religious tales for peasants and children, and an examination of the Gospels, the Creed, and the foundations of violence on which he believed the entire system of civil government rested. His literary ambitions had been treason to the deepest convictions of his soul. The literary caste set up to teach what they did not know, and for the sake of his family he had shared their delusions:

'The new conditions of my happy family life completely drew me away from all search for the general meaning of life. All my life during that time was centred in my family, my wife, my children, and, therefore, in cares for the increase of the means of existence. The striving after perfection, which before had given way to the striving after perfection in general, after progress, now gave way simply to the striving after making it as comfortable as possible for me and my family. Thus another fifteen years passed.'¹

The struggle to break away from this treason to the higher life led to great family unhappiness, and ultimately to his mysterious and tragic end.

2. **Ethical and religious ideas.**—Tolstóy's principal works after his 'conversion' are *My Confession* (1879-82), *Critique of Dogmatic Theology* (1880-82), *The Four Gospels Harmonized and Translated* (3 vols., 1880-82), *My Religion* (1884), *What shall we do then?* (1884-86), *Moral and Religious Tales*, *The Kingdom of God is within you* (1893), *What is Art?* (1897), and *Resurrection* (1899), his last great novel, in which he sums up his indictment of Church and State and the entire structure of society. It is from this vast mass of literature that we must now attempt to deduce the religious and ethical convictions into which, with endless vacillations, Tolstóy finally settled.

(1) Tolstóy's fundamental conviction is that the one purpose of life is to know God by bringing all relations of humanity into harmony with His will. In reply to the decree of the Holy Synod which excommunicated him in 1901 he states his creed:

'I believe in God, whom I understand as Spirit, as Love, as the beginning of everything. I believe that He is in me and I in Him. I believe that God's will is most clearly and comprehensibly expressed in the teaching of the man Christ, whom to understand as God and pray to I consider the greatest blasphemy. I believe that the greatest true good of man is the fulfilment of God's will, but His will is this, that men should love one another and in consequence of this should treat others as they wish that others should treat them, as, indeed, it says in the Gospel that in this is all the law and the prophets. I believe that the meaning of the life of every man is, therefore, only in the augmentation of love in himself; that this augmentation of love leads the individual man in this life to a greater and ever greater good, and gives after death a greater good, the greater the love is in man, and at the same time more than anything else contributes to the establishment of the kingdom of God in the world, that is, of an order of life with which the now existing discord, deception, and violence will give way to free agreement, truth, and brotherly love of men among themselves. I believe that there is but one means for success in love, and that is prayer, not public prayer in temples, which is directly forbidden by Christ (Matt. vi. 5-13), but such as Christ has given us an example of,—solitary prayer, which consists in the establishment and strengthening in our consciousness of the meaning of our life and our independence of everything except God's will.'²

(2) Tolstóy warns us that, when he calls God 'Father' and speaks of His 'will,' he is not to be understood as meaning that God is a personal being. He admits that, when he prays, he is inconsistent with his doctrine of the impersonality of God: it is a necessity forced on him by the fact that he himself is a person. The doctrine of the Trinity is blasphemy. Metaphysical speculations conceal God; nothing reveals Him but love in its

² Ch. ii. (Works, xiii. 81.)

¹ *My Confession*, ch. iii. (Works, xiii. 16).

² *Answer to the Decree of the Synod* (Works, xxiii. 235 f.).

application to human life. The fundamental idea of *The Kingdom of God is within you* is that God is, in every man, the revelation of life and the power by which man lives and acts upon the world. Whatever approves itself to the God within has divine sanction and right. Since God thus acts naturally through man, miracles are impossible.

(3) Tolstóy's conception of Christ passed through many fluctuations. In the Crimea he dreamed of a new Christianity 'purged of dogma and mysticism,' giving happiness here on earth. At his brother Nikoláy's funeral he projected 'a Life of Christ as a Materialist.' After reading a German work on the Gospels he inclined to agree with the author that Christ never existed. In the end, while admitting His existence, he denied indignantly His divinity. 'To recognise Christ as God is to renounce God.'¹ On the theory of His divinity the Temptation becomes absurd—'God is tempted by God Himself.' The miraculous Birth is an invention to cover His mother's shame. The Resurrection is 'a trite, contemptible invention,' contrary to reason and needing the invention of other miracles to support it. He is 'the living Christ' only in the sense in which all men live on in the spirits of those who come after them. Jesus is grouped with other great religious teachers of the world, such as Confucius, Buddha, Lao-tse. These views are asserted with a peculiar earnestness: 'I am standing with one foot in the grave, and I have no need to feign.' The truth is that Tolstóy had almost a personal interest in thus emphasizing the human side of Christ: he found in it those elements of wavering of which he was conscious in himself. The Temptation, the shrinking of His soul at the visit of the Greeks, the agony in the Garden, the cry 'My God, my God' on the Cross, seemed to bring Him nearer to his own weaknesses and vacillations. There was even a moment, he held, when Christ resolved to use violence against violence and advised His followers to sell their garments and buy swords; and it was only in the Garden that He was able to overcome the terrible temptation by prayer.

(4) Tolstóy's attitude to Scripture settled down into acceptance of nothing that did not commend itself to the God within himself. The OT is non-essential to Christianity. The Church doctrine of the infallibility of Scripture—myths, miracles, contradictions, immoral stories, and all—only commits the soul to untruth. Yet he admired the OT stories and the Gospel parables as the highest form of art, taught them to the peasant children in his schools, and advocated that cheap unabridged copies be given them, not one word omitted:

'The book of the childhood of the race will always be the best book of the childhood of each man. . . . There is no book like the Bible to open up a new world to the pupil and to make him without knowledge love knowledge.'²

After giving elaborate interpretations of the Four Gospels, he warns his readers against all interpretations: let each man read for himself in the spirit of a little child. To get nearer the original meaning he learned Greek; and he used his new-found instrument in the most uncritical and arbitrary way. The Four Gospels were the heart of the Bible; the Sermon on the Mount was the heart of the Gospels; and a few sayings of Christ formed the heart of the Sermon. Whatever in Scripture did not harmonize with these few sayings and Tolstóy's vast 'private interpretation' of them was set aside without scruple as no part of the true original teaching; and, as one has said, if he cleared away superstitions of the Church, he created others of his own.

¹ *Three Letters on Reason, Faith, and Prayer* (Works, xxiii. 473).

² *The School at Yásnaya Polyána* (Works, iv. 308, 310).

(5) In substance, Tolstóy reduces Christianity to five commandments of Christ in the Sermon on the Mount:

(a) *Thou shalt not be angry* (Mt 5:21-26).—He takes this prohibition absolutely, omitting 'without a cause.' It forbids, not killing merely, but the anger from which violence flows. In his own experience he found that contempt was the root of anger; and, since contempt was possible only to inferiors, he strove to divest himself of the worldly possessions, standing, and privileges which gave him a false sense of superiority over those who were sons of the one Father. If it be said that Christ in this passage speaks of the penalty of judgment and fire for this sin, Tolstóy replies that He never prescribed this penalty, the mention of which only indicates the severity of His condemnation of it. In his discussion of Mt 23 he does not seem to recognize that Christ's indignation against the Pharisees must be a breach of His own law against anger, if understood in the absolute sense.

(b) *Thou shalt not commit adultery* (Mt 5:27-32).—Tolstóy interprets the words in v. 32, 'saving for the cause of fornication,' as meaning that the husband by divorcing his wife 'causes her also (as well as himself) to commit adultery.' His views pass through several stages and are influenced by his own early lapses. For the first fifteen years of his married life his ideal for woman was the duty of motherhood. He disapproved of celibacy and held that monogamy is 'the natural law of humanity.' The close of *What shall we do then?* is an impassioned appeal to women to fulfil 'the highest act of life,' the duty of maternity. *Domestic Happiness* (1859), however, warns against basing the happiness of marriage on the romantic fever of the senses called love, from which motherhood is the true escape. This view persists through *War and Peace* and *Anna Karénin*. In the latter a young and beautiful woman, married to a man much older than herself, turns to feed her starved heart to an illicit passion; and the suicide in which she ends is, in the author's intention, far less the punishment of her infidelity to her husband than of her unfaithfulness to her lover and their child—the burning out through jealousy of her lover's affection, and her unworthiness of her own maternity. *The Kreutzer Sonata* (1889) marks the extreme development of his views—a sordid story of the murder of a guilty wife and the acquittal of the husband on the ground that he had merely defended his honour. The title implies that in Tolstóy's view Beethoven's music irritates and hypnotizes soul and sense into crime. His final position is given in his *Epilogue to the Kreutzer Sonata* (1890), written to defend himself against many attacks. In substance, he demands an absolute chastity, whether in the married or in the unmarried life. The teaching of the gospel is 'in the first place that a married man must not be divorced from his wife, in order to take another, and that he must live with the one with whom he has come together (Matt. v. 31-32; xix. 8); in the second place, that for man in general, both married and unmarried man, it is sinful to look upon woman as an object of enjoyment (Matt. v. 28-29), and, in the third place, that for an unmarried man it is better not to marry at all, that is to be absolutely chaste (Matt. xix. 10-12).'¹ He admits, however, that this absolute chastity is not a precept, but an ideal, to which the race is meant to approximate. To the objection that this ideal would annihilate the race he replies coolly, Why not? Both Church and science foretell an end of the world; why should it not come through the increase of virtue?

(c) *Thou shalt not swear* (Mt 5:33-37).—This means much more than mere simplicity and truth of speech: 'Yea, yea; nay, nay.' Christ forbids us to bind ourselves by an oath to any human power or authority. To do so is to abjure the freedom of conscience, which is the divine within us, and to make ourselves the slaves of a human will which may be the enemy of the will of God. It is the deliberate renunciation of Christianity. In short, this command of Christ strikes at the root of all military power, since all armies rest on an oath of allegiance to some human authority; and this plain command the Church explains away, knowing that, if it were obeyed, the entire structure of society, and its own institution as part of it, would fall to the ground.

(d) *Resist not evil* (Mt 5:38-42 7:2-5 etc.).—This doctrine of non-resistance dominates all the rest of Tolstóy's teaching. It was the first command of Christ which he understood, and it opened the meaning of all the others. Physical force, being an outrage on the freedom of conscience, which is the Kingdom of God within the soul, must never be applied to make any man do what he does not wish to do. Compulsory military service, the whole system of civil and criminal law and government, parliaments, courts, judges, police, jails, taxation, even the payment of debts—all stand condemned as unchristian. Property must be abolished, since it rests on force; it is not merely theft, but murder, because human life is the price paid for it. He prophesied the bankruptcy of the present system of violence; and, were he alive, it is conceivable that he would point to the Great War and the horrors of Bolshevism as the fulfilment of his prophecy. Non-resistance is the only way to destroy violence. 'As fire does not put out fire, so evil does not put out evil.' Given a non-resisting community, 'no enemies—neither Germans, nor Turks, nor savages—would kill or torture such people.' His fanatical and uncompromising Russian mind admitted no limits to this doctrine. If he saw a madman attack a child or a horde of savages fall on his own wife and children, this command of Christ forbade him

¹ Works, xviii. 430.

absolutely to protect them by force. The worst that can happen by not resisting is death, whereas to resist is to 'act contrary to the law of Christ, which is worse than death.' We need not hesitate to say that this carries the doctrine to the point of insanity. The natural instinct of a normal conscience is to protect the weak and the defenceless from a drunkard or a madman.

(e) *Wage no war* (Mt 543-45, 48, Lk 632f.).—The five commandments of Christ form five widening circles: (1) the individual heart—harbour no anger; (2) man and woman, the family—avoid carnal lust; (3) private worldly relations with others—bind the conscience by no oath or promise; (4) relations to the State—resist no evil by force; (5) the human race—regard no nation as your enemy: 'If they make war on you, submit, do good, and wage no war.' It is absurd to say that Christ, who forbade anger to the individual, now allows anger, and murder which is the fruit of anger, to communities and nations.

From the Sevastopol sketches, on through *War and Peace*, *The Kingdom of God is within you*, and innumerable pamphlets, etc., Tolstóy never ceased to strip war of its 'glory' and to hold up its naked falsity, cruelty, and bestiality. Under all its fine names its true purpose is murder. Three causes are named: (1) the unequal distribution of property, that is, the robbing of one class of people by another, (2) the existence of a military class, that is, of people educated and destined for murder, and (3) the false, for the most part consciously deceptive, religious teaching, in which the young generations are forcibly educated.¹ Patriotism is the chief war-criminal—a sentiment fostered by pageants which hypnotize the people into 'loyalty,' by alliances with or against other nations, based on an unreal love and a created hate. There is no such thing as a good patriotism, the aim of all patriotism being that of 'Deutschland über Alles,' to exalt our own nation over others, by violence if need be. It is this sentiment that puts into the hands of rulers a diabolic weapon, making possible military conscription and all the cruelties, atrocities, and bestialization of invasions and battlefields. The one remedy is the substitution for love of country of love for man as man, and the refusal of individuals to submit to military service, be the consequences what they may. Tolstóy had a profound distrust of peace congresses and courts of arbitration, because 'the decision of the court of arbitration against the military violence of the states will be executed by means of military violence.'²

(6) Following out his doctrine of human freedom, Tolstóy attacked all current forms of education as the forcible ruin of life and ethics. The schools on his estate were based on absolute freedom. The children came when they pleased, sat where they liked, were at liberty to speak, had no home lessons to torture them. Yet the order and attention were perfect. The teaching included walks in the fields, explanations of natural sights and sounds, history, folk-tales, stories and parables from the Bible, by far the finest instrument of education. Tolstóy wrote a series of tales, which had a great success in Russian schools; but he held that it is the peasant children who can teach us to write, not we them: they are nearer the original harmony of beauty, truth, and goodness than men, whose education has been a system of destroying that harmony. His views are summed up thus:

¹ I am convinced that the school ought not to interfere in that part of the education which belongs to the family; that the school has no right and ought not to reward and punish; that the best police and administration of a school consist in giving full liberty to the pupils to study and settle their disputes as they know best.³

He opposed 'popular education' because it was not popular, but compulsory, based on violence, and hated by both parents and children, who forgot its artificial results as quickly as they could.

⁴ Schools which are established from above and by force are not a shepherd for the flock, but a flock for the shepherd.⁴

From infant school to university the system was arbitrary, mechanical, and out of relation to life and its needs. To compel all child-natures to pass through a standardized system, without freedom of choice, is torture. In fine, education has become an elaborate system of demoralizing child-nature, which is good, in the interests of the world and its evils. At an early age it severs the natural bond of parent and child, and of the great mother, Nature herself, and it does so in a way which

fosters lying, hypocrisy, and vice, and destroys individuality.

(7) In *What is Art?* Tolstóy sweeps aside with contempt all theories of mere aesthetics and 'art for art's sake,' and reduces the criteria of art to the following: (1) art must spring from a genuine feeling in the artist; (2) this feeling must have the power of infecting others with the same emotion; (3) it must have the power of uniting men by this infection of a common hope, joy, love, or whatever it be: if it separates men, it is not art. The more widely it unifies men, the more worthy is it of the name. 'Upper class art,' dependent on an artificial training, springs from no living infectious emotion in the artist, who has to write, paint, etc., to please his rich patrons, who lead idle, artificial, and parasitic lives. Such art grows ever narrower in its appeal, and its patrons ever prouder of its exclusiveness, whereas 'great works of art are only great because they are accessible and comprehensible to every one,' like the story of Joseph and the parables of Christ. Whole generations of artists, singers, poets, players, artisans, workmen, are practically serfs for the production of false exclusive art—an art which is simply the expression of the pride, sensuality, and weariness of life of the men and women who pay them.

All good art, being universal, depends on universal emotions which unify men by infection. What these are is revealed by 'the religious perception' that all human good is contained in 'the fraternal life of all men, our love-union among ourselves.'

Hence 'the Christian art of our time can be and is of two kinds: (1) art transmitting feelings flowing from a religious perception of man's position in the world in relation to God and to his neighbour—religious art in the limited meaning of the term; and (2) art transmitting the simplest feelings of common life, but such, always, as are accessible to all men in the whole world—the art of common life—the art of a people—universal art. Only these two kinds of art can be considered good art in our time.'¹

The name of art is denied to emotions which divide men, as patriotism, or religious sectarianism, or the honour given for wealth, education, rank, or profession. The theory has met with much ridicule; but, making allowance for some exaggeration in Tolstóy's dislike of the conventional forms in which every art seeks expression, we may agree with Kropotkin that *What is Art?* is a much-needed protest against the over-artificiality into which modern art has drifted.

(8) Tolstóy's doctrine of the future life may be described as a kind of pantheistic immortality. His novels overflow with studies of death and the process of dying. The higher ranks meet death with reluctance and complaining, the poor with cheerfulness and faith. Of Natálya, the old stewardess in the home of his childhood, he says: 'She executed the best and highest act of this life,—she died without regrets or fear.'² During the period of his 'conversion' thoughts of suicide became so strong that he had to hide a rope that hung in his dressing-room and could not trust himself to go out hunting with a gun. There was no meaning in life, no end to which it moved. He was saved from suicide by the discovery that the end was God, God in whom he lived, and moved, and was. The fear of death is a 'superstition' due to the fact that men live in a mere fragment of their own nature and of the world, and thus the lower fragment of their carnal and personal being, instead of their rational consciousness in its relation to the sum of things, which is God. Life is given to be a ministry of life to the world, and

¹ *What is Art?*, ch. xvi, tr. Aylmer Maude, London, 1905 (of this tr. Tolstóy in a Preface says: 'I request all who are interested in my views on art only to judge of them by the work in its present shape.' The tr. is from the original MS, and is free from the mutilations of the Russian censor).

² *Childhood*, ch. xviii. (*Works*, i, 136).

it lasts just so long as this ministry is being fulfilled. To cast it away in suicide when it becomes unpleasant to us is sinful, partly because just then is probably the time when this ministration truly begins. Moreover, it is in this life of universal ministry that man finds the only true immortality. Personal immortality is impossible, because true life is the deliberate sacrifice of all personal ends. Resurrection and reincarnation would be nothing better than a return to the carnal and personal relations which are spiritual death. Life is an ever onward movement of reason and love, and the only real death is to arrest the movement at any given point. Live onward beyond the old self, and life becomes a living part of the growing good of the world. This is the life eternal and the only true immortality for man.

3. **The last phase.**—The life of the great Russian ended in a mysterious tragedy of conscience. For many years his life consisted of a struggle to bring his practice into harmony with his principles by escaping from his class, his wealth, his family. In *My Religion*, written in his fifty-sixth year, he lays down five conditions of human happiness: (1) a life that does not break the link with Nature—the open sky, sunlight, fresh air, soil, plants, animals; (2) work, physical labour, giving appetite and sleep; (3) family life; (4) a free and living intercourse with all the various classes of mankind; (5) health, and a natural and painless death. These conditions are open most widely to the peasant, and grow narrower the higher you rise in the privileged classes, the Tsar, *e.g.*, holding intercourse with none but a few of his jailers. Hence Tolstóy's later years were one long effort to transform himself into a peasant; and the asceticism which formed part of his strangely complex nature finally struck out the third condition, the family life. He transferred to his wife the responsibility of managing his estates, and, although he continued to live in the family mansion, it was, as far as possible, as a poor man working with his hands. It was a compromise which gave no peace of conscience. More than once he left his home intending never to return, but family affection always drew him back. The family friction which resulted is portrayed in the form of fiction in *Walk in the Light, while ye have Light* (1888). One's sympathies are not entirely on the husband's side; the countess had much cause for complaining that the burden of the children, the estates, and the publication of his books was transferred to her shoulders. In spite of a true affection between them, they drifted apart.

Tolstóy's actual departure from his home came about through the question of the copyright of his works. From 1882-83 the countess, to counterbalance her husband's neglect of the estates, became the publisher of his writings; and in 1894 she deposited in a public museum for safety large quantities of his manuscripts, producing evidence afterwards that they were given her by Tolstóy. This was done, evidently, to protect herself from a deliberate attempt by one of his disciples, V. G. Tchertkóf, to deprive her of them and of all control of their publication. In 1891 Tolstóy, having convinced himself that to make money by his moral and religious writings was sinful, made public announcement that any one was free to publish his works written from 1881 to the time of his death. About the same time he gave Tchertkóf the right of first publication, in Russian and in English, of his future writings. Although this was almost equivalent to copyright, Tchertkóf was not satisfied with it, and set about a long series of intrigues to induce Tolstóy to make a will in his own favour, and without the knowledge of the countess, on the ground that only through him would his works be published in accordance with his publicly expressed wishes. An unhappy aspect of the affair is that his youngest daughter, Alexandra, was in the intrigue against her mother. After many tentative wills had been drawn up and signed, a final one was made on 22nd July 1910, bequeathing all his productions and the manuscripts themselves into the full possession of his daughter Alexandra. An 'explanatory note' stated his wish that 'all papers extant at the time of his death shall be handed to V. G. Tchertkóf, that he may examine such documents and publish what he may consider suitable.' This will was signed on the stump of a tree near Tchertkóf's house, after a long series of unscrupulous

intrigues, and when the old man of eighty-two was fast breaking up in both body and mind. At 5 o'clock on the morning of 28th Oct. 1910 he left his home for ever, accompanied by his daughter Alexandra and his disciple Dr. Makovítsky. His son Ilyá, in his *Reminiscences*¹ of his father, traces his flight to the intolerable moral torture of the dilemma of confessing all to his wife or of repudiating the will. He started with no object but to hide himself somewhere, anywhere. He went first to see his sister Mary, a nun of the Shamárdino convent, and expressed to her his intention of taking a peasant's cottage and living near her; but his daughter, fearing that her mother should discover his whereabouts, carried him off secretly, with the intention of securing a passport and leaving Russia. The old man, however, was nearing his end. At Astápoovo he had to be removed to the house of the stationmaster, where he lingered on till the morning of Sunday, 7th Nov. 1910 (20th, N.S.). Tchertkóf, professing to guard him from intrusion, refused to allow the countess—who had learned where he was only through a message from a newspaper office—to see her dying husband until he was in the article of death and past the power of recognizing her.

Thus passed away in darkness the greatest of modern Russians. Nevertheless, he had attained moral and spiritual unity as nearly as was possible to a nature so vast and turbulent. The common idea that his life is broken into two distinct parts is a mistake. His 'conversion' is simply the emerging into clear consciousness of those ideals of truth and right towards which we see him striving even in the midst of his most dissolute life. His fixed idea was God, and, in spite of all appearances, the effort to make God all and in all gave to his life a great and solemn unity. He was like a wild tumultuous river with the fall of the mountains behind it, thwarted by rocks, gorges, precipices, but never ceasing to turn and twist and foam around and over every obstacle in its thirst for the sea.

TOLTECS.—I. **Origins.**—The beginnings of the Toltec peoples are enveloped in the fogs of mythology. Their origin is rather mysteriously attributed to the acts of a certain hero-god, Quetzalcoatl ('a twin'), compounded of two words *quetzalli*, a plume of green feathers, and *coatl*, a serpent, in other words, a plumed-serpent (-god). Some wild speculations and pious conjectures have identified him with St. Thomas, and others with the Messiah. Another mysterious hero-god (personage) who has been closely linked with Quetzalcoatl was Votan, the reputed founder of the civilization of the Mayas, for a time a contemporary and rival people with the Toltecs.

In the pre-Toltec period of history in Mexico and Central America the Nahua and the Maya were the two leading civilizations. Quetzalcoatl, the plumed-serpent divinity, was the creator of man,² the founder of the new order of things among the Nahua peoples. Like the Maya peoples of Yucatan and Central America, the Nahuas did not confine

¹ *Reminiscences of Tolstoy*, Eng. tr., London, 1914.

² Bancroft, *NR* iii. 272, 275.

their colonies or activities to any one area of territory, though their main settlement was on the plateau of Mexico. In the 6th and 7th centuries the Toltec Chichimec tribes, representing the Nahua power, migrated from Central America and settled down on the Mexican plateau, in proximity to the wonderful lakes of that region.¹ Of the Nahua tribes who made their homes in this region the Toltecs were one of the prominent sections, the beginnings of whose separate and independent existence cannot be sharply depicted.

2. **History.**—At the opening of historic times the Toltecs were in possession of Anáhuac (a section of the plateau of Mexico) and outlying territory. While the civilization was old, the name Toltec was new, possibly derived from Tollan or Tullan, the original capital of the empire. The boundary lines of the Toltec sovereignty cannot be fixed, though it probably did not exceed that of the Aztec domain of later times. It is thought to have extended so far west as to have covered Michoacan, which was never conquered by the Aztecs, and stretched eastward to the Gulf of Mexico, including also the Totonac territory of Vera Cruz. The many tribes and peoples of which the Toltec empire was composed cannot be identified by name with any of the later nations found in Anáhuac. Outside the so-called Toltec empire, the peoples, particularly in the north, were regarded as barbarians and were popularly known as Chichimecs.

From the 7th to the 12th cent. the Toltec empire was in the main ruled by a confederacy which resembled the alliance of a later time between Mexico, Tezcuco, and Tlacopan with capitals at Culhuacan, Otompan, and Tollan respectively. Each capital in its turn became the dominant force in the confederacy. Tollan on the river Quetzalatl is reputed to have reached the highest point in culture, splendour, and fame. It is now represented by the little village of Tula, about 30 miles north-west of the city of Mexico. Culhuacan was the only one of the three capitals of the confederacy to survive by name the bloody revolution by which the empire was finally overthrown, and to maintain anything of her earlier greatness. The confusion and often contradiction between the numerous reports and records and manuscripts of the native and Spanish writers lays a heavy burden upon a historian; but Bancroft and Nadaillac are apparently faithful to the best evidence available in those writers. Let us make a survey of the history and constitution of the Toltec empire, so called, during its five centuries of domination in the central plateau of Mexico, based on the representations of Bancroft and Nadaillac.²

The pre-eminent personage in the beginnings of this new agglomeration of tribes and peoples was Hueman the prophet. It was through his line that a powerful priesthood ruled the destinies of the Toltec empire from its inception to its downfall. The government was in reality a theocratic republic, in which each leader directed his own tribe both in war and in peace, but all were more or less subservient to their spiritual leader in all matters of national import. Seven years after the arrival of these peoples in Tollan the heads of families and chiefs met in assembly and decided to change their form of government, and establish a monarchy, in order to consolidate their strength against any possible future challenge to their rights as a people. On the advice of Hueman, the chiefs sent an embassy to the reigning king of the Chichimecs to ask for a son or other relative to be crowned king over the Toltecs, accompanied by a specific requirement of agreement on the part of the Chichimec king that the Toltecs should ever be a free and independent people, owing no allegiance whatever to the Chichimecs, although the two powers would enter into an alliance for mutual defence and aid. The Chichimec king was only too ready to seize such an opportunity, and sent back with the embassy his second son with the required guarantees, to be crowned first king of the Toltecs at Tollan under the royal name of Chalchihui Tlatonac, 'shining precious stone.' This young king, by his splendid bearing, fine character, intelligence, and amiability, immediately won the admiration and affection of the people. His coronation

and accession to the throne took place about the first quarter of the 5th cent., between 710 and 720.¹ Immediately after his accession the young king and his counselors laid down a law that the time limit of a king should be 52 years, at the end of which he should abdicate in favour of his oldest son, to whom he might, however, act as adviser. If the king should die before the time limit had been reached, the unexpired term should be filled by magistrates elected by the people. The next task of the king was to find a wife to provide an heir to the throne, so that the dynasty might be perpetuated. The amiable young king left this choice entirely to his subjects—at least so the records say—to their joyful satisfaction. Their choice fell upon the daughter of Acapichtzin, who himself had been a candidate for the throne when it was proposed to found a kingdom. Two Nahua documents give a rival story of the beginnings of the monarchy, but the main features are not so widely different.²

Chalchihui Tlatonac, the first Toltec king, died at the end of 52 years and was buried in the chief temple, about A.D. 771. His son and successor was Ixtlilcuechahuac. He had a peaceful and prosperous reign. The signal event of his rule, and near its conclusion, was a meeting of all the wise men under the direction of the old prophet Hueman. This assembly collected all the Toltec ancient and modern documents, and after a prolonged conference and careful investigation, compiled the *Teomoztli*, 'book of God.' On its pages they inscribed the Nahua annals from the creation down; also their religious rites, their governmental system, laws, and social customs; their methods of agriculture; their arts and sciences, and especially astrology; their methods of computing time and interpreting their writings. To these wealthy pages was added a chapter on the forecast of the future events of the kingdom, including the disaster through which it was crushed and destroyed.

The third king, Huetzin, succeeded to the throne about 823. The fourth king, Totepenh, sometimes given as the second king of Culhuacan, came to his father's throne at the end of 52 years; and handed it down at the same time limit to his son Nacaxoc, the fifth king at Tollan, who was succeeded by Nauhoyotl, or Milt. This sixth reign stretched over 59 years. During all these six reigns there was great advance made in building new cities, beautifying old cities, erecting new temples, one of especial magnificence at Quauhnahuac and another at Tollan rivalling even the Temple of the Sun at Teotihuacan, a city which surpassed Tollan in extent and beauty. These more than 300 years saw the Toltec empire well and prosperously established over a large territory and many peoples.

Looking back at some of the details of those reigns, we gather a few significant facts. The annals of Culhuacan mention Totepenh (the fourth Toltec king) as the second king of that city. He waged several successful wars, notably in the province of Huitznahua, where he found, conquered, and married a princess Chimalman, who bore him an heir named Ceacatl Quetzalcoatl. This notable scion of the royal family succeeded in establishing certain laws of succession which prevailed down to the end of the empire; but the most far-reaching act was the conclusion of an alliance between the crowns of Culhuacan, Otompan, and Tollan. Each king was to be independent in his own domain; but in affairs of general interest the three rulers were to constitute a council, in which the king of Culhuacan was to rank first, with a title almost equivalent to emperor. Otompan took the second rank and Tollan the third. The date of the formation of this confederacy or empire was about A.D. 856.

After Quetzalcoatl had ruled in Culhuacan about ten years, he met obstinate opposition to his authority from his enemies. He was a radical reformer whose ideas ran counter to those of the reigning pontiffs. He modified much of the religious ritual and abolished human sacrifices. These sacrifices had had a first place from pre-Toltec times at Teotihuacan, and more or less general acceptance in Culhuacan and Tollan. He absolutely prohibited them in the temples of Tollan, and so stirred up the enmity of the powerful priesthood of Otompan and Culhuacan. The nobility of Tollan also, who resented the curbing of their religious liberties, became jealous of their brothers of equal rank among other peoples of the empire. Nevertheless, Tollan became the metropolis of the confederacy. In the magnificence of her palaces and temples, in the skill and fame of her artists, if not in her population, Tollan surpassed all her rivals on the plateau. This was too much for the other centres, and active aggressive opposition, political,

² *Id.* v. 248-250.

magical, and religious, raised its weapons of warning. Quetzalcoatl's aversion to the shedding of blood is said to have caused the abandonment of his throne, against the ardent wishes of his more warlike friends, and his crossing over to the eastern part of the plateau of Huiztilapan in 895. His successor in Tollan, Nacaxoc, known under several other names, was the fifth king of the Toltecs.

The reign of Nanhyotl, or Mitl, the sixth king of Tollan, was marked with great prosperity and peace. His entire energy and strength were devoted to the promotion of the glory of his city, where he re-affirmed and carried out the reforms of his predecessor. Cholula, a rival sacred city, really stirred him to vigorous action, in building greater temples and more attractive shrines to prevent pilgrimages from Tollan to the rival city. He also built superb temples in other provinces to the south outside the boundaries of Anáhuac.

Nanhyotl, or Mitl, at his death, was succeeded by his queen, Xiuhaltzin, who reigned four years. She showed wonderful wisdom and skill in her direction of public affairs, and her death was greatly lamented by her subjects. Her son and successor was Matlocoatl, whose reign covered 949 to 973; he was succeeded by Tilcoatzin, who ruled from 973 to 994, and who was followed by Tecpancaltzin. The records of this period are almost a blank, except that in Culhuacan Quetzalcoatl was succeeded in 953 by Chalchih Tlatonac (II.) and the latter in 955 by Totepuh, the second king of that name.

We now approach the period when the Toltec empire was descending the slopes of ruin. The annals of this period are scarlet with the sanguinary struggles between the powerful tribes and bands from the north and north-west and the civil and religious authorities of the empire. The extensive records of the period of the downfall of the Toltec empire are confusion worse confounded. They abound with tales of marvel and mystery, as if intending to throw dust into the eyes of the reader.

Spanish writers still speak of Tollan as the empire, but Nahua documents find in that city the 'occurrences which caused the destruction of the Toltec power.' Whether this is the truth or not, it seems that a battle was fought between the king of Culhuacan and the king of Tollan, and, while this contest was going on outside the city, a party of invaders was admitted into Tollan. Civil strife followed in the streets between three rival sects, until the city itself was nearly in ruins. The three allied powers fought each other, and later there came a period of famine and pestilence in the land. These events occurred between 1040 and 1047.

Defence was so weakened, the reins of government so loosened, that dependencies took advantage of their opportunity to renounce Toltec authority and declare their independence.

The other Toltec cities of power, Culhuacan, Otonipan, and Tezucuo, seem to have gone down before Tollan. Invaders from the north and north-west, from the powerful Chichimec tribes and Nahua peoples, fell upon the weakened Toltecs without mercy and took possession of all their cities and territory. The cities of the confederacy were plundered and burned except Culhuacan, whose king seems to have made a 'delivering' alliance, about A.D. 1060.

The Toltec power was overthrown. The last years of its struggle for existence are inextricably mixed. Plots, intrigues, battles, invasions, assassinations, blot the escutcheon of the once noble kings of the Toltec empire. Many of the nobility of the Toltecs are said to have migrated before the storm burst. They went to foreign provinces with their families, their treasures, and their other movable wealth. But the Toltec peoples of the humbler classes remained in Anáhuac. Some of them are said to have maintained a national existence for a time in Culhuacan, and possibly in Cholula. But they finally became the subjects of the invaders, whose language and customs were probably identical with their own. Even the sanguinary records do not warrant us in believing that the Toltecs as reported were reduced to merely a few thousands in number. The Toltec collapse was the fall of an empire, not the annihilation of a nation. The succeeding period was a struggle to secure the authority which fell from the hands of the Toltec rulers.

3. Physical features and culture.—The Toltecs, we are told,¹ were tall, well built, with clear yellow complexions; their eyes were black, their teeth white, their hair black and glossy, their lips thick, their noses aquiline, and their foreheads receding. They had thin beards, and little hair on their bodies. Their mouths made an agreeable impression, but their facial expression was severe. They were brave, cruel, and vengeful, and their religious rites were sanguinary.

They were intelligent, eager to learn, and are said to have been the first [in Mexico] to construct roads and aqueducts; they used the ordinary metals except iron, cut precious stones, built houses of stone laid up in lime mortars; knew how to spin, weave, and dye cloth; and built mounds similar to those found so plentifully in the Mississippi valley.² Their cities were marvels of construction, beauty, and durability. Their temples were ornate with sculptured bas-reliefs and hieroglyphics, cut in porphyry, basalt, and obsidian.

Their commerce was important and pioneering. Their products were exhibited yearly at fairs, spread before the public in the cities of Tollan and Cholula. Though they seemed not to have used iron, they did work in gold, silver, copper, tin, and lead. They were skilled in making fine jewellery, in which precious stones, such as emeralds, turquoises, and amethysts, were mounted. Cholula was famous for its pottery in the form of vases, utensils for the house, idols for the temples, and ornaments for the people.

The weapons used by the Toltecs were slings, bows and arrows, spears, and darts pointed with silex, obsidian, porphyry, copper, or bone. The warriors wore padded cotton armour, practically impenetrable to arrows or javelins, and so heavy that a warrior once fallen could not always get up again. Their round shields of light flexible bamboo were decorated with feathers and covered with cloth or the skins of animals which they had killed in hunting. The shields of the chiefs were decorated with plaques of gold as a mark of their rank.

4. Human sacrifice.—Prisoners of war were often sacrificed to their gods. Funeral ceremonies were also accompanied by the burning of women upon the funeral pile of their husbands; this the women joyfully accepted because it opened to them the door into the first celestial sphere, where they could follow their husbands and thus avoid Mictlan, a gloomy and solitary abode.

5. Religion.—The religious system of the Toltecs is a chaos of ceremonies and ritual, so entangled with the pre-Toltec era and modified in the subsequent Chichimec-Aztec period that little definite and specific can be affirmed beyond those items already mentioned above in § 2. Even the many extracts from native and Spanish writers given by Bancroft and Nadaillac convey merely a hazy idea of the so-called religious systems of the Nahua nations of which the Toltecs were a part. Their multitudinous polytheism only adds to the confusion and attests that religion, mysticism, and mythology were such a conglomerate of everyday life that even the alleged documents of native writers could not disentangle them.

6. Calendar and hieroglyphic language.—The so-called Mexican calendar, found on a block of porphyry uncovered in the old city of Mexico in 1790, probably supplies us with the Aztec astronomical cycle. The Mexicans kept a solar year, and a lunar year only for religious holidays; the latter was divided into periods of thirteen days, corresponding to the phases of the moon.³ The Toltecs (and Mayas) had a month of twenty days, apparently based on the normal number of a man's fingers and toes.⁴ The key to the ancient hieroglyphic language of the peoples of Mexico and Central America, as found on their great monuments at Palenque and Copan and other remarkable ruins, is practically lost.⁵ A few signs are known, but, until a sure key is established, we shall have to rely mainly on the native sources, as reported to and by Spanish writers, for any information regarding the hieroglyphic era of the pre-Aztec, and even of the Aztec, peoples.

Even the most comprehensive works on the Toltecs are inadequate and insufficient in method to clear up the problems that native and Spanish authors pour out on the table of the modern student of ancient Mexico.

TONGANS.—i. Introduction.—Tonga—or at least the Tonga of this article—is the name of a group of islands in the Western Pacific, lying to the north of New Zealand, the east of New Caledonia, and the south of Fiji and Samoa. It is sometimes known as the Friendly Isles, the name given it by Captain Cook. The Tongans who inhabit this group are a tiny nation of the Polynesian race. Although few in number—about 20,000 only—their nationality is clearly marked, and they can easily be distinguished from their neighbours the Fijians and Samoans. Typical Tongans are tall, large-limbed, of a light coffee colour, with upright forehead and straight hair; but a little acquaintance with them shows that there has been an admixture with a race that was short and had receding foreheads. This agrees with their traditions, which state that, when the Tongans came to the group, some five or six centuries ago, it was already occupied by an aboriginal race. Traces of these have been found in one of the volcanic islands, but the vestiges have not been scientifically examined. Still it is clear that the Tongans, and Polynesians generally, have emigrated from a distance; and the most probable theory is that of Fornander, that they came from the head of the Persian Gulf.

Old navigators used to speak of the Tongans as 'the most splendid savages in existence,' and they were certainly the terror of the neighbouring groups, all of which are said to have been once conquered by them. They acknowledge themselves to be mentally inferior to the European; but it cannot be said that they come very far behind; and occasionally students at Tubou College have achieved results that could be equalled only by the best pupils in English schools. A fair measure of the size of their brains may surely be found in their language, which contains, it is estimated, at least 10,000 words in use. The verbs have about 20 voices, and the pronouns are developed to such an amazing extent that there are more than 100 ways of saying 'our,' against two in English, 'our' and 'our own.' As the adjectives, too, have many degrees of comparison, and there are more than two articles, shades of meaning can be produced to an almost infinite extent. That the Bible translates well into a language like this is not surprising; but geometrical treatises, and such works as Milton's *Paradise Lost*, can also be well rendered.

Physically, then, and mentally, the Tongans stand high; and it comes as a surprise that their

spiritual development, as represented by their old religion, was low. Their pantheon was a medley, and their theology unredeemed by any gleams of philosophy as in the religion of India.

2. The gods of Tonga may be divided into three classes.

(1) In common with other parts of Polynesia, their great gods comprise the two groups of the Tangalao and the Maui (pronounced Mow-y: Mow as in *now*). The *Tangalao* were the earlier group, and consisted of Tangalao 'Eiki ('Lord Tangalao,' or 'Tangalao the Elder'), Tangalao Tufunga ('Tangalao the Smith, Carpenter, or Artificer,' who made axes and built canoes), and Tangalao 'Atulongolongo ('Tangalao the Sender-forth-of-sound'). The *Maui* group consisted of five persons: Maui Motu'a ('Old Maui,' or 'Maui the Father'), Maui Loa ('Maui the Tall'), Maui Buku ('Maui the Short'), and Maui 'Atalanga ('Maui the Vigorous Planter'). This last had a son called Maui Kijikiji (pronounced Kitsikitsi: 'Maui the Violent, the Mischievous'), who was, of course, the grandson of Maui Motu'a.

There were, however, older gods than any of these. One was called Tama-bo'uli-ala-mafoa ('Son-of-the-Darkness-that-can-have-a-dawn'). Some accounts represent him as the original deity. Another of the primitive gods was 'Eitu-matubu'a ('Eitu-of-the-older-time'). He is spoken of as the father of the Tongan people. Another of these gods was Hikule'o, the Tongan Satan. *Hikule'o* means 'the echo,' and there is no doubt that this was the original signification of the name; but as it *might* mean 'Watching Tail,' the legend grew up that the tail of this deity was so long that when he, the god, went about, the tail kept watch at home. But even now the Tongans, when they hear an echo, say it is Hikule'o walking in the woods; and the other explanation was evidently an afterthought.

These with others were the original gods of Tonga. By and by a division of departments took place. To the Tangalao was assigned the Sky (or Heaven); to the Maui group the Under World; and to Hikule'o the World and Bulotu (Hades). But in order to keep Hikule'o in his place, as he was a god that delighted in mischief, a cord was attached to him, one end of which was held by Tangalao in the sky, and the other by a Maui in the under world, to prevent his leaving Bulotu to damage the world. This division was effected by an older god than any, namely, Taufuilifonua ('Frequent-Upsetter-of-the-land'), who also assigned the sea to Hemoana, and the woods and dry land generally to Lube (the Dove). Hemoana's name is sometimes pronounced Heimoana, and the present writer believes that Tongavalevale spoke of him as Hea-Moana, though he is unable to speak positively on that point. *Hea-Moana* would signify 'Hea-of-the-deep-sea'; *Hemoana* would be simply 'the Deep Sea'=Oceanus. His shrine was the banded sea-snake. These were the Olympian gods of Tonga; but, with the exception of Hikule'o, they were rarely worshipped, and few if any temples were erected in their honour. The exception is due to the fact that Hikule'o was a mischievous god, and must therefore be propitiated.

(2) The second class of gods were an inferior race, who had their shrines in animals, birds, fishes, trees, whales' teeth, clubs, and even stones. Yet these were the gods worshipped by the people, and their temples were to be found in every village. Here are a few of them: Tu'i 'Ahau ('King of the town of 'Ahau'), whose shrine was a volcanic stone of peculiar shape; Tu'i Lalotonga ('King of Rarotonga,' or perhaps of the world below Tonga), whose shrine was the dragon-fly; Tali'ai Tubou (the god of the reigning dynasty while yet heathen),

whose shrine was a shark [Mariner renders *Talii Tubou* by 'Wait there, Tubou,' which is certainly incorrect; *Talii Tubou* was probably the name of a king]; *Bulotu Katoa* (the *Pleroma* of the Spirit World, who presided over hurricanes, and agriculture), whose shrine, we think, was a tree at *Kolonga* [Mariner mentions several the present writer has never heard of: *Tubou Toutai* ('Tubou the Mariner'); *Tubou* is the familiar designation of the king, and one of his family is usually called *Tubou Toutai*]; *Hala'evalu* ('Eight Ways'; also the name of a chief); *Alo'alo* ('the Fanner'), the god of wind and weather, rain, harvest, and vegetation; *Tu'i Bulotu* ('King of the Spirit World'). Other gods resided in the turtle, the cuttle-fish, the kingfisher, etc. *Fonokitangata's* shrine was a war-club. These were, so to speak, the private gods of the people, and the shrine of each was tabu to its worshippers. Thus the people of *Te'ekiu* were forbidden to eat the octopus, that being the shrine of their god. In the neighbouring villages, however, it would be freely eaten. In *Nomuka* one particular family were thus debarred from eating turtle, while the rest of the town were free to partake of that delicacy.

(3) In addition to these there were a number of supernatural beings whose position in the Tongan pantheon is not clear. They were looked upon as gods, and the term expressive of highest deity was applied to them; but they were never worshipped, nor were temples built to them. On the contrary, they were looked upon with contempt, and their follies freely portrayed and laughed at. It is curious to see these ascriptions of high divinity and expressions of contempt standing side by side. Is it that these were the gods of the inferior race which the Tongans found in the group when they landed?

Take an instance or two. *Jiji* and *Faiga'a* were two goddesses in this class, who had set their affections on a Tongan of great masculine beauty called *Bajikole*. He, tired of their attentions, plaited two large baskets of cocoa-nut leaves, put one goddess in each, and, shouldering them like a Chinaman, conveyed them into the hush, and hung them on the branch of a tree, and left them there for two years, until the baskets rotted, and they fell to the ground. They made another attempt on his affections, and he finally got rid of them by inveigling them into his fish traps, and leaving them at the bottom of the sea, where they lay until *Tangaloa* took pity on them, and sent a god to release them. Take another instance. In this case also it was two goddesses, who set out to meet a mortal lover. While waiting for him, they took off their heads to dress their hair. Suddenly his footsteps were heard, and they put their heads on again; but in the hurry one of them put hers on hind before; and when she attempted to move, her face went one way and her legs another. It is extremely puzzling to meet with tales like these, referring to those to whom the titles of highest deity are given: and yet, after all, they do but recall the vagaries of the Olympian deities as described by Homer, when

'Unextinguished laughter shook the skies.'

On the subject of ancestor-worship, Mariner speaks positively (vol. ii. p. 97): 'That there are other *Hotooas* or gods, viz. the souls of all deceased nobles and mataboos.' The present writer was disposed to agree with him at first, especially as it was a custom of the people to go to the cemeteries to pray, even after a sacrifice had been presented at the temple. But further inquiry has convinced him that they did so because they fancied themselves nearer the spirit-world in such places. Intelligent chiefs like *Valu*, who were acquainted with heathenism, are equally positive in the other direction, and deny that they looked upon the spirits of deceased chiefs as gods. We think the truth lies between the two statements, and that Mariner himself gives us a key to the solution of the question. In vol. i. p. 376, he speaks of *Feenow* as being frequently inspired by the spirit of *Mumni* (a late king of Tonga). Now we can readily understand that in such circumstances *Feenow* would pray to *Mumui*, and others would join him; so that in time *Mumui* would be

looked upon as a god. This would account for such gods as *Tu'i Lalotonga*, *Tu'i 'Ahau*, *Talii Tubou*, and others. All the inquiries of the present writer negative the assertion that the spirits of chiefs as a general thing became gods. We may then look upon the gods of the first class as primitive, brought by the Tongans from their original home, and the third class as the gods of the aboriginals whom they conquered. The second class contained also some primitive gods, but was recruited largely from the spirits of ancestors—i.e. the spirits of certain deceased chiefs by whom kings and notable personages fancied themselves to have been possessed.

The other point the present writer made special inquiries about was whether the Tongans worshipped the clubs, whales' teeth, animals, trees, stones, etc., before which they placed their offerings, or the god who was supposed to be temporarily residing in them. The answer was decisive. The clubs, trees, etc., were simply the *vaka*, the god itself was spiritual. *Vaka* signifies a 'mode of conveyance,' usually a canoe, but also a carriage, or anything by which one is conveyed from place to place.

Probably we may see here a development of their spiritual ideas. The oldest class—*Tangaloa*, *Maui*, *Hemoana*—were undoubtedly corporeal. Their bodies performed all the functions of human bodies, and they were inflamed with human passions. But the Tongans had long ceased to pray to them, and scarcely any vestiges of their worship remained when the missionaries came. The third class of gods, too, were corporeal, but there are no signs of worship being paid them at any time. These two classes existed side by side; but long before the introduction of Christianity both had been discarded as objects of worship, which was paid only to the second class. In other words, the Tongans had worked out a theology, which had, at any rate, this noble feature in it, that God was a spirit, and they that worship Him must worship Him in spirit.

The general Tongan term for supernatural beings is *fa'ahikehe*. This is often shortened into *fa'ahi*, and when the adjective *lahi* ('great') is added—*fa'ahi lahi*—the idea conveyed is that of full deity. *Fa'ahi* signifies properly 'a party,' 'a side' (as in cricket); or it may be short for *fa'ahinga* = 'kind,' 'class,' 'race,' 'species,' 'genus.' *Kehe* = 'other' (*ἕτερος*, not *ἄλλος*), so *fa'ahikehe* is 'different folk,' 'other kind of people.' The usual word for 'God' is *'Otua*. Mariner spells it *Hotooa*, but there is no *h* in it. The inverted comma represents a guttural, a half *k*, which is one of the difficulties of the language. It is not readily recognized by the European ear, and is mostly neglected by foreigners, while being as intractable as the *Ayin* in Hebrew. The present writer has failed to find any derivation for *'Otua*, or meaning other than 'God,' and believes it to be a primitive Polynesian word. In some parts of the Pacific it appears as *Atua*.

The other great word is *'Eiki* = 'Lord,' which is used as in English for both earthly and heavenly lords. Hence it is not so high a term as *'Otua*. Indeed it seems sometimes to mean only 'supernatural.' Thus a corpse is called *ha me'a faka'eiki*, which apparently signifies 'a thing belonging to the spirit world.' Probably Mariner was thinking of this when he said (vol. ii. p. 130): 'The human soul after its separation from the body is termed *hotooa*, i.e. a god or spirit.' He is certainly wrong in that statement. It is clear that *'eiki* was not the original form of the word, which the laws of the language point out to have been *ikeiki*.

We must not pass over the fact that the members of one of the dynasties of kings were regarded as gods. This was the earliest line of kings, and their title was *Tu'i Tonga* ('King of Tonga'). They were certainly looked upon as in some sense divine beings; and instances are on record of prayers being offered to them. Words applied only to the gods were used in addressing them; such as *'Ei*, already referred to, *ha'e*, and *'afio*, used of the movements of deity. The face of the *Tu'i Tonga* was termed the 'sky,' and to him, as the representative of the gods, were presented the 'first-fruits.' This ceremony, called the *'inaji*, or 'portion,' is described by Mariner (vol. ii. p. 196). When a *Tu'i Tonga* died, he was said to be 'missing' (*hala*), and he was buried in a *ziquurat*, or pyramid

of steps. This was called a *langi*, or 'heaven'; and many of them remain in tolerable preservation, and excite the wonder of the visitor by the huge size of many of the stones, some of which measure over 20 ft. in length.

Many, probably most, of the names of the Tu'i Tonga have been preserved, and their history curiously reminds us of the story of the Carolingians and Merovingians in France. One of the Tu'i Tonga, called Takalaua, was murdered, and his son and successor Kau'ulufonuafekeai, from weariness or fear, devolved the duties of government on his younger brother, reserving to himself the honours and emoluments of the office. His brother assumed the title of Tu'i Ha'a Takalaua ('King of the Takalauans'), and soon got all the power into his hands, the Tu'i Tonga becoming a *roi fainéant*. After a few generations, however, the Tu'i Ha'a Takalaua became effete, and the government was handed over to another branch, called the Tu'i Kanokubolu ('King of Kanokubolu,' the town in which he lived). This is the title of the present dynasty. Representatives of the other two lines, however, still exist, but the titles are not used. The representative, however, of the Tu'i Tonga holds even now a quasi-sacred position, and is still addressed as the gods used to be; and words sacred to deity are used for all his movements.

Mariner mentions another semi-divine person called the Veachi (vol. ii. p. 80). This part of his narrative is very perplexing, as neither Veeson nor Thomas nor any of the modern chiefs knows anything about him.

The word used all over Polynesia for 'religion,' 'worship,' 'prayer,' etc., is *lotu*. Fortunately this has a meaning in Tongan, and signifies 'a seeking for something that is hard to find.' Thus when famine prevails, the people *lotu kai*, i.e. go all over the land looking for food. It is also used for the restlessness of a caged animal seeking an outlet, and for the cry of an animal for its mate or companions. This is not the only word common to Polynesia which finds its meaning in Tongan. *Tabu* (or *taboo*), now of world-wide use, signifies in Tongan that something which might be opened is closed. These and other considerations lead one to think that the Tongan language comes nearer than most of the dialects to the original Polynesian tongue.

3. The religious rites of the Tongans were few. There was nothing in their religion corresponding to our idea of worship. If they wanted something—rain, fair winds, good crops, successful fishery—or if they wished to prevent some calamity—such as sickness, death, hurricanes, war—they would seek the favour of a god, would offer sacrifice and pray. But to come into his temple, to worship, to sing his praises, to dwell upon his attributes—this was a foreign idea altogether. Hence there was very little in the Tongan religion to cultivate the conscience, or to control the passions, or to elevate the thoughts. Mariner thinks otherwise, and we would gladly believe his favourable report of the Tongan character. But all our information—and much of it goes back to Mariner's time—contradicts his statements. He even contradicts himself. The Feenow he speaks so highly of was a monster of iniquity; and there is no doubt that for centuries theft, murder, lust, treachery, and almost everything in the catalogue of evil, have been rife in Tonga. No man's life or property, and no woman's honour, was safe for a day.

They never went to their gods empty-handed; a piece of kava root for making the native drink was a *sine qua non*. Baskets of food, too, were usually brought in addition, and presented to the god or his priest. One of the party would then state the object of their visit, and implore the deity to grant their request, or use his influence with the gods of

Bulotu in their favour. Sometimes the priest would remain silent; at other times he would object that their gifts were too small. If he spoke at all, he spoke as the god, being supposed to be 'possessed' by the god at the moment. John Thomas says (Farmer's *Tonga*, 128): 'Often there was another person present, the friend of the god, who acted as mediator, and addressed the priest on behalf of the offerers.' Hingano, a chief lady of great age, described to the present writer how she and others would take baskets of food to the door of Taliai Tubou's temple in Nuku'alofa, and, bowing down, would implore the god's favour. Shortly a white (*sic*) foot would be protruded from beneath a curtain, which they would kiss and then retire.

If their object was to deprecate a calamity, as in a case of sickness, the rite assumed a darker hue. Fingers were cut off, wrapped in banana leaves, and presented; or children were strangled, and their bodies brought as a sacrifice. When prayers were offered to Fonokitangata, the sacrifice was always an adult. Generally a man obnoxious to the community was hunted down and killed, and his body brought in a basket and laid before the priest; but Mariner speaks of a chief of rank being killed in one instance. The offerers, clothed in old and dirty mats, and wearing necklaces of chestnut leaves, would squat on the ground at a distance, and weep and beat their breasts, while the priest, holding in his hand a war club, the shrine of the god, would listen to their prayers with his eyes fixed upon the club or upon the ground. Sometimes he would reply in his ordinary voice, but more often in unnatural tones, as if some one were speaking in him; and frequently he would begin to shake as if in a fit, and to roll about and foam at the mouth. Any words he might utter whilst in this condition were eagerly caught up as the direct utterances of the god. After a while the shaking would cease, and the priest, striking the ground with the club, would announce that the god had departed. Mariner (vol. i. p. 160) has a good description of this kind of possession; and he evidently thought that the phenomena were not altogether voluntary, but that a real possession of some kind took place—a belief which was shared by some of the earlier missionaries.

4. The Tongans believed in the immortality of the soul. Mariner, Veeson, and Thomas are agreed on this point.

Veeson says (Farmer's *Tonga*, p. 131): 'One day they were conversing about a person that was lately dead, and said, "He goes to the island through the sky." "How can he be," said I, "in that place, when he is dead, and his body here? Did you not bury him some moons ago?" But all they answered was, "But he is still alive." And one took hold of my hand, and, squeezing it, said, "This will die, but the life that is within you will never die"—with his other hand pointing to my heart.'

Mariner and Veeson, too, agree in stating that this immortality is enjoyed only by the upper classes: the souls of the Tu'as, or common people, die with their bodies. This, no doubt, was the belief of the upper classes, who looked down upon the Tu'as as little better than animals; but it is no evidence of the belief of the Tu'as themselves. Thomas says more truly: 'Of the faith of the common people there was no certainty.'

The 'island' referred to was called Bulotu, and 'through the sky' meant 'over the horizon.' Bulotu is, the present writer thinks, a primitive Polynesian word, and is the name for Paradise in all the dialects. It was situated west or north-west of Tonga, and could be reached by sea. At least the ballads speak of canoes touching there; but how the disembodied spirits got there is not stated. Mariner tells us (vol. ii. p. 101) that Bulotu was believed by the Tongans to be a large island, stocked with all kinds of useful and

ornamental plants in a state of high perfection, and that when these were plucked others would immediately occupy their place. The whole atmosphere was filled with a most delightful fragrance; there were also beautiful birds of all kinds, and abundance of hogs—all of which were immortal unless killed to provide food for the gods. At the moment a bird or a hog was killed, another living bird or hog came into existence. Further on he gives another account of Bulotu brought by a canoe which touched there:

'The crew landed, and proceeded to pluck some breadfruit; but to their unspeakable astonishment, they could no more lay hold of it than if it was a shadow. They walked through the trunks of trees, and passed through the substance of the houses without feeling any resistance. They at length saw some of the gods, who passed through the substance of their bodies as if there was nothing there.' The gods were supposed to have no canoes, not requiring them; 'for if they wished to be anywhere, there they are the moment the wish is felt.'

Now, is this again a development? For the ballads, which date from a time long antecedent to the visit of Mariner, give a very different description. According to them, everything in Bulotu was material. Its entrance was guarded by a woman with eight tongues. There was a large canoe for the gods to voyage in, which was called Langotangata ('the human-rollered'), because it was dragged down to the sea on living rollers, each being a human being. The same trees grew as on earth: cocoa-nuts, breadfruit, yams, etc.; and provision was made for the favourite pastimes of chiefs. There were eminences for netting wood-pigeons, reefs for shark-catching, 'ulua to be fished, and gigantic clams to be dived for. Ovens of food were cooked as on earth, and kava was prepared and drunk. The houses had solid posts, and the roofs were constructed in the usual way. One of the halls in Bulotu was panelled with the pupils of men's eyes 'which sparkled and flashed.' The women had a hall lined with mirrors—a veritable crystal palace. There was a *Vaiola*, or Fountain of Life, whose waters were so potent that a child plunged into it grew up to manhood in a few days. There was also a *Vai-lolofafanga*, or Fountain of Perfumery, and other delights of women (see 'Voyage of Faimalie,' *Tubou College Magazine*, vol. iii. p. 39).

5. Cosmogony.—The earliest chapters of the Tongan genesis run somewhat as follows:

Some seaweed and slime clung together, and were carried away by the sea, and washed up on the island of Totai in Bulotu. By and by there grew up between them a large metallic stone called *Tonifafutuna* ('Pregnant-how-long-ago!'). Suddenly it began to shake, and sent out a sound like thunder; and, splitting, there sprang out a male and a female twin. The male was called Biki ('Sticky') and the female Kele ('Slimy'). Again the huge stone rolled about as if there was an earthquake, and other twins sprang out: the male called Atungaki (?), and the female Maimoa'alongona ('Vagaries-of-sound'). Again the stone groaned, and twins sprang out, called 'Land-turtle' and 'Sea-turtle.' Again the stone sounded and earthquake, and twins sprang forth, Hemoana (the Sea-snake), and Lube (the Dove).

They grew up and married, i.e. the first pair and the second and the third. The eldest child of Biki and Kele was a son, Taufuilouua ('Frequent-overturner-of-the-land'). The next was a girl called Havea-lolofouua (Havea-of-the-underworld). The second pair had a girl called Vele Lahi, and the third pair a girl called Vele Ji'i. (*Vele* signifies 'longing' or 'desire'; *Vele Lahi*='Desire the Elder,' *Vele Ji'i*='Desire the Younger'). Sticky and Slimy created a new land called *Tonga Mama'o* ('Distant Tonga'), and put on it Taufuilouua and Havea-lolofouua.

[The next incident is unprintable, but is a realistic setting of the words, 'And they were both naked, the man and his wife, and were not ashamed.' They were ignorant even of the sexual function, which they discovered only by accident. The result was a boy called Hikule'o ('the Echo,' the Tongan Satan: see above.)]

Then Havea said to Vele Lahi and Vele Ji'i, 'Come and marry your brothers as I have done, for there is no man for you.' They did so, and Vele Lahi gave birth to the Tangaloas, and Vele Ji'i to the Maui family. Then Taufuilouua divided the heaven and earth as stated above.

In process of time the Tangaloas ordered Tangaloa 'Atulongo-ongo to go down and see in what condition the world was. So

¹ *Tau* is sometimes intensive. This would then mean 'complete-overturner.'

he entered into the Kiu (? 'Sea-lark'), and went down, and flew in all directions, but could not see any land, only shallows. Then went he up to heaven and reported to the Tangaloas that there was no land, only something that looked like shallows. Said the heavenly chief, 'Wait seven nights, and then go again and see': so Tangaloa 'Atulongo-ongo remained seven days in the sky, and then went down to look at the shallows. The bottom was evidently coming up, and he reported to heaven, 'It looks like a reef.' He said also, 'I can find nothing to stand on and rest.' So they said, 'Go to Tangaloa the Smith, and let him throw down the dust of the pumice he sharpens his axes with.' So Tangaloa Tufunga did so, and threw down the dust of his grindstone, and produced the island of 'Eua. On this being reported, Tangaloa was sent down to stand there and watch. By and by a bit of the shallows would become dry, and ultimately a large land grew up, which consisted, however, only of sand. Tangaloa reported, 'My land is large, but nothing will grow on it.' Then said Lord Tangaloa, 'Take this seed, and set it in the land you have discovered.' It was a *fee* (*convolvulus*). So he set it, and it overspread the land. Then said he, 'There is vegetation enough, but no people: and Lord Tangaloa and the other heavenly chiefs replied, 'Go and split the root of the *fee*.' He did so, and it rotted and produced a grub. So he reported to the sky, 'A great thing is lying in the *fee* I split.' They ordered him to cut it in two, and to call the head Kohai ('Who is it?') and the tail Koua ('It is I'). He did so, and both parts became men: as did also a little piece that had adhered to his beak. This was called Momo ('Little Bit'): and he with the other two were the first men.

Now at that time Maui the Elder ordered his family to go on board a canoe, and fish up lands. There were four Maui in the canoe: Maui Loo, Maui Buku, and Maui 'Atalanga with his son Maui Kijikiji; and they took their mother Vele with them. She was the maker of mats and fine robes. They called at Manuka, a part of Samoa that was already above the waters. And Maui Kijikiji, leaping ashore, went to get a fish-hook. Meeting the chief's wife, he ravished her; and she, taking kindly to him, revealed her husband's secret, that the magic fish-hook, which would bring up lands, was not a bright and glittering one, but an old and rusty hook, stuck in the reeding. So they got the hook, and, having tried it successfully near Samoa, sailed on boldly, and pulled up Tonga and many other groups of islands. When they came to 'Eua, and saw the three men, they asked whether they had any women; and on their replying 'No,' they went and fetched three, so that they might have one each.

At that time the sky was very low, and an ironwood tree that stood in Tonga reached quite up to heaven. So 'Eitu-Matuba'ua was wont to climb down, and visit the earth; and, cohabiting with a woman in one of the islands, had a child by her called 'Aho'eitu. When he grew to man's estate, he asked who and where his father was; and was directed by his mother to climb up the ironwood tree, and seek him in the sky. He finds him, is recognized, and sent to play with his brothers, who become jealous, and finally kill and eat him. 'Eitu, finding this out, makes them vomit into a large tub, and covers the *dissecta membra* with the leaves of the tree of life (*Novu*). By and by the fragments cohere, and ultimately 'Aho'eitu is found sitting up alive. His brothers are punished by being turned out of heaven, and have to serve 'Aho'eitu on earth, who becomes the first Tu'i Tonga, superseding the children of the 'grub.' The Maui afterwards pushed the sky higher up, as it is at present.

Now the Maui dwelt in the under world, but one of them, Maui 'Atalanga, said to his brethren, 'Have you any objection to my living on the earth, if I visit you from time to time?' And they said, 'No.' So 'Atalanga went up to the earth, taking his young son Kijikiji with him. He lived in Vava'u, and married a mortal wife. Now Maui 'Atalanga did not plant in Vava'u; for he was a mighty planter, and there was not land enough; so he had his plantation in the under world. He kept this, however, a secret from his son Kijikiji, for he was such a mischief. But Maui Kijikiji tracked his father by his footsteps, and, seeing him lift a bush and descend into the earth, waited a while and followed him. Many tricks did he play, until one day his father sent him to Maui the Elder to get a fire-stick. Kijikiji kept quenching the fire and going back for more. At last old Maui told him to take the whole log. This was of enormous size, but the young Maui took it up with ease. Old Maui, who had not recognized his grandson, perceiving that he was a superhuman being, challenged him to wrestle—with the result that the elder Maui was thrown and left for dead. 'Atalanga, hearing of it, strikes his son with his spade and kills him. On going, however, to see how his father was faring, he finds the old man alive, and rather pleased than not with his defeat by his grandson, and angry with his son for having killed him. They apply, however, the leaves of the tree of life, and Maui Kijikiji revives. His next exploit is to carry some fire from the under world to earth, in spite of the efforts of his father to prevent him. They then devote themselves to fighting with and destroying the monstrous animals that infested the world—a huge rat, a gigantic bird called the Moa, a lizard, and some carnivorous trees, etc. Maui 'Atalanga is at last devoured by a huge dog that lived in a magic cave which opened and closed automatically; and his son, after killing the dog, died of grief for his father, etc.

LITERATURE.—The principal authorities on the state of Tonga in early times are these: William Mariner, *An Account of the Natives of the Tonga Islands*, London, 1813; G. Veeson, *Authentic Narrative of Four Years' Residence in Tongatapu*, do. 1810; S. S. Farmer, *Tonga and the Friendly Islands*, do. 1855. [Mariner's is a most valuable work. He gives evidence

of being possessed of no common ability, and of an excellent memory; and, if the present writer has ventured to differ from him, it is for the following reasons: (1) the shortness of Mariner's stay—only 4 years; (2) his obvious want of acquaintance with the niceties of the language; (3) the considerable time that elapsed between his leaving Tonga and the writing down of his reminiscences; (4) the fact that the present writer's acquaintance with Tonga extends over a period of 40 years; (5) that most of his information was taken down from the lips of the 'Last of the Bards,' a once heathen chief called Tongavaleale, who was the repository of their folk-lore and ballads; (6) that he has had access to the unpublished journals of the Rev. John Thomas, Wesleyan minister, who went to Tonga in 1826, and was the first missionary to make a lengthened stay.]

J. EGAN MOULTON.

TONGKING.—Ethnographically Tongking is divided into two parts: South Tongking, the special domain of the Annamese race, and North Tongking, bounded on the north by the Annamo-Chinese frontier, on the east by the sea, on the west by the range where the waters separate into the Red and Black Rivers (Song-Koi and Song-Bo), and on the south by a line bisecting the provinces of Kwang-Yen, Bac-Giang, Thai-Nguyen, Tuyen-Kwang, and Yen-Bay. This Upper Tongking has an area of 54,700 square kilometres, and a population of 374,528, belonging to 26 different ethnic groups. There are no Annamese or Chinese except officials and merchants; the country is peopled chiefly by Tai, Man, or Yao, Pa-Teng, Meo, Lolo, Muong, and a very small number of representatives of far more ancient ethnic groups, such as the La-tchi (La-ti) and the Keu-Lao.

I. **TAI.**—The Tai element, most important in point of numbers (239,179 individuals—about 60 per cent of the total population), is divided into numerous sub-groups, the most important being the Thô (146,000), who are found round Cao-Bang, the Nung (66,000), and the Black Tai (14,500). The Tai have a strong admixture of Chinese and Annamese and are thus closely related to the Siamese and Laotians.

1. **Physical characteristics.**—The Tai are strong and of a lively disposition, careless, fond of pleasure and play, and extraordinarily indolent. This race seems to be on the decrease; there are few births, and infant mortality is very high. They are not absolutely averse to mixed marriages: their daughters may marry Chinese or Annamese if they choose, and their sons take wives from any variety of the race whatever, even from the Man; these mixed marriages produce a stronger and more provident race than the pure Tai.

The Tai live in the plains and low valleys by preference. Their houses are, as a rule, built on piles, the ground-floor being reserved for live-stock and poultry, the upper storey for the inhabitants. The Nang and several other tribes dress like the Chinese; the rest of the Tai follow the Annamese fashion, but wear much brighter colours—indigo blue is almost universal—and far more ornamentation. Rice is the staple food. The Tai also use beans, sweet potatoes, and gourds; pork is their most usual meat, chickens and ducks being reserved for feast-days; they also eat fish. Tea is their chief beverage, though they sometimes drink too much wine or spirit made from fermented grain. The use of tea and betel is practically universal among them; opium is confined to the rich.

The Tai are essentially farmers. They cultivate rice, maize, buck-wheat, beans, peas, sweet potatoes, and sesamum. Industry and commerce are practically non-existent owing to the indolence of the race. They can, however, distil alcohol, weave cloths, make rich embroidery, and do fine basket-work. The Thô even spin a little silk.

2. **Religion.**—On their original animism the Tai have superimposed a confused mixture of Taoist, Buddhist, and Confucian ideas, derived from the Chinese and Annamese. A few priests or lettered men have a vague knowledge of the cosmic system of the *di-kinh*.

They believe that the primordial principle of nature gave birth to the male and female principles, from which issued everything and everybody. The male principle is the sun, the sky, the intellectual soul of men; the female is the dark earth, the moon, the vital and sensual soul of beings. Man has three subtle souls, or *hôn*, which emanate from the male principle, and seven or nine (according as the sex is male or female) vegetative souls, or *viã*. At death these *viã* return to the earth whence they came, while the *hôn* go to the infernal regions. Here we see the influence of the Buddhist doctrine of the transmigration of souls and their purification by punishment. After undergoing the punishments which they have merited, they may approach the throne of the emperor of Jade, the supreme Taoist idol.

The great majority of the people, a most superstitious race, confine themselves to the worship of the evil spirits which infest the air and lie in wait for man even in the most insignificant actions of his life. These are combated by means of forethought and offerings, and especially by the help of more powerful good spirits which are rendered propitious by devoted worship. Among the good spirits the genius of the hearth and the tutelary deity of the village are held in highest honour; of the evil spirits, which have different names in the various Tai groups, the most dreaded are the spirits of people who have died a violent death and the chicken-spirits that insinuate themselves into people, especially women, and give them the evil eye. Of course the Tai believe in white and black magic, spells, lots, and philtres.

Their priests are chiefly sorcerers, who earn their living by offering sacrifices to the spirits, exorcizing the sick, and warding off all the evils invoked against man. They also choose the material with which to build villages or houses, the propitious day for beginning any work, etc. Among the Tai they are nearly all connected with an official cult, but there are independent sorcerers and sorceresses.

The only temples that the Tai possess are small rustic pagodas, nearly all dedicated to the tutelary genius of the locality.

Their religious festivals are borrowed from the Annamese; but among certain tribes, particularly the White and Black Tai, there are some festivals which seem peculiar to the race. (1) *Kin lao mao* ('drink,' 'alcohol,' 'drunk') takes place in September. All the inhabitants of the village meet in one of their houses for a banquet, which is followed after sunset by music and singing. The feast lasts three days, during which no one may enter or leave the village. (2) *King pang* ('to eat bread') takes place in January. It is characterized by round dances to the accompaniment of chants. Among the White Tai it is the women who dance, among the Black Tai the men. (3) *Kin tien* ('to eat coined money') takes place in December in honour of the dead. It lasts three days, with banquets, dancing, and singing. Both men and women take part.

Ancestor-worship exists among the Tai, but only a more or less slavish imitation of Annamese ritualism. It is practised chiefly among the Thô, who preserve the names of their ancestors to the fourth generation, make offerings at prescribed times, and train their children to honour the dead as the protectors of the hearth. Only those who have died a natural death have a place on the family altar; those who have died a violent death, out of doors, have only a small outside altar, usually built in the garden.¹

3. **Myths and legends.**—Among all the Tai is found the tradition of a universal deluge, from which the god of the earth saved only a brother and a sister—a poor but pious couple—who shut themselves at his command inside a hollow pumpkin, with some rice for provision. After the subsidence of the waters the present-day races were born from the union of this couple.

4. **Medicine.**—The Tai regard nearly every illness as the work of evil spirits, and the best medicine is the sorcerer; the more enlightened members of the race sometimes admit that there are natural ailments, which they treat with simples and mineral products borrowed from the Chinese pharmacopœia.

¹ It should be noticed that the Tai know nothing of the property called *hư'ng hoa* in Annam—an inalienable part of the patrimony reserved to meet the expense of the cult of the dead and the upkeep of the tombs. As a rule after a few months, at most after four years, the Tai have nothing more to do with the tombs.

5. **Marriage.**—Although the manners of the Tai are not so free and easy as those of the Laotians, youths and maidens meet freely to sing and play—which often leads to sexual relations; all that Tai morality requires is that there be no tangible proofs of these relations, and hence recourse is had to abortive measures or the suppression of children.

The father is the unquestioned head of the family, yet it is only among the highly Annamitized Tai that he chooses a mate for his child; among the Tai of the right bank of the Red River the young people make their own choice. The proposal is made by a go-between; the young man pays a dowry, and the engagement is settled after a sorcerer has compared the genealogical forecasts of the couple, in order to see whether any supernatural influence opposes their union. The engagement is generally long—from three months to three years—and is rather expensive for the *fiancé*, who is expected to give a great number of presents. The engaged couple are bound to observe the strictest reserve; they are not allowed to take any notice of each other until the wedding-day, while they have complete liberty in their relations with the other young people of both sexes. The marriage-ceremony itself is borrowed from the Annamese.

The outstanding characteristic of marriage among the Tai—with the exception of the Thô in the west, the Nung, and the Thô-Ti—is the quaint custom of separating husband and wife after the celebration of their union: among some tribes the wife spends a fortnight with her parents and a fortnight with her husband; among others she cannot go to her husband except when invited. This state of affairs comes to an end with the appearance of pregnancy, or, in cases of sterility, at the end of the fourth year of married life, when the wife takes her place at the family hearth. As the separated husband and wife retain complete liberty of behaviour outside with people of their own age, Tai morality suffers some strange drawbacks from this custom. The Tai youths marry usually between twenty-three and twenty-five, the girls between sixteen and eighteen.

The Thô of the west and several other tribes practise marriage by adoption and marriage by contract also. A poor young man can enter a rich family without paying the usual dowry, on condition that he takes his father-in-law's name, and lives with and works for his father-in-law. Should he wish later to live apart with his wife, he is liable to pay an indemnity to his father-in-law. A young man can also marry without paying a dowry and without changing his name, by undertaking a contract to serve his wife in her father's house for a stated number of years—from four to seven. If he dies before the contract has expired, his widow is responsible for his debt. These two forms of marriage, which are not held in high esteem, entail no long engagements and no costly wedding-feasts.

Polygamy is allowed by the Tai, but seldom practised; the number of wives is usually limited to two, only the first having honour and authority at the hearth, the other being practically her servant. Among the White Tai, however, the daughter of a chief has the rights of first wife, no matter when she is married. The Tai woman, though she enjoys a life of perfect freedom in her youth, becomes after marriage a sort of beast-of-burden; all the hard work in the fields and in the house falls on her. She has no real individuality till she becomes a mother. Divorce is rare; by right only the husband can seek it; in actual life it is the wife who applies for it. Repudiation is still more rare and is nearly always due to sterility.

6. **Birth.**—The house of the mother is forbidden to strangers during and for a certain time after confinement. If they did enter, they might themselves be contaminated and bring harm to the child. The confinement is made known to those outside by a branch of shaddock and a piece of coal among the Thô of the west, by a piece of wood, a knife, and a green branch among the Thô of the east, fastened to the ladder of the house. The first visitors to enter the house of the mother have to pass over a burning brand or a pail of water, into which red-hot iron is plunged. The Tai woman is delivered nearly always in a standing position, holding on to ropes with her hands. The eastern Thô alone light a brazier on the campbed whither she is afterwards carried. The placenta is secretly buried by the midwife. The birth is announced with libations to the ancestors by the head of the family. A propitious day is chosen for putting the child in the sack that does duty as swaddling. The choice of a name is surrounded with the same superstitious fears as are found among the Annamese, and the same unpleasant designations are chosen.

7. **Death and disposal of the dead.**—The Tai originally practised cremation and still do so for certain chiefs. As a rule they have now adopted burial. Funeral honours are paid only to men over 18 years of age and to married women. The rites are imitations of those of the Annamese. The medicine-man determines the position of the coffin and the situation of the grave. The deceased is dressed in his best clothes and a pair of new sandals, and is put into a coffin containing about 10 kilogrammes of ashes. On the bier are placed some duck-feathers to help him to ford the rivers of the other world, and a pencil and paper for him to make his wishes known. On the day of burial—usually the third after death—the corpse is placed on a paper catafalque and taken to the cemetery with great ceremony. The one idea at this juncture is to prevent the dead from returning to torment the survivors at home and at the same time to protect him from evil spirits. It is for this purpose that the medicine-man is employed; he brandishes his sword at intervals round the coffin and the mourners, who strew the road with gold and silver paper in order to tempt the evil spirits to stop and gather it up. The coffin is then put into the grave under the protection of the medicine-man's sword; food is placed on the tomb, near which the catafalque is burned—a house for the dead in the other world. Among the Chong-Kia Tai, when the coffin has to cross a river, the children stretch a piece of cloth from side to side for the souls of the dead, to keep them from wandering. Commemorative rites are not observed regularly by the Tai, except where they are very much under Annamese influence.

8. **Tabu.**—There seems to be only one kind of tabu among the Tai, viz. the entering or leaving a village during a local festival. Strangers are warned to turn back by notices placed outside the village.

II. **MAN.**—This Chinese name, which means 'barbarous,' 'rude,' is applied in Tongking to the ethnic group of the 'children of Pan-Hù or Phien-Hù,' who claim to be descended from the union of the dog Pan-Hù with the daughter of the emperor of China, whose inveterate enemy had been vanquished by Pan-Hù. The Man, or Yao, probably inhabit the high parts forming the basin of the Li-Kiang in the north, and are about 50,651 in number in N. Tongking and much more numerous in the west than in the east. Their various groups have been classified in six great families issuing, they say, from the six sons of Pan-Hù: the Man Cóc, or 'horned Man'; the Man Tiên, or *sapèque*

Man; the Man Lan-Tien, or 'indigo-tinted Man'; the Man Quân Trắng, or 'blue-trousered Man'; the Man Quân Cúc, or 'short-trousered Man'; and the Man Cao-Lan, or 'great rainbow Man.' The Man Cúc, most numerous and most important, live in the highest parts of the country; lower down are the Man Tiên; the Lan-Tien hardly ever are found at a greater altitude than 300 metres; the others follow by various stages to the borders of the deltaic plains; as a rule, they all find life in the valleys uncongenial.

1. **Physical characteristics.**—The Man are not so tall as the Tai, but are more robust, more intelligent, and much more active. As they have no rice, their staple food is maize, vegetables, and yams. They eat meat sparingly, chiefly pork, rarely buffalo or ox, never the dog—for this is the totem of their race. They do not chew betel, but both men and women smoke tobacco and the rich consume opium.

Their houses are built sometimes on the ground, sometimes on piles, and sometimes half-and-half. A random group of these houses forms a village, and the village is scarcely ever surrounded by a wall. The Man borrow their style of dress from either the Chinese or the Annamese according to their locality. The women's garments are embroidered on the skirts, facings, neck, and sleeves with bright red and blue designs so intricate and elaborate that it takes three years to embroider one costume. Their hair-dressing is also elaborate, and is nearly always finished off with a large turban having coloured edging and embroidery.

The Man are essentially agriculturists; but they are also good blacksmiths, and can make the trinkets that their women use, and also paper from bamboo-fibre. They are good fishers and hunters.

2. **Religion.**—Their beliefs are like those of the Tai, but even more confused—a few vague notions from the three great religions of China; but the mass of the people are animists, though not quite so superstitious as the Tai. Ancestor-worship is held in great honour among them. They have the same flood legend as the Tai. The Man have only a few pagodas dedicated to the tutelary deity of the village. They are nearly always built against a fruit-tree. They have medicine-men who present offerings, exorcize spirits, and work cures. The reputation of these sorcerers varies with the Man Cúc according to whether they have or have not received complete initiation to the third degree. Among the other tribes initiation generally comprises only one degree. The Man worship consists in sacrifices, songs, and dances. They observe the Chinese feasts with varying regularity. They have also two curious local feasts celebrated with great pomp, especially by the Man Cúc. The one takes place every three years in certain tribes, every five years in others, and commemorates the rescue of the Man race when—so long ago as to be in the region of hypothesis—it was shipwrecked in sight of the Chinese coast on its way from an island in the east. The second feast, called 'the great fast,' comprises five days of extraordinary pomp, and occurs only once in ninety years. We have no data of any value on its origin or symbolic meaning.

3. **Medicine.**—Their medicine comes from the Chinese, but the Man would not believe in the efficacy of any medicine that was not accompanied by incantations and exorcisms.

4. **Metamorphism.**—The Man believe that their neighbours, the Mao, have a third cutting of teeth in their old age, and after death escape from their graves and reappear as tigers.

5. **Marriage.**—The Man do not attach much importance to virginity. When a child is born before marriage, it is suppressed without a thought of the law which demands a fine for such an offence. Violence is also punished by a fine. The young people themselves, and not their parents, arrange their marriages. The young man makes his choice, then tells his parents, who send a go-between to make proposals to the parents of the girl. After examining the genealogical forecasts, the go-between may, at a second visit, discuss the

amount of the dowry and the presents to be offered by the suitor. The engagement is concluded when the young man himself brings all or some of the presents. All intercourse between the engaged couple is stopped until the wedding-day, which is signalized by the customary banquets; the couple drink a cup of rice-wine together and prostrate themselves before the ancestral altar. They live together after the marriage-ceremony. The daughter-in-law must scrupulously avoid touching her husband's parents, though she serves her father-in-law at table.

The Man are also familiar with marriage by adoption and contract. Among the Man Cao-Lan the newly-married couple do not live together until two or three months after the marriage-ceremony. Among the Man Quân Trắng the marriage is preceded by a term of three years spent by the young man in his future father-in-law's house, the girl being usually about thirteen or fourteen at this time. The youth may marry her at the beginning of the three years on condition that he indemnifies his father-in-law for the three years' service which he owes. If pregnancy occurs during this term, the parties are bound to each other; if the youth changes his mind before the end of the term, he can leave without paying or receiving anything; if he is dismissed, he can claim an indemnity for the service rendered. After marriage the couple serve seven years in the paternal home of the husband.

Polygamy is practised among the Man; the number of wives is usually restricted to two, the first alone having authority in the house. The Man Quân Trắng allow polygamy only in exceptional cases. The material status of woman is high among the Man, the men doing all the heavy work; her legal status is different; she is the property of her husband, who can give her away and repudiate her. She, on the other hand, is not allowed to leave him. In cases of adultery the husband has the right to send his wife back to her parents and reclaim the dowry that he paid for her; if he keeps her, he can claim damages.

6. **Birth.**—From the third month of pregnancy sexual relations cease, and the woman abstains from fat, green vegetables, and garlic. She is not allowed to sew or embroider except outside her house. The Man Lan-Tien believe that, if a pregnant woman were the first to cross a new bridge, it would fall; that the touch of such a woman spoils rice and alcohol; the Man Quân Trắng, on the other hand, keep her away from these things for her own sake, in case they should cause miscarriage. The birth is announced to outsiders by a bunch of grass hung on the door among the Man Cúc, by threads stretched across the door among the Quân Trắng; no announcement is made among the Lan-Tien. The Man woman is delivered sitting on a little stool. No fire is put under the bed after delivery. The placenta is taken far away and hidden in a hole in a tree or rock; it is buried under the mother's bed among the Man Lan-Tien; if eaten by an animal, it would bring misfortune on the child. Children born out of wedlock among the Quân Trắng belong to the mother; but the father, if known, is liable to pay a fine and give two months' service free in the house of the mother's parents to repay them for the loss of work caused by the birth. They practise adoption freely and thus receive into their families many Annamese children as their own.

7. **Death and disposal of the dead.**—The Man Cúc used to burn their dead, and this custom survives west of the basin of the Red River. The Lan-Tien nearest the delta buried only those over fifty; the Quân Trắng buried all the heads of families. The burial rites are copied from the

Annamese. The Man Cóc do not make 'the white silk soul' or catafalque; a sorcerer of the second degree exorcizes the tree from which the coffin is to be made so that the tree-spirit may not come to torment the dead.

III. *PA-TENG*.—The Pa-Teng, about 200 in number, live near the Man on the heights separating the Red River and the Clear River (Song-Ka). They are often classed with the Man, but are really separate linguistically. Their beliefs and customs are practically those of the Man.

IV. *MEO*.—The Meo, or 'cats,' numbering 21,471, are found in Cao-Bang, Bao-Lac, Lao-Kay, and Coc-Len as well as in the provinces of Thai-Nguyen and Yen-Bay. They claim to have come originally from the Chinese provinces of Yun-Nan, Kwei-Chu, and Tse-Chuen. Their last invasion into Tongking, in 1860, was very violent.

1. *Physical characteristics*.—The Meo are little and squat, very vigorous on their short legs, brave, hardy, and independent; they can be very abstemious, but are inclined to eat and drink heavily. Maize is their staple food; they eat very little meat, and drink a great deal of alcohol, but tobacco is not used and betel is unknown among them. Their rustic huts, of *pisé* or mud, are dirty to repulsiveness.

2. *Religion*.—Their traditional beliefs are borrowed from China and are very unprecise and wavering. They dread evil spirits—among others, the souls of beheaded people and of the unburied dead. A vague form of ancestor-worship is practised; it amounts to a few prayers and offerings of food, which are quickly consumed by the survivors. They are familiar with the flood-legend of the couple saved in the hollow pumpkin. Their priests are sorcerers.

3. *Marriage*.—Paternal authority is not strong. The young people make their own choice of mates, and marriage is accomplished through a go-between. In some districts the suitor has both to pay a dowry and to serve his future parents-in-law for two years before marriage. The Meo marry freely with other ethnic groups. Marriages are always accompanied by dances, songs, and games; if the bridegroom cannot afford the expense, he may leave it for his father-in-law to bear, on condition that he and his wife give so many years' work in payment. Marriage by capture is also found: the youth may carry off the girl who has been denied him, and he atones for his offence by paying a heavy dowry. Polygamy is allowed, but is not practised except when the first wife has no children. In adultery the husband has the right to kill the culprits, but as a rule he is content with repudiating his wife and taking back the dowry.

4. *Birth*.—There is nothing to mark the house on the occasion of a birth; the mother is delivered sitting and remains indoors for 33 days. The placenta is buried in front of the house, if the child is a boy; under the fire-place, if it is a girl.

5. *Death and disposal of the dead*.—The Meo bury their dead. The watch by the corpse consists of three days' feasting and dancing; the children of the deceased invite him to join in the banquets, and even slip a piece of food between his teeth. By the side of the corpse, which is dressed in new clothes and fixed in an upright position to a wall of the hut, a dead dog, killed for the purpose, is placed. The two are bound together by a strip of paper going from the dog's mouth to the dead man's wrist. The dog's duty is to guide his master in the other world. The coffin and the body are taken to the grave separately; the body is carried on a litter and is followed by the sorcerer, the family, and some friends, while guns are fired to frighten the evil spirits. When the grave is filled in, the litter is broken over it, some food (which must be renewed for several days) is placed on the tomb, and the funeral-procession returns to a banquet at the deceased's house.

V. *LOLO*.—The Lolo, a people almost certainly originating in the Brahmaputra valley, are about 2300 in number in Tongking and live chiefly in the region of Bao-Lac.

1. *Physical characteristics*.—Of medium height, muscular and well built, with fine regular features and a copper complexion, they recall to the Western mind the Bohemians of Europe. They are luxurious and indolent, marrying only among themselves; but their race is degenerating through the use of opium. Their chief foods are rice, maize, vegetables, and gourds, meat being reserved for festivals. They make alcohol from fermented maize. They use no betel and very little tobacco, but indulge in opium to excess.

Their houses are built on piles in the rich villages; in poor villages they are wretched huts placed on the ground. In dress the Lolo resemble the Chinese or the Thó according to locality, but their garments (those of the women in particular) are shorter and much more elaborately embroidered. The Lolo are great agriculturists and hunt and fish a little.

2. *Religion*.—Their beliefs and psychical life vary according as their villages are next a Tai, Man, or Meo clan. Their chief cult appears to be that of evil spirits, and they countenance ancestor-worship, theoretically. They also have the story of the flood and the survival of their ancestors in a pumpkin.

3. *Marriage*.—Marriage, which takes place during the night, comprises no religious ceremonies, but simply banquets and dances. After marriage the wife lives only two or three nights with her husband, and then returns to her parents until pregnancy privileges her to take her place in her husband's home. Marriage by capture is practised, the captor paying a double dowry. Adultery is punished by the death of both offenders. Polygamy exists only in theory.

4. *Birth*.—The rites connected with birth have no peculiarities among the Lolo. Adoption is of frequent occurrence, either by free consent or as the result of a bargain, and is the occasion of great festivities.

5. *Death and disposal of the dead*.—Burial takes place, without ceremony and in presence of relatives only, three days after death. For nine days in the case of a man, eight for a woman, and six for a child, the family keep a fire burning on the tomb, and after that take no more trouble. Certain tribes exhume the dead, after one or three years, with great pomp, and put the head or all the bones into a little wooden box, which is then placed on a neighbouring rock, where the survivors can see it while at work. Their ancestor-worship is very crude. The place of the tablet is often taken by a representation of the dead made from an orchis stem and little bits of paper, placed against a partition or between the wall and the roof of the hut.

6. *Tabu*.—Women after puberty are forbidden to eat pork, chicken, duck, or dog, and must not even cook their food in dishes which have been used for preparing these foods; hence the necessity of two fire-places and two utensils in a Lolo house.

VI. *MUONG OR MON*.—The Muong or Mon are an ethnic group centring in the province of Hoa-Binh. They are of uncertain origin, but appear to be closely connected with the Annamese, whom they resemble strongly in physical type, dress, and customs. Their religion is a development of the popular animism of the Annamese.

It should be noted that in one thing they are very different from the Annamese: among the Muong the relations between the sexes before marriage are very free. Whenever a girl becomes pregnant, her family and that of her seducer are made to pay a fine to the village. As among the Annamese, the blood-test is applied when the father of a child denies his paternity. Marriage is celebrated according to the Annamese rites. Accouchement takes place on a camp-bed under which the usual fire is kept burning, and the house is marked to outsiders, after the delivery, in the

same way as among the Annamese. The placenta is buried underneath the house itself. The dead are buried in accordance with the Annamese rites. The corpse is placed in a coffin made from a hollow tree-trunk and set up in front of one of the doors of the hut. Outside, and facing it, there stands on a bamboo tripod a basket containing a little dog killed for the purpose, some rice, alcohol, and incense-sticks. A special cord binds the tripod to the coffin. After the coffin has been let down and the grave filled in, a wide-mouthed jar is emptied near the stone which marks the position of the dead man's head; and, if rain-water comes and fills this jar again, it shows that the grave has been well chosen and it brings a thousand blessings to the survivors. The bodies of the *quan-lang* (village chiefs) are kept, it appears, for three years before burial in front of the ancestral altar; a long bamboo tube leading from the hermetically-sealed coffin right up beyond the roof of the hut preserves the hut from mephitic vapours.

VII. *KEU-LAO*.—The Keu-Lao, of whose origin and customs we know next to nothing, form an ethnic group of seven families in the neighbourhood of Dong-Vâu.

VIII. *LA-TCHI*.—The La-tchi or La-ti are about twenty in number and live in the village of Chi Ka, near the upper valley of the Song-Chay. Though resembling the Annamese of the delta in physical type, they claim to be aboriginals. They are very little known and seem to live like the Meo. Their characteristic trait is their abstention from pork, the diet *par excellence* of the Far East, because, they say, their orphaned ancestors were fed by a sow.

ANTOINE CABATON.

TONGUE. — I. Physiology. — The essential organ of taste is 'the mucous membrane which covers the tongue, especially its back part, and the hinder part of the palate.'¹ Here are found certain cells, arranged in groups which are known as 'taste-buds' and are connected with two cranial nerves. Sensations of taste are intermingled with accompanying sensations of touch, and often of smell.²

¹ There appear to be distinct terminal organs for bitter tastes, for sweet tastes, for acid tastes, for salt tastes, and possibly for other tastes, all differing from the terminal organs for tactile sensations, and from the structures, whatever they may be, which are concerned in general sensibility.³

Modern knowledge of the physiology of taste began (1665) with Malpighi (1628-94), who employed the newly invented microscope.⁴ The sense of taste was grouped by Aristotle under that of touch, both operating only through immediate contact.⁵ Pliny notes that the human palate also possesses the sense of taste, and he gives many details about the variety in the tongues of animals.⁶ An Anglo-Saxon leech-book, in prescribing 'for men in whom the string under the tongue is badly swollen,' says that 'through the string first every disorder cometh on the man.'⁷ But the chief significance of the tongue for

primitive thought is obviously in regard to the faculty of speech, to which it contributes, together with the throat and lips, in the modulation of the voice. That vibration of the vocal cords which is called 'voice' is modified by the varying shape of the resonant chamber formed by the mouth. The tongue, however, is not indispensable to speech; Huxley refers to a case in which conversation remained quite intelligible though the tongue had been completely amputated.

2. Localization of psychical function.—This characteristic of primitive thought concerning the physical organs¹ is frequently illustrated by primitive practices in regard to the tongue. Since the nervous system and the minuter structures of the tissues were unknown to the ancients, the tongue was thought to possess an *inherent* faculty of speech, as something residing in it, so that the faculty or its special qualities could be transferred by acquisition or assimilation of the tongues of specially gifted animals or men.

Thus, among the Tlingits of Alaska, the chief of the spirits sends the candidate for shamanism 'a river-otter, in the tongue of which animal is supposed to be hid the whole power and secret of shamanism. . . . If, however, the spirits will not visit the would-be shaman, or give him any opportunity to get the otter-tongue as described above, the neophyte visits the tomb of a dead shaman, and keeps an awful vigil over night, holding in his living mouth a finger of the dead man or one of his teeth; this constrains the spirits very powerfully to send the necessary otter.'² 'In Bohemia the tongue of a male snake, if cut from the living animal on St. George's Eve and placed under a person's tongue, will confer the gift of eloquence.'³ 'A North American Indian thought that brandy must be a decoction of hearts and tongues, "because," said he, "after drinking it I fear nothing, and I talk wonderfully."⁴ In S.E. Australia 'one of the Wakelbura was observed to take the tongue out of a certain grey-and-white lizard called Bungah, and give it to his little son, a child of about thirteen months old, and gave as a reason for doing so that after eating the tongue his child would soon be able to talk.'⁵ 'When a child is late in learning to speak, the Turks of Central Asia will give it the tongues of certain birds to eat.'⁶ The converse is illustrated by the belief that the saliva of a queen touching the tongue of a bird gave it human speech.⁷ Among the Nubians, 'before the tongue of any animal is eaten, the tip is cut off; on human analogy they believe that "here is the seat of curses and ill-wishes."⁸ It is a common custom of hunters to cut out the tongues of animals that they have killed. Perhaps 'the removal of the tongues is sometimes a precaution to prevent the ghosts of the creatures from telling their sad fate to their sympathising comrades, the living animals of the same sort, who would naturally be frightened, and so keep out of the hunter's way.'⁹ The cannibal practice of eating the tongue of a slain enemy is partly based on the idea that the localized qualities are in this way acquired.¹⁰

3. Ordeals.—The idea of the localization of psychical function and its ethical qualities underlies different forms of the tongue-ordeal.

Lady Anne Blunt records an interesting case of this in connexion with a dispute as to the parentage of a child: 'The matter, as all such matters are in the desert, was referred to arbitration, and the mother's assertion was put to the test by a live coal being placed upon her tongue.'¹¹ Here the original thought seems to have been that the truth would be elicited when the inherent falsehood of the tongue was, if necessary, burnt out. Similarly, in case of theft among certain W. African tribes, use is made of a needle which the operator 'thrusts through the tongue of each member of the household in succession, to discover the thief, it being believed that it will fail to pierce the tongue of the person who committed the theft.'¹²

Reference to the tongue-ordeal among E. African natives was recently made in the British House of Commons: 'A native chief was investigating a case of cattle theft in the presence of

the District Commissioner, Mr. Dundas. The chief called on the accused, one of his people, to go through the native form of ordeal by fire, by licking a hot knife. Mr. Dundas did not prohibit this procedure, but took care that the knife was not sufficiently heated to burn the tongue of the accused.¹ An ordeal of a different kind is undergone by the medicine-man in certain tribes of Central Australia. The tongue is mysteriously mutilated, and 'remains throughout life perforated in the centre with a hole large enough to admit the little finger.'² But this may rather be an example of the frequent practice of mutilating an organ before its special use in order that it may be used with impunity (cf. circumcision, etc., at puberty).

4. **Religious usages.**—The tongue is not often named as a separate offering in the rites of sacrifice.

The Homeric Greeks concluded a feast by casting the tongues of the victims upon the fire, over which they poured the drink-offering.³ According to some accounts, the tongues of the victims were assigned by the Greeks to Hermes, as the god of speech, or to his human representatives, the heralds.⁴ The Yakut made a special sacrifice, for a sick man's recovery, of tongue, heart, and liver, consuming the rest of the meat themselves.⁵ In the horse-sacrifice of the shamanists of N. Asia the tongue of the sacrificed animal is torn out (in order to make its spirit dumb under the shaman's control?).⁶

Honey was placed on the tongue of one who was being initiated into Mithraism, as was the custom with newly-born infants;⁷ we may compare with this the ceremonial tasting of milk and honey by those being baptized into the Christian faith.⁸ In this connexion may be noticed the miracle of healing ascribed to Martin of Tours, wrought by anointing the tongue of a dumb girl with oil after exorcism.⁹ The wide-spread rule of silence (*q.v.*) during particular religious ceremonies falls beyond the scope of this article, but the idea of the localization of function probably underlies the Indian usage recorded by Devendranath Tagore:

'On another elephant sat the Rajaguru (religious preceptor of the Raja) dressed in the ascetic's brick-coloured robe, and silent. He had his tongue encased in wood, lest he should speak.'¹⁰

5. **Penalties.**—In the light of these illustrations of the fundamental idea of localized function (or 'diffused consciousness'), we may better understand certain barbarous mutilations widely practised by way of penalty or revenge. These have often survived into times relatively more civilized than those of their origin, when the idea that first prompted them has been lost, viz. the idea of penalizing the guilty organ in which the original evil resides.

The Laws of Hammurabi enacted that in certain cases an adopted son denying his new parents was to have his tongue cut out.¹¹ According to 2 Mac., when the seven brethren were being tortured, the king 'commanded to cut out the tongue of him that had been their spokesman' (74). Judas Maccabæus, 'cutting out the tongue of the impious Nicanor, said that he would give it by pieces to the birds' (153^b). Maximus and two other opponents of Monotheletism were dragged from Rome to Constantinople, where their tongues and right hands were cut off, before they were driven into exile.¹² Blasphemy for the fifth time was punished by excision of the tongue, according to a law (1347) of Philip of Valois (1293-1350).¹³ Evagrius writes of the heretic Nestorius: 'I learn from one who wrote an account of his demise, that when his tongue had been eaten through with worms, he departed to the greater and everlasting judgment which awaited him.'¹⁴ The instinct which doubtless

created this legend worked also in Fulvia's savage action, when she thrust her needle through the tongue of her dead enemy, Cicero.¹ 'The Clarendon Papers, quoted by Southey, state that at Henley-on-Thames, as late as 1646, it was ordered that a woman's tongue should be nailed to a tree, for complaining of the tax levied by Parliament.'²

6. **'Figurative' usages.**—The selected evidence already given will prepare us to recognize a deeper meaning in many phrases of ancient literature which the modern mind is apt to dismiss as simply figurative and poetical. The Biblical usages will sufficiently illustrate this. The quality of 'a backbiting tongue' is as inherent as that of 'an angry countenance' (Pr 25²³); a lying tongue hates those that it wounds (26²⁸); the tongue devises wickedness, like a sharp razor (Ps 52⁴); Job asks more literally than most readers suppose, 'Is there injustice on my tongue?' (6³⁰). The Servant of Jahweh declares that his Master has given to him the disciple's tongue, that he may know how to help the weary by his words (Is 50⁴). In the Messianic future the tongue of the stammerers will be prompt to speak plainly (32⁴), the tongue of the enemies of Israel will consume away in their mouth (Zec 14¹²). The tongue is not named in the well-known narrative of Isaiah's call (Is 6), but the cleansing of his lips by the live coal illustrates the principle of the localization of psychical function. So in the NT, when the tongue is said to defile the whole body, and to be a restless evil, full of deadly poison (Ja 3^{6, 8}), there is a hidden intensity of meaning derived from primitive thought. The importance of this is seen in regard to such a phenomenon as the 'gift of tongues,'³ which implies that the local and quasi-independent organ has been taken possession of by the Spirit of God. This is more difficult for the modern mind to conceive sympathetically than it was for the ancient, largely because we have lost touch with the idea of the localization of psychical function and ethical attributes, and have replaced it by that of the cerebral centralization of consciousness.

LITERATURE.—J. G. Frazer, *GE³*, pt. v., *Spirits of the Corn and of the Wild*, London, 1912, ii. 269 f. (where a number of primitive practices in regard to the tongue are collected in a long footnote); J. B. Mayor, *The Epistle of James*, do. 1910, pp. 219-221, discusses the ethical aspects of the use and abuse of the tongue. See also H. Wheeler Robinson, art. 'Tongue' in *DAC*. H. WHEELER ROBINSON.

TONGUES.—See CHARISMATA.

TONSURE.—Tonsure is the shaving or cutting of the hair after a particular fashion as a sign of reception into the clerical order and to the privileges pertaining thereto. As a rite it is preparatory to the reception of holy orders, and is administered by the bishop or by a mitred abbot or by certain privileged priests in whom its administration has been vested by the pope. At first it was part of the ceremony of ordination, but was separated from it towards the end of the 7th century. The origin of the tonsure is obscure, but from passages in the Fathers it is clear that long hair in men was considered effeminate or worse, and this was particularly true in the case of monks. Epiphanius censures some Mesopotamian monks for their long hair against the rule of the Church, and Jerome is particularly indignant at the custom.⁴ A monk's hair had thus to be cut short, though not shaven, as this was the custom with the priests of Isis.⁵ The earliest tonsure was probably no more than a close cutting of the hair of the entire head, though this may have become a shaving of the whole head after the manner of

the Nazirites and those under a vow (Nu 6¹⁸, Ac 21²⁴).¹ It may also have been adopted by monks as a symbol of a penitential life, since penitents had their hair shorn. This is the Eastern form of tonsure, or that of St. Paul. Bede tells how Theodore of Tarsus, before being consecrated by Pope Vitalian in A.D. 668, waited four months for his hair to grow, that it might be shorn into the shape of a crown (the second or Western form of tonsure, or St. Peter's), 'for he had the tonsure of St. Paul the apostle, after the manner of the Eastern people.'² The Petrine tonsure consists in leaving only a circlet of hair round a shaven crown, this symbolizing the crown of thorns or the crown of Christ's royal priesthood. It had displaced the Pauline form in the West, and is first mentioned by Gregory of Tours (6th cent.), and was worn by Pope Gregory the Great (A.D. 590-604), who sent Augustine to England.³ It is ordered in the 41st canon of the Council of Toledo (A.D. 633)—that 'all clerics must shave the whole front part of the head, and leave behind only a circular crown' of hair on the lower part. While tonsure arose as a monastic custom, it was soon adopted by all clergy, probably before the end of the 6th cent., and the Quinisext Council of 692 appoints it for such lesser orders as readers and singers.

A third form, that of St. John—or of St. James, as its upholders claimed—seems to have been peculiar to the Celtic Church, and occasioned great controversy with the missionaries from Rome, who were astonished to find it in use in Britain, and vigorously combated its use. Nevertheless it continued to be used long after the Synod of Whitby (A.D. 664), which decided against it. What precisely its nature was is uncertain. The Irish Druids are known to have used a tonsure, perhaps denoting servitude to the gods, as it was customary for a warrior to vow his hair to a divinity if victory were granted him.⁴ The Druidic tonsure seems to have consisted in cutting all the hair on the anterior part of the head from ear to ear, except a small patch at the forehead.⁵ This was looked upon as the tonsure of Simon Magus, regarded as the archdruid or Magus. It has been thought that the Celtic Christian tonsure resembled this and was retained through national feelings. But there was apparently some difference, possibly slight, and it is hardly likely that, while other Druidic observances were banned, this would be retained. Two views are held regarding the Celtic Christian tonsure. (1) It left the hair long at the back, the upper part of the front being shaved so as to leave a band of hair round the forehead from ear to ear.⁶ This view was first mooted by Thomas Innes, who says:

'The tonsure of the Scots was not fully round and did not reach the hindmost part of the head, and therefore resembled a crescent or semi-circle.'⁷

(2) All the front of the head was shaved, to a line from ear to ear, behind which the hair was

¹ And also as a mark of servitude to God, since Roman and Greek slaves had their heads shaven.

grown.¹ Each of these forms has strong supporters, but the former is probably confirmed by Ceolfrid's account of his discussion with Adamnan, who wore the Celtic tonsure, and to whom he said:

'You who think you are advancing to the crown of life which has no end, why do you wear on your head the representation of a crown which has an end, as Simon Magus did? His tonsure resembled a crown in front but on closer inspection was seen to be imperfect.'²

The adherents of the Petrine tonsure generally ascribed the origin of the Celtic to Simon Magus, by way of contempt, or, for the same reason, to the swine-herd of King Loigaire MacNeill.³ At an earlier time St. Patrick, who was tonsured after the then prevailing Roman manner, viz. the whole head shorn, tried to induce its adoption, but apparently in vain.⁴ According to Bede, the community at Iona and the others subject to it accepted the Petrine tonsure about A.D. 716, but other Britons did not conform then.⁵ The Celtic tonsure, carried by emigrant Britons to Armorica, was known there in the 9th century.

The Latin form of tonsure with regulars leaves often no more than a circlet of hair; with seculars it is smaller. According to the Synod of Placentia (A.D. 1388), it was to be of the breadth of three fingers. Once the tonsure has been received, it must always be retained.

LITERATURE.—Besides the works cited, see E. Martène, *de Antiquis Ecclesiæ Ritibus*, Venice, 1753; artt. 'Tonsur' in *PRE*³, and in H. J. Wetzer and B. Welte, *Kirchenlexicon*², Freiburg i. Br., 1882-1901. J. A. MACCULLOCH.

TONSURE (Buddhist).—There is no mention of tonsure, and no regulation as to the method to be adopted in wearing or not wearing the hair, in the 227 original rules of the Buddhist order of mendicants. But in the *Khandhukas*, or collection of subsidiary and supplemental rules, completed at the end of the first century after the Buddha's death, we find the following paragraphs:

1. 'You are not, O Bhikkhus, to wear long hair. Whosoever does so, shall be guilty of a minor breach of the regulations [i.e. of a *dukkata*]. I allow you, O Bhikkhus, hair that is two months old, or two inches long.'

2. 'You are not, O Bhikkhus, to smooth the hair with a comb, or with a snake's hood [i.e. with an ivory instrument so shaped], or with the hand held in that shape, or with pomade, or with hair-oil.' . . .

3. 'I allow you, O Bhikkhus, the use of razors, of a hone to sharpen the razors on, of powder prepared with *Sipāṭika*-gum to prevent them rusting, of a sheath to hold them in, and of all the apparatus of a barber.' . . .

4. 'You are not, O Bhikkhus, to have the hair of your heads or on your face cut by barbers, nor to let it grow long.' . . .

5. 'You are not, O Bhikkhus, to have your hair cut off with a knife.'⁶

We should not draw, from the fact of these paragraphs being found among the subsidiary rules, any conclusion that they belong to a later time than the original rules. The subsidiary rules refer quite often to what were evidently older customs in the order, and only legalize and give authority to practices already followed, though not mentioned in the older rules. But we should notice in the first place that there is no mention of scissors. The reason of this is curious; scissors had not then been invented. This is confirmed by an exception to rule 5 above. If a *bhikkhu* had a sore on the head, and the hair round it could not be removed by a razor, then a knife might be used.⁷ In this case no doubt, if scissors had been

⁷ The word *sattaka* (*Vin.* ii. 115) has been rendered 'scissors' by Sten Konow, *JPTS*, 1909, p. 55. But this cannot be right. See Buddhagoṣa as quoted in *Vinaya Texts*, iii. 90.

then known in the Ganges valley, their use would have been allowed, at least as an alternative.¹

The members of the order, we see, were to be shaven, not only on the face, but all over the head; and the shaving had to be performed, not by a barber, but by fellow-members. Why was this the rule? Undoubtedly because this was the custom previously followed by the *religieux* belonging to the other orders that we know to have been older than the Buddha's time. It was only natural that men who had devoted themselves to the higher life, and whose main duty was the learning by heart and the repetition of texts dealing with the higher life as they conceived it, should have thought it becoming to themselves to avoid, not only the use of fashionable clothing, but also the elaborate hair-dressing then habitually used by men of the world. The medallions carved in bas-relief on the stone railings round the Bharhut tope may serve as illustrations of these turban-like arrangements, in which strips of brocaded cloth are intertwined with the hair (left long), the faces being clean shaven.² Though the sculptures are later in date, earlier texts confirm the general style by descriptions ambiguous without the help of such illustrations.

There is one passage in a very early text, about the same age as the five paragraphs, which confirms the suggestion that those paragraphs probably give us the earliest customs as to shaving followed in the order. That is *Digha*, i. 90, in the *Ambattha Suttanta*, where a Brahman, reviling the adherents of the new movement, and in fact referring to the Buddha himself, calls them 'shavelings, sham friars, the off-scouring of our kinsman's heels.'³ It is clear that, in the view of the compilers of this passage, the members of the order had their heads shaven. Another such passage is preserved in the popular anthology called *Dhammapada*, 264, which says: 'Not by his shaven crown is one a *samaña*' (a member of any order of *religieux*, a 'religious'), if he be irreligious. It should be noticed that the technical word used is not *bhikkhu* (a member of the Buddhist order), but *samaña*, which included non-Buddhist orders also.

In the much later legend of the Great Renunciation—it is at least about seven centuries later than the event which it purports to relate—we are told that the first act of the future Buddha after he had 'gone forth' was:

'Taking his sword in his right hand, and holding the plaited tresses of his hair, and its twisted decoration with his left, he cut them off. So his hair became two inches long, and lay close to his scalp curling from the right, and so it remained his life-long; and his beard the same.'⁴

Now the oldest representations of the Buddha that we possess—the so-called Greco-Buddhist bas-reliefs and statues—are an endeavour to reproduce the coiffure thus described. This story, therefore, as to the imperfect form of the tonsure habitually followed by the Buddha himself, must have been credited, incredible as it seems to us, at the date of those sculptures, not only in the Ganges valley, but also beyond the present frontiers of India, in the extreme north-west. In the second place, the inventors of the story ascribe to the Buddha the belief that every *religieux*—not only Buddhists, for there were none then—should have the hair cut quite short. In other words, they claim a pre-Buddhist origin for the custom followed in the Buddhist order. Perhaps the whole episode is merely invented as a popular explanation of the odd rule as to two inches in the first of the five paragraphs quoted above.

¹ *Vinaya*, ii. 134, tr. *Vinaya Texts*, iii. 139.

² See figs. 21 and 22 in Rhys Davids, *Buddhist India*, pp. 94-97.

³ The whole episode is translated in Rhys Davids, *Dialogues of the Buddha*, i. 112 ff.

⁴ *Jātaka-nidāna*, p. 64 (vol. i. of the *Jātaka*, ed. Fausböll).

At the present time the *bhikkhus* in Burma, Siam, and Ceylon hold theoretically to the two-inch rule, but in practice never appear in public without the head and face clean shaven. The numerous sects of Buddhists in Tibet and Mongolia, China, and Japan have long ago forgotten, if they ever knew, the ancient rule. But we have no exact particulars as to when and where they have enacted and carried out any newer rules of their own.

T. W. RHYSDAVIDS.

TONSURE (Chinese).—I. Confucianism, being a system of ethics, has no priests or monks. The tonsure is therefore unknown in it.

2. Buddhist.—(a) *Monks*.—The Buddhist tonsure was brought into China by monks from India. The whole head is shaved once a month or oftener. With boys brought up in monasteries, being either dedicated by their parents to a religious life or bought by the monks for that purpose, the tonsure takes place early, but with others the age is often eighteen or twenty. At the reception of a novice the liturgy directs that the introducer of the candidate shall ask the chapter assembled that the tonsure may be granted. This acceded to, the vows are taken.¹ A rite which is apparently a constant sequel of the tonsure consists of the branding of the head with from three to eighteen small circular spots.² A mutilation of one or more fingers is also sometimes undergone. An explanation of the Buddhist tonsure given by some of the Chinese is that it indicates the 'desire to put away . . . everything of the world, so that the monk does not claim as his own even his hair.'³

(b) *Nuns*.—Aspirants are received at the age of ten into the nunnery, and their novitiate continues till they are sixteen. During these years only the front part of the head is shaved, but all the hair is shaved when they become nuns. A woman desiring to become a nun must obtain the consent of parents, husband, or guardians.

¹ One of these must act as sponsor to her at the time of initiation and must hand the razor to be employed in shaving her head to the Prioress who is to perform the ceremony.⁴

3. Taoist.—(a) *Monks*.—Taoist monks shave all about the crown, but the rest of the hair is allowed to grow long and is gathered together into a top-knot fastened by a wooden article like the back of a tortoise.⁵ In some cases all the hair is allowed to grow.⁶

(b) *Nuns*.—Taoist nuns do not shave their heads, but have their hair done up on the top of their heads.⁷

4. Dislike of the tonsure.—Though Buddhism has benefited largely in the past from the favour of emperors, the tonsure has often been very obnoxious to the governing classes in China, who doubtless took it as the outward sign of the celibate priesthood, which severs its connexion with the family, entirely against Chinese ideas of the paramount importance of domestic life. Memorialists inveigh strongly against it. The following are instances:

In A.D. 624, in a memorial to the emperor requesting the suppression of Buddhism, it was stated that it caused people to

⁷ J. H. Gray, *China*, London, 1878, i. 104.

'shave their heads and abandon their ruler and their parents.'¹ The memorialist says again: 'Before the Western Ts'in Dynasty [A.D. 256-317] reigned, the ruling dynasties enacted stringent laws by which the people of the Middle Kingdom were prevented from shaving the head at pleasure.'²

In A.D. 995 an edict threatened severe punishment to those who were 'shaved surreptitiously' without first obtaining permission of their district prefect to become monks or nuns.³

In A.D. 1408 it was decreed that, 'if any person surreptitiously took the tonsure to become a monk,' he should be punished with a term of hard labour, and after that become a husband-man.⁴

The determination of the Chinese Government to keep the tonsure as well as the age of receiving it under their control is seen in other enactments. Taoists are also mentioned in some of these cases.⁵ Eight blows was the punishment under the Manchu dynasty to Buddhist or Taoist who in the one case took the tonsure and in the other did up his hair on his own account.⁶ At the same time monks were not allowed to go about without the tonsure, and pupils adopted by the Buddhist clergy had to be tonsured. Those in monasteries without the tonsure had to return to secular life, being neither monks nor laymen.⁷ This was the case also in A.D. 1458 for those who had been tonsured after twenty, but the culprits were to be banished for life;⁸ and in A.D. 1537 it was decreed that not only those who privately shaved their heads, but also their parents, neighbours, and helpers,⁹ were to be punished.

5. **Ridicule of the tonsure.**—The tonsure of the Buddhist lends itself to the derision of the Chinese, who are very susceptible to anything that opens a way to mockery or banter. One term applied to the Buddhist monk is 'bald-headed ass,' another is 'bald-headed thief.'¹⁰ As a further example of the way in which the shorn and shaven priest is despised may be instanced the curious custom of shaving the head of a young boy in order that the evil spirits may think that he is of no consequence—in fact worthless to the parents—and thus pass him by uninjured. The boy is then called 'Buddhist priest.' The present writer saw an instance of this in the case of a neighbour's son in Canton.¹¹

6. **The Manchu tonsure.**—A species of tonsure was practised by every male except monks in China under the Manchu rule of the country. The hair is now allowed to grow, instead of the greater part of it being shaved off.

7. **Tonsure of children.**—Young children's heads are also shaved to a large extent. The first shaving of an infant's head, when a month old, often has a religious character, being done before an idol or the ancestral tablets.¹²

LITERATURE.—See the works referred to in the footnotes.

J. DYER BALL.

TONSURE (Hindu).—*Chūdā*, 'tonsure,' is the name of an ancient rite in India, also called *chūdākaranam* or *chūdākarma*, *chaulam*, which is performed on boys, sometimes on girls also, and derives its name from the tuft of hair left on the top of the boy's head (*chūdā*). According to the ancient rule, this rite is to be performed when the boy is three years old, or, in the lower castes, in his fifth or seventh year. The boy is dressed in new clothes, and placed on his mother's lap. A barber cuts his hair with a razor, while sacred verses from the Veda are recited. The hair is thrown on a heap of cow-dung, and afterwards dug into the ground (see Hillebrandt, *Rituallitteratur*, Strassburg, 1897). It is interesting to note that this rite, as pointed out in Gerini's monograph on the tonsure rite in Siam, has spread into Siam, together

with other Brāhmanical institutions. In India it has been invested with some legal importance, the Sanskrit lawbooks stating that a boy on whom the ceremony of tonsure has been performed in the family of his birth is no longer capable of being affiliated to another person (see Jolly, *Tagore Law Lectures*, Calcutta, 1885). The tonsure rite is carefully kept by many castes of the present day, though the time of its performance varies. Thus the Kanoj Brāhmins of Poona perform the rite when a boy is from six months to two years old; the Lingayats, after a year; the Vanis, at any time from six months to five years. Sometimes the child is taken to the village temple for the ceremony, or after its performance (see the *Bombay Gazetteer*, *passim*; Rai Bahadur L. B. Nath, *Hinduism*, Meerut, 1899). The tonsure rite is supposed to belong to the common heirloom of Indo-European nations, because similar rites and superstitions occur in the Avesta of the Zoroastrians, and, particularly, among some Slavic nations, such as the Servians and Bohemians.

LITERATURE.—J. Kirste, 'Indogermanische Gebräuche beim Haarschneiden,' *Analecta Graeciensta*, Graz, 1893; Potanski, *Die Ceremonie der Haarschur bei den Slaven und Germanen*, Cracow, 1896. J. JOLLY.

TOPHET.—Although the OT references to Tophet, the scene of the Moloch sacrifices in the Valley of Hinnom, leave no doubt as to its great importance in the popular religion of Judah in the period before the reformation under Josiah, the place itself is mentioned only in the following places: 2 K 23¹⁰, Is 30³³, Jer 7³¹, 19⁶, 11. 12-13. The similar word in Job 17⁶ is clearly not to be understood in this connexion. The original pronunciation of the word, which is transliterated in the LXX *Tápeθ* or *Θαπέθ*, is unknown, the Masoretic pronunciation in this case, as in others, being due to the substitution of the vowels of תָּפֵת, 'shame.' Moreover, the etymology of the word is quite uncertain, and it cannot be determined whether the final *t* is radical or is merely the feminine ending. In Is 30³³ indeed the form is תָּפֵת, which, if the text could be trusted, would be evidence of the former alternative, unless the word should be understood as having a double feminine ending such as תָּפֵתֵת; (Ps 3²). But against this supposition is the fact that the word is construed as masculine in its immediate context. In any case, since, with the exception of Is 30³³, it always has the definite article or is capable of being so pointed, it is evident that it is not strictly a proper name. We may reasonably infer that there were several *tophets*, although we know only of the one which was situated in the Valley of Hinnom.

Robertson Smith,¹ arguing from the fact that 'at the time when the word תָּפֵת first appears in Hebrew, the chief foreign influence in Judean religion was that of Damascus (2 K 16),' sought to connect the word with the Aramaic *tfaya*, which means a 'stand or tripod set upon a fire . . . of which we might, according to known analogies, have a variant *tfāth*. The corresponding Hebrew word is תָּפֵת (for *shfāth*), which means an ashpit or dunghill, but primarily must have denoted the fireplace.' But this explanation of the word by an Aramaic etymology takes for granted that the cult practised at the *tophet*, or at any rate the precise ritual of the cult, was a comparatively new-fangled thing in the 7th cent. B.C., and there are grave difficulties in such an assumption. Even if Ahaz did bring from Damasus a new contrivance for burning the children's bodies, why should it have kept in Hebrew its Aramaic name, when the Hebrew language itself possessed the same word with the ordinary dialectic difference? When the same king introduced in Jerusalem the innova-

tion of a great stone altar, it was called by the Hebrew word for 'altar,' not the Aramaic. Moreover, it is extremely improbable that such a practice as the sacrifice of the first-born should have been suddenly introduced into Jerusalem as late as the 8th cent. B.C. When it is considered how hard debased superstitions have died in our own country—if indeed they are dead—we can understand the survival or even the recrudescence in Palestine of aboriginal superstitions, but not the adoption of so terrible a rite as human sacrifice by a people who had reached an altogether higher level of religion. The OT is unintelligible unless it is recognized that the population of Palestine in the days of the kings of Judah and Israel was not so homogeneous as later writers imagined it to have been, and that the true-born Israelites were in a minority. In a fusion of races there is, no doubt, a tendency for the higher to be drawn down to the level of the lower. When a man of fairly good intelligence, but not possessed of any strong religious convictions, marries a thoroughly superstitious woman, it is the wife's superstition rather than the husband's intellect that will be the dominant factor in the household. And that the sacrifice of the first-born was a deeply-rooted Canaanite cult is proved not only by the excavations at Gezer,¹ but also by more than one passage in the OT. It is most significant that the E document of the Pentateuch represents God as commanding Abraham to sacrifice Isaac (Gn 22²), and that the same document in its legislation (Ex 22^{29f.}) puts the first-born of men and cattle on exactly the same level, not requiring the redemption of the former as is ordered in Ex 34²⁰ (J). And that a law allowing, if not requiring, the sacrifice of the first-born was at one time issued in Jahweh's name is evident not only from Ezk 20^{26f.}, but also from Jeremiah's protest (7³¹; cf. 19⁵) that Jahweh had never commanded or contemplated any such cult. Although Ahaz is the first king of Judah of whom it is definitely stated that he sacrificed his first-born, it would be unsafe to conclude that he was the first who actually did so; for what had been done by earlier kings unheeded may well have called forth a vehement protest in the days of Isaiah. Certainly, if the stories of David recorded in the books of Samuel are based on a sound tradition, and are not merely what later prophets of the non-reforming party thought David must have done, there would be no difficulty in supposing that even David had presided over the Moloch cult at the *tophet* in the Valley of Hinnom. On the other hand, it must not be forgotten that, as the story of the Rechabites proves, certain strata of the population remained till a late period aloof from and uncontaminated by the Canaanite elements, and it is doubtless these non-Canaanite elements that we ought to credit with the attempts made from time to time to abolish the worst of the pre-Israelite superstitions which threatened to swamp the religion of Jahweh. There is no reason to question the statements in the book of Kings that reforms were attempted in the days of Asa and of Jehoshaphat.

While it is not improbable that the method of burning the bodies at the *tophet* in the Valley of

Hinnom was the same as that adopted elsewhere,¹ it is by no means clear that either the cult itself or its ritual came from Damascus. It must not be overlooked that the *tophet*, or at any rate the place of the *tophet*, is called in Jer 19⁵ 32³⁵ 'the high places of the Baal.' The point of Jer 7³² is that in the massacres which may be expected corpses not slain in sacrifice will be buried at the *tophet*—proof of the impotence of the *tophet* sacrifices to avert the divine wrath.

Robertson Smith, in discussing the meaning of Is 30³³, writes as follows:

'It appears that Tophet means a pyre, such as is prepared for a king. But the Hebrews themselves did not burn their dead, unless in very exceptional cases, and burial was equally the rule among their Phœnician neighbours, as is plain from researches in their cemeteries, and apparently among all the Semites. Thus, when the prophet describes the deep and wide pyre "prepared for the king," he does not draw his figure from ordinary life, nor is it conceivable that he is thinking of the human sacrifices in the valley of Hinnom, a reference which would bring an utterly discordant strain into the imagery. What he does refer to is a rite well known to Semitic religion, which was practised at Tarsus down to the time of Dio Chrysostom, and the memory of which survives in the Greek legend of Heracles-Melcarth, in the story of Sardanapalus, and in the myth of Queen Dido.'²

But surely at a time when sacrifices were being offered to Moloch, *i.e.* the king, at the *tophet*, a statement that a *tophet* has been prepared for a king must have suggested the ritual of the Valley of Hinnom; the prophet declares with grim Hebrew irony that a *tophet* has indeed been prepared for a king, only in this case the king will be the victim and not the recipient of the sacrifice.

How long *tophets* remained in Palestine it is impossible to say. It is asserted (2 K 23¹⁰) that the one in the Valley of Hinnom was defiled by Josiah; but this statement occurs in a passage which appears to be secondary, and, even if Josiah tried to put a stop to the cult, there may have been a recrudescence of it after his death; and beyond the limits of his diminutive kingdom it probably continued considerably later. It is difficult to see why Jeremiah should have published his denunciation of the *tophet* in the fourth year of Jehoiakim, if it had been abolished once for all in the eighteenth year of Josiah. And if, as seems probable, Deuteronomy is to be dated in the 6th cent. B.C., it is evident that as late as that time it was still necessary, at least in some parts of Palestine, to protest against the sacrifice of children (Dt 18¹⁰). Moreover, the prophecy in Is 30, though based on a genuine utterance of Isaiah, bears many evidences of having been modified at a later date, and, if Asshur here, as in 11¹¹, 16 and 19^{23f.} (cf. Ezr 6²²), means the Seleucid empire, the king referred to in the present form of the passage may be Antiochus Epiphanes. It is certainly not impossible that in some outlying districts of Palestine, such as Ammon, Moab, or Edom, the cult associated with the *tophets* held its own down to the 2nd cent. B.C.

TORCH (Greek and Roman).—In common with other races, the Greeks and Romans held many festivals at night, when torchlight was a practical

¹ 'The human holocaust is not burned on an altar, but on a pyre or fire-pit constructed for the occasion. This appears both in the myths of Dido and Heracles and in actual usage. At Tarsus a very fair pyre is erected yearly for the burning of Heracles; in the Carthaginian sacrifice of boys the victims fall into a pit of flame, and in the Harranian ox-sacrifice the victim is fastened to a grating placed over a vault filled with burning fuel; finally, Isaiah's Tophet is a broad and deep excavation filled with wood exactly like the fiery trench in which, according to Arabic tradition, the victims of 'Amr b. Hind and the martyrs of Nejrān found their end' (Robertson Smith², p. 376 f.).

² P. 372 f.

necessity, and need have no particular religious significance. But the torch was also important in various ceremonies where its presence was not merely utilitarian; and in many cases where it may have been originally used for merely practical purposes it acquired a sacred or symbolic meaning. In agricultural festivals, *e.g.*, the use of fire is a well-known rite, although its precise significance may be doubted. Mannhardt and Frazer have collected a large number of customs which illustrate fire-ritual as a means of promoting the growth of crops and animals.¹ The underlying idea may sometimes be a belief that earthly fire represents the sun; and torches, carried over the fields, may be the means, by sympathetic magic, of 'making sunshine.' It is more probable, however, that the fertility which the use of fire is believed to cause is to be explained by its purifying power.

In Greek myth and ritual the torch is specially connected with Demeter. According to the Homeric hymn, the goddess, after the rape of Persephone, rushed wildly in search of her daughter with lighted torches in her hands. The hymn deals with the Eleusinian mysteries, and it is probable that the actual rites observed by the initiated were attributed to the example of the goddess. The Eleusinia² included a 'torch-day' (*lampadum dies*), when the *μῦσται* roamed along the shore with torches. They supposed themselves to be imitating the wanderings of Demeter; but the original meaning of the rite was doubtless to purify the land and ward off pestilence from the crops. In the same way the early Eleusinians seem to have purified their children by making them pass over the fire, as the myth of Demophon, in the same hymn, appears to indicate.³ The most solemn ceremonies at Eleusis took place at night, when the hall of the mysteries (*μυστικός δῶμος*) was lit by torches. One of the chief officials was called the 'torch-bearer' (*δαδοίχος*), and a priest bearing the same title took part in another festival (the *Lenæa*), and assisted at a rite of purification or atonement of sin.⁴ Juvenal⁵ speaks of the torch as the special emblem of the Eleusinian priest.

The torch is an attribute of various Greek deities besides Demeter. Persephone has the same emblem as her mother. In literature and art we find the torch regularly associated with Hecate, perhaps as a moon-goddess.⁶ Artemis is also commonly represented with a torch in literature⁷ and in art from the 4th cent. B.C. Here the torch may be the symbol of a moon-goddess; but Farnell,⁸ who holds that Artemis was originally an earth-goddess, thinks that it belongs to her as a deity of vegetation. The torches which in art are a frequent attribute of the *Mænads* are perhaps best explained by reference to their nocturnal festivals. Finally, Ares sometimes carries a torch, an appropriate emblem for the god of war.⁹

In Greek custom the most conspicuous example of the use of torches is in the torch-race (*λαμπαδηφορία*, *λαμπαδηδρομία*, or, most often, simply *λαμπάς*). This competition is best known as Athenian; but it is also recorded for other Greek states, and Alexander included it in most of the festivals which he established in various cities. In Athens

the torch-race was a feature of various festivals, in honour of Prometheus, Athene (in the *Panathenæa*), Hephæstus, Pan, Bendis, Hermes, and Theseus. It was even held in the festival of the dead (*επιτάφια*). The date of its institution is unknown, but it was first held in honour of Prometheus, the fire-bringer, at whose altar the competitors lit their torches. As regards the festival of Pan, we know that the race was instituted after the battle of Marathon. At the *Bendidea* it was run on horseback, and was a novelty in the time of Socrates; elsewhere the race was on foot. The competitors were apparently chosen from the several Attic tribes. The torch was passed from one member of a team to another, at fixed intervals along the course, and the victory rested with the team whose lighted torch first reached the goal—an altar on which fire was kindled with the torch. This procedure gave rise to the famous simile of Lucretius ('*et, quasi cursores, vitæ lampada tradunt*'), the idea of which is found in Plato.¹ An equally famous line in Æschylus² also refers to the race, although the exact point is doubtful.

Æschylus might possibly have meant that all the runners in the winning team have an equal share in the victory, the last no less than the first; but more probably he refers to the fact that the winning torch was handed in by the last to receive it. This man would be first in relation to the rival teams, but last in relation to his own.

The Greeks themselves explained the torch-race as a commemoration of the gift of fire by Prometheus;³ but the original motive must have been something more than a mere commemoration. The essential feature seems to lie in the transference of fire from one altar to another at the greatest possible speed. It is probable, therefore, that the underlying idea is the need of carrying fire from a pure source to take the place of a polluted fire. At Athens all fires were extinguished before the race began (at least in the *Promethea*), and were rekindled from the new fire. A belief in the pollution of fire is shown in the Argive custom of extinguishing fire after a death, and rekindling it from another source *ὡς μεμιασμένον*.⁴ Similarly the fires at Plataea were defiled by the presence of barbarians, and new fire was brought from the sacred hearth of Delphi. The attraction of such a rite to the cults of Prometheus and Hephæstus needs no explanation. Athene, too, might well have adopted a torch-race, as being the patron of handicrafts and metal-working, for which fire was a necessity; but more probably she claimed the torch-race as the supreme head of the city. The race seems less appropriate to the other gods, with the possible exception of Pan. The theory that he was a sun-god cannot be accepted; but fire certainly played a part in his ritual, and an ever-burning lamp was maintained in his cave under the Acropolis. Most probably, however, the Athenians instituted the race in his honour to commemorate his appearance to the runner Phidippides after the battle of Marathon. Once established, the race became popular, and was attached to other festivals without any special religious fitness.

The Romans had no torch-race, and the torch was less prominent in their ritual than in Greek religion. But the same ideas can be traced in Italy as appear in Greek fire-rites, although it is not always possible to distinguish the indigenous from the borrowed element; *e.g.*, the festival of Diana at Aricia (*Nemi*) no doubt belongs to a primitive Italian stratum, but it is impossible to say how far Greek influence may have modified its

details. In this festival women whose prayers before child-birth to the goddess favourably heard bore lighted torches to her shrine. It is difficult to say whether this custom is a survival of a purificatory rite (Diana representing a forest deity or the goddess of agriculture) or whether the torch is only a symbol of the moon-goddess, who was the natural patron of women in child-birth.

In Greek and Roman private life the torch was an important feature in marriage, as the bridal procession took place at night or towards evening. As early as Homer¹ there is mention of this torch-light procession. It was the duty of the bride's mother to light the nuptial torch.² In Italy the bride was also escorted to her new home by torch-light, under the protection of Juno Domitica or Iterduca. Hence the god of love, both in Greece and in Rome, is often represented with a torch—an idea no doubt assisted by the common conception of love as a 'fire.'

The torch had also funereal associations to the Romans, being used to light the pile on which the corpse was burned. Those who applied the torch averted their faces.³ The 'two torches' (of marriage and death) are mentioned by Propertius⁴ and Ovid.⁵

LITERATURE.—The *Λαμπάδροφορία* has been frequently discussed—e.g., by A. Mommsen, *Heortologie*, Leipzig, 1864, p. 282; P. Foucart, in *Revue de Phil.* xxiii. [1899] 112; N. Wecklein, in *Hermes*, vii. [1872] 437; Daremberg-Saglio, s.v. 'Lampadédromia'; J. R. S. Sterret, in *JPh* xxii. [1901] 293. E. E. SIKES.

TORTURE.—*Questio*, said Baldus de Periglis, an interpreter of that word of dire significance in Roman law, 'is a certain kind of inquisition made for the purpose of tearing out the truth ('*eruendae veritatis*') by torments and bodily pain.' Few institutions have more signally failed even to afford rational excuse for their evil existence as a method of extracting evidence. Starting from a deep instinct of violence, it consistently made manifest its inherent viciousness, which no fundamentally good intention could redeem and no humane afterthought of qualification and exception could withhold from pernicious and cruel consequences. Unlike the ordeal (*g.v.*), which was in some measure an appeal to a fairly equal chance, torture was without even the negative virtue of offering a percentage of probabilities of right and truth in its results. It is difficult to think of any principle which could make it really assist in evoking truth from reluctant witnesses or reliable confession from accused persons. The one point of affinity to ordeal was the resort to torture when there was a deficiency of direct legal evidence. Its basis in injustice is shown not only in its penalizing the innocent and unconvicted, but in the fact that its applicability was long confined in both Greece and Rome to slaves—significant of its palpable unfitness for freemen. It never was universal, though in ancient use among Assyrians, Egyptians, Medes, and Japanese; it does not appear in the early laws of Chinese, Hindus, or Jews. There is no mention of it in the OT record. The metaphoric heaping of coals of fire on the head probably refers to torture, as appears from a Muhammadan penalty of a live coal laid on a lascivious palm. From a remote age torture prevailed in Greece for slaves, and, although freemen were generally exempt, the

exemption was overborne in cases of conspiracy and murder. Slaves in Athens were subject to torture in causes civil as well as criminal. At times the actions were determined by balancing the testimonies of the slaves of the opposing litigants put under the pressure of the wheel, the ladder, the rack, or the burning tile. Grecian practice has not transmitted any code; that was reserved for Roman law, which unfortunately hardened into permanence the crude tradition of force which it shared with Greece.

In this exposition we are not dealing with torture as a method of punishment, to which some speculations give an earlier place than belongs to the torture of witnesses or accused persons. It is as a process for obtaining testimony or confession, chiefly in causes criminal, that torture has historically played its most unreasoned and baneful part. In the Roman Republic it had wide currency in spite of sharply defined restrictions which instructively exhibit the efforts, too tardily made and not thoroughgoing enough, to modify and restrain an institution for which abolition was the only remedy. And yet credit must be given to the insight and humanity of some of the distinctions made. The exemption of freemen gave way under imperial impulses when lese-majesty was imputed. The general safeguard that there must be vehement presumptions of guilt before resort to the torture was clear enough in theory, but was widely ignored in practice. Most curious fact of all perhaps is the frankness of the authorities grouped in the *Digest* on the primary desirability of doing without torture, on the frailty and peril of the method as an engine for ascertaining facts, on the delusive character of confessions induced by modes which were tests not of truthfulness but of physical endurance, and on the danger to third parties from the allegations wrung from men willing to say anything to save themselves. Evidence of slaves under torture was declared inadmissible against their masters, but there were exceptions of some intricacy. The apostle Paul (Ac 22²⁴) pleaded with success his right as a Roman freeman as a protection from examination under the scourge. Mainly used only in causes criminal, the institution made good its footing in some civil causes also. Exemptions of minors, patricians, priests, and pregnant women were inapplicable when charges of treason were made. The direction of Antoninus Pius that torture was not to be used to secure betrayal of alleged accomplices was as wise as it was humane, but the very object of getting at other culprits came ultimately to be a main occasion of its employment. The provisions of the *Digest*¹ and the *Code*² systematize several contradictory doctrines 'de quaestionibus' illustrative of a considerable development. The emperors were not long in discovering what Dante was to illustrate by extreme examples, that treason was the worst of crimes. This was the creed too of Anglo-Saxon as well as of later feudal criminal law, and it encouraged violent processes of detection. In Rome the kind of torture with widest currency was that of the *equuleus*, or rack, which passed on as perhaps the worst legacy of Roman law to mediæval Europe.

The abolition of the barbarian ordeal by the Lateran Council of 1215 left a vacuum—the Roman method of 'tearing out the truth.' Under the Salic law ordeal and torture had co-existed, but the latter for slaves only, the provisions obviously echoing Roman practice. The Riparian code apparently countenanced ordeal alone. The renaissance of Roman law explains the return of torture after some measure of abeyance. In

France and Italy it seems to have re-established itself during the 13th century. Continental charters cited by Du Cange¹ gave exemption from torture. Its French name, *gehenné*, was fit enough. There were many modes—the *brodequin*, the *estrapade*, the *chevalet*—all used in the *question préparatoire*, preliminarily in the trial, and in the definitive *question préalable* after conviction to disclose accomplices. In England, though without place in the common law, it was practised as an abuse notably in the anarchy under King Stephen and in King John's processes of extracting treasure from the Jews. The *peine forte et dure*, however, or torture by pressure of weights to compel a prisoner to put himself 'upon the country' or verdict of a jury, appears about 1300. Under Edward II. in 1311 papal inquisitors in the trial of the Templars applied torture admittedly never legally countenanced in England before. Though long without regular sanction in the courts for crime, the practice of torture crept in with what may be called council government under the Tudors. As always, secret courts favoured secret methods, and torture loved the darkness. With Shakespeare and other Elizabethan dramatists 'rack' and 'strappado' were household words. Coke might excommunicate the institution from the common law, but Coke and Bacon alike countenanced it in practice when the scent of treason was strong.

In Scotland the law and practice appear to have nearly paralleled the state of things in England. Isolated examples of torture, such as that given by way of punishment to the murderer of James I., may have been preceded, as one annalist asserts, by judicial torture at his trial. So late as 1542 the point of law was established that a confession procured by torture was null. George Buchanan, in spite of the risks that he himself had run from the Inquisition, recognizes without censure the obtaining of proofs by torture. The deplorable inhumanities resulting from the witchcraft craze, nurtured in Scotland by the sapience of the demonologist James VI., and absolutely paralleled by the like frenzy in England and France, were a distressing combination of the mischiefs of torture with a recrudescence of the ordeal. The victims were often old, miserable, and insane; the pitiful and pitiless mania, however, was not merely a British but equally a European crime; its creed on the Continent was of one context with that in Britain; everywhere the witch-finders used the same methods of pain. It was the last stage of a sort of common law of torture, although the variety of local usage shows a wide range of divergence in detail. In the Covenant time a last outburst of persecuting zeal revived the decadent engine of violence. A dubious tradition traces the thumbkins in Scotland to a Russian origin.² Museums of torture such as those of Nuremberg, The Hague, and the Tower of London—competitions in horror as they are—unite in a kind of commonplace of malignancy. Authorities on torture in like manner dwell with the same tedious insistence on the *indicia*, or preliminary evidences needed to justify torture, and on the conditions of its infliction. The *Summa Angelica*, a great cyclopedia of instruction to confessors, enjoins the interrogation to judges in confession whether they had put people to torture without sufficient *indicia*, which was very rightly classified as a deadly sin. Now and again a tractate of law and practice of torture, such as that of Paulus Grillandus, breaks away from its companions in the great folio vol. xi. of Zilettus (1584) by its superior realism. Grillandus

distinguishes with grim precision the five degrees of torture: now a mere threat, now a suspension on the rack for the space only of an Ave Maria or a Paternoster, now a graver suspension for the space of a Miserere, now for a period which might reach into hours, and, last degree of all, where the victim's limbs, weighted down, were jerked and twisted till the agony was greater than the amputation of the hand. It is marvellous how men endured such torments, but that they did so is attested by occasional observations by the judges or assessors of court who wrote the treatises. Grillandus, *e.g.*, drawing upon his experience at Pisa and at Rome, registers the wonderful case of a most cunning thief whose absolute impassiveness was ascribed to certain words that he whispered when the torture was applied until a slip of paper was found bearing as a charm the Scriptural text (well known for its use in amulets) 'Jesus autem transiens.' Finally, however, with the charm removed altogether, this stout malefactor defied the torture again by his whispered invocation so that it was necessary to abandon the torture. And still greater cases, the commentator concludes, were seen at Milan and Rome when certain words touching the milk of the Virgin enabled the victim to go through the torment as if he slept. This particular variety of charm was reported to be no less effective as a counter-charm, but Grillandus shows no faith in its potency as an aid to the prosecutor.

An unfortunate feature of torture was its adoption by the inquisitorial courts of the Church for the investigation of charges of blasphemy, heresy, and the like. Was persecution not, like the Inquisition itself, a confusion of a secular with a sacred function, in which the analogy of treason to an earthly potentate carried priests of religion to extremes not compatible with the conception of a majesty which, though wounded, was divine? Whatever of error lurked in the concept itself, the tribunal which was its executive of vindication added to the wrong in principle by a series of false directions of the practice in prosecution. It surely was a blunder worse than a crime to adopt methods which doubly branded with public odium courts which were designed by processes of barbarism to repress the freedom of the human mind. The fact that already by the middle of the 13th cent. papal dispensations to churchmen were needed for irregularities in the use of torture casts a lurid light on the procedure. No safeguard of institutions is so sound as publicity—the liberty of moderate criticism, the freedom of defence, and the avoidance of the abuses which wait upon invisible dungeons and courts. Secrecy inevitably means tyranny and obscurantism. The refusal of counsel for the accused was a fundamental and far-reaching error in a 'court of inquisition into heretical depravity,' which by its very object tended to unite the zeal and interest of both prosecutor and judge against the heretic. The double sanction of royal and ecclesiastical authority sometimes enabled the machinery against heresy to be used for political rather than spiritual ends. The most notorious persecution of the 16th cent. was in the Netherlands, and torture was the keynote of its procedure. The Renaissance had not wholly escaped the persecutions which rose to their evil eminence during the transition period in which the swaying boundary-line came to a stand between Lutheran reform and Roman orthodoxy. In 1532 the Constitutions of Charles V. codified for Germany a system which incorporated torture among the fundamentals of procedure. His establishment of the Inquisition in 1550 inaugurated a period of atrocities perhaps worse than any other in human history. Philip II. of Spain found in the Duke of Alva a spirit of

¹ *Glossarium Mediæ et Infimæ Latinitatis*, new ed., Niort, 1883-87, vi., s.v. 'Questio.'

² Maclaurin, *Arguments and Decisions*, preface, p. xxxvii.

merciless executive in the Netherlands, scarcely less jealous of public liberty than of private creeds, and Alva's *horrenda gloria* of death penalties earned for him not only his downfall but also the execration ever since attached to his name. Out of that fierce time aptly came its strange definitive and callous expression in a contemporary book, the *Praxis Rerum Criminalium* of Josse de Damhoudère, a councillor under both Charles and Philip in the Netherlands, published in French and Latin in 1554 and repeatedly afterwards, remarkable among other things for its matter-of-course attitude to torture, which makes only too intelligible the excesses of practice under the most illustrious and excellent Alva, whose honour and sagacity a preface in some editions incidentally extols. Woodcuts queerly illustrate the varieties of crime, while seven whole chapters on torture make transparent the vices of a system the radical barbarity of which, despite its antiquity of sanction expounded by generations of civilian glossators and jurists, all its touches of humanity—and there were some—were hopeless to redeem. Damhoudère harrows the modern soul perhaps most by his passionless exposition as of a principle doubtless imperfect, yet itself of the nature of things. Leading modes indicated are by the rope (*i.e.* the rack), by water forced through the mouth, by oil internally administered, by burning pitch or lime, by hunger, cold, or the thumbscrew, by mice or parasites that gnawed the flesh, or by fire intensified by basting the body with oil—these were only a few of at least fourteen species of torments. What wonder that Damhoudère after this enumeration should consider that torture often could most happily (*felleissime*) be applied by scourging alone? Two pictures complete the impression, one showing a victim girt and twisted with ropes and swung stretched out with weights at his feet, the other an idyllic group of the doctors, knights, priests, old men, children, and prospective mothers, who were benignly excusable from torture.

It was a law from which no conceivable evolution could eliminate the initial anomalies (1) of punishing an accused by torture before he was found guilty or a witness before he was proved a perjurer; or (2) of torturing an accused after conviction when torture was no part of the sentence, and when the judge's function was ended and the process was no part of the trial. These were dilemmas from which no escape was ever devised, and they gave effectual leverage to criticism when—late in the day, it must be owned—the opposition developed energy enough to make abolition of torture a direct object of humane propaganda. Illustrious opinions against torture were many; those in its favour were perhaps less illustrious. Augustine, Ulpian, Quintilian, and Montaigne could be cited on one side, and Demosthenes, Aristotle, Bodin, and Pothier on the other. But the lawyers were indifferent, and their neutrality and acquiescence gave the practice a long lease of life. Roman tradition persisted little shaken in Europe till Beccaria and Voltaire threw a new intensity into attack on abuses, and the objection to torture passed from being a mere dissent into a positive and earnest movement to repeal what was at once a futility and a cruel injustice. From the middle of the 18th cent. until the beginning of the 19th the Continental countries by degrees followed the example of repeal set by Great Britain. Torture had died out in England by the middle of the 17th cent.; it was abolished for Scotland by statute in 1708. Its extinction on the Continent has been assigned in Prussia to 1740, in Portugal to 1776, in Sweden to 1786, in France to 1789, in Russia to 1801. But in the last-named country it is said that so late as 1906-07 political prisoners underwent grievous

treatment in a 'museum of torture' comprising brutalities in which 'scorching of the feet at the fire' was among the least revolting. In the Far East the persistence of the evil has been still greater. In China the usage has long held, and presumably still holds, place as a fundamental law. But in Japan it was abolished in 1876. Suspicion, however, obtains that in Oriental lands, despite reforms and prohibitions, illegitimate torture is still secretly carried on. One main fact in Europe is perhaps that, while the lawyers 2000 years ago already saw the fallacy and futility of torture, seventeen centuries had passed before its abolition was taken firmly in hand. The many generations of clerical jurists and judges did no better than the laymen, accepting the institution and 'passing by on the other side,' if indeed the ecclesiastical tribunals were not the worst offenders. The divorce of the judges from all legislative function has much to answer for in checking the critical initiative of amendment sometimes induced by judicial experience. Abolition at last came neither from the logic of the law nor from the impulse of the Church, but from the impassioned zeal of humanitarian philosophy.

TOTEMISM.—I. Introductory.—The word 'totem' is derived from *ototeman*, which in the Ojibwa and cognate Algonquian dialects means 'his brother-sister kin.' Its grammatical stem *ote*, meaning the consanguine kinship between uterine brothers and sisters, the group of persons recognized as by birth or adoption collectively related together as uterine brothers and sisters who cannot intermarry, is never used alone.¹ The word was introduced into the English language by J. Long² in the form of *totem*. This he wrongly defined as the favourite spirit which each of the savages (Chippewa or Ojibwa) believes watches over him, adding:

¹ J. N. B. Hewitt, in *HAI* ii. 787.

² *Voyages and Travels of an Indian Interpreter and Trader*, London, 1791.

'This *totam* they conceive assumes the shape of some beast or other, and therefore they never kill, hunt, or eat the animal whose form they think this *totam* bears.'¹

The first to give an account, accurate as far as it goes, of totemism on the American continent was Peter Jones, himself an Ojibwa chief, but an ordained Wesleyan Methodist minister and missionary to his tribe. He wrote the *History of the Ojibway Indians*, published without a date in London after his death, which took place in 1856. He says:

'Their belief concerning their divisions into tribes is that many years ago the Great Spirit gave his red children their *toodains*, or tribes, in order that they might never forget that they were all related to each other, and that in time of distress or war they were bound to help each other. When an Indian in travelling meets with a strange band of Indians, all he has to do is to seek for those bearing the same emblem as his tribe; and having made it known that he belongs to their *toodain*, he is sure to be treated as a relative. Formerly it was considered unlawful for parties of the same tribe to intermarry, but of late years this custom is not observed. . . . Each tribe is distinguished by certain animals or things, as for instance the Ojibway nations have the following *toodains*: the Eagle, Reindeer, Otter, Bear, Buffalo, Beaver, Catfish, Pike, Birch-bark, White Oak-tree, Bear's Liver, etc. etc. The Mohawk nation have only three divisions or tribes—the Turtle, the Bear, and the Wolf.'²

What Jones calls a tribe is now usually called a clan or gens, meaning a group, not necessarily localized, of persons regarded as united by a bond of kinship real or fictitious, extended beyond the family properly so called to a brotherhood bearing the same name and including strangers who have been formally adopted into it. This brotherhood or clan may, and frequently does, extend also beyond the boundaries of the local body called by Jones a nation, but now usually known as a tribe.

In the meantime Sir George Grey, then governor of S. Australia, in the account of his travels in W. Australia, drew attention to the similarity between the Australian *kobong* and the American totem, describing the *kobong* at some length and giving genealogical lists to illustrate the mode of descent.³ A series of articles in the *Fortnightly Review*⁴ on 'The Worship of Animals and Plants' by J. F. McLennan was suggested, at all events in part, by Grey's observations. It was this series of articles, with McLennan's important but erroneous speculations, which finally brought the subject of totemism before the scientific public in Britain. Among others whose attention they attracted were Lord Avebury (then Sir John Lubbock) and W. Robertson Smith. It was especially the use made of totemism by the latter in the speculations embodied in his important work, *The Religion of the Semites*, that started the controversies incessantly waged on the subject from that day to this.

2. Definition; plan of the article.—Totemism as exemplified in N. America and Australia, where it has been found in the fullest development, is a form of society distinguished by the following characteristics: (1) it is composed of clans or bands of men each united among themselves by kinship real or fictitious, a kinship frequently extending beyond the limits of the local tribe; (2) the clan is distinguished by the name of some species of animal or plant, or more rarely of some other natural phenomenon, such as the sun, rain, etc.; (3) the species or object which gives its name to the clan is conceived as related to the clan, and to every member of it, in some mystic way, often genetically; and in this case every individual specimen of the object, where it is an animal or plant, is regarded as belonging to the clan; (4) such species or object

is usually the subject of a religious or quasi-religious emotion, and every individual specimen is the subject of tabus or prohibitions: subject to certain limitations, ceremonial or in self-defence, it may not be injured or killed, or (where eatable) eaten; (5) moreover, as in all societies organized on the basis of kinship, the members of the clan are entitled to mutual defence, protection, and resentment of injuries. They may not marry or have sexual intercourse within the clan.

These characteristics are general, but they vary to some extent not merely from area to area, but from tribe to tribe. After detailing a few typical examples, it will be necessary to mention others where totemism seems to be decadent, and then to consider whether it has ever prevailed among peoples where it is not now to be found, and lastly to inquire into its origin. Various influences tending to modify, submerge, or destroy it will be indicated from time to time in the course of the article.

3. Typical examples.—(a) *America*.—Somewhat fuller accounts than that of Peter Jones are now available concerning the totemism of the Ojibwas. They were divided into about 40 exogamous totemic clans, of which those of the Crane, Catfish, Loon, Bear, Marten, and Wolf were the principal, and the first five appear to have been the original. The other clans are said to have been formed by the segmentation of these. Nearly all the clans are named from animals of either land or water. Members of a totem-clan were held to be closely related to all other persons of the same totem, even though belonging to different tribes.¹ We have no information whether the Ojibwa clans regarded themselves as having descended from the totems whose names they bore; but the clans of some other Algonquian tribes claim such descent. Thus, among the Delawares or Lenape the Tortoise, Turkey, and Wolf clans (the three chief clans of the tribe),² among the Sauks the Fox, Eagle, Bear, Beaver, Fish, Antelope, and Raccoon clans,³ among the Menomini the Bear, Golden Eagle, Wolf, and other clans,⁴ and among the Ottawas the Carp clan,⁵ are specified as tracing their lineage to the animals after which they are named; and in the last-mentioned tribe the Bear clan ascribed its origin to a bear's paw without explaining the precise nature of the relationship. However this may be, the Ojibwa Bear clan was held to resemble the bear, its totem, in disposition. The members were surly and pugnacious, the acknowledged war-chiefs and fighting men of the community; the war-pipe and war-club were committed to their custody. The Crane clan took its name (Bus-in-as-see, 'Echo-maker') from the loud, clear, ringing cry of the crane; members of the clan were thought to possess naturally a loud ringing voice, and they were the acknowledged orators of the tribe.⁶ We are not informed whether in their personal appearance, dress, or ornaments the Ojibwa totem-clans were ordinarily in the habit of imitating the totem-animals, as some other tribes do. The Abenaki, also an Algonquian tribe, painted their totems on their arms, breasts, and legs.⁷ An Ojibwa sometimes had the figure tattooed on him, or carried some

other token by which his totem might be known.¹ Unfortunately our reports are chiefly confined to the social aspects of the Ojibwa organization, so that we have little or no information as to the religious outlook. Religion is inextricably mingled with other aspects of savage life; hence we may be sure that it reacted upon social and political life. Among their neighbours, the Sanks or Musquakies, dances in honour of the totems were held. At these dances—a religious exercise—those who took part were covered with masks and dresses to resemble the totemic animals, so dreadful that the women were seriously frightened, and the old masks were therefore destroyed and milder ones substituted.² Special ceremonies were performed by the Bear clan of the Ottawas to soothe a bear when they killed it, including an offering to the dead animal of its own flesh. When a member of that clan or of the Carp clan died, he was buried, whereas by command of the totem a member of the Great Hare clan was cremated—at least, whenever he died at a distance from home.³ Among the Menomini a member of the Bear clan who, when hunting, met a bear would apologize and ask forgiveness before killing it; and no member of the clan could eat of the meat (though members of other clans might do so) except the hunter himself, who was permitted to eat of the paws and head, the bones of the head being carefully preserved in a place of honour in the wigwam as a relic of the totem-animal to which due reverence must be paid.⁴ The Ojibwa reckoned descent and kinship through the father only; but there is some evidence that they formerly reckoned through the mother only—a change possibly accelerated by white, and particularly missionary, influence. Such a change is known to have occurred elsewhere.⁵

The Iroquois, a confederacy of six tribes in what is now the state of New York, on the other hand, were matrilineal. They were organized in totemic clans, of which all of them possessed three—the Bear, Wolf, and Turtle—some of them eight. There is some reason to think that the larger numbers were derived by segmentation from the three original clans, though it is possible that, in some of the cases at all events, the number of the three clans may have been augmented by the adoption of captives from other tribes, who formed separate clans. The clans were exogamic, but in the eight-clan tribes they were formed into two phratries. The members of the clans were not allowed to marry indiscriminately into any other clan; they could marry only into a clan of the opposite phratry, the phratry thus becoming the exogamic unit in place of the clan. On the social side of Iroquoian totemism we have fairly full information. The members of a clan were united for mutual defence and the resentment of injuries; and the phratries, where the tribe was organized in phratries, had certain important functions at the death of a chief and the election of his successor.⁶ On the religious aspect, however, our information is sadly deficient. There is one account by a chance traveller, in which the Iroquois were stated to believe in their descent from the turtle (or tortoise), the bear, and the wolf—their three chief totems;⁷ and among their

myths one has been preserved by a scientific inquirer relating how the turtle became a man and the progenitor of the Turtle clan.¹ But neither L. H. Morgan nor Horatio Hale, to whom we are indebted for nearly all that we know of the organization of the Iroquois, has told us anything concerning the intimate relations between the totem and its clan, or the aspect in which the totem was regarded by the clan, or the members by one another.

The Iroquois, however, had one custom common to a number of N. American tribes. Each clan had a stock of personal names appropriated to it only, which other clans of the same tribe were not permitted to use, so that, if a person's name was known, it was possible to say to what clan he belonged. To such a length was this custom carried by some tribes that, when the clan organization began to decay, a child could be assigned to another clan than that into which by hereditary descent he was born, by the simple process of giving him one of the personal names belonging to the latter clan—at all events if the clan recognized the child and thereby confirmed the choice.² The clans of some of the N. American tribes performed ceremonies for the control of their totems for the common good of the tribe. This was the practice, e.g., among the Omaha.³ But its utmost development is found in the southwest of the United States among the various tribes of Pueblo Indians.⁴

(b) *Australia*.—In Australia totemism has been crossed, and among some tribes superseded, for exogamic purposes by a system of marriage-classes.⁵ The consequent variation in the social arrangements of the different tribes has introduced a confusing factor into the totemic organization. Among those tribes whose organization has been least affected is the Dieri, inhabiting part of the Lake Eyre basin in S. Australia. They possess a number of clans of which the names of 27 are known. Their totems belong chiefly to the animal world; but the list includes some vegetable totems and such objects as rain and red ochre. It seems to be common to all the tribes in the Lake Eyre basin, though it is not ascertained whether all the totems are recognized by every tribe. Each tribe, like some of the Iroquois tribes, is divided into two moieties, or phratries, some of the clans belonging to one phratry and the rest to the other. These phratries are called by the Dieri Kararu and Matteri respectively; and, as among the Iroquois, not only the clan but also the phratry is exogamous. A Kararu man must marry a Matteri woman, and conversely a Matteri woman a Kararu man; but within the limits of the opposite phratry the mate may belong to any clan. Both the clan and the phratry descend in the female line, the children in all cases taking those of the mother.⁶ The Dieri clans do not claim their totemic animals or plants as ancestors. More than one legend accounts for them.

According to one story, the totems (*murdus*, properly *madas*) came out in an unfinished condition from the earth in the midst of Lake Perigundi and lay on the sandhills around the lake until the warmth of the sun strengthened and raised them up as human beings, whereupon they separated in all directions. Hence the *madas* (totemic clans) are now scattered all over the country. According to another story, a malignant *mura-mura*, or supernatural being, was killed by the people for his misdeeds, but came to life again. He followed footprints, and, finding the people busy fishing, opened his mouth and swallowed water, fish, and men. Some escaped, running off in all directions, and to every one as they ran he gave a *mada*. In proof of the story, rocks are pointed out which are said to be the body of the *mura-mura* in question, and his teeth.⁷

If we may trust one account, the Dieri do not regard the animal or plant which is their totem as sacred, but will kill or eat it.⁸ It is not, however, certain that we can rely on this statement. Its author, for a long time a mounted constable in the district, and hence brought much into contact with

the natives, was, we know, mistaken in other matters with respect to them. In general throughout Australia the clansmen regard their own totem with reverence.

Thus, in the Wakelbura tribe we are expressly told that the totem-animal is spoken of as 'father.' 'For example, a man of the *Binnung-urra* (Frilled-lizard totem) holds that reptile as sacred, and he not only would not kill it, but would protect it by preventing another person doing so in his presence. Similarly a man of the Screech-owl totem would call it "father," and likewise hold it sacred and protect it. . . . A man who was lax as to his totem was not thought well of, and was never allowed to take any important part in the ceremonies.'¹ In the tongue of the Wotjobaluk *yauerin*, 'flesh,' is used for totem, indicating the close relationship of the totem and the totem-clan.² Grey, writing of the tribes of W. Australia, reports that 'each family [clan] adopts some animal or vegetable as their crest or sign, or *kobong*, as they call it,' and that 'a certain mysterious connection exists between a family and its *kobong*, so that a member of the family will never kill an animal of the species to which his *kobong* belongs, should he find it asleep; indeed he always kills it reluctantly, and never without affording it a chance to escape. This arises from the family belief that some one individual of the species is their nearest friend, to kill whom would be a great crime. Similarly a native who has a vegetable for his *kobong* may not gather it under certain circumstances and at a particular period of the year.'³ So far is this belief in a connexion between the totem-clan and its *kobong* carried that in the Wakelbura tribe, 'when a man could not get satisfaction for an injurious action by another, he has been known to kill that beast, bird, or reptile which that man called "father," and thus obtain revenge, and perhaps cause the other to do the same, if he knew of it.'⁴ Such is the influence of belief that the killing of a man's totem has been known to hasten his death.

An interesting development of totemism in Australia is the assignment of a number of sub-totems to each totem. Thus in the Wotjobaluk tribe the Deaf Adder totem has for sub-totems the Native Cat, Black Swan, Tiger-Snake, Sulphur-crested Cockatoo, Crow, and Dingo; and the other totems have similar lists.⁵ Where, according to the peculiar exogamic regulations, the phratries developed into marriage-classes, the sub-totems were attached to the latter. Ultimately the result was to divide the universe between the various classes and sub-classes—a result expressed in diagrammatic form in accordance with the points of the compass by the Wotjobaluk, who buried their dead orientated to agree with the diagram thus obtained.⁶ What the reason was for assigning these sub-totems to the different totems and classes has not been ascertained; to us it seems arbitrary. At any rate the Australian native extended the regard for his totem to the sub-totems comprehended in the totem-clan or class to which he belonged.

A man of the Buandik tribe, we are told, 'does not kill or use for food any of the animals of the same sub-division with himself, excepting when hunger compels; and then they express sorrow for having to eat their *warigong* (friends) or *tunang* (their flesh). When using the last word they touch their breasts to indicate the close relationship, meaning almost a part of themselves.'⁷

Another custom developed extensively in Australia, but (as already intimated) not unknown among the Sioux in N. America, and elsewhere, is that of the performance of ceremonies by a totem-clan for the purpose of exercising control over the totem—e.g., for multiplying its numbers, especially where it was edible, or for ensuring its capture, or, where it was injurious, for driving it away. The *intichiuma* ceremonies of the Arunta have by the investigations of Spencer and Gillen become the best known; they are perhaps the most elaborate, but by no means the only, ceremonies of the kind. The Dieri and other tribes perform such ceremonies, though it is not clear in all cases that the performers are confined to members of the totem-clan. From the analogy of cases both in Australia and in the islands of Torres Straits we

may probably assume that they are. Whether these ceremonies should be called religious or magical is a question of terminology, though it seems certain that the performers are under the influence of emotional excitement such as we usually connect with religious rites.

Little is known about the relations of the clansmen in Australia among themselves. From vague references by Howitt and others it would seem that they enjoyed mutual defence and responsibility. But offences were brought before a tribal council, by whose decision blood-revenge was pursued in a quasi-legal manner and, if resisted, ultimately involved the whole tribe in the blood-feud.

(c) *Africa*.—Another area in which totemism has been found is that large portion of Africa which is occupied by the Negro and Bantu races. Of the totemism of some of these peoples, particularly of the Negroes, our information is fragmentary. Concerning the Tshi-speaking Negroes of the Gold Coast we have on the whole most information. They are divided into totemic clans, or 'families,' of which the principal are twelve in number, viz. Leopard, Buffalo, Dog, Parrot, Plantain, Cornstalk, Servant, Red-Earth, Palm-oil-Grove, Abadzi, and Dumina or Dwimina. The meaning of the names of the last two clans is uncertain. The last is probably a local variant of the name of the Nsonna, or Bush-Cat, clan; and, according to some accounts, Abadzi, which may mean 'cannibal,' is another name of the Ntwa, or Dog, clan. About certain of the clans little or nothing beyond the name is known, and questions of identity arise on some of them. These difficulties are incidental to traditional lore where we are dependent upon natives who are not familiar with all the clans about which inquiries are made. To the Leopard clan the leopard is sacred, though members of it are reported now to abstain from the flesh of all the *felidae*. No member may kill a leopard; if he were to do so by accident, he would exclaim, 'I have killed my brother,' and would put palm-oil on the wounds. If he sees a dead leopard, he must scatter shreds of white cloth upon it and anoint the muzzle with palm-oil, as a sign of respect and sorrow. If a dead leopard is brought into the town, the members of the clan smear themselves with chalk (a sign of mourning) and bury the body. If on a journey a member of the clan were to meet a leopard, he would turn back. The Buffalo, Bush-Cat, Dog, and Parrot clans abstain from eating the totem-animal. The Bush-Cat clan, it is said, abstain from killing not only a bush-cat, but also a crow, under penalty of sores on their bodies. Formerly, if they found a crow or a bush-cat dead, they would bury it, and with the crow a piece of white cloth, with the bush-cat a piece of speckled cloth. The traditional accounts which have reached us of the origin of these clans do not generally claim genetic descent from the totem.

One account states that 'people originally came from the earth, sky, sea, mountains, and the animals, etc., that came with them are their totems'; e.g., the Parrot clan came with the parrots on their loads; the Dog clan came from a river with a broom and with a dog carrying fire.

Other clans, fewer in numbers and conjectured to be of more recent origin, claim that they are descended from an actual animal which possessed the power of assuming human shape at will. In the case of two such clans tales belonging to the Swan Maiden type are told to account for them. The totem-animal is revered. It is addressed as 'grandfather,' a title of respect used in addressing the kings of Ashanti. It is supposed to help the clansmen in various ways; and restraint is said to be placed upon it in order to compel it to grant the wishes of the tribe. There are no marks or dresses distinguishing the clans; but, when a member of

the Leopard clan dies, the mourners (clansmen) make spots on their bodies with red, white, and black clay to represent a leopard, and scratch the figure of a leopard on the wall of the house and on the coffin. The Nsonna clan in the like case put white clay or white cloth round their necks, because the crow which the clan respects has a white band round its neck. The clan is always matrilineal and exogamous; and it has a common burial-place. There is said to be a belief that at death a clansman becomes or transmigrates into an individual of the totemic species, and, further, every clansman's life is bound up with one such individual, so that, if it dies, he will also die.¹

The Bantu have for the most part advanced from maternal to paternal descent, though among some tribes we find an intermediate stage. This has not been without its effect upon their totemism, which in several ways varies from the pattern of true matrilineal totemism. The Bechuana, who occupy the centre of S. Africa, are divided into a number of independent 'tribes' generally called by totemic names and having totemic practices and beliefs. In many cases, however, these 'tribes' are not true totemic clans. Since the wife always goes to reside with her husband, the result of the change to paternal descent is to collect the members of the clan together, instead of distributing them as in a matrilineal people, and hence the clan tends to become identified with the geographical and political tribe. Every Bechuana tribe is ruled by a chief, whose totem is recognized as that of the tribe. The political conditions were such that before the European occupation of the country members of a tribe who were discontented with their chief used to desert him and go to a neighbouring rival, with whom they were sure of a welcome. Thus a powerful chief was liable to be reduced to weakness, and perhaps conquered by a neighbour, if his rule was unpopular. It followed that a tribe frequently comprehended members of many totemic clans. But they all accepted the chief's totem, and in time became indistinguishable from the true clansmen, though we do not read of any formal adoption into the clan or of any blood-covenant. The chief is always addressed by the name of the totem, as 'O Crocodile!' 'O Lion!' The Bechuana word for 'totem' is *siboko*, which has led Van Gennep to propose the name 'sibokism' to distinguish the S. African variety of totemism. The chief's totem is held sacred, and the animal, plant, or other object is regarded with fear and reverence.

Thus the Banoku, 'they of the porcupine,' are reported to 'sing,' i.e. 'feast, worship or revere' that animal. 'When they see any one maltreat that animal, they afflict themselves, grieve, collect with religious care the quills, if it has been killed, spit upon them and rub their eyebrows with them, saying: "They have slain our brother, our master, one of ours, him whom we sing." They fear that they will die if they eat the flesh of one.' Yet they doctor a new-born child with it, mixed with the juice of certain plants.² The Bakuena, 'they of the crocodile,' call the animal their father; 'they celebrate it in their festivals, they swear by it, and make an incision in the ears of their cattle, by which they distinguish them from others.' They call it 'one of them, their master, their father.' Similar practices are recorded of other clans. 'No one dares eat the flesh or clothe himself with the skin of the animal the name of which he bears. If this animal is hurtful, as the lion, for instance, it may not be killed without great apologies being made to it and its pardon being asked. Purification is necessary after the commission of such a sacrilege.' The Bataung, 'they of the lion,' 'carefully abstain from touching his flesh as other people do; for how could one think of eating his ancestor? Nor does even the chief dare to wear, like other chiefs, a lion's skin by way of royal mantle.'³

But totemism is decadent among the Bechuana, and has been so for a period which probably dates from before the coming of the European,¹ due partly to the change to paternal lineage, partly to the political conditions, and partly to the keeping of herds of cattle, a custom that seems to have been adopted from the Hottentots.

America, Australia, and Africa are the three chief areas in which totemism has been found widely spread and fully developed. It will be perceived that each of them has its own type, though variations in detail are found in individual tribes and peoples. The remaining areas are India and Melanesia.

(d) *India*.—In India totemism is found only among the non-Aryan tribes, and chiefly among the Dravidians. Of these we may take the Oraons on the plateau of Chotā Nagpur in Bengal as representing the type. Though they have to a great extent emerged from the hunting and pastoral stages of culture, totemism 'still forms the fundamental feature of their social organization in so far as kinship, marriage, and relations of the sexes are concerned.' They are divided into a number of exogamous clans distinguished by names supplied by 'the fauna and flora of their past and present habitats'; and to these, 'with the acquisition of a knowledge of agriculture and the use of metals, a few new totem names have been since added.' The animal and vegetable names amount in number to 62. There are also (probably of more recent origin) two mineral totems, those of Iron and Salt; two which may be called place-totems, viz. Bāndh, an embanked reservoir of water, and Jūbbi, a marsh or surface-spring; and two which belong to a class known elsewhere, called 'split-totems' as involving tabus of a portion only of an animal or vegetable, and frequently known by the name of that portion. Among the Oraons these split-totems are Anvir (rice-soup) and Kispōttā (pig's entrails). Sexual union within the totem-clan is reckoned incestuous, though at the present day, if a marriage takes place in which the rule is infringed wittingly or unwittingly, the offending pair, after paying a fine and giving a feast to the clansmen by analogy with the usual caste practice in India, are formally re-admitted to the tribe and their union is thus legalized. The remaining ordinary totemic tabus are observed. 'An Oraon must abstain from eating or otherwise using, domesticating, killing, destroying, maiming, hurting or injuring' his totem. A wife, in addition to the tabus of her own clan, is required to observe those of her husband's while she actually resides in his village. Men of the clan whose totem is any kind of tree may not go under the shade of the tree or use its produce in any shape. But some modifications have been introduced where the totem is an indispensable article of diet or household use.

Thus members of the Paddy clan abstain only from eating the thin scum on the surface of rice-soup when left standing in a cool place; members of the Salt clan abstain only from taking raw salt, the tabu not extending to food or drink in which salt is an ingredient or flavour; members of the Iron clan abstain only from touching iron with their lips or tongue; members of the Pig clan are forbidden only to eat the head of the pig; members of the Bārā clan, of which the *Picus Indica* is the totem, may eat the fruit whole, but not by dividing it in two.

On the other hand, the tabus of some clans have been extended to objects having a real or fancied resemblance to the totem or bearing the same or a similar name.

Thus members of the Tiger clan not only have to observe various tabus in reference to the tiger and to the wolf, but also must abstain from eating the squirrel's flesh, since the squirrel is striped like the tiger, and they may not marry in the month of Māgh (December-January) because the name Māgh rhymes with *bāgh*, the Hindi word for 'tiger.'

¹ A. B. Ellis, *The Tshi-speaking Peoples of the Gold Coast*, London, 1887, p. 206; J. M. Sarbati, *Fanti Customary Laws*, do. 1897, p. 4; *JAI* xxxvi. [1906] 178 ff.

² T. Arbousset and F. Daumas, *Narrative of an Exploratory Tour to the N.E. of the Colony of the Cape of Good Hope*, (r. J. C. Brown, Cape Town, 1846, p. 176.

³ *Ib.* p. 213 f.; E. Cassalis *The Basutos*, London, 1861, p. 211.

¹ W. C. Willoughby, *JAI* xxxv. [1905] 298.

In this case the foreign word *bāgh* points to a late and highly artificial origin for such a tabu, which is obviously due to the timidity of superstition. Other additional tabus have been suggested to be due to the fusion of clans, just as some 'split-totems' may have arisen from the opposite process of the division of clans.

'The general attitude of an Orāon to his clan-totem is that of a man to his equal—to his friend and ally,' though some periodical practices seem to indicate a more religious regard—at any rate for its effigy. But totemism is now in decay, as it is over the rest of India. An unintentional breach of a tabu is no longer believed to entail any serious consequences, though looked upon with social disapproval. There is no difference between the clans in personal dress or adornment, nor is a man supposed to partake of the qualities of the totem. There are very few traditions of the origin of totem-names. Such as there are do not reveal any belief in the descent of the clan from the totem, but rather in some other relation between the totem and the human ancestor of the clan. The Orāons are patrilineal.¹

(e) *Melanesia*.—In Melanesia (including New Guinea and the islands of Torres Straits) there is a tendency to associate with the principal totem of a clan a number of subordinate totems which have been called 'secondary,' 'subsidiary,' or 'linked' totems. The western islands of Torres Straits have for many years been the scene of successful missionary enterprise. Under this influence the totemism which formerly existed among the people has almost disappeared. But twenty years ago the members of the Cambridge Anthropological Expedition, who spent some time on the islands, were able to recover very definite evidence of its existence. The population was divided into a number of exogamous totemic clans. As a rule each clan had subsidiary totems in addition to its chief totem. 'In some cases two or more clans might have the same chief totem, while differing in their subsidiary totems'—which looks like the fission of an original clan. Members of a clan were distinguished by wearing an emblem of the totem, or more rarely bearing it in cicatrices or keloids on the flesh. Personal belongings also, it is said, were adorned with a representation of the owner's totem. Descent was reckoned in the male line; but adoption seems to have been practised. In conformity with patrilineal reckoning there was a tendency to a geographical distribution of the clans. This, however, was apt to result in quarrelling; and the missionaries had accordingly succeeded in inducing the people, at all events of one of the islands, to abandon the localization of the clans.

'The solidarity of the totem-clan was a marked feature in the social life of the people, and it took precedence of all other considerations; not only so, but there was an intimate relationship between all members of the same totem [-clan] irrespective of the island or locality to which they might belong and even warfare did not affect the friendship of totem-brethren. Any man who visited another island would be looked after and entertained as a matter of course by the residents who belonged to the same totem as himself.'²

The clans were grouped in two classes or phratries. On the island of Mabuiag these two phratries were respectively known as 'the children or people of the Great Totem' and 'the children or people of the Little Totem.' The former comprised the Crocodile, Cassowary, Snake, and Dog clans (all land animals); the latter the Dugong, Shovel-nosed Skate, Shark, Ray, and Green Turtle clans (all water animals). On this island there is

¹ S. Chandra Roy, *The Orāons of Chōtā Nagpur*, Ranchi, 1915, p. 324 ff.; cf. Frazer, ii. 234 ff., and the authorities there referred to.

² A. C. Haddon and W. H. R. Rivers in *Reports of the Cambridge Anthropol. Exped. to Torres Straits*, Cambridge, 1901-05, v. 161.

no sufficient evidence that the phratries regulated marriage during recent times; but there is reason to think that they were exogamous on some other of the islands. Members of a clan might not kill or eat the totem; but this did not apply to the Dugong and Turtle clans, for both dugong and turtle were important articles of food on the islands, which are somewhat barren. Members of the clan, however, were not allowed to eat of the first dugong or turtle caught, but might partake of those subsequently caught. They performed ceremonies to entice the animals to the island and ensure a good season. They could, on the other hand, by magical rites with the contrary intention, prevent them from coming. A mystical relation was held to subsist between the totem and the clan. He was said to be 'all same as relation, he belong same family.' The Cassowary, Crocodile, Snake, Shark, and Hammer-headed Shark clans were reputed to be truculent and to like fighting. The peaceable clans were the Shovel-nosed Skate, Ray, and Sucker-fish; while the Dog clan was sometimes peaceable and at other times quarrelsome—all like the totem-animal. Certain of the clans, possibly all, had formulæ which they repeated in going into a fight, and which were either magical or in the nature of invocations to the totem. The prayer is in some stages of civilization near akin to the spell.¹

4. *Decadence of totemism*.—The foregoing examples will sufficiently indicate the chief characteristics of totemism in the five great areas in which it has been found. It is apparent that in each area totemism was by no means a new phenomenon. It arises in a low condition of savagery and is connected in its typical forms with matrilineal descent. But, even before contact with Europeans, it had begun to assume forms very divergent from what we understand by normal totemism, leading in some cases to degeneration and disintegration.

(a) *America*.—Among the divergences found in N. America those of the coast-dwellers of the north-west are the most remarkable. The Tlingit, inhabiting S. Alaska, are divided into two exogamous phratries or classes, called after the raven and the wolf respectively;² and these two phratries are again divided into a number of totemic clans. The members of a clan are believed to be related to one another more closely than to those of other clans even of the same phratry. They reckon descent through the mother and as a consequence are not gathered at one place, but distributed as social groups and not geographical. Yet each clan usually derived its origin (and most of them, at the present day, their names) from some village or camp which it once occupied. They seem, however, to have had alternative names (if F. Boas's account is correct) derived from the animal, or one of the animals, which they claimed as a badge. In point of fact the emblems or representations on the north-western coast, generally called totems, are rather badges or crests. The clans of each phratry, indeed, all use the totem of the phratry; they also use a number of other badges, some of which are the special property of the clan, or of some sub-clan, and are guarded with much jealousy. They carve and paint the badge on the so-called totem-poles erected in front of the dwelling-house, or on a grave. These poles are, however, less frequently erected by the Tlingit than by some of their neighbours. The badge is also exhibited on many other articles of property, worn as a mask or hat used as a disguise at dances, potlatches, and funeral ceremonies, and painted

¹ Haddon and Rivers, *ib.* v. 153-156.

² J. R. Swanton, *26 REEW* [1905], p. 407, suggests that these two phratries may have had a racial origin.

on the faces of the clansmen. It is not now held that the clan or phratry is descended from the totem or animal represented, though it may be suspected that in former times this was believed. At present stories are told by the clan or sub-clan claiming a badge of its acquisition by an ancestor through an adventure with the animal in question, such animal being often conceived as of super-human power.

As Frazer points out, many of 'these tales have the true totemic ring about them; they point clearly to the former identification of the clanspeople with their totems, which is only another way of saying that the present people are supposed to be descended from the totemic animals.'¹

To this it may be added that, according to Boas's report, 'the animal and a member of its clan are considered relations. Thus the wolf gens will pray to the wolves, "We are your relations; pray don't hurt us!" But notwithstanding this fact they will hunt wolves without hesitation.'²

The truth is that the more or less permanent settlement of all the tribes along the coast—at least from the Tlingit to the Kwakiutl—in villages, and their increasing civilization, have led to the division of the population into ranks or castes and to a continually higher value being set on the crests or badges as marks of rank and wealth, and as symbols, if not guarantees, of descent from a distinguished ancestor. This has resulted in an accumulation of crests, some clans or sub-clans obtaining a larger number than others; and some of the crests were used by more than one clan.

'The great majority of Tlingit personal names referred to some animal, especially that animal whose emblem was particularly valued by the clan to which the bearer belonged.'³

Of these names many seem to have been peculiar to one or other of the clans. The solidarity ordinarily subsisting between members of a clan is found, among the Tlingit, rather between the members of a phratry.

'According to the unwritten Tlingit law it was incumbent upon everyone belonging to a phratry to house and feed any other member of that phratry who should visit him, no matter from how great a distance he might come'; and it was a mark of good manners, therefore of high caste, not to abuse such hospitality.⁴

Any serious collision at a potlatch arising out of the rivalry of opposing parties of dancers was averted or stayed by the host's people, who rushed between them bearing the emblem of their phratry or making the call of the animal whose name was that of the phratry. When a man died, the funeral ceremonies were conducted by the opposite phratry, who were afterwards entertained at a mourning feast by the relatives of the deceased. On the whole it may be conjectured that the two phratries represent original totem-clans, out of which the existing clans or groups, whether social or local, have developed. There was also reckoned among the Tlingit population a small group at Sanya, called the Nexádi ('People of Nex,' a creek in the neighbourhood), who stood outside both phratries and might marry into both. They bore the Eagle crest or badge and had personal names having reference to the eagle. They were doubtless a small intrusive population, which Swanton, the latest investigator of the Tlingit, suggests as perhaps of Athapascan derivation.⁵

Coming down from north to south along the coast and islands of Alaska and British Columbia, we find a similar organization, differing however in detail, among the various peoples, with an increasing emphasis laid on rank and the possession of crests, until we reach the Kwakiutl. The Kwakiutl proper (or Southern Kwakiutl, as they are often called to distinguish them from the Heiltsuk, their northern congeners) are organized in 'tribes,' which in turn are subdivided into

exogamic groups distinguished not, as a rule, by totemic names but by the collective form of the name claimed as that of an ancestor, by geographical names, or by 'names of honour.' The evidence seems to show that they are neither definitely patrilineal nor matrilineal in descent, but in a state of transition, since a child may belong to any 'clan' or exogamic group to which one of its ancestors belonged at the arbitrary discretion of its parents. Each exogamic group, like the ordinary clan of several of the tribes east of the Rocky Mountains, had a number of personal names appropriated to it; and to assign a child to such a group it was enough to give it one of these names. In this way it appears to have become *ipso facto* a member of the group; it might even belong to more than one at the same time. What was more important in Kwakiutl society was the possession of crests and the privileges that they carried. These were obtained in three several ways: (1) they might be inherited by direct patrilineal descent from an ancestor who acquired them through an adventure in the course of which he obtained the protection and guidance of a *manitu*, or spiritual helper, for himself and his descendants; direct inheritance of this kind, however, was comparatively rare; (2) more usually they were obtained by marriage; the payment of a bride-price secured not only the bride, but also the right of membership in her 'clan' or exogamous group, the crest and privileges of the bride's father, and a good deal of other property; (3) the third method was to obtain them by killing the owner, as in the case of the position and privileges of the King of the Wood of Nemi. The privileges include not only the use of the crest but also the right to the membership of certain societies and the ownership and exclusive right to practise certain dances connected with the ceremonials of the societies. They are, however, not acquired for the benefit of the son-in-law in the case of marriage, but for his successor, whoever he may be. Seeing, moreover, that the number of noblemen is fixed, and there is only one person at a time who personates the ancestor and has his rank and privileges, the person entitled must wait for a vacancy before he can be admitted to them. He may wait in vain; for before a vacancy occurs the owner may change his mind, or even after the person entitled has obtained the privileges he may divest them and confer them upon some other successor.

This is manifestly not totemism, for the societies operate only during the winter, when they dominate the social organization to the exclusion of the kinship and local groups. It may have been influenced by true totemic conceptions, from which it may even have sprung. But its cause must be sought in the increasing power of wealth, the consequent development of rank, and the desire for display.¹

The transformation that thus seems to have overtaken totemism among the Kwakiutl is in process also among the Pueblo tribes of New Mexico and Arizona. Here the cause is different. In these tribes, originally organized in totemic clans and phratries with matrilineal descent, the struggle for existence in an arid country has evolved a sense of dependence upon the supernatural powers and a religious ritual and elaborate ceremonies, partly religious and partly magical, for the production of rain and maize. At first these ceremonies appear to have been performed by the appropriate clans, as we have found in other areas. In some cases they are so still, as among the Zúñi, but aided and superintended by the priests of the various deities. In other cases,

as among the Hopi, the Snake clan has been superseded for this purpose by an 'order' or society, the members of which were probably at the beginning recruited exclusively from the clan. The rule is now somewhat less strict, embracing others besides members of the clan, though the members of the society are limited.¹ In fact the latest inquiries appear to show that the societies or fraternities have broken away and become quite independent of the clan organization.²

(b) *Australia*.—Turning to Australia, we find that among the Central tribes the totemic clans have been carried far towards their complete conversion into societies performing magico-religious rites, the object of which is the multiplication of the totemic animal or plant. The Warramunga hold that the totem-clans originated each from a single ancestor, half-beast, or half-plant, from whose body emanated a number of spirit-children; and the descendants of the clan are all animated by these spirit-children. The ceremonies are here performed by the clan in a definite order, representing in dramatic fashion the traditional history of the clan. The Warramunga and the tribes to the north of them are definitely patrilineal with exogamic clans; but the members of the clan in every generation are believed to be continual re-encarnations of deceased ancestors. The Arunta, on the other hand, have ceased to regulate their marriages by totemic exogamy and now regulate them solely by class-divisions consisting of the pristine moieties of the tribe, which have been doubly subdivided, so that they are now eight in number. There are various places in the territory of the tribe which are totemic centres believed to be haunted by the spirit-children of the original ancestors. One of these spirit-children is held to have entered the body of every pregnant woman, according to the totemic centre near or at which she first felt herself pregnant. In this way the 'clan' of the child is ascertained, and in no case does it depend upon that of the father or mother. The resulting group passing under a totemic name is clearly no true clan.

'There is no such thing as the members of one totem [-group] being bound together in such a way that they must combine to fight on behalf of a member of the totem [-group] to which they belong.'

Inasmuch as every death is supposed to be due to witchcraft, revenge has to be taken by somebody. Normally this duty would fall on the clansmen of the deceased. But among the Arunta it would seem to be the members of the local group who undertake it.

'In fact,' say Spencer and Gillen, summing up the subject, 'it is perfectly easy to spend a considerable time amongst the Arunta tribe without even being aware that each individual has a totemic name'; but the fact of his belonging to one or other of the divisions governing marriage is soon apparent.

These groups thus passing under totemic names perform under the direction of their respective headmen from time to time, as the headman concerned decides, the ceremonies known as *intichiuma*. These ceremonies are not, like those of the Warramunga, the property of the entire group, but each of them belongs to a specific individual, who alone has the right of performing it or of requesting others to do so. One consequence of this is that they are not performed in a definite series: they are fragments and may be given in any arbitrary order. They have ceased to be a representation of the traditional history of the group; they have become mere magical rites. Further, in the tribes both south and north of the

Central group, consisting of the Arunta and their immediate neighbours, a man is forbidden to kill, injure, or eat his totem. In some of the tribes, though patrilineal, the prohibition also applies more or less absolutely to the totem of the clansman's mother—probably a relic of an older matrilineal condition. Among the Arunta, however, there is no such prohibition. Indeed the members of a totem-group are expected to eat of the totem during the ceremonies; and they have liberty to do so at other times, though only sparingly. The conclusion from these and other facts is irresistible that the Central tribes of Australia are finding their way out of normal totemism, and that of these tribes the Arunta and their immediate neighbours to the north (the Kaitish, Unmatjera, and others) are the farthest advanced on the road. Their totemic organization is not merely decadent; it is obsolescent. Such remains of it as persist are preserved only as societies held together for the performance of certain magical or religious rites and as the carriers of certain religious traditions, but no longer as organic social groups.¹

But decadent totemism often takes another course in its transformation. In most totemic communities it is customary to assemble the growing youths for the purpose of what are generally called the puberty ceremonies. By means of these ceremonies the youths of the tribe are taken from their mothers' care and out of the society of women and children, are submitted to tests of courage and endurance, educated in sexual matters and in the customs and traditions of the tribe, and fitted henceforth to take their part in the life of the tribe as adult and fully admitted members. Such initiation rites are prominent all over Australia. Among the Central tribes they have been developed beyond all others. They have been made very severe, not to say cruel; they have been elaborated into four distinct stages and protracted through years, though not of course continuously during that period. Their performance is everywhere one of the important occasions on which the tribe comes together. The members are summoned by special messengers with traditional formalities. But the actual performance of the greater part of them is secret, in the sense that no one is allowed to witness or take part in it who has not previously been in a similar manner initiated.

(c) *Africa*.—There is evidence of the existence of totemism in W. Africa from Senegambia southward in almost all the populations. In many places, however, where it is decadent or obsolete it is replaced by secret societies which dominate or supplement the nominal government. Thus at Old Calabar there is a very powerful society known as Egbo, divided into numerous grades. The king is the head. It has in a rough and ready way the whole administration of the law in its hands.² Farther south, in the cataract region of the Lower Congo, is a secret society known as Nkimba. According to the latest researches, it is entered about the age of puberty. The candidates are chosen by the *nganga*, or medicine-man. The ceremonies take place in the forest, where the camp is jealously guarded from all intrusion. There the candidates remain for a period variously stated as from one or two months to five or six years. They are painted white, and a narcotic is administered. They are subjected to a number of tests, such as the imposition of a new name and an oath of secrecy, and to flagellation. They are circumcised, if not already in that condition. They are taught a new language, and it is believed

¹ The various minutely detailed accounts of the Pueblo Indians and their ceremonies have been admirably summarized by Frazer, iii. 195 ff.

² A. L. Kroeber, 'Zuni Kin and Clan,' *Anthrop. Papers of the Am. Mus. Nat. Hist.*, xviii. [New York, 1917] 145 n., 150 ff.; J. W. Fewkes, *19 RBEW* [1900], pt. ii. p. 935.

by the women and other non-initiated that they are put to death and brought to life again. They are instructed in the religious beliefs and moral rules to which they must in future conform. Various prohibitions are enforced during and after their retirement. If approved for the purpose, they may become fetish-priests or medicine-men; otherwise they become simply adult men, ready to take part in public life. This is obviously little more than the puberty rites of ordinary totemic peoples; but there is reason to think that the Nkimba tends to become more magical in its purview. Those who have passed through it have acquired a character in some degree sacred and mysterious; a special tie is established between them; they regard one another as brethren and render mutual aid. Another society called Ndembo, often confounded with the Nkimba, exists on the Congo. A Ndembo is not held periodically, but one is established whenever the elders of the village direct. It appears to have a specially sexual aim; men and women are admitted, and sexual licence is said to be encouraged in the camp; and to such a length is the comedy of death and resurrection carried that, on returning after the conclusion of the ceremonies, those who have been subjected to them pretend to have lost all remembrance of their previous life, act in the most foolish manner, and are only gradually recalled to ordinary sense and behaviour. The object of the Ndembo appears moreover to be more specialized, more decidedly magical, than that of the Nkimba.¹ It seems probable that all these secret societies have been developed from, or at least deeply influenced by, the initiatory rites of totemic tribes.

The Herero of S.W. Africa, who have been massacred and almost entirely destroyed by the Germans, offer a peculiarly difficult problem, not yet entirely solved. They were divided into clans called *eanda* (plur. *omaanda*) reckoning descent exclusively through the mother. A tradition of their origin is related, deriving it from a pair who emerged from the trunk of an *omborombonga* tree in the far North, whose children were all daughters fructified by contact in some way or other with various objects of the external world. These objects became the totems of their descendants. Among them may be enumerated the sun, rain, the tree, the marmot, the koodoo, the chameleon, besides others the significance of whose names is disputed. The members of an *eanda* called themselves brothers-in-law (not brothers) of the totem. The blood-feud attached to the *eanda*, which moreover, formerly at least, was exogamic. Side by side with the *eanda* stands another organization, apparently of more recent origin, the *oruzo* (plur. *oluzo*). The *oruzo* descends exclusively in the paternal line. It is also totemic; and among the totems appear the chameleon, the sun, the koodoo, rag, necklace of beads. The members of an *oruzo* are distinguished by the mode of dressing their hair, by their food-tabus, and by special sacrificial regulations. The colour and shape of the horns of the cattle which an *oruzo* possesses also differ from those of every other *oruzo*. The institution of the *oruzo* is attributed to the medicine-men; and there can be little doubt that it is specially a religious organization for the maintenance of the sacred fire of the family and the worship of ancestors. All cattle belong to the *oruzo*, for the Herero are a pastoral people, and their wealth consisted of cattle until the Germans deprived them of their stock. The cattle never descended to or through females, at all events if there was a male descendant to inherit them. The food tabus of the Herero are probably not all totemic. The Herero have no

totemic badges or signs.¹ The totemism prevalent among them is thus widely divergent from the common type. Its twofold organization is manifestly the result of a conflict between matrilineal and patrilineal institutions. How that conflict originated is obscure; but it is obviously not unconnected with the growth of ancestor-worship and the introduction of herds of cattle among a hunting and perhaps rudely agricultural people, and the consequent changes of mode of life and social arrangements. The country which they now inhabit is steppe, almost desert, and quite unsuitable for agriculture. After the rains there is for a time abundant pasture, which at other seasons must be sought in the deep and sheltered dales with which the land is intersected. The change to a pastoral life may be surmised to have occurred when or shortly before they penetrated to their present possessions, not probably more than five or six centuries ago. The consequent development of their institutions is even yet incomplete.

At the other extremity of the area occupied by the Bantu are found the Baganda, the most highly civilized of the race. They were governed by kings probably descended from a Hamitic stock which conquered the country several centuries ago.

The Baganda are divided into a large number of totemic clans, the members of which observe the two fundamental canons of normal totemism, since they abstain both from injuring their totem and from marrying a woman of the same clan.² Each clan has a principal and a secondary totem, and takes its name from the former. Both totems are sacred to members of the clan, who may neither kill nor destroy them. Other people, however, may kill or destroy them for a reasonable purpose, without hurting the feelings of members of the clan.³

The Baganda trace their lineage in the male line; but a woman's children were taught in infancy to respect her totems and to avoid them. When they grew up, they adopted their father's totems and ceased to regard those of their mother. Yet they were forbidden to marry into their mother's clan. For these and other reasons it seems clear that descent had originally been reckoned in the maternal line, and that, as in the case of the Herero, though on different lines, the transition had been recently and incompletely effected.³ Like the clans of certain N. American tribes, each clan had special names appropriated to its children; hence the clan to which a man belonged was recognized by his name.⁴ The king had a large harem. His children, however, took the totem of their mother; and it was naturally deemed an honour for a clan to give a king to the realm by means of the union of one of its female members with the king. From this honour certain clans were excluded for reasons which are now unknown. To obviate this some of the excluded clans joined more favoured clans, so that their daughters might marry the king and have children who might be in the succession to the throne. Another reason for the union of clans was to better the position of a despised clan. Clans so associated obtained the right to use the totem of the more honourable clan; yet they were so little regarded as relations by the members of the latter that intermarriage between members of the two clans was not forbidden. The Lung-fish clan (the largest of all) also was in an exceptional position in that its members were not subject to the rule of exogamy.⁵ The totems are usually some species of animal. A few species of trees and other vegetables are found as totems, besides beads and other articles of human manu-

facture; and 'split-totems' and other anomalous totems (as a tailless or a spotted cow, and rain-water from roofs) are not unknown.¹ Notwithstanding the existence of a system of law and administration of justice, the sense of clan-solidarity remained strong. The blood-covenant was practised and was considered more binding than common oaths.² Murder was rare; but cases of murder and manslaughter, when they occurred, were taken up by the clan. The clan of a murdered man might accept and share a fine, instead of insisting on the punishment of death; and, on the other hand, the clan of the wrong-doer contributed to the payment. 'When a member of a clan wished to buy a wife, it was the duty of all the other members to help him to do so'; when a person got into debt, or was fined, the clan combined to assist him to pay the debt or fine.³ Thus the totemism of the Baganda, while preserving many, if not most, of the essential features normally present, departs widely from more typical totemism. The religious aspect, though not quite absent, has fallen into the background before polytheism and the cult of the dead. The kingship and the organization of the kingdom have been imposed by a non-Bantu conquering people, which brought a military class, imperfectly assimilated by the bulk of the people when the English occupation took place. This people probably introduced domestic animals, some of which have become totems; and its influence is perhaps also to be traced in the 'split-totems.' Secondary totems are met with elsewhere, as we have seen.

Totemism is decadent also among the tribes of the Congo. It there manifests itself chiefly in tabus, though totemic tabus are only a few of the tabus observed. Among the Bangala of the Upper Congo the totem-animal may not be killed or eaten. A woman after marriage observes her husband's totem as well as her own. A child born to them takes the totems of both parents, until a council of both families determines which totem it is to take permanently—usually the father's. The Bangala are patrilineal.⁴

(d) *India*.—In continental India the decadence of totemism has been caused chiefly by the spread of Hinduism, and with it the extension of the caste system. The origin of caste has not yet been entirely cleared up. Within the Hindu system it is largely, if not mainly, occupational. As applied to the Dravidian and other races of the peninsula, it is transforming, or has transformed, independent tribes into castes; and by means of legends, some of them doubtless consciously forged to manufacture claims, these tribes have succeeded in gaining reluctant and often strongly contested admission as castes into the Hindu social hierarchy. The Reddi or Kāpu, the largest caste in the Madras Presidency, are probably descended from a Dravidian tribe which in the early centuries of our era was powerful in India. They are now a great caste of cultivators, farmers, and squireens in the Telugu country and rank next to the Brāhmins in Hindu society there. They are divided into a number of sections, for whose names fanciful etymologies have been found, and for some of them legends have been invented. One of these sections, the Panta Kāpus, are again severed into two endogamous divisions. But they are said also to have true totemic sept, of which the following are examples:

(1) Magili (*Pandanus fascicularis*): the women of this sept do not, like those of other castes, adorn themselves with the flower-bracts; and a man of the sept 'has been known to refuse to purchase some bamboo mats, because they were tied with the fibre of this tree'; (2) Ippi (*Bassia longifolia*): this tree and its products must not be touched by members of the sept; (3)

Mancham (cot): members of this sept avoid sleeping on cots; (4) Arigala (*Paspalum scrobiculatum*): members of this sept do not use this grain as food; (5) Chintaginjala (tamarind seeds): these seeds may not be used or touched by members of the sept; (6) Puccha (water-melon): the fruit may not be eaten by members of the sept.

Moreover, the names of various exogamous Kāpu sept are suggestive of totemism, such as the Cow, Grain, Buffalo, Sheep, Fowl, Goat, Elephant, as well as various plant-names, though others, such as Cart, Army, Hut, Harrow, Woman's Skirt, Plough, are more doubtful.¹

This is not an uncommon type of caste. It suggests that the caste in question is a transformed tribe, and that the divisions of the caste originate from totemic clans, many of which retain their totemic names and some of their tabus, though other subdivisions have forgotten them or originated in a different manner. The Khangars are a low caste of village watchmen and field-labourers in the Central Provinces, almost certainly of non-Aryan origin. They are divided into numerous exogamous sept, all of which are said to be totemic. 'The members of the sept usually show veneration to the object from which the sept takes its name.' Thus the Barha sept is named from *barāh*, 'pig,' this sept worshipping the pig; the Chirai from *chiriyā*, 'bird,' this sept revering sparrows; the Ghurgotia from *ghora*, 'horse,' towards which the members practise certain observances; the Kasgotia from *kāusa*, 'bell-metal,' which is tabued by the sept; the San from *san*, 'hemp,' pieces of which are placed by members of the sept near their family god. The Hanuman sept is so called from the monkey-god, and the Viṣṇu sept from Viṣṇu, the god worshipped by it.²

In the United Provinces there are also many tribes and castes, probably of Dravidian origin, among whom totemism is traceable. Such are the Agariya of Mirzāpur, who have seven sept, all exogamous and apparently of totemic origin: the Markām named from the tortoise, which the members will not kill or eat; the Goirār from a certain tree which they will not cut; the Paraswān from a tree (*Butea frondosa*) which they will not cut and whose leaves they will not use for platters; the Sanwān from hemp (*san*), which they will not sow or use; the Baragwār from a tree (*Ficus Indica*) which they will not cut or climb and from the leaves of which they will not eat; the Banjhakwār, said to be named from *beng*, 'frog,' which the members of the sept will not kill or eat; and the Gidhlē, the members of which will not kill or even throw a stone at a vulture (*gidh*). The Agariya are patrilineal; and they have been deeply influenced in other ways by Hinduism. Indeed they call themselves Hindus in religion, though they worship none of the regular Hindu deities. There are, however, traces of a previous matrilineal condition. They practise tatuing, and many of the marks inscribed on their bodies are probably totemic in origin, 'but the real meaning has now been forgotten, and they are at present little more than charms to resist disease and other misfortunes, and for the purpose of mere ornament.'³ The social and political conditions of India are such that almost the only possible relics of totemism consist in the names of the sept and the prohibitions of marriage within the clan and of eating, killing, or using the totem. Hindu influence leads to the ascription of descent to human beings rather than to animals or plants, concerning which tales are told to account for the totemic name and observances. The organization of the tribe or caste by means of a council and the police regulations render unnecessary the union of members for mutual protection. Hence, and owing to the universal tendency of caste to subdivision, the sense of solidarity is greatly weakened and is daily decreasing in force.⁴

(c) *Melanesia*.—There are signs that totemism was developing in the islands of Torres Straits into an anthropomorphic cult. Traditions are found of culture-heroes associated with various clans. Of these Sigai and Maiau on the island of Yam appeared first in the likeness of a hammer-headed shark and a crocodile respectively. For each of them a shrine was erected, the essential feature of which was a turtle-shell model representing either a hammer-headed shark or a crocodile; under each of these was a stone in which the spirit, the so-called *augud* ('totem'), resided.

Uninitiated persons were not allowed to visit these shrines, nor did they know what they contained: they were aware of Sigai and Maiau, but they did not know that the former was a hammer-headed shark and the latter a crocodile; this mystery was too sacred to be imparted to uninitiates. When the heroes were addressed it was always by their human names, and not by their animal or totem names.¹

Each was associated in his animal form with one of the two phratries or groups of totem-clans. Warriors before going to battle prayed to them. Totem-dances were celebrated and songs were sung, which were believed to have an effect upon the weather, by the shark-men and crocodile-men, dancing separately and wearing feathers coloured white or black according to the party to which they belonged. On Mabuiaug and Muralug the hero was Kvoiam, a warrior-hero, who himself was called an *augud*. In the Muralug group of islands he was regarded as the 'big *augud*' and 'the *augud* of every one in the island.'

He is said to have made and worn 'two crescentic objects of turtle-shell, which blazed with light when he wore them at night-time, and he nourished them with the savour of cooked fish. These objects were termed *augud* . . . and they became the insignia of the two phratries into which the old totem-clans of Mabuiaug were grouped.'²

'When attacking an enemy the warriors formed into two columns, each of which was led by a head-man who wore the Kvoiam emblems.'³

Like Sigai and Maiau, he possessed a sacred shrine. It was situated on the island of Pulu; there his crescentic emblems were kept, and thence they were taken with certain ceremonies to be borne before the appropriate phratry in war.⁴

A similar evolution has been observed in Fiji.

'The people of the interior of the island [of Viti Levu] form a number of independent communities which may probably be regarded as tribes, and each of these has a number of divisions and subdivisions, which in the relatively high development of Fijian society have departed widely from the character of the septa into which a totemic community is usually divided. The animals from which descent is traced, and whose flesh is prohibited as food, are usually associated with the larger groups which seem to correspond to tribes, though the divisions of the tribe often have sacred animals or plants peculiar to themselves in addition to those which are *tabu* to them as members of the tribe.'⁵

Rivers goes on to give examples.

The tabued animal of the people of Cawanisa is an aquatic creature called the *dravidrabi*, from which they believe themselves descended; and none of the divisions have restrictions peculiar to themselves. The sacred animal of the Nadrau or Navuta people is the *qilyago*; some of its divisions have restrictions peculiar to themselves, the Wailevu division eating neither the dog nor a fish called *dabea*, the Kavuici respecting the snake. Other animals were held sacred in other parts of the island, the people believing in descent sometimes from the tabu animal of the tribe, sometimes from that of the smaller group. Marriage is regulated by kinship alone, and there is no evidence at present of totemic exogamy. It is manifest that this kind of totemism is widely divergent from what is usually reckoned normal totemism. Nor is this to be wondered at, seeing how far Fijian civilization has progressed. Yet it presents 'the three characteristic features of the institution: belief in descent from the totem, prohibition of the totem as an article of food, and the connection of the totem with a definite unit of the social organization.' Rivers discovered evidence

among these hill-tribes 'that the sacred animals had become gods, which had, however, retained their animal form definitely.' Certain rules of conduct given to the Nadrau people by the bird *qilyago* showed an early stage in the evolution of a god from the totem-animal. In the Rewa district in the low country things had gone a step farther. 'Here each village had a deity called *tevoro*, with a name which usually showed no sign of an animal origin, but in many cases these deities had the power of turning into animals, and in such case the people of the village in question were not allowed to eat the animal.' Thus the people of Lasakan, a division of Bau, had a *tevoro* who turned into a bird called *sese*. 'The bird could not be eaten, and here, as in the hills, it was clear that the restriction extended to the whole people and was not limited to either of the two divisions of which the Lasakan people are composed.'¹

These are not the only cases which he mentions; but they are probably enough to render the evolution plain.

It is almost unnecessary to remark that totemism may decay, especially where it comes under European influence, by simple neglect.

Thus the Winnebago, a Siouan tribe of N. America, tracing their descent from animals who were transformed into human beings and became ancestors of the various clans, treat the totem-animal in no way differently from other animals, hunting it and eating it if edible. Descent is patrilineal, and a child used always to take a name of his father's clan; but this is falling into desuetude. The reckoning of descent has become irregular; and the sacred bundle of the clan occasionally now passes out of clan-possession.²

Again, the Diegueno of California were all formerly totemic. Descent is paternal. Clan exogamy is still observed by many of the clans, but not by all. Some, like the Blue Wild-Cat clan, regard the totem-animal as brother. But many of the clan-names have ceased to be totemic, and the clans have become, or are becoming, mere local groups. The clan-name is frequently taken as a personal or family surname under modern conditions.³

Such cases may be found elsewhere than in America.

5. Traces of totemism among non-totemic peoples.—Over a large area of the globe, embracing Europe, the greater part of Asia, S. America, and Polynesia, the north of Africa, and the extreme north of N. America, inhabited by the Eskimo, totemism is now unknown. But among many of the peoples of these regions certain beliefs and practices have been reported which seem to bear traces of a former prevalence.

(a) *Polynesia*.—Rivers' discoveries, just referred to, in Melanesia find their analogies in Tonga and Tikopia.

In the former he learned that 'each family had its *otua* [a Polynesian word, usually written *atua*, meaning "god" or "ancestor"], some of which were animals and some stones, while a man might also be an *otua*. Examples of animal *otua* were the octopus, the flying fox, and the pigeon. . . . An animal was never eaten by those whose *otua* it was, and I was told,' he says, 'that there was definite belief in descent from the animal.' Similarly on the island of Tikopia he found a number of animals called *atua*. 'Some of these animal *atua* belong to the whole community and may be eaten by no one on the island; others belong to one or other of the four sections into which the people are divided.' Thus the octopus is the *atua* of the Kavika; but it is forbidden as food not only to them but also to the whole people. The Taumako may not eat the sea-eel or a bird called *rupe*—prohibitions limited to this division of the people. The Fangalele may not catch an *one* fish. The Tafua may not eat the fresh-water eel, the flying fox, or the turtle, the two latter 'being also prohibited as food to the whole community, though regarded as especially sacred to the Tafua.' There was also evidence that the Kavika were believed to be descended from the octopus, the Taumako from the eel, the Tafua from the flying fox; and it was believed that one man of this division became after death a fresh-water eel, while two men of the Fangalele became, the one an *one* fish, the other a *moko* bird. There are also plant and vegetable *atua*, to which corresponding restrictions attached.⁴

Thus there is reason to think that totemism had at one time existed and had left traces attributable to no other cause. Elsewhere in Polynesia there are relics more or less distinct of the same conditions.

(b) *Egypt*.—We are naturally reminded of Egypt. The origin and early development of Egyptian religion are obscure. What we find is that in the earliest period known to us by the

Tribes and Castes of N. W. Provinces and Oudh, passim; and the other works referred to in Crooke's notes to Kinsley's observations. Cf. also Crooke's observations in *PR*² ii. 148-169.

monuments each nome or district had its own peculiar object of adoration in some animal, which was regarded with indifference or, in consequence of local quarrels, with hostility in the adjacent nomes. Moreover (in spite of changes during the country's long history, in spite of the evolution into higher polytheism and of the syncretism which gradually won its way, at all events among the educated classes), the same attitude towards these animals prevailed to the end. One nome venerated the ibis, one the crocodile, one the cat, one the gnat, one the ram, one the *oxyrhynchus* fish, and so on. Some of these are domesticated animals; in the earliest period, however, domesticated animals do not appear. The monarchy seems to have been introduced by a people which invaded Egypt and conquered the aborigines. The invaders carried the standard of a falcon, from the name of which (*heru*) that of Horus, later regarded as the last of the gods who reigned over Egypt, is derived. When the objects of adoration took human form, becoming anthropomorphic gods, these were identified with various animals, and are represented on the monuments with the heads of the appropriate animals. The animals remained sacred, as their numerous mummies attest; and various legends were told to account for their relation to the respective gods. At Bubastis, where the cat was venerated, the goddess Bast had her seat; Ombos, where the crocodile was honoured, was the sacred town of the crocodile-headed god, Sebak; the ram-headed god, Khnum or Ammon-Rā, was worshipped at Thebes, and there precisely was the place where the sheep was revered. As a result of the unification of the country under the kings, syncretism in theology spread, and the various gods tended to be identified with one another and with the animals honoured in the different towns. At length the myth and worship of the culture-hero, Osiris, prevailed throughout the land; and his myth included a story of how the various gods fled, 'disguised in brutish forms,' from the rage of his enemy Typhon. In short, all sorts of devices are adopted to account for the local gods and animals venerated in the different cities and districts and to unify the religion. These devices were probably known to, or at least accepted by, the educated classes only. All the other classes remained attached to their local deities.¹ The evidence points to the prevalence at one time in the valley of the Nile of a form of totemism, which possibly included various trees and other vegetables (for these, though less prominent than animals, are not unknown in Egyptian religion), and which by a series of steps was slowly merged and elevated into a polytheistic worship tending ever in the minds of the educated more and more to monotheism.²

Of the original social organization, however, we know little beyond the fact that it was matrilineal. The woman was mistress of the house; the husband on marriage was received as a guest or went to reside with her. Those men who could afford it kept harems, the members of which were under the governance of the chief wife. It is a probable conjecture from the available information that society was constituted of clans, in later ages directly or indirectly giving birth to trading and other guilds. The custom of the husband going to reside with his wife secured the local concentration of the clan and facilitated the conversion of the clan-settlement into the nome and the dominance of a single animal-totem in each nome.

² A. H. Sayce, *The Religions of Ancient Egypt and Babylonia*, Edinburgh, 1902, p. 116.

All this was doubtless the result of the agricultural occupations of the people. What were the relations of the members of the clan to one another or to the totem we are not informed.

(c) *Greece*.—Scientific controversy has raged over the question whether remains of totemism are discoverable in ancient Greece. Salomon Reinach, Toutain, and Van Gennepe have been the protagonists. Andrew Lang pointed out the various remains of animal-worship among the Greek peoples—in Thessaly the Myrmidons claiming descent from the ant and revering ants; in the Troad and the islands the mice sacred to Apollo Smintheus and a tribe referred to by an oracle as mice; the adoration of the wolf at Delphi and Athens and of the sheep on Samos; the descent of Tennes, the hero of Tenedos, from a swan; the invocation of Hecate as a dog and the sacrifice to her of a dog;¹ the Artemis of Arcadia, identified with Callisto, a nymph who is fabled to have been metamorphosed into a she-bear, from which the Arcadians claimed descent; the similar tale of the Brauronian Artemis in Attica, served by girls called bears, dancing with the gait of bears and probably in archaic times wearing bear-skins; and a hundred other such myths, rituals, and metamorphoses.² Nor has he been alone in discerning that such cases pointed to a primitive totemism, outgrown and misconstrued before the dawn of authentic history. The social organization of Athens has also been examined. The *γένος* and *φρατρία* have been pronounced parallel in all essentials with the organization of the Australian totemic clan and phratry.³ There are good reasons for suspecting that originally matrilineal descent was the rule, of which vestiges subsisted down to historical times.⁴ Though this view has been challenged,⁵ and it is undoubted that agnatic descent prevailed in historical times, the suspicion is not without solid foundation. Probably the pre-historic population of the period called the Mycenaean age was matrilineal and was conquered by a patrilineal military people from the north, who formed the dominant classes in the Homeric age, and under whom Greek society was transformed and reorganized. On the whole we are justified in accepting with L. R. Farnell the theory that various remarkable cults—the Arcadian worship of Zeus Lyceus and of Artemis Calliste, the Attic worship of Zeus Polieus, and perhaps some others—can be explained only by a survival of what is in effect totemism.⁶ But, if so, then other cults and myths of which the connecting links have been lost may with the more likelihood be assigned to the same origin.

(d) *Ireland*.—Over the rest of Europe the traces of totemism are still more uncertain. They will be found, as in Greece, if at all, on the side of belief and practice which may be called quasi-religious rather than in social observances such as marriage restrictions; for under the dominance of Christianity and the social ideas, Hebrew and Roman, carried with it society has been shaped for two millenniums. In Connemara and the islands off the west coast of Ireland persons bearing the name of Conneely, who are descended from the clan Conneely, an old family of Iar-Connaught, claim 'that they have seal's blood in them, and that is why they are such good swimmers.'

A story is told of some members of the clan who at a distant period were changed into seals. Since then, it is said, no Conneely can kill a seal without afterwards having bad luck.

³ A. W. Howitt and L. Fison, *JAI* xiv. [1885] 142 ff.

⁴ Hartland, *Primitive Paternity*, London, 1909, i. 265, ii. 18.

⁵ L. R. Farnell, *ARW* vii. [1904] 70; H. J. Rose, *FL* xxii. [1911] 277 ff.

⁶ *CGS*, Oxford, 1896-1901, i. 41, 58, 91, ii. 434, 441 (cf. iv. 116, v. 106; and J. E. Harrison, *Themis*, Cambridge, 1912, *passim*, esp. ch. v.).

Seals are said to be regarded with profound veneration. They are called Conneelys, and are said to be the souls of departed friends. We are told that 'in some places the story has its believers who would no more kill a seal, or eat of a slaughtered one, than they would of a human Conneely.'¹

Both in Ireland and in the Scottish isles are stories and customs which point to an extinct totemism as the best explanation; and the same explanation has been offered, with more or less probability, of various beliefs and practices in Wales and England as well as in other European countries.²

(e) *W. China*.—In W. China among the Lolos, an aboriginal mountain people of Szechwan, there is something more than traces of totemism.

Their 'surnames always signify the name of a tree or animal or both tree and animal,' and 'these are considered as the ancestors of the family bearing the name. This name is often archaic. Thus the surname Bu-luh-beh is explained as follows:—Bu-luh is said to be an ancient name for the citron, which is now known as *sa-lu*. The common way of asking a person what his surname is, is to inquire "What is it you don't touch?" and a person of the surname just mentioned would reply "We do not touch the *sa-lu* or citron." People cannot eat or touch in any way the plant or animal, or both, which enters into their surname. The plant or animal is not, however, worshipped in any way.

People of the same surname may marry if there is no obvious relationship. There are, however, groups of two or three surnames amongst whom intermarriage is forbidden; and no explanation of this is given. There are also groups of two or three surnames who are called comrades, and intermarriage amongst them is favoured.³

The Chinese themselves are on a higher plane of civilization, and totemism is unknown. But from sundry prohibitions its existence has been suspected. Among some other peoples of S.W. Asia and various islands of the Indian Archipelago totemism has been either found or suspected. In Madagascar and in the Polynesian islands a number of superstitions have been ascribed with more or less probability to an original totemism no longer forming part of the social organization.

(f) *American*.—In Central and S. America also customs and beliefs have been interpreted as traces of totemism. Thus in Peru, where the various clans were localized, each clan worshipped its ancestor, and the tendency seems to have been for such objects of worship to assume the form of an animal, vegetable, or some other natural phenomenon. Each clan, moreover, had a distinctive dress. But our information is too imperfect to permit of a definite opinion on the subject.⁴ The Bororo of Brazil claim to be araras (a bird with a red plumage) and believe a neighbouring tribe, the Trumai, to be water-animals, while a certain cannibal tribe is descended from the jaguar.⁵ In N. America it was usual for a young man at adolescence, or a man who wished to acquire special powers, to go out into the woods and fast for days in order to acquire a guardian spirit, which usually took the form of an animal. It was revealed to him in a vision in which his austerities culminated; and when it took the form of some animal, a portion or symbol of that animal became his fetish or medicine. Thereafter he obeyed the restrictions and prohibitions believed to have been communicated to him by the vision. There was a tendency among some tribes, particularly in the north-west, for the guardian spirit (*súlia* or *manitu*) to be inherited by his descendants. And some writers have seen in this the origin of totemism.⁶ A variety of the practice in

Central and S. America is known under the name of nagualism (Quiche *nagual*, 'the knowing one' or 'sorcerer'), in which some natural object, commonly an animal, is believed to have a parallel relation with a human being, so that for weal or woe their fates are mutually dependent. The *nagual* is sometimes chosen by divination for an infant at birth, but more often obtained, like a *manitu*, by fasting and prayer.¹ It seems that the *nagual* is a purely personal acquisition and is not inherited like the *súlia*. It should, however, be pointed out that neither the belief of the Bororo nor the *manitu* or *nagual* of other tribes has the marks of true totemism. It has no relation to a clan, nor is it in any way related to the social organization: where the *manitu* descends, it is only to the children or remoter issue of the original possessor, and in such case the descent has only taken place under the influence of patrilineal kinship.

(g) *Australia*.—In Australia among the Kurnai and some other tribes of the south-east the two sexes have animals respectively regarded as their protectors, with whom the life of individual members of the sex is supposed to be bound up. Fights between the sexes on behalf of their sex-totems often occurred, as a means, or a preliminary, to marriages.² Here again, and for the same reason as in nagualism and the other American beliefs just referred to, the sex-totems are, whatever their origin, entirely unconnected with true totemism.

6. *Origin*.—The origin of totemism has been the subject of much discussion and speculation among anthropologists. It is only necessary here to refer to a few of the hypotheses offered. That which is identified with the name of Hill-Tout has already been incidentally dealt with. Though accepted by some American anthropologists, it has not generally found favour on either side of the Atlantic. Frazer, having previously adopted the theory that the totemic clan was in its primitive form and purpose a society for the multiplication by magical ceremonies of the totem-animal or vegetable, and so for ensuring a continuance of provision for the food and prosperity of the community, so far as the totem-animals and vegetables were edible or otherwise available for use,³ has relinquished that hypothesis. Instead, in his latest conjecture he is now inclined to the opinion, suggested by observation on the part of Spencer and Gillen of the peoples of Central Australia, and on the part of Rivers of the Melanesians, that totemism originated in a primitive explanation of conception and childbirth. The latter people hold that their mothers were impregnated by the entrance into their wombs of spirit-animals or spirit-fruits, and that they themselves are severally nothing but the particular animal or fruit which effected a lodgment in the mother and in due time was born into the world as a human being. Hence they partake of the character of the animal or fruit in question and refuse to eat all such animals and fruits. The supposition is that these beliefs become in particular cases hereditary and result in the evolution of clans derived respectively from ancestors who originated from the animals or fruits.⁴ Such a theory, however, encounters the same difficulties as the theory which ascribes the origin of totemism to the *manitu* become hereditary.

Earlier than either of these theories Frazer had suggested 'that the key to totemism might be found in the theory of the

external soul, that is, in the belief that living people may deposit their souls for safe keeping outside of themselves in some secure place, where the precious deposit will be less exposed to the risks and vicissitudes of life than while it remained in the body of its owner.¹ This hypothesis, though founded on a widely spread practice and belief, has not, he frankly admits, been confirmed by further research, inasmuch as 'the evidence which connects this theory of external human souls in animal bodies with totemism appears to be insufficient to justify us in regarding it as the source of the whole institution.'²

Andrew Lang, towards the close of his life, was led to emphasize the social aspect of totemism. He advocated a theory similar to that first propounded by Herbert Spencer, and adopted by the German scholar, J. Pötker,³ that the origin is to be sought in names. According to this theory, bands of men, having been given names from outside, either by way of distinction or as nicknames, accepted these names and came to fancy that they themselves were in a mystical connexion with them, or rather with the things signified by the names, and then the course of social organization, from one cause or another, led first to the preference for wives of another band having a different name, and subsequently to a positive prohibition to marry a woman of the same band and necessarily having the same name—in other words, to clan-exogamy.⁴ The influence of names, and the inveterate tendency to regard a name as a real objective existence belonging to and having a mystical connexion with the person or thing signified by it, are practically universal in the lower culture. But why these names were appropriated and accepted by the various bands is left unexplained. Lang apparently agrees with Frazer that the institution of exogamy is distinct from totemism, and that totemism as a matter of fact preceded exogamy.⁵ It certainly is a usual, but not quite invariable, accompaniment of it. Lang indeed offers explanations of the origin of exogamy, but it cannot be said that his speculations are more satisfactory than those of previous inquirers.

A. C. Haddon some time ago hazarded a suggestion of the possible origin of one aspect of totemism.⁶ It is that there were numerous small human groups in favourable areas, each occupying a restricted range in which a certain animal or plant or group of animals or plants might be specially abundant, and that they consequently utilized these as a food-supply and for other purposes, the superfluity of which could be bartered for the superfluities of other groups.

Thus 'the group that lived mainly on crabs and occasionally traded in crabs might well be spoken of as "the crab-men" by all the groups with whom they came in direct or indirect contact. The same would hold good for the group that dealt in clams or in turtle, and reciprocally there might be sago-men, bamboo-men, and so forth. It is obvious that the men who persistently collected or hunted a particular group of animals would understand the habits of those animals better than other people, and a personal regard for these animals would naturally arise. Thus from the very beginning there would be a distinct relationship between a group of individuals and a group of animals or plants, a relationship that primitively was based, not on even the most elementary of psychic concepts, but on the most deeply seated and urgent of human claims, hunger.'

Here Haddon agrees with Lang that the name of the group was probably imposed from without and adopted by the group thus named. Once accepted, the name and the regard for the animal, or whatever was the object signified by the name, would result in a mystical connexion being held to exist between the object and the human group, which might issue in the object being tabued instead of used as originally, and, on the other hand, in magic being worked to secure a continuous supply of the object. As part of the tabu, or incident to it, exogamy, originating in a prefer-

ence for women of contiguous groups, might be developed.¹

E. Durkheim, envisaging chiefly the Australian evidence, considers totemism as a religious institution. According to him, it is the religion of a sort of anonymous and impersonal force manifested in various animals, men, and emblems, none of which possesses it entire, but all of which participate in it. It is the god adored in all totemic cults; but it is an impersonal god without name or history, immanent in the world, diffused in an innumerable multitude of things. It is, in short, *mana* (*q.v.*) or *orenda*. It is not, however, represented under its abstract form, but is conceived as a species of animal or vegetable—in a word, under a sensible form—each group of men taking for ensign the animal or vegetable diffused most plentifully in the neighbourhood of the place where the group was accustomed to assemble. The totem is really only the material form under which this immaterial substance, this energy diffused through all sorts of heterogeneous beings (which is the sole object of the cult), is represented to the imagination. It is the symbol not only of the impersonal totemic principle or god, but also of the definite society, the clan, of which it is the totem. It is the standard, the emblem, by which each clan distinguishes itself from the others, the visible sign of its personality, the mark borne by every one that makes part of the clan, whether men, beasts, or anything else. All are sacred in varying degrees; but most sacred of all—more even than the totem-animal or other object itself—is the artificial standard or emblem of the clan. Since all who communicate in the same totemic principle are sacred, the totem is the source of the moral life of the clan, and all are morally bound to one another, with definite duties towards one another of help, vendetta, and so forth. The totem is thus not only a material but a moral force, which may easily transform itself into a divinity properly so called. Totemism therefore is bound up with the organization of society. It is practically assumed as the earliest form of religion and of society everywhere.² In the striking work of which the main thesis is here imperfectly summarized Durkheim elaborates this thesis with infinite pains and abundance of illustrations. But everything rests on the assumption of primitive universality, which no attempt is made to prove. Large spaces of the world, however, remain in which totemism has never yet been found. More or less probable traces of it may, indeed, be discerned in these areas; or they may hereafter be discovered. Meanwhile Durkheim's theory remains a brilliant conjecture, and nothing more.

In its insistence on an attitude towards nature and on a psychology different from that of civilized mankind it avoids the rock on which most of the hypotheses heretofore considered have split. This was also emphatically laid down, as the condition of success in solving the question of the origin of totemism, by E. Reuterskiöld, a Swedish scholar, in an article which appeared almost contemporaneously with Durkheim's work. This article is an extension of part of a previous essay by the same author published in 1908. He urges that totemism is connected with an impersonal conception of life. A group of men are allied with a group of animals. There is nothing personal, nothing individual, in their union. It is an association peculiar to the primitive mode of thought, which does not compare one thing with another: if it finds likeness between them, it identifies them. For primitive man the individual is nothing; the group or the species is

everything. Man did not picture himself as lord of creation. He did not sever himself in thought from other living creatures; he was only a part of a great community. He felt himself closely united with a kind of animal living in his neighbourhood and coming in touch with him. It was no accident that he associated himself with one or other species. Totemism has its various sides—religious, magical, and social. These were in the origin undistinguished from one another. The distinction between them came later, with the development of individualism and analysis.¹

In this way Reuterskiöld would explain the origin of totemism. Without saying that he has completely solved the question, the opinion may be expressed that he has realized the conditions of primitive life and thought sufficiently to define at all events some of the conditions to be fulfilled and so lead to a solution. In endeavouring to explain the attitude towards nature of the tribes of Central Brazil Von den Steinen not only says that they draw no strict line of demarcation between man and brute; he uses the emphatic expression that, to understand it, 'we must think the boundary completely away.' There is thus no impediment to their assimilating themselves to one or another animal. Indeed, the Bororo declare, as we have seen, that they are red araras, not that they will become araras after death, nor that they were araras in a previous existence, but that they are araras here and now. From this attitude of mind we can see how it follows that in their stories human modes of life and thought are attributed to the lower animals, and indeed, as frequently in savage tales, it is often impossible to say whether the actors are human or brute; it follows also that marriages between the former and the latter are in the tales contemplated without aversion or are even regarded as natural, and that interchanges of shape are quite ordinary incidents. It is no question of naming. Totemism is founded on something deeper than that. It assumes a community of nature between men and other creatures; and the existence of the individual is ignored, except as a small and subordinate part of a group, thought of as a whole. It was part of the organization of society which is bound up with the general concept of the world indicated above—a concept by no means confined to totemic peoples, but not always issuing in the same type of organization. How or why particular totems were chosen is a difficult question, but, however interesting, relatively unimportant.

In strict acceptance of the term totemism is not a religion. The respect of the clan for its totem arises out of the attitude of mind just explained. The relation of the clan to its totem assumes a mystical aspect and generates an intense feeling of kinship. This frequently is expressed in the belief that they are descended from the totem-species. As civilization evolves, this belief becomes modified into the shape of a story of the adventure of a human ancestor with the totem-species. Although regarded with reverence and looked to for help, the totem is never, where totemism is not decadent, prayed to as a god or a person with powers which we call supernatural. In fact, in that stage of culture totemism usually co-exists with the cult of the dead and often with the worship of other spirits and gods accurately so called.

Its connexion with the social organization, on the other hand, is very intimate. Probably beginning in a more or less inchoate recognition of kinship, it develops the clan-feeling and the clan-organization and by means of clan-exogamy binds

¹ ARW xv. [1912] 12 ff. The author's previous work, to which reference is made, is entitled *Till frågan om uppkomsten af sakramentala måltider med särskild hänsyn till Totemismen*, Uppsala, 1908.

the whole tribe together. Whether exogamy actually precedes totemism in point of time or not, there can be no doubt that the interaction of the two strengthens and develops it, until exogamy is seen as an essential element of totemism in its full force. When, in the course of evolving civilization, totemism begins to decay, exogamy may and often does continue to exist independently. And the cases are numerous where the clan-system and exogamy have arisen and existed for long periods without any other element of totemism, so far as we know. So various are the forms of totemism that it has been maintained with plausibility that they are due to a fortuitous concurrence of causes which has united elements originally diverse but tending to converge into a system on the whole marvellously similar wherever it obtains, just as the disintegration, and in many cases the dissolution, of the system have historically been due to a concurrence or a sequence of causes of the opposite kind.

LITERATURE.—The most comprehensive account of totemism is J. G. Frazer, *Totemism and Exogamy*, 4 vols., London, 1910. It is indispensable to every student of the subject, and it includes a reprint of his early work, *Totemism*, Edinburgh, 1887, and of his subsequent art. in *The Fortnightly Review*, new ser., lxx. [1899] 647 ff., 835 ff., and lxxviii. [1905] 162 ff., 452 ff. Other important works are Andrew Lang, *Social Origins*, London, 1903, *The Secret of the Totem*, do. 1905, and his earlier work, *Myth, Ritual and Religion*, 2 vols., do. 1887; W. Robertson Smith, *The Religion of the Semites*, Edinburgh, 1894; F. B. Jevons, *An Intrad. to the Hist. of Religion*, London, 1896; four art. by L. Marillier, on 'La Place du totemisme dans l'évolution religieuse,' in *RHR* xxxvi. [1897] and xxxvii. [1898]; Salomon Reinach, *Cultes, Mythes et Religions*, vols. i. and ii., Paris, 1905-08, Eng. tr., London, 1912, *Orpheus*, Paris, 1909; J. Toutain, 'L'Hist. des religions et le totemisme,' in *RHR* lvii. [1908], and A. van Gennep's reply in *RHR* lviii. [1908]; A. A. Goldenweiser, 'Totemism, an Analytical Study,' in *JAF* lxxiii. [1911], with replies by R. H. Lowie in *American Anthropologist*, new ser., xiii. [1911], by A. Lang, *ib.* xiv. [1912], by W. D. Wallis, *ib.* xv. [1913], and the consequent discussions, including an art. by A. A. Goldenweiser, in *ib.* xx. [1918]. Articles bearing on totemism will be found in various volumes of *ASoc*, 1897-1907. Works in German are numerous, but of less importance. The remaining literature in English will be found in the usual anthropological periodicals and other works published in England and America, many of which have been referred to in the text. Other important works have been indicated in the course of the article.

TRACTARIANISM.—See OXFORD MOVEMENT.

TRADE.—See COMMERCE.

TRADE UNIONS.—A trade union has been defined as 'a continuous association of wage-earners for the purpose of maintaining or improving the conditions of their employment.'¹ This definition would not be regarded as an adequate account of the objects of a trade union by many labour leaders of the present time, but it may stand with the proviso that there are large questions of politics and industrial reconstruction which under modern conditions have a direct or indirect bearing upon the 'improvement of conditions.' The underlying basis of the movement is the power of combination, and the progressive realization of this power by the masses of the workers in various countries has gone far to revolutionize the face of civilization. Labour is no longer a suppliant pleading for justice, but a strong man armed, presenting demands which he has the power to enforce. How will that power be used? The time seems appropriate for a consideration of the ethical aspects of the trade union movement.

I. Historical.—Trade unionism, like parliamentary government, is the child of the passionate instinct of the British people for civic freedom. It has been transplanted to the colonies, adopted by the working people of every nation in Europe, carried

¹ Sidney and Beatrice Webb, *History of Trade Unionism*, p. 1.

across the Atlantic to America. It pervades the whole world of intelligent white labour, but England was its cradle.

Attempts have been made to trace its descent from the craft guilds (*q.v.*) of the Middle Ages, but those institutions are to be regarded as associations of masters rather than of men, and there is little or no evidence of the existence of permanent associations of wage-earners before the 18th century. It was then that the differentiation between employer and employed became more and more marked until a great gulf was finally set between them by the transformation of industry effected by the introduction of machinery and the institution of the modern factory system of production on a large scale. The trade union movement was a direct response to the change of conditions.

In the early part of the 18th cent. continuous associations of wage-earners generally took the form of friendly societies, with sick and funeral funds attached; but, as the century wore on, and the effects of the industrial revolution, in divorcing the worker from the instruments of production and degrading his position, became more apparent, they inevitably assumed a different character. The meetings of the clubs afforded opportunities for talk about questions of wages and conditions of labour, and we find Adam Smith writing:

'People of the same trade seldom meet together, even for merriment and discussion, but the conversation ends in a conspiracy against the public, or in some contrivance to raise prices.'¹

This was what the early trade unions appeared to be to the governing classes of those days—'a conspiracy against the public'—and they were only taking the same view as had been taken by the governing classes long before. Combinations of workmen were held to constitute a danger to the State, and from early times a series of statutes had been directed against them. The earliest of these appears to have been the statute 33 Edw. I. c. 1 (1305).

It stamped as conspirators 'all who do confeder or bind themselves by oath, covenant or other alliance, as relates or extends to combinations or conspiracies of workmen or other persons to obtain an advance of, or fix the rate of, wages, or to lessen or alter the hours or duration of the time of working, or to decrease the quantity of work, or to regulate or control the mode of carrying on any manufacture, trade, or business, or the management thereof.'

From this it may be seen that labour questions, including the limitation of output, were much the same in the first part of the 14th cent. as they are to-day. The statute goes on to declare 'combinations or conspiracies of masters, manufacturers, or other persons' to be equally illegal; they too were regarded as constituting a danger to the State; and the principle that all combinations, whether of masters or of men, should be suppressed in the interest of the public may be said to underlie most of our earlier industrial legislation. But, as time went on, the tendency was for the laws against labour to be rigidly enforced, while those in its favour were very laxly administered or allowed to fall into oblivion.

The Act of Edward I. was followed by a series of others of the same nature. In the 18th cent. they became more and more frequent with the rise of the new associations. At least fifteen were enacted in the reign of George III. before the year 1800. That year marks an epoch. The whole of the existing Combination Acts were consolidated in a new law which made all associations of workmen (and of employers) illegal, and membership of such an association a criminal offence (39 and 40 Geo. III. c. 106).

The position of the workers now was that, while no attempt was made to extend already existing State regulations as to wages, hours, and condi-

tions of employment so as to apply them to the altered circumstances of the times—and many of them had become practically inoperative—they were debarred by statute from what seemed the only chance of escape, association for mutual protection. But, in spite of this, associations were formed, some of which, as the direct result of this repressive legislation, took the form of secret societies with strange oaths and revolutionary rites, and the next twenty-five years were full of trouble and discontent. Eventually by the Acts 5 Geo. IV. c. 95 (1824) and 6 Geo. IV. c. 129 (1825) the Combination Laws were repealed and association for the purpose of regulating wages or hours of labour was expressly legalized.

The position of the trade unions was now secure. Some forty-five were discovered in 1824 to have managed to maintain a precarious existence in spite of the Combination Laws, but, when the laws were repealed, trade unions sprang into life all over the country. The next few years were a period of great industrial activity, and the work of organization was taken in hand in earnest. It was also a time of great political activity, and soon after the passing of the Reform Act of 1832 we find that the unions had already accumulated members and funds sufficient to make them a distinct power in politics. They threw themselves heartily into the movement initiated by Robert Owen—the membership of his 'Grand National Consolidated Trades Union' in 1834 has been estimated at half a million—but on the whole stood aloof from the Chartist movement which played such an important part in the history of the working classes between 1837 and 1848. Between 1850 and 1860 trade unionism made rapid strides on the old lines, and then there was a marked increase of political interest with the Reform Bill of 1867 as its centre.

The Trade Union Act of 1871 marked another stage. Though the repeal of the Combination Laws had left the workers free to combine, all combinations 'in restraint of trade' were still illegal. The funds of any such society therefore did not enjoy the protection of the law, but were at the mercy of any official who had access to them. As a matter of fact the trust had been very seldom abused, but the position was unsatisfactory, and the Act remedied it, and also strengthened the position of the unions in other respects. In 1875 a further Act recognized employers and workmen (they were no longer called master and servant) as equal parties to a civil contract, and 'peaceful picketing' during a strike was expressly permitted. Thus 'collective bargaining, with all its necessary accompaniments, was after fifty years of legislative struggle finally recognized by the law of the land.'¹

Ten years later the movement entered upon a new phase. The leading spirits were no longer content to proceed steadily upon the old lines, and John Burns and Tom Mann became the apostles of a more militant and aggressive creed. A 'new unionism' came into existence which was inspired by the doctrines of socialism (*q.v.*). Its spirit was manifested in the labour unrest of 1889-90. This has been in its turn outpaced by the still newer unionism of the 20th cent., which is syndicalist instead of socialist and regards the general strike as its weapon. But, at all events up to the outbreak of the war in 1914, the great bulk of trade unionists seem to have been content, as Joseph Clayton has said,

'to proceed steadily on the old lines—distrusting revolutionary sentiments, favouring the return to Parliament of their officers, of whose abilities and honesty they are well aware, believing that by collective bargaining they can achieve a more comfortable life for themselves and their families and that

¹ *Wealth of Nations*, bk. i. ch. 10.

¹ Webb, *History of Trade Unionism*, p. 275.

legislation of a social character is also needed to improve their position.¹

Beyond the outbreak of the war we do not propose to go.

The total number of trade unions in existence at the end of 1913 is given in the *Labour Year Book* as 1135 with a membership of just under four millions—more than double what they had been ten years before.

2. Moral and economic justification of trade unionism.—No one would be likely to deny that trade unions are a necessary feature of modern industrial life, and most people would admit that they are on the whole a salutary feature. Our forefathers may have been sincere in their belief that the State could not afford to allow such associations to exist, that they constituted a real danger to the public; but in those days there was little knowledge of the conditions under which the 'lower classes' lived and little sympathy with the workers themselves. Moreover, the existing order was taken for granted. It was recognized that there were evils which called for alleviation, but the ideas of the most sympathetic did not get farther than palliation; prevention was beyond their scope. Such attempts as were made in early times to regulate industry by legal enactments were crude; and, when the great crisis of the 18th cent. arrived and there was the most urgent need of strong and intelligent control, there was no one who saw the meaning and implications of the change. The industrial revolution went its way unfettered; the old industrial order was swept away and chaos supervened; whole classes of workers became involved in a condition of unparalleled servitude, poverty, and degradation. But the governing classes failed to realize that, if there was a possible element of danger in the existence of combinations of workers, the existence of such a state of things was a far greater danger and in addition an intolerable disgrace to any civilized country. From the fetters riveted upon us in those evil days we as a nation have been for a century endeavouring with infinite struggles and effort to set ourselves free. The conscience of the public was at last aroused, but long before it was aroused the workers had learnt to help themselves; the State at last awoke to some sort of a sense of its responsibilities, but the driving power which lay behind the various enactments was the power of the associations of workers. This is the first and broadest ground of justification of unionism. It has laid the foundations of a new industrial order, and those foundations were laid in the power of two far-reaching ideas—the realization of the power of combination and the conception of the organization of labour.

Another debt which the country owes to trade unionism is the emancipation of large sections of its population from the cold and selfish individualism of past days. It is a debt which is not generally realized and seldom acknowledged; but no one who knows anything of the actual working of trade unions, or is brought much into contact with their members, can fail to see how strong the bonds of fellowship are, how clearly the members realize their dependence upon one another, how ready they are to bear one another's burdens if occasion arises. Trade unionism is full of paradoxes, and none of them is more striking than that action which appears to be hard and selfish is found sometimes upon investigation to be based upon the most unselfish motives, or that practices which intelligent workers themselves admit to be unjustifiable in theory are invested with a strong moral sanction as the only means for the protection of the weak.

¹ *Trade Unions*, London, 1913, p. 27.

On these two broad general grounds—that it has pointed the way to the establishment of a new industrial order, and that it has recalled us to a sense of a forgotten side of our social order—it may be said that the trade union movement has abundantly justified itself. We shall now proceed to consider some of the special manifestations of its activity which have been at different times the subject of criticism.

(a) *Strikes.*—The strike (*q.v.*) has always been the trade unionist's most effective weapon. He can do much to protect himself by the method of mutual insurance or collective bargaining, but the strike gives him the power of bringing pressure to bear if he desires to enforce an agreement or to secure an improvement in wages or conditions of labour. The question whether it is a fair weapon is therefore fundamental. At present the right to strike has been practically acknowledged by the law, but the concession has only been gradual. At first all strikes were regarded as conspiracies and illegal; then there came a stage at which the right to strike was tacitly acknowledged, but the courts condemned them on the ground of assumed 'malicious intent'; next attempts were made to discriminate between different kinds of motive; and now the tendency seems to be to uphold the right to strike as such.

The relation between employer and employed has been regarded in law since 1875 as a civil contract between two theoretically free and equal individuals. It is in some cases a contract of very short duration, but it does not differ in nature from longer contracts. A weekly-wage-earner is in this respect in the same position as a highly placed salaried official. He therefore has the right to terminate his contract when he pleases, so long as he does not contravene its terms. But the essence of a strike is that it is the simultaneous termination of many contracts, and it derives its power from the fact that it is inconvenient or even harmful to the employer, and generally meant to be so. Now no one would deny that any worker where wages are inadequate or conditions intolerable has the right to say to an employer, 'I will not work for you for such wages or under such conditions.' Nor will it be denied that many of the workers have a right to say this simultaneously as a joint protest. Finally, it is hard to see how they would be wrong in endeavouring to persuade others to do the same. If these three points are conceded, the right to strike is established in principle.

The strike then, regarded as a protest, is a lawful weapon, but the days are long past when strikes were simply protests. To-day in the majority of cases they are used as weapons of offence. Even as such they are doubtless often justifiable, but weapons of offence are used to threaten or to inflict injury: that is what they are for; and, if it is conceded that the use of such weapons is allowable in industrial warfare, there would seem to be need of some controlling power to see that they are used fairly. A strike may be simply an instrument of tyranny and oppression.

Moreover, the whole question has assumed a new aspect in recent years as the result of closer association between different classes of workers and the enormous increase of power which the strike has derived from their simultaneous action. A strike on a large scale is no longer a mere matter between employers and employed: the whole nation may be affected. An unpleasant feature of some recent strikes has been the frank admission by their promoters that it was their deliberate intention to cause such general inconvenience and even injury as would force a settlement in their favour, simply to put an end to them. Such

action is narrow and selfish and is condemned by public opinion. In no civilized country can any one body of men be allowed to hold the nation to ransom at their pleasure. The State is greater than any of its component parts, and is morally bound to take measures to protect the nation as a whole from exploitation by any section of it.

The question of picketing is closely connected with that of strikes. A strike really is a device to starve an employer out; its efficacy depends upon the completeness with which his supplies of labour can be cut off. It is therefore of the first importance to the strikers to see that no one else takes their place, and that none of the workers continue their work. Hence an elaborate system of sentries and pickets. There is nothing to be urged against 'peaceful persuasion,' but it is obvious that, at a time when strong emotions are aroused, such a practice needs careful watching if the persuasion is not to be allowed to degenerate into intimidation or even violence.

The Act of 1875 rendered liable to a fine or imprisonment 'every person who, with a view to compel any other person to abstain from doing or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority *watches or besets* the house or other place where such other person resides or works'; but declared that attending at or near the house or place 'in order merely to obtain or communicate information' shall not be deemed watching or besetting.

(b) *The limitation of output.*—There are some things about trade unionism which will never be understood unless they are regarded as projected against a background of injustice and petty tyranny. The deliberate limitation of output is one of them. It has been, and is still, the practice of some unions not to allow their members to do more than a given amount of work in a given time. A bricklayer, *e.g.*, may not lay more than a given number of bricks in a day. This practice is unjustifiable from the economic point of view, because the object of industry is production and the worker who systematically produces less or worse work than he might is not true to his trade. It is also morally unjustifiable because every one is bound in honour to accomplish to the best of his ability the task which he has taken in hand. And intelligent labour is ready to admit this. On what grounds then is it defended? On the ground that it is the only protection that can be devised for the weak against the lowering of the rate of wages by an unscrupulous employer. It was found that an employer who had already agreed to a certain piece-rate, on finding that the best of his men were earning wages which seemed to him in his short-sightedness preposterous, went back upon his word and proceeded to cut the rate, with the result that the slow or weak among the workers were no longer able to earn the weekly wage which he himself had considered as fair when he fixed the original piece-rate. Labour, in order to remove any such excuse for a lowering of wages, resolved that no member of the trade, whatever his strength or speed, should be allowed to outpace the rest. The best workers were called upon to make a sacrifice, but it was made readily and it rested upon altruistic motives. It is an anomaly, and it is injurious to industry. As the progressive organization of industry proceeds, the need of it will probably disappear. Meanwhile it remains, not without a touch of pathos, as an indication of the dislocation which has invested in the eyes of the workers a practice which they would not really defend with the sanction of self-sacrifice.

(c) '*Cà canny.*'—The policy of limitation of output is sometimes adopted upon less defensible grounds. We do not refer to those cases in which a man does less than he might, or as little as he can contrive, out of personal resentment towards

an employer or as a protest against a system which he believes to be unjust. Such cases are not uncommon, but it is doubtful whether any union would deliberately support them with its formal sanction. But many unionists believe that there is only a certain amount of work to be done, and that there will not be enough to go round if the standard of production per man is too high. This 'lump-of-labour' doctrine of the worker is the complement of the old 'wages-fund' theory of the capitalists of the 19th cent., who believed that there was only a certain sum available for wages, and that, if one set of workmen got more, it meant that of necessity another set would get less. Both were equally fallacious. There is neither a fixed amount of work nor a fixed sum available for wages; both are elastic. The way to increased wages lies through increased production, for it is out of the value of the product that wages, like salaries and the cost of raw materials, are paid. To limit production is to lessen the fund out of which wages are paid. There is also a belief that, if the best workmen are allowed to force the pace, the result will be a subtle reduction of the standard of earnings of the average worker—a 'bell-wether' is regarded as an abomination—and the best protection against this danger (which is a real one) is held to be a sort of standardization of output comparable to the standardization of hours and wages in which the workers have found protection and safety. But it seems indisputable that, if the best workers in a trade are circumscribed and shackled, the whole trade must be the worse for it, workers included.

(d) It is difficult to estimate the truth of the charges of tyranny, intimidation, and violence which have often been brought against the trade unions. There have doubtless been many cases of such things in the industrial history of the last 150 years. Violence has been used against employers; intimidation and violence have been used against other workers who failed to come into line. What we want to know, and what is very difficult to find out, is to what extent, if at all, the unions have condoned such action. We should be safe, however, in asserting that violence forms no part of the trade union programme, and we may go further and say that with the growth of trade unionism there has been a distinct improvement in the conduct of strikes. Violence and bloodshed are certainly less common now than they were.

(e) It has been said that the organization of labour on modern lines is an idea which we owe to the trade unions. Has this organization in some cases been carried too far? Employers often complain that they find themselves fettered and obstructed by trade union regulations which seem to them to be merely meticulous and vexatious. There is probably some truth in this. Trade unionism, on its defensive side, has surrounded itself with an elaborate system of bulwarks against every conceivable possibility of an attack. These regulations are not arbitrary; the initiated know that they are applications in detail of some principle which the workers regard as important. They are born of mistrust, and they will not disappear until employers and employed learn to understand one another better and feel that they are co-partners in the same enterprise. But it should be realized that industry cannot work in chains.

Trade unions are 'an inevitable product of modern economic life.' They are now almost universally recognized, and the recognition is based upon the fact that the conditions of labour are now group conditions and that the worker who forms a simple unit of a large group is powerless

to bargain successfully with an employer. The employer occupies a superior strategic position, and the worker's only hope is in association. It is undeniable that, where large associations of industrial units are formed, there is a danger of tyrannous action, and the larger the association, the greater the danger; but it is equally undeniable that the circumstances of the time seem to call for such associations, and the danger should be confronted. The advantages to be gained are great, and the danger can be met with the assistance of the legislature and the law-courts.

TRADITION.—The word 'tradition' means, etymologically, 'handing over.' The conception of tradition, therefore, implies (a) a 'deposit' which is handed over, and (b) 'depositories,' i.e. persons who are in possession of the deposit, and are commissioned to preserve it and transmit it to successors. Most religious systems claim to bear within themselves a deposit, consisting of ceremonial, myth, dogma, or ethic, or of some of these elements, revealed by some ultimate divine or quasi-divine authority, and meant to be handed down to posterity by a succession of duly qualified trustees. This article discusses the part which the principle of tradition has played in the history of Christianity.

1. Christ and Jewish tradition.—There is not much uncertainty regarding the attitude of the Founder of Christianity towards the Jewish tradition which He found already in existence. He was Himself a member of the Jewish Church, and disclaimed any idea of being a rebel against it: 'Think not that I came to destroy the law or the prophets: I came not to destroy, but to fulfil' (Mt 5¹⁷). It would be generally agreed that His object was, not to abolish the traditional Mosaic deposit or to annihilate the depository society—the 'congregation of the Lord,' the 'Israel of God'—but rather to develop and expand the then existing Jewish Ecclesia into the 'Kingdom of God' and to reform and purify the deposit by blending it with the gospel, or 'good news,' of a glorious age to come. In regard to the reform of the deposit, He insisted primarily upon its re-moralization. The classical passage for this is, of course, the famous saying about Corban (Mt 15¹⁻²⁰, Mk 7⁹⁻²³), with the affirmation, which follows, that it is not the things which go into a man, but those which come out of the man, that defile the man. This may appear, at first sight, to challenge in principle the whole conception of the ceremonial deposit and brusquely to deny any spiritual value to outward observances. It certainly claims an infinitely higher place for ethical values as compared with ceremonial precepts; it might be taken, further, to imply that the sole seat of religious authority for a pious Jew lay in the written Word, the *Tôrâh*, and that the oral tradition of the Rabbis was comparatively worthless. An even stronger implication as to the transitory nature of the Rabbinical tradition is contained in the saying about the 'new wine' and the 'old wine-skins' (Mk 2²¹, Mt 9¹⁶), though it is to be noted that Luke (5³⁹) appends a saying which may seem to point in the other direction—'The old (wine) is better.'

It may perhaps be said also that, to a certain extent, Christ demanded the re-intellectualization of the deposit. The authority of tradition is subordinated, not merely to that of the moral law embodied in the written Word, but to that of

common sense. This is illustrated by His various sayings on the subject of the Sabbath. The impression which we gain from a review of the teaching of Christ, as recorded in the Synoptic Gospels, is that His attitude towards the Rabbinical tradition was simultaneously both reverential and critical, both conservative and progressive. There are two other pieces of evidence which should be considered in this connexion. Opinions differ as to the amount of historical value which should be assigned to the Fourth Gospel; but it is to be presumed that the exceedingly hostile attitude assumed by the Johannine Christ towards 'the Jews' is at least based upon genuine reminiscences of one side of the teaching of Jesus; and the declaration that the worship of the future was to be conducted neither on Mount Gerizim nor at Jerusalem, but throughout the whole earth, 'in spirit and in truth,' represents an attitude as anti-Rabbinical as it is possible to conceive. On the other hand, sayings recorded by 'Matthew,' the specifically Jewish evangelist, seem to represent Jesus as a whole-hearted supporter of tradition, though a severe critic of the moral shortcomings of its depositories. 'Not one iota or one vowel-point shall pass away from the law until all be fulfilled' (Mt 5¹⁸) is a passage in which the characteristic Jewish doctrine of the eternity of the *Tôrâh* seems to be proclaimed; He adds that, unless the zeal of His converts for the literal observance of the Law exceeds even that of the scribes and Pharisees, they cannot hope to enter into the Messianic Kingdom (5²⁰). The official, as distinct from the personal, authority of the Rabbis appears to be affirmed in the saying, 'The scribes and the Pharisees sit on Moses' seat: all things therefore whatsoever they bid you, these do and observe: but do not ye after their works,' etc. (23²). Another saying in the same chapter contains the warning that Christ's insistence upon the supreme importance of moral conduct is not meant to imply any contempt for ceremonial minutiae, in their proper place: 'Ye tithe mint and anise and cummin, and have left undone the weightier matters of the law, judgement, and mercy, and faith: but these ye ought to have done, and not to have left the other undone' (v. 23). On the other hand, it is fair to remember that the denunciations of the hypocrisy and quibbling casuistry of the Rabbis recorded by St. Matthew equal in intensity and bitterness the Johannine Christ's most vehement invectives against 'the Jews.' It seems probable that the Rabbinizing utterances in the First Gospel represent ironical sayings of Christ, which the first evangelist has misunderstood and taken literally, in accordance with his Judaistic presuppositions.

We may sum up this section of our inquiry by observing (a) that, in the view of the Founder of Christianity, the Jewish Church was in any case destined to be expanded and transformed into the 'Kingdom of God,' and that His attitude towards Jewish tradition must, therefore, have been of an interim and provisional nature, which will not necessarily give us the clue to His attitude towards the whole principle of tradition, as such, in religion; (b) that, for the time being, He had no desire to deny the value or divine origin of the main body of the Jewish deposit; it seems that His invectives against the *de facto* depositories had reference rather to their personal shortcomings than to the official authority which they claimed; (c) that He insisted upon the subordination of the existing oral tradition to the authority of Scripture, the moral law, and common sense; and (d) that He was a deadly foe to that tendency towards the hypertrophy of ceremonialism, and the evanescence of moral and intellectual content, which is familiar to the historical student as the weakness to which traditional religions are peculiarly liable.

2. Christ and Christian tradition.—We now approach a question on which opinions are, and have been for many centuries, acutely divided. It seems clear that Christ did not, on any showing, contemplate the eternal permanence of the Jewish tradition; but did He Himself mean to found a new one? Did He design to promulgate a new

deposit, a body of dogmatic and ethical truth revealed by Himself for the first time? Did He mean to found a society as the guardian of this deposit and its authorized expounder? Did He institute a class of depositaries within the society, empowered to decide as to its true contents in cases of dispute? Or did He mean to make a complete breach, in theory and principle, with the great religions of the ancient world as they had historically grown up, and to propagate, not so much an organized religion as a philosophical point of view or a mode of emotional feeling? In other words—Is Christianity to be regarded as the perfect traditional religion, the crown and flower of that whole process of traditional evolution which may be traced down the centuries, possessing a deposit of immutable truth and authentic, life-giving sacraments, and preserved by a majestic, supernatural society, a Kingdom which is in this world, yet not of it? Or was Christianity, as designed by its Founder, meant to involve a complete break with the past, and an entirely fresh start upon non-dogmatic, non-sacramental, non-ecclesiastical lines?

3. The 'Catholic' view of tradition.—It is a well-known fact that at the present day three-quarters of Christendom would return an unhesitating affirmative to the question, Did Christ intend to be the Founder of a traditional religion? We may refer to this great majority of Christians as the 'Catholic' part of Christendom—not with the object of begging any controversial questions, but merely in order to have a convenient label for denoting that system of faith and practice which is, in its general outlines, common to the 'pre-Reformation' Churches—*i.e.* to the Roman, Eastern Orthodox, Coptic, Abyssinian, Armenian, Syrian Jacobite, Chaldean, and Malabarese communions—and which was inherited by them from the ancient undivided Church of the Græco-Roman Empire, of which they are fragments. The 'Catholic' view of tradition maintains that the deposit of faith (*depositum fidei*) was partly taken over by Christ from the existing Jewish Church and partly revealed by Him to His apostles and other hearers during His earthly life and especially during the 'great forty days,' which, according to St. Luke (Ac 1³), intervened between His resurrection and ascension, and during which He spoke of 'the things pertaining to the Kingdom of God.' He thus committed to them—either by stamping with His own approval certain already existing Jewish beliefs or by Himself revealing fresh truth for the first time—in germ and essence the great doctrines of the orthodox faith and the system of sacraments which He instituted for the salvation of mankind. He told His adherents that they were to consider themselves as being the true Israel, *His* Ecclesia, which, in some sense, He would build upon Peter as a foundation (Mt 16¹⁸). With this divinely-founded society He promises to be present all the days, even unto the consummation of the age (28²⁰), and to it He promises to send the Paraclete, who would guide its members into all truth (Jn 16¹³). These promises are interpreted by 'Catholics' as guaranteeing the 'infallibility' of the Church in the interpretation and definition of the authentic contents of the deposit. It is, further, believed that within the Church the special task of preserving (and, when need should arise, of defining) the deposit was committed by Christ to the twelve apostles and to their successors, the bishops.

According to this view, therefore, all that Christ instituted was (1) a deposit (no doubt embodied at first in a way of life, rather than in an exactly formulated creed, and expressed, so far as it was verbally expressed at all, in pictorial rather than

logical or metaphysical terms), and (2) a depositary class, consisting of the twelve men whom He had designated, in apocalyptic language, as the satraps of the future Kingdom. It would be hardly correct to speak of Him as having instituted the depositary body, the Church, inasmuch as this was conceived of as being, not a new society, but the only orthodox remnant of the old Jewish Church. But in these rudimentary beginnings the possibility of a magnificent development was given. The living force of the Christian tradition spontaneously generated the same complex mechanism for its own preservation and perpetuation as may be seen, endeavouring to struggle into existence, in the fields of Zoroastrianism and Buddhism. The first element in this apparatus to appear was the canon of Scripture. At first the only Scriptures which the Christian Church possessed were those of the Jewish Church, or, rather, of the Jewish Church as it existed outside Palestine. The Bible recognized in most parts of the earliest Christian Church was the Septuagint Old Testament, containing the books now called Apocrypha; so that, from the first, the oral tradition, vested in living depositaries (the apostles and their successors), was, to a certain extent, controlled by the existence of written documents, believed to embody some at least of the main constituents of the deposit. The Marcionite controversy of the 2nd cent. compelled the Church to form a collection of apostolic writings for the purpose of demonstrating the identity of the deposit, as she maintained it, with that committed by Christ to the original depositaries, and refuting the Gnostic claim to possess a secret tradition other than, and opposed to, the ecclesiastical tradition. This apostolic collection became canonized as 'the New Testament' of equal authority and inspiration with the original Scriptures, the 'Old Testament' of the Jewish Church.¹ In the 2nd cent., too, we observe the first beginnings of the baptismal creeds, brief formulæ whose threefold structure was derived from the threefold invocation of the Father, Son, and Holy Ghost in the solemn words of baptism, and intended to summarize the essentials of the orthodox faith in a form which could be committed to memory by persons of the weakest intellectual capacity.² The canon of Scripture and the baptismal creeds were thus the two great contributions of the 2nd cent. to the organization whereby the Catholic deposit was perpetuated and safeguarded against any essential change of content. The last great development of apparatus for safeguarding the authenticity of the deposit is to be found in the institution of ecumenical councils—the characteristic invention of the 4th century.³ In the 2nd and 3rd centuries it had been possible for Hippolytus, Irenæus, and Tertullian to appeal to the unbroken succession of the bishops and to point to their unanimous consent as a proof of the authenticity of the ecclesiastical tradition, as against the alleged secret traditions of the various Gnostic sects. But towards the end of the period of persecution it came to be realized that the bishops themselves, the chief depositaries of the faith, might disagree as to its content; and these disagreements could only be resolved, in Christianity as in Buddhism, by the expedient of summoning a council representing, in theory or in fact, the complete body of chief depositaries, *i.e.* the total episcopate of the world. The object of a council was not so much to discover fresh truth as to determine what, as a matter of fact, was the doctrine which had been believed in the Church from the beginning. Hence, though each bishop

¹ See art. BIBLE IN THE CHURCH, I, 1 f.

² See art. CONFESSIONS, B.

³ See art. COUNCILS (Christian: Early, to A.D. 870).

had, in theory, the right to put before the council that version of the faith which he had received from his predecessors and which had been handed down to his local church from its first founder, the greatest weight was naturally attached to the testimony of the great 'apostolic sees.' Complete unanimity in the acceptance of one particular version of the faith would, of course, have stamped it in the minds of Catholic Christians as unquestionably authentic and apostolic; but, if complete unanimity had been possible of attainment, it would probably have been unnecessary to summon councils. The principle was, therefore, arrived at that an overwhelming majority of the depositaries, especially if it included the occupants of one or more of the great apostolic sees, had the same authority as the whole body. This principle is expressed by St. Vincent of Lerins when he says, or implies, that the consensus of 'paene omnes' is as good as that of 'omnes [sacerdotes].'¹ Hence it follows that a small minority of the depositaries, contumaciously refusing to submit to the authority of the majority, necessarily becomes schismatic. Another famous expression of the right of a majority among the depositaries to decide what is the true version of the deposit is to be found in St. Augustine's celebrated aphorism: 'Securus indicat orbis terrarum, bonos non esse, qui se diuidunt ab orbe terrarum in quacumque parte terrarum.'²

It is true that most of the so-called ecumenical councils were not actually representative of the total episcopate of the world. They became ecumenical in virtue of their acceptance, immediate or gradual, by the majority of bishops. We are here concerned solely with theory, and need not go into the question as to how far theological controversies during the first thousand years of Christianity were merely the reflexion of political, national, or racial antagonisms. It is sufficient to note that each of the great decisive doctrinal formulations of the conciliar period was followed by a split between the majority, which accepted, and the minority, which rejected, it. Thus, after Nicea and Constantinople, a separate, 'non-juring,' Arian Church came into existence among the Goths and other northern barbarians; after Ephesus a 'non-juring' Nestorian Church³ was constituted in Syria and Persia; after Chalcedon the Monophysite Church,⁴ which still includes most of the Christians of Egypt and Armenia, split off from the rest of Christendom. But, whilst shedding, so to speak, these dissentient bodies round its periphery, the 'great Church,' the Church of the majority of the depositaries, the Church of the Græco-Roman Empire, the 'Melkite' or 'Imperial' Church, as it was derisively called by the Eastern schismatics, held together round the imperial throne and the great apostolic see of Rome, maintaining its majestic unity unbroken, with the brief exceptions of the Zenonian and Photian schisms, for a thousand years. In the 'Great' or 'Melkite' Church, as it stood on the eve of the Great Schism of 1054, the fourfold structure of traditionalism, towards which the Buddhist and Zoroastrian faiths had been dimly groping their way, had come into full, explicit, and conscious existence, in the most imposing and magnificent form which has ever existed upon earth. The Church, the hierarchy, the canon of Scripture, and the ecumenical councils are all there, each fulfilling its harmonious part in the task of preserving, elucidating, and defining the apostolic deposit.

4. The Reformation and tradition.—The Reformation (*q.v.*) was, in essence and in its earlier stages, a revolt not so much against the authority of the deposit or of its Founder as against that of the existing depositary class in Western Europe—a revolt occasioned by the corruption and exactions of the pope and the hierarchy. In the first fervour of indignation against the vices of the clergy it seemed necessary to deny the whole principle of a body of men divinely commissioned to safeguard the Christian revelation. The mental outlook and *Weltanschauung* of the earlier Reformers was just as scholastic as that of the mediæval theologians, and demanded, just as imperiously, a clear-cut body of dogmatic theology as an essential element in religion. Hence, only those elements in the deposit were discarded the rejection of which followed immediately from the rejection of the

hierarchy; and a new basis of authority had to be found for the Christian tradition. This basis was found in 'the Bible, and the Bible only.' We have seen that, for Catholic Christians, the structure of the orthodox faith was raised upon two pillars—the oral tradition of the Church and the Scriptures. The logical effect of the Reformation was to knock away the first of these pillars, leaving the second standing; and so adamant was (and is) the cohesion and solidarity of orthodox Christianity that for three hundred years it was able to remain practically intact throughout Protestant Europe, balanced upon the solitary surviving pillar. The last hundred years have witnessed the gradual erosion of this pillar, through the continual dropping of the rains of Biblical criticism, and the consequent collapse in those regions of the superincumbent structure. This result, however, could not then have been foreseen. The great orthodox Protestant theologians of the 16th and 17th centuries only designed to modify the Catholic theory of authority in the following sense:

'We quite agree with the Catholic in holding that there is a changeless deposit of eternal truth, and that this was imparted by Christ our Lord to the apostles as depositaries, during His earthly life and the "great forty days"; but we deny that the functions of the apostles as depositaries were meant to be transmitted, or were transmitted, by them to any successors. Their functions as guardians of the truth were purely temporary, and ended at their deaths. They were, however, divinely inspired to write the New Testament, in which, together with the Old Testament, the deposit is fully and sufficiently contained. Thenceforward, the sole authority for the content of revealed truth was and is to be found in the written Word of God; and councils and synods have no authority other than that which may attach to the piety and learning of their members.'

It would, perhaps, be unfair to assert that this doctrine of the Bible, isolated and abstracted from the life of the teaching Church, as the sole fount of religious truth, necessarily presupposes the mechanical theories of 'verbal inspiration' which prevailed during the era of Protestant scholasticism, though it certainly did much to encourage them. Two difficulties, however, at once made themselves felt: (1) 'If the authority of the Church is practically *nil*, how do we know what "the Bible" is, *i.e.* what books ought to be included in the canon and what not? Because, hitherto, it has only been on the authority of the Church that we have believed in the canonicity and inspiration of these particular books.' (2) 'As some parts of the Bible are admittedly written in an obscure style, how are the unlearned to decide what the true meaning is?' The former difficulty, which the Catholic theologians of the counter-Reformation were not slow in pressing upon their opponents, at once raised the question of the canonicity of the Apocrypha, books which were uncongenial to the Reformers because of the passage (2 Mac 12⁴⁸⁻⁴⁹) commending prayers for the dead. A similar difficulty was created for many Protestant Christians by the *prima facie* incompatibility of the Epistle of St. James with Lutheran solidification—a fact which caused Luther to describe it as an 'epistle of straw.' The second was emphasized by the fissiparous tendencies which immediately began to manifest themselves in reformed Christendom, converting it into a chaos of sects, which ranged from the high scholastic orthodoxies of Luther and Calvin down to the Arianism of Socinus and the crazy extravagances of the Münster Anabaptists. The patent contradiction between the Protestant theory of the simplicity and obviousness of the meaning of Scripture and the infinite diversity of opinions held by those who professed to accept it as the sole authority for the outlines of the Christian deposit was satirized in the celebrated couplet of Werenfels of Basel:

'Hic liber est in quo quaerit sua dogmata quisque
Invenit et pariter dogmata quisque sua.'

¹ *Commonitorium*, iii. 6.

² *C. Epist. Parmen.* iii. iv. 24.

³ See art. NESTORIANISM.

⁴ See art. MONOPHYTISM.

To the former of these objections the Reformers replied by taking the short Palestinian canon of the OT, as now held by the Jewish Church, on the ground that (as Jerome had urged) the Jews must surely themselves know what their own Scriptures were (thus abandoning the primitive Christian tradition which had taken over the longer, Septuagintal canon from the Hellenistic Jew) and by affirming that, so far as the NT Scriptures were concerned, their authority was manifest on the face of them, in virtue of the sublimity and elevation of their style and doctrines. This reply obviously settled nothing as to the disputed case of the Epistle of St. James, inasmuch as the question at issue between Luther and his opponents on the subject of this book was precisely this—Were its doctrines to be called 'sublime' or pernicious? To the second question, also, no very satisfactory reply was ever given. In logic the orthodox Protestant divines were compelled to maintain, and did in fact maintain, that the whole system of Nicene and Chalcedonian doctrine could be deduced with unerring certainty from the text of the NT, given a prayerful and reverent spirit on the part of its readers. But the 'subordinationistic' passages in St. Paul's Epistles (cf. 1 Co 11¹⁸ 15²⁸ etc.) and those in which the Logos and the Spirit are apparently identified (cf. Ro 8^{9c}, 2 Co 3¹⁷), together with the patent fact that Socinus and his followers regarded themselves as 'prayerful' and 'reverent,' must have made the orthodox Protestants doubt in their inmost hearts whether the matter really was as simple as this; and hence they sometimes show signs of being, unwillingly, driven back upon the conception of a teaching Church as the authorized interpreter of Holy Writ.¹ The Thirty-Nine Articles characteristically take up a position which may be interpreted as consistent either with the Catholic view of tradition and Scripture as joint authorities for the truth of the deposit or with the Protestant conception of the book of the Scriptures as the sole authority, independent of any living exponent.

So we are told that 'Holy Scripture containeth all things necessary to salvation,'² that the three creeds are apparently only to be believed 'because they may be proved by most certain warrants of Holy Scripture,'³ that 'General Councils may err, and sometime have erred,' and that 'things ordained by them as necessary to salvation have neither strength nor authority, unless it may be declared that they be taken out of Holy Scripture.'⁴ On the other hand, 'the Church . . . hath authority in controversies of faith' and is 'a witness and a keeper of Holy Writ.'⁵

So far as a coherent conception of the relations of tradition to Scripture can be wrought out from these statements, it has been attained by Hooker, whose *Ecclesiastical Polity* appears to be based on the now antiquated assumption that the Chalcedonian theology can be deduced from the text of the NT as directly and irresistibly as the movements of the heavenly bodies can be deduced from a set of astronomical tables. A characteristic and explicit expression of the thoroughgoing Catholic view within the Anglican Communion is to be found in Thorndike's declaration that an indispensable mark of the true Church is 'the preaching of that word and that ministering of the sacraments which the *tradition* of the whole Church confineth the sense of the Scriptures to intend.'⁶

It is well known that the new Protestantism of the Continent would go much farther than the old in its attack upon the Catholic tradition, and that it would in fact dispute not merely the authority of the depositaries, but that of the deposit and the Founder Himself. Its contentions may be summed up under two headings, (1) philosophical and (2) historical. (1)

¹ Cf. the affirmation of the *Confession of Württemberg*: 'Credimus et confitemur quod . . . haec ecclesia habet jus iudicandi de omnibus doctrinis,' quoted by E. C. S. Gibson, *The Thirty-Nine Articles*, London, 1896, p. 513.

² Art. 6. ³ Art. 8. ⁴ Art. 21. ⁵ Art. 20.

⁶ *Theological Works*, 10 vols., Oxford, 1844-56, iv. 895.

Philosophical.—Starting from Kant's denial of the validity of the categories of the theoretical understanding within the noumenal sphere, Ritschl (*q.v.*) and his followers would deny the possibility of a deposit of intellectual truth altogether. Owing to the creaturely limitations of man's understanding, intercourse with God is a matter of emotional feeling and right conduct, not of strictly intellectual apprehension. (2) *Historical.*—It is admitted that the essence of the Catholic deposit and of the traditional conception of Christianity can be traced back from the ecumenical councils, through the sub-apostolic writers, into the NT itself; and the modern liberal Protestant finds no difficulty in allowing their natural sense to such passages as 2 Th 2¹⁵: 'Stand fast, and hold the *traditions* (τὰς παραδόσεις) which ye were taught, whether by word, or by letter of ours'; 3⁶: 'Withdraw yourselves from every brother that walketh disorderly, and not after the *tradition* which they received of us'; and notably to the Pauline, or deutero-Pauline, injunction, τὴν παράθετον φύλαγον (1 Ti 8²⁰), in which 'the deposit' is expressly mentioned.

It would now be conceded that St. Paul regarded Christianity as a dogmatic, sacramental deposit, of which the 'apostles' were, in a general sense, the depositaries. But it is contended that in this respect there is an absolute gulf between the teaching of Jesus and that of Paul; that Jesus regarded Himself merely as a teacher of ethics, or as the prophet of a new eschatological enthusiasm; that the movement which He initiated was of a purely emotional kind, though fraught with an *Interimsethik* valid only for the very brief period of time which, in His view, remained before the collapse of the existing world-order and the inauguration of the New Kingdom; and that, as Jesus believed in the imminence of this catastrophe, He could have had no idea of promulgating a deposit or constituting a depositary class. On this view it is Paul himself who was the real founder of Catholic Christianity. It was he who transformed the vague and formless apocalyptic enthusiasm of the first Christian generation into a mystery-cult, with wonder-working sacraments; it was he who taught Christendom to identify the Prophet of Nazareth with the Logos of Platonic and Stoic metaphysics, thereby laying the foundations upon which later ages were to build the elaborate structure of Trinitarian and Christological dogma; it was he or his immediate successors who taught primitive Christians to regard themselves as members of a mystic international brotherhood, the new Ecclesia or Congregation of God, thereby institutionalizing Christianity as a Church and a hierarchy. It is obvious that this view, if it can be historically sustained, destroys the whole traditional conception of Christianity by severing the connexion between the deposit, as it stands, and its alleged founder. The history of Christianity then becomes exactly analogous to the history of Mazdæism and of Buddhism. It is the history of the gradual overlaying of the teachings of the founder by dogmatic, sacramental, mystical, and hierarchical integuments derived from other religions; 'Catholicism' is to authentic Christianity what Lamaism is to primitive Buddhism. The classical expression of this view is still, perhaps, Harnack's great *History of Dogma*, in which the majestic pageant of Church history is exhibited as a gradual working out of that 'acute secularization' of Christianity initiated by the well-meaning, though mistaken, desire of St. Paul to commend the new religious movement to persons who had grown up in the atmosphere of the Hellenic and Anatolian mystery-religions. It follows from this view that the whole of the 'Catholic' deposit, including the great central doctrines of the Trinity, Incarnation, and Atonement, must be discarded, and not merely those comparatively peripheral portions of it which were dropped by the great 16th cent. Reformers; so dogma as an essential element in Christianity will disappear entirely, and institutionalism will be reduced to the minimum consistent with the practical efficiency of religion. Despite the many conscious or unconscious attempts that have been made to becloud the issue, this question, Is the Catholic deposit *in toto* substantially what was promulgated by Christ, or is it a vast mass of Græco-Roman accretion which has nothing whatever to do with His authentic teaching?, is the primary and crucial question that lies before the religious thought of Europe at present, and will probably have to be answered decisively, in one sense or the other, before one hundred years are over.

5. *Recent developments.*—Within the sphere of traditional Christianity three additional developments deserve brief mention. These are all, it may be observed, confined to the Western or Latin Church, as in the East the era of petrification, which set in with the death of St. John of Damascus and precludes the possibility of development, still holds sway. (1) The first of these is analogous to what may be noticed in the case of Lamaism, viz. the tendency to concentrate the functions of the depositary class in the hands of a single chief depositary or supreme pontiff. So, within the Roman Church, the pope was declared by the Vatican Council of 1870 to be endowed, when performing his office of supreme pastor and teacher of Christians, with the same infallibility (*q.v.*) as that which Catholic traditionalism attributes to the Church; and this belief is concisely

summed up in the 'I am tradition' of Pius IX.—a remark in which an unfriendly critic might discern a recrudescence of the old priest-king idea. (2) The second development is the tendency, analogous to what we see in Judaism, with its attempts to form 'a hedge around the Law,' to protect the real deposit by surrounding it with a kind of secondary deposit as with an armour. In Judaism this protective armour or integument was supplied by the *dicta* of the Rabbis. In Latin Catholicism the opinions of theologians have, in practice, come to assume the same position. Outside the central nucleus of the deposit, consisting of doctrines which are strictly *de fide*, there is a fringe, or penumbra, of 'pious opinions' which are *proxima fidei*, based, not upon the decrees of ecumenical councils, but upon the *consensus theologorum*. To deny these opinions is not indeed heretical, but may be censured as 'temerarious' or 'offensive to pious ears.' In practice the distinction between the dogmas of the primary deposit and the pious opinions of the secondary does not appear to be very clear; and even local traditions regarding the authenticity and sanctity of particular holy places and objects, which in principle are merely a matter of ordinary human evidence, are sometimes treated with as much respect—and criticism of them is as much resented—as though they belonged to the inner nucleus of the deposit of faith. (3) The third development represents a reaction against the former two, and is popularly called 'Modernism.' In its extreme French and Italian forms, Modernism (*q.v.*) is logically identical with the extreme Ritschlian Protestantism sketched above. It denies that Christ meant to promulgate a deposit, or would have had any authority to do so if He had so meant; and regards Him rather as a religious genius, not exempt from the errors and limitations of His age and country, who merely gave the first impulse to a wave of emotional feeling, which has reverberated down the centuries and is still affecting myriads of human souls. This view is, of course, entirely destructive of Catholic traditionalism as described above. In England, Germany, and America, however, the Modernist movement has taken a more moderate form; and, within the Anglican Church, the corresponding movement has raised a very interesting problem—that of the relation between the spiritual contents of the deposit, which the Anglican Modernist would not deny that Christ promulgated, and the conceptual forms borrowed by the early Fathers and councils from Greek metaphysics to contain it. Whilst the Anglo-Catholic would maintain that the Church was divinely inspired to choose the right conceptual forms, and that these, having received ecumenical sanction, cannot be discarded by the individual believer, the Anglo-Modernist regards the forms as having no more than a purely human authority, and as capable from time to time of variation or even of supersession.¹ The question of the depositary class does not seem to have been directly raised in these discussions, but it is probable that the Anglo-Modernist would regard the whole Church or Christian people, and not any specialized class within it, as being the depositary.

TRAGEDY.—See DRAMA.

TRAINING (Religious).—Religion is an attitude towards God. It expresses itself in acts of appreciation of values by individuals and groups. These actions are rooted in the basal instincts. They may be few and irregular; they may be gross expressions of wild passion; or they may be refined and well-disciplined reactions of the whole personality in the presence of eternal values. The differences are determined chiefly by training the inner life to react consistently to higher ideals and motives, and by training conduct to habitual and adequate expression of appreciation.

There is a broad sense in which religious training is a feature of all forms of religion, from primitive animism with favourite incantations up to the cultured forms of ritual, all transmitted to successive generations by imitation and other educative processes. But this article deals only with the specific types of religious training now practised or proposed in the English-speaking world.

By religious training is meant a systematic effort to preserve, improve, propagate, and transmit religious life, by methods commonly used in education, such as imitation, instruction, discipline, and inspirational and ideal-forming agencies, in correlation with other means of promoting religion. It goes even farther in some minds; and not without justification the claim is made that educational training, no matter how secular or technical, is not complete or adequately motivated unless in its aim and spirit it leads up into that social purpose which is the chief part of religion (Herbart, Coe).

I. Background.—The types of religious training which now prevail have arisen by connected development (1) out of a long and diversified history of maladjustment between childhood and the Christian Church, (2) out of numerous artificial theologies and individualistic theories of religion, and (3) out of an utter lack, until recently, of any psychology of religion or of childhood.

(1) The historical background of religious training may be found (a) in the stereotyped forms of worship and religious expression handed down to successive generations through church and family life; (b) in the catechism and confirmation class, where formal drill and authoritative doctrine and precept have long produced educational results of some importance in religious life. (c) A nearer background exists in the modern Sunday schools, first with their memorized Bible lessons, and since 1870 with their uniform lessons taught by rather feeble hortatory methods.

(2) The theoretical background is found in an individualistic theology. The corner-stones of this theology were the natural sinfulness of every man, the impending judgment of punishment therefor, and the miraculous atonement of Jesus Christ, which made possible the repentance and pardon of the individual sinner. The supernatural factor was magnified; the human ways and means were subordinated, and the ethical discrepancies passed unnoticed. The process was conceived as judicial on the basis of a retributive penology now discarded in the best judicial practice. The instruction given was not regarded primarily as educative, but rather as dogmatic, evangelistic, and hortatory. No important significance was attached to the teachings of Jesus about the growth of the spiritual

life or the conditions of the ground into which the seed shall fall.

The social gospel lately found to be so conspicuous in the teaching and life of Jesus was unknown. For lack of it the process of salvation was essentially self-regarding, which is doubtless the main reason why Christianity has been so long and slow in making its way in the world. When the era of modern missions dawned, three significant things happened. (a) The individual gospel was proclaimed from social and really Christian motives, and the result was good so far as it went, but incommensurate with the effort expended. (b) Actual conditions in mission fields and the emergence of social ideals at home forced an expansion of missionary aims so as to include social service—a gospel which was not always well correlated with the other. (c) As soon as this social gospel had time to reveal its character and possibilities, results became overwhelming; and the missionary prayer is no longer for the opening of doors, as it was a half-century ago, but for teachers, doctors, nurses, farmers, and skilled workmen, by hundreds, to carry a full-orbed Christian civilization into all the lands whose Macedonian calls are coming unsolicited.

(3) Until the last quarter of the 19th cent. psychology was a thing remote from religion. It had not then as now stressed the unity of the self, as against a number of more or less independent 'faculties' bearing little relation to religion. Nor had child psychology made known the extent to which the mind is at first rudimentary, and subject to the continuous and slow changes which the long human infancy makes possible.

Psychology and social and educational science have found no place in the theory of religion until the last generation, and even yet there are those in every religious body who shudder at the thought of applying scientific methods to the propagation of religion. But it is out of these diverse conditions ancient and modern that a theory and practice of religious education is now rapidly taking shape.

2. **Theory and aim.**—There is a type of religious education which perpetuates the theoretical background of intellectualism and individualism. Its propositions are arranged in logical order, and not in the order in which they arise in human experience. They are held to be authoritative, and are taught in dogmatic form. Under this theory the service which education renders to religion is to make these formulæ known, and here the service ends.

Under the other type the service rendered by education to religion is much broader. The knowledge to be imparted is not dogmatic but inspirational; not an end, but a means to spiritual values; not generalized and abstract, but presented concretely and made illuminating to the pupil's present life. This type of religious training includes habits of worship, attitudes towards the natural world, ideals of life, deeds of service, the relations sustained to the smaller and larger groups of one's fellow-men, and, in fact, every form of useful expression which can be given to inner spiritual life.

(1) The theory on which any adequate plan for religious training is based includes the following fundamental ideas as to the development of religion. (a) The presence of the religious life is felt not only in worship and in the conventional forms of religious expression, but especially in character and in social purpose, which subordinates all interests to the supreme values of life. (b) The religious life is a continuous growth, not a thing produced artificially, or judicially instituted at the moment of a passing experience. (c) This growth involves not a special organ or faculty, but the whole person-

ality. It involves even the group of persons, and it tends to realize in them their oneness with the larger whole of society and of the world in God. (d) Finally, the growth of the religious life is normal, vigorous, and healthy, in proportion as its true nature is understood, as favourable conditions for its growth are provided, and as consistent work and painstaking devotion are given to its cultivation.¹

(2) The following educational facts and principles are also involved in the theory of religious training. (a) The subject of an educative process is a person with all his inherited equipment of race instincts and family traits, as well as his undeveloped mental, moral, and religious powers. It is the business of education, not to eradicate or supplant any of these, but to develop and cultivate them, and subordinate them to the highest ends. (b) Education is more than instruction. It not only builds up many and rich concepts, which shall serve as a basis for judgment and action by a member of society; but it also takes measures to establish desirable habits, and to create ideals of commanding dignity and emotional power. (c) Education uses concrete materials for this purpose. It selects for its use those human experiences best fitted in character and grade to accomplish the particular purpose in view. The treasures of the race have become very rich in such material, so that the selection and preparation of it is a task demanding the skill of educational experts.

(3) The thing that is aimed at in religious education is (a) to put one as early and as completely as possible in possession of that rich treasure of experience which has come down from the past, and has been gathered from the ends of the earth, especially those parts of it which are richest in their meanings for a man's life in the world with other people and as a worker with God. (b) A further aim is to turn the full force of that experience, in the form of socialized ideals and purposes, as a motive power upon conduct and upon the ordering of the programme of life. This is an individual aim, but it is far more. It enlists churches, homes, and communities in this motivation of conduct for the well-being of society at large. (c) It is believed that the instruction to be gathered from the parable of the soils (Mk 4²⁻²⁰) is a lesson of education, in which the minds mellowed by long processes of nurture are those which respond quickly and whole-heartedly to the evangel. Such nurture would seem therefore to be the most direct and effective way of co-operating with the Spirit of God for the evangelization of the world.

3. **Content.**—Since religion and its promotion are understood to be, to some extent at least, an enterprise in education, it is necessary to choose for such instruction that material which will be most fruitful religiously. Rather vague ideas prevail on this subject, due to lack of critical analysis of the values to be sought, and to incomplete knowledge of how to produce and conserve those values.

The educational reformers of a century ago established the principle of gradation of material—*i.e.*, that the ability of children to understand and master material changes as they grow older. The material must therefore be chosen with reference to this changing ability; *e.g.*, the incident of a boy robbing a bird's nest can be understood and remembered by a five-year-old child, but the moral interpretation of the same incident is better suited for a mind several years older.

The fallacy of catechetical instruction is partly a pedagogical one. It consists in presenting adult abstractions to children—in offering strong meat instead of milk to babes. A similar

¹ George A. Coe, *A Social Theory of Religious Education*, New York, 1917.

fallacy has vitiated much of the Bible teaching in Sunday schools where 'uniform' lessons have been chosen for young and old alike. If the children had a story which they could understand and remember on one Sunday, they must feed on Prophets and Epistles for several weeks before they might expect another children's lesson. Of course adaptations by editors and teachers could do something to overcome the discrepancy in grading, but it is only making the best of a bad case. It is wholly unnecessary for religious instruction to be subjected to these hindrances, now that the principles of grading are understood and have been applied to the materials used in religious training.

There is also a religious fallacy in catechetical instruction, appealing as it does exclusively to the intellect with logical propositions dogmatically conceived and expressed. The emotional and social aspects of the child's religious life are the first to be required for the development of ideals and the motivation of conduct. The intellectual formulations satisfy better the mature religious needs of adults, and the different needs of children should be provided for.

In selecting and grading the materials for religious education there are a number of considerations to be provided for.

(1) The language of religion must be acquired. As in any field of human experience, the language and the thought develop together. Some terms are advanced and technical, but many are elementary. The history and practice of religion, the reading of the Bible, and the social environment offered by a religious community can make familiar to children, nurtured in such an atmosphere, all the elementary concepts of religion, and the words and phrases which express those concepts. They can make known a few of the landmarks of religious history, at least by their names and by some characteristic incidents associated with those names.

A properly graded curriculum therefore provides for young children a selection of simple Bible incidents on subjects within their experience, or a like class of subjects taken from biography, literature, and life. For this purpose one may choose stories about children, animals, natural objects, and the things familiar to childhood, especially those which contain some of the language and forms of religion, but none of the generalizations and abstract principles in which religious teaching is so often couched.

(2) The child inherits certain capacities for a moral and religious life. But each individual must shape his concepts of that life from the examples of other experiences seen and heard by him. His education consists in becoming acquainted with these selected experiences of others, in reading meaning into them, and in shaping his own habits, judgments, and ideals, with reference to the experiences so set before him. This formation of concepts represents a later stage of religious development than the language stage mentioned above, but the later mingles with the earlier stage, and they move forward together. A class of more meaningful experiences is chosen for this purpose, such as the parables of Jesus, tales of moral heroism, events in which service and sacrifice are exemplified, the revealings of motives and of character and of loyalty to persons and to ideals, and the superiority of moral and spiritual values over those values which are chiefly carnal and commercial.

It is therefore the business of religious education to bring into the life of youth an abundance of human incidents rich in moral and religious meaning; to present these experiences with sufficient detail and pedagogical skill to assure them an atmosphere, an emotional vitality, and some permanence; and to give definite guidance to each youth in the construction of his own habits, judgments, and ideals, out of the concrete materials furnished to him. The selection of material for this purpose out of the Bible or from other sources is the most responsible and difficult task of religious education. It is also the point at which failure

has been most complete in nearly every curriculum thus far proposed for religious training.

(3) While it belongs to the province of science and general education to develop in youth a conception of the causal connectedness of the world and of its unity, consistency, and organization under natural law, it is a well-known fact that this is not generally done. Such reflexions arise more frequently in connexion with religion than elsewhere, and it is proper that religious education should provide in place of discarded cosmologies a better instruction, which can serve the common people as a credible philosophy of nature. Nothing can do more to disintegrate religious faith and moral integrity than lack of a believable philosophy of the world. Such a philosophy is entirely within the mental compass of enlightened youths; and they have a right to it as a support for their faith and as a part of their education. Indeed they will have it. The only uncertainty is as to how good or how poor a philosophy they shall work out for themselves if wise help is withheld from them.

For the few but important lessons on this subject the creation stories and a few other portions of Scripture will serve as occasion for wise and modern instruction. A few of the great chapters in the history of science are required. These need to be correlated, not only with the names of discoveries and inventors, but with the forward movements in the world's life, and the human values which they have enhanced.

(4) A task of religious education still more important is the interpretation to young minds of the world of human life. We live and act in a world of purpose and meaning, as well as in a world of natural law and causal connexion. It is out of this purposive life that real values arise; and it is with those values that religion is concerned. There is no gain for religion in knowledge of the Scripture, or of the facts of nature, and no benefit in formal covenants and ordinances, unless in the human heart there is an ideal which throws over all these things an emotional glow that enriches them with meaning and value. It is doubtless the same thing that is spoken of as the Spirit of God in the human heart taking the things of Christ and showing them to us.

Religious teachers generally try to do this. Most expository Bible teaching is so intended. So also is the preaching. But the efforts are desultory, and the results are not cumulative. A need is felt for a programme or a definite policy, based on a sound philosophy and on educational principles, to give continuity and cumulative effect to the propagation of religion. It can hardly be claimed that such a programme has yet been proposed, although efforts have been made in that direction, and in some cases with gratifying results.

The choice and arrangement of material awaits a fuller agreement upon Christian ideals and the fundamental philosophy of religion. In this task the interpretation of the world of human life is the chief factor. What is called the social gospel has already gone far to supplement and modify the individualism of the former day. But 'a theology for the social gospel,' as Walter Rauschenbusch calls his book,¹ has not yet formulated itself in popular thinking. In the light of such a theology and philosophy, there is required a re-defining of the virtues and of the unifying principle by which those virtues are correlated in the good man. The new sense of the structural character of society, the place and function of the individual within the structure, and the interactions between the structure and its members must have much weight in determining what the content of a religious education curriculum ought to be, and what educational aims and values ought to be conspicuous in that material.

(5) The great issues over which men and nations have struggled in the world's forward movement need to be made known to young people, and

¹ New York, 1918.

their meanings interpreted. Such issues were drawn in OT times by the prophets against royal and ecclesiastical dignitaries. Jesus defined an issue between the Pharisees and the new religion of the inner life. Every forward step, every reform, every moral and spiritual achievement from that day to this, can be of great service to those whose motives and ideals are forming. They are needed as a background for the tasks and problems of to-day, as a guide in defining present and future issues, and as an inspiration to loyalty in trying situations. Here will appear biographies of men and women who have caught visions of an improved world and have helped to realize those visions. Here also belong the rise and fall of institutions in response to the changing needs of the world. Out of such rich and varied sources are being selected the graded and sifted materials for a curriculum of religious training.

4. **Method and organization.**—While the history of pedagogy has been progressive, and general education has profited by every improvement, religious training has been slow to take up improved methods. Memoriter catechetical teaching is still common. Hortatory and semi-expository teaching of the Bible is quite general in church schools, the aim being evangelistic and not primarily educative.

There is a marked tendency to reconstruct, not only the curriculum in ways already indicated, but also the method and organization. In method these changes consist in a larger use of direct narrative in connexion with concrete story material used in the lower grades; the immediate oral reproduction by pupils of the narrative so presented;¹ the increased use of pictorial and graphic representation, and the tendency to substitute for the leaflet, pamphlet, or bare Bible specially prepared text-books of a more permanent and attractive character.

But the most important tendency is towards things to be done, as an expression in real life of the moral and religious impulses, as they awaken in childhood and youth. Daily conduct, positions taken on moral questions before associates, missionary work, community betterment, neighbourly and charitable work, and worthy social activities in general, offer a welcome field for religious training in this growing aspect. Out of such activities arise deeper and truer thinking and finer emotional responses than any didactic method can produce.

Modern forms of church organization provide for a department of religious training in the local church. This department is free to adopt methods in harmony with improved educational and religious ideas, and to introduce a curriculum something like that outlined above. Only in those local churches where the broad full meaning of religious education has been discussed and appreciated has the reconstruction taken place. But the number of these churches is increasing; they are profiting by experience; and their results are watched and reported.

In several American communions, notably the Protestant Episcopal, the Congregational, and the Presbyterian, important steps have been taken to reconstruct the denominational machinery on educational lines. Numerous officials are employed to propagate the principles and ideals of religious training in the local churches, and to aid in the installation of better systems. These methods are especially successful in missionary fields, (1) because there the need is more obvious, and (2) because these fields are not bound by tradition to antiquated methods as many of the churches are.

While the prospect for the future of religious education is best in the direction of denominational organization, there is also a distinct movement on foot for community organization disregarding ecclesiastical divisions, or at least bringing them

¹ W. J. Mutch, *Graded Bible Stories*, Ripon, Wis., 1914.

into co-operation.¹ This plan calls for a local board and a superintendent, who shall inaugurate a school system parallel to the other system or systems in the same community. Less time would be required for the religious than for the general and vocational schools; yet the effectiveness of it cannot be estimated by the time spent. In addition to the direct values of such training the material of general education is re-interpreted and given new meaning and dignity from the spiritual aspect. Teachers who have training in the principles of education, as well as personal fitness and inspiring leadership, soon make apparent the large possibilities of religious training, both in its own field and in its effects on the whole structure of society.

In Britain and in some other European countries the schools supported at public expense are expected to furnish some instruction of a religious nature. Recognition is made of denominational preferences, and teachers are assigned to groups with this in mind. In France religious instruction is entirely excluded from all public and private schools of general education, and the members of religious orders are disqualified as teachers. This of course does not prevent the teaching of religion in the churches. In the United States of America religion is excluded by the laws of the States from the public schools; but entire freedom is given for this instruction under church or community supervision. In some States the pupils are released for one session each week from required attendance at a public school on condition of spending that time under approved religious instruction, proportionate credit being given if such work is satisfactorily done.

In general it may be said that the ideals and content of religious education have been reconstructed in accordance with modern ideas. The realization of the better ideals has been achieved in a limited degree, and every year marks distinct gains. But the progress is retarded (1) by conservative traditions among earnest religious people, who have not seen the spiritual values in a religious life conceived developmentally and socially; (2) by inadequate conceptions of and facilities for training in religious activity and self-expression, and (3) by lack of united and trained leadership in the re-organization of religious education in local communities. It seems to be the task of Christian colleges to raise up a generation of men and women who have the religious and educational ideals and the ability and enthusiasm to organize them into the life of our time.

A good central organization for the study of religious education, for the comparison of results, and for the promotion of this large interest in the life and thought of the world exists in the Religious Education Association (Henry F. Cope, Secretary, 1440 East 57th Street, Chicago, Ill.). It was founded in 1903 by representatives of all religious faiths. It has held important annual conventions, mostly in American cities. These conventions have done much to shape thought, guide effort, and stimulate experiment. The volumes of the bi-monthly magazine of the Association entitled *Religious Education* furnish much material in the history and discussion of this subject.

TRANSCENDENTALISM.—The term 'transcendental' plays an important part in Kant's *Critique of the Pure Reason*—'transcendental aesthetic,' 'transcendental analytic,' etc.—and through the influence of the critical philosophy the term has become familiar in modern thinking and even in popular literature. Kant did not originate the term; but he gave it new vigour and a new orientation.

1. **Pre-Kantian transcendentalism.**—(1) *Use of the term in scholastic logic.*—Before Kant's time 'transcendental' and 'transcendent' were familiar terms in the scholastic logic and were practically equivalent in meaning, although he sharply distinguished between them. To the scholastic logicians these terms were used of those most general notions that could not be subsumed under the ten Aristotelian categories. They rose beyond or transcended them. Spinoza uses 'transcendental' in this sense of the most general notions and gives his view of how psychologically they originate.¹ Strictly speaking, these *transcendentia* or *transcendentia* belonged to a realm above ordinary categorical logical thinking and as such were beyond the province of logic proper. Various enumerations of these transcendental notions are given. Albertus Magnus gives *ens, unum, bonum,* and *verum*; and very generally these, along with *res* and *aliquid*, make up the list of the six *transcendentia*. Their interrelations are stated and various subtleties regarding them introduced by different schoolmen. *Ens* was as a rule regarded as super-transcendental, the rest being passions or modifications of being (*passiones entis*). This category in scholastic philosophy was pretty much what the 'Absolute' is in modern philosophy.²

(2) *Use of the term in theology.*—To the schoolmen, however, logic was only the handmaiden of theology, and so we find these terms more or less always moving into the area of theological speculation. These transcendental notions had their reality in the mind of God, who is transcendent *par excellence*. The passage in Augustine³ where he posits the transcendental ideas in the divine mind became classical and is quoted by all the great medievalists. It is historically the fusion of Greek thought with Christian experience. Plato speaks of the good (*τὸ ἀγαθόν*) as transcending being (*ἐπέκεινα τῆς οὐσίας*),⁴ and Plotinus uses the phrase often.⁵ Transcendent is simply the Latin equivalent of *ἐπέκεινα*, 'beyond.' At times this tendency became extreme, as in the case of Erigena and the mystics who speak of God as above all predicates—*ὑπεραληθής, ὑπέρσοφος, ὑπεραιώνιος*, 'above truth,' 'above wisdom,' 'above eternity.'

Transcendentalism in theology, then, means the position that God's knowledge and character are perfect, absolute as distinct from man's knowledge, which is imperfect, and from man's virtue, which is immature; as such it is part of the very essence of theology and the unmovable conviction of religion. But it may become falsified through over-emphasis and dangerous through over-refinement of subtlety. Ordinary living religious experience speaks of the divine in plain speech, ascribing to God organs, actions, passions, movement, change, purposes, and this is done without any feeling of

incongruity—even when the divine spirituality is clearly recognized. Transcendentalism becomes over-subtle when it objects to this, and it is usually when religious experience is at a low ebb and beset by foes that this form of transcendentalism gains a hearing. Even in the OT, as Schultz points out,¹ we have the beginning of reflective transcendentalism. It is more evident in the Septuagint translation and in the post-Biblical Jewish literature, and it operates dominantly in Philo until God becomes the Great Unknowable. In the history of Christian theology we find the superimposition of this metaphysical and mystical transcendentalism on the direct religious thought of the NT. Edwin Hatch, in his famous Hibbert Lectures,² maintains that the great creeds of Christendom buried religion under this metaphysic; and in his zeal he has overstated the case; for transcendentalism in the sense of God's absoluteness is an integral part of religion and of theology, but, when it makes this a mode of throwing discredit on man's knowledge and of undermining man's notions of right and wrong, when it empties God of feeling, purpose, and initiation, then it becomes false and dangerous.

It is better to deal here with the special forms of transcendentalism in this sense, before discussing the Kantian and post-Kantian usage of the term, as these forms of thinking have their roots in a soil different from that which is specifically and dominantly under the influence of Kant.

2. **Extra-Kantian transcendentalism.**—Transcendentalism in the theological and philosophical sphere means, in a general way, the recognition of God as exalted in thought and character above man and sensible objects. It is thus contrasted with phenomenalism, naturalism, and materialism, and, one may say, also agnosticism, for, although the agnostic may grant the existence of such a Being, the concession is of no value either for knowledge or for morality. In this sense every religious view of the world is transcendental. When, however, we ask what the relation between man's knowledge and virtue and God's is, the real problem of transcendentalism emerges, and, according to the answer given, thinkers fall into different classes, which for purposes of clearness may be distinguished as follows.

(1) *Extreme transcendentalism.*—Those who hold that God is utterly incomprehensible to us, and that knowledge and virtue in Him are quite different, not only in quantity but also in quality, from what we mean by these terms, are extreme transcendentalists in the sphere of ontology. Modern examples are Hamilton and Mansel, who, borrowing a Kantian distinction, maintained that our predicated knowledge of God is regulative not speculative truth, that it was given, not to satisfy the reason, but to guide the practice of man, not to tell us what God is in His absolute nature, but what He wills us to think of Him in our present conditioned state. This phase of transcendentalism arose as a protest against what Hamilton calls 'the scheme of pantheistic omniscience so prevalent among the sequacious thinkers of the day.'³ Speculative theologians have always had leanings towards this mode of reasoning regarding the divine, and its influence can be traced in theology from the days of Origen. While the ordinary religious consciousness speaks of God as wise and good, and cannot help so doing, yet these terms in reality do not apply to Him, and are to be understood anthropopathically. He has deigned

to accommodate this revelation to our limited intelligence, but it is, after all, only an accommodation (*συνκατάβασις*), and the true method of theology is to strip away all these predicates and to proceed *via negationis*. The danger here is obvious, viz. forgetting of the truth that man is made in the image of God, and forgetting that thinkers are apt to cut apart God and man, and thereby religion and reason alike become unreal and untrustworthy. Under this impulse religious men fall back on an authority which has no basis in our rational or moral nature, or on some occult faculty apart from reason; and others, strictly adhering to the working of the understanding, leave the transcendental sphere of Being alone. Outside the small circle illuminated by the understanding there may be Something, but to us it is unknown and unknowable. Agnosticism as regards ultimate reality is the result of this attitude.

(2) *Religious transcendentalism*.—Others, again, maintain also God's transcendental character, but they hold that man's knowledge is accurate as far as it goes, that in quality, though not in quantity, it is the same as God's, and that morality in man can not be different in essence from what it is in the divine, that the pathway of true knowledge and moral progress leads to God. God's revelation is certainly an accommodation, but this accommodation itself is an education of man by God, progressing from less to more and conserving in its more perfect stages continuity with the earlier, and besides the process is self-correcting. J. B. Mozley¹ gives a very fair view of this position as regards the OT. God dealt with men as they were, but in such a way as to lead them onwards and upwards. Man makes God in his own image, but it is because God first made man in His image. Augustine, who often speaks of God as incomprehensible—as indeed every religious mind must do, so that Hamilton has no difficulty in compiling a catena of such passages from various writers—yet maintains that our intellectual and moral strivings are but a returning to the Source whence intelligence and goodness spring. The human mind and heart participate in transcendent knowledge and goodness, and the aim of theology is to ascend by this road to God; only to man the grace of the Holy Spirit is necessary to initiate and guide this quest. The method here is not so much that of negation as of eminence (*via eminentiæ*), and it differs from pure philosophical or epistemological transcendentalism both in its insistence on the need of grace and in its proper valuation of other aspects of experience besides the pure intellect. It is this that 'Rabbi' Duncan has in view when he defines transcendentalism as 'the denial of that which renders man's knowledge an inferior kind of knowledge';² and it is in this sense that F. D. Maurice is a transcendentalist when in somewhat exaggerated fashion he fathers on Mansel's theory such frightful consequences.

(3) *Epistemological transcendentalism*.—Distinct from this again is what one may call pure epistemological transcendentalism, according to which the highest knowledge in man becomes identical with, and indistinguishable from, the divine knowledge. Thus Boethius:

'Sense judges figure clothed in material substance. Imagination figures alone without matter. Thought transcends this again, and by its contemplation of universals considers the type itself which is contained in the individual. The eye of intelligence is yet more exalted, for overpassing the sphere of the universal it will behold absolute form itself by the pure force of the mind's vision.'³

From the plane of intelligence, according to Boethius, all the contradictions of the ordinary experience are reconcilable. Thus to God they harmonize, and to us as far as we look at them from this point of view. No one can fail to notice the similarity between this and the method of modern absolutist transcendentalism, with its solving of contradictions and its transcendental intuition. This school speaks in such a way as to lead the ordinary reader to suppose that the individual can attain by knowledge to the divine point of view—a claim which it is extremely difficult to distinguish from omniscience.

(4) *Moralistic and mystical transcendentalism*.—The term, however, may be applied, and often is applied, to those who are keenly conscious of the limitations of the human mind, and impatient and sceptical regarding its slow ratiocinative processes, but who hold that man's moral nature or his feelings or intuitions can give immediate access to the divine. Typical thinkers of this school are Pascal, Schleiermacher, and Ritschl. They lay stress on the supremacy of the heart—'The heart makes the theologian'—or on the value of feelings or intuitions; and a strong current to-day draws many along the pathway of the subconscious towards God. Thus we have schools of moralistic and mystical transcendentality. They disparage reason and logic, and find refuge in the allogical departments of the soul. The so-called New England transcendentalism¹ combines both mysticism and moralism with a large element of vague eclecticism, but it may, for purposes of classification, be included here.

3. *Kantian transcendentalism*.—To appreciate modern transcendentalism both in its philosophical and in its more popular application, we must briefly review Kant's view of knowledge.

(1) *The factors in knowledge*.—To Kant knowledge—mathematics and the physical sciences—involved two factors, one due to the activity of the mind, the other due to sense-data. He did not doubt the fact of knowledge itself, nor did he concern himself with its psychological origin. He found in knowledge a synthesis of these two elements. Nothing could form the subject-matter of knowledge but what came from sense-data, but then sense-experience itself was a chaos without the principles supplied by the understanding and the activity of the mind; even perception itself required space and time—mental forms. To him God, the world, and the soul could not become the objects of scientific knowledge and therefore they were transcendent; i.e., they were outside the limits of possible knowledge. There can be no doubt that Kant had a horror of those who spoke familiarly of God, as if He were an object of sense-perception, and that his real anxiety to mark clearly the boundaries of possible knowledge was largely due to fear of intrusion from this quarter. He thus distinguishes clearly between 'immanent principles which apply solely within the limits of possible experience' and transcendent principles 'which are intended to reach beyond these limits.'²

Kant did not deny the reality of God, or of the soul, or the ultimate essence of matter, but he did strongly insist that the pure reason got into hopeless difficulties when it tried to apply the principles valid in the sphere of phenomena to these extraphenomenal entities. To him we owe the very prevalent modern view that science has its own domain—it includes all knowledge, though not all reality—and religion and morality have their domain; and that the marches between them should be clearly defined; and that there should be no raids, excursions, or alarms from one side or the other.

(2) *Transcendental principles*.—Having thus excluded transcendent realities from the domain of the understanding, because we can have no scientific knowledge of them, he shows that in knowledge itself there were principles like causality—the categories, in short—which were not due to sense-data. Those principles are transcendental (as distinct from transcendent), which means both that they are not due to sense and that they can be shown to constitute knowledge. Without sense-data they are empty, but sense without them is blind.

Transcendental to Kant then means constitutive

¹ See § 4 (1) below.

¹ *Ruling Ideas in Early Ages*, London, 1877.

² *Colloquia Peripatetica*³, ed. W. Knight, Edinburgh, 1871, p. 111.

³ *Consolation of Philosophy*, tr. H. R. James, London, 1897, p. 189.

of valid knowledge, and a transcendental inquiry, such as his own critical method, 'concerns itself, not so much with objects, but with the way in which we know objects in so far as this may be possible *a priori*.'¹ What reality in itself may be is not the aim of the critical philosophy to determine, but to find out that element in knowledge which makes it valid and to guard knowledge against the admission of anything which cannot be scientifically known. Kant is not concerned with ontology but with epistemology, and the two to him are not identical. Kant thus sharply distinguishes between transcendent and transcendental. He uses the former term in a disparaging sense, while the latter means constitutive of knowledge—what makes knowledge possible.

'The term *transcendental*,' says R. Adamson, 'probably has, for English ears, an unpleasant ring, and will suggest metaphysical efforts to transcend experience. It must be understood, however, that *transcendental* method is simply the patient and rigorous analysis of experience itself. For any question or theorem which might pass beyond possible experience, Kant reserved the term *transcendent*; and the distinction, if not the mode of expressing it, is accepted by all his successors. Neither in Kant nor in Fichte is there anything in the slightest degree resembling what is commonly called metaphysics.'²

David Masson³ traces through all history two tendencies in regard to the origin of knowledge—one fathering all knowledge on sense-experience (this may be called empiricism), the other maintaining that 'there are elements in knowledge, the origin or reason of which transcends or lies beyond the horizon of historical conditions.' Historically it is the conflict of these two that we find in the controversy between Locke and Leibniz or between Mill and Hamilton. The transcendental position is summed up in the famous phrase: 'Nihil est in intellectu quod non prius fuerit in sensu—nisi ipse intellectus.' There is no doubt that Kant is a transcendentalist in this sense, yet for him transcendental meant something different. He is not interested in innate ideas or intuitions. He is dealing with knowledge as it exists, not as it grows, and he finds in it what sense alone does not explain, but rather what explains sense, unifying forms or principles, supplied by the mind itself, which give receptivity to sense-data and combine them together into adequate knowledge. Ultimately the formal unity of the mind itself is involved in knowledge. Thus he might agree even with the physiological psychologist in his analysis of knowledge and yet maintain the necessity of the unity of the mind.

(3) *Pure and practical reason.*—Although Kant maintained that God, the world, and the soul as noumenal realities could not be objects of knowledge or constitutive of knowledge—that they were not transcendental in his strict sense of the term—yet he allowed that they were present in knowledge regulatively. The mind was constrained to aim at unity, and this striving was due to the regulative influence of these ideas of the reason. It is this part of his system that he himself calls transcendental or critical idealism. As ideas in the mind they were transcendental, though only regulatively so; yet in themselves as realities they are transcendent as far as knowledge goes—they are beyond the bounds of knowledge. Sometimes indeed he speaks of the reality of the material world as the 'transcendental object,' where we might expect him, if he were strict in his own use of terms, to use transcendental. And he speaks of it in such a way as to suggest a *substratum* which is the outward cause of our perceptions, but for the understanding it is simply x , an unknown quantity. His transcendental object is the limit which our

understanding can reach in dealing with phenomena from the side of the receptivity of mind, just as 'the transcendental unity of apperception' is the limit on the side of the mind's synthesizing activity. Neither of these is noumena for the understanding, for it knows nothing of noumena.¹ If one were to regard this only as Kantianism, the first review of the *Kritik*—that of Christian Garve of Breslau, in the *Göttingische Gelehrte Anzeigen* of 19th Jan. 1782—might have force:

'This work . . . is a system of the higher or transcendental idealism—an idealism which embraces both mind and matter, transforms the world and ourselves into ideas, and represents the objective world as derived from appearances which the understanding combines in the interdependent whole of experience. . . . The cause of these ideas is to us unknown and unknowable.'²

But what pure reason cannot attain to, practical reason can. Morality needs transcendent realities as postulates, and, because the sphere of morality is to Kant more real than, or as real as, the sphere of knowledge, this postulation is necessary and valid. The transcendental of knowledge becomes the transcendental of morality. God, the world, the soul, freedom, and immortality become real here. We cannot prove their existence, it is true, by cognitive methods, but they are imperatively demanded by the facts of the moral life, of which facts he had no doubt.

4. *Post-Kantian transcendentalism.*—Kant's system was profound in its effects, different thinkers adopting those parts of it which served their turn, so that the complexion of their transcendentalism is determined by their point of contact with his view. His influence touched the English-speaking world at first largely through the works of Coleridge, Carlyle, and Emerson.

(1) *The teaching of Coleridge, Carlyle, and Emerson.*—Coleridge's philosophical function 'may be defined by saying that through him was transmitted an opportune suffusion of Kant and Schelling into England as of light softened through a stained-glass medium, and that into this suffusion he also resumed whatever of Anglo-Platonism had been floating long neglected in the works of old English Divines.'³ Thus the distinction between the 'reason' and the 'understanding' became familiar, and 'transcendental philosophy' acclimatized in English speech. The reason could overcome the impotence of the understanding and get hold of unseen realities.

'As the elder Romans distinguished their northern provinces into Cis-Alpine and Trans-Alpine, so may we divide all the objects of human knowledge into those on this side, and those on the other side of the spontaneous consciousness; *citra et trans conscientiam communem*. The latter is exclusively the domain of pure philosophy, which is therefore properly entitled *transcendental*, in order to discriminate it at once, both from mere reflection and re-presentation on the one hand, and on the other from those flights of lawless speculation which, abandoned by all distinct consciousness, because transgressing the bounds and purposes of our intellectual faculties, are justly condemned, as *transcendent*.'⁴

It is clear that Coleridge has no interest in accurately reproducing Kant. To him transcendentalism is just emphasis on the spiritual side of man's nature, and this is the meaning also to Carlyle:

'The grand unparalleled peculiarity of Teufelsdröckh is, that with all this Descendentalism, he combines a Transcendentalism, no less superlative; whereby if on the one hand he degrade man below most animals, except those jacketed Gonda Cows, he, on the other, exalts him beyond the visible Heavens, almost to an equality with the Gods.'⁵

Under the influence of Coleridge and Carlyle, and the general romantic movement of the time,

⁵ Sartor Resartus, bk. i. ch. 10.

transcendentalism came to mean the recognition of supersensible realities, and the spiritual nature of man—that man was more than ‘an omnivorous biped that wears breeches.’ A passage from Coleridge shows the influence of this attitude in the sphere of interpretation:

‘The intelligible forms of ancient poets,
The fair humanities of old religion,
The power, the beauty, and the majesty
That had their haunt in dale, or piny mountain,
Or forest, by slow stream, or pebbly spring,
Or chasms, and watery depths; all these have vanished;
They live no longer in the faith of reason.
But still the heart doth need a language.’¹

The faith in ‘the light that never was on sea or land,’ ‘the vision and the faculty divine,’ the fight against a crude interpretation of man’s spirit as ultimately matter, and the protest against literalism in all its forms, characterize transcendentalism at this stage; and this is still the sense of the word in extra-philosophical literature. In New England Emerson and others, rebelling against an orthodoxy that tended to make men wholly sinful and corrupt and the will of man necessarily in bondage, and impatient of dogmas derived from a revelation confined to one book, initiated a movement that got the name ‘transcendentalism’ more in derision than in honour, but the term was accepted, and the claim made that all the best in the world’s thought was here included. Carlyle, who, in spite of his sympathy with Emerson, saw in this movement an extravagant disregard of facts and an enthusiastic eclecticism, warned Emerson against the dangers ahead:

‘You seem to me in danger of dividing yourselves from the Fact of the Universe, in which alone ugly as it is can I find any anchorage.’²

James Martineau—himself a transcendentalist in the Carlylean sense, whose intellectual history is a pilgrimage from the bondage of empiricism—does not take Emerson seriously. No doubt New England transcendentalism became extravagant, welcoming the ravings of the Swedenborgian and of the unregulated mystic as possible revelations, yet it never became a system, and its airy optimism is explicable and defensible as a protest and a reaction; yet to its influence is largely due the fact that to many, if not to most, in our day transcendentalism means hopeless and unwarranted idealism—unworkable dreaming. It was not patient enough to be lasting, and, with all its boasted catholicity and insight, it was blind to the facts that gave the old orthodoxy its seriousness and its power of rejuvenescence. On the other hand, it was a refreshing and liberalizing movement.

(2) *Science and transcendentalism.*—Kant’s influence was felt in a very different quarter—among those whose interests were devoted to science. Thus Lange, the historian of materialism, interpreting Kant, as he thought, confines man’s knowledge of reality to the results of science, but contends for a world above this created by our moral and spiritual needs—an unsubstantial world of ideals, a transcendentalism which is like a painted cloud; and this attitude has more or less existed since, differing according to the amount of reality the individual thinker gives to this beautiful but airy realm. It is found in the historian Buckle, and has been well described as a ‘consolatory private transcendentalism.’³ Herbert Spencer’s magnanimous handing over of the Unknowable to religion is an example of this ‘private transcendentalism.’ It is due to a one-sided exploitation of Kant without regard to

Kant’s moral certainty. To Kant the moral nature of man planted man in an intelligible real world, although knowledge left him only in the phenomenal, with just a glimmer of the noumenal breaking through, but this transcendentalism which, as in Lange’s case, pretends to be its lawful heir finds the phenomenal the real, and the transcendental the vague and the shadowy.

Others more alive to the reality of religion have sought to place this transcendentalism side by side with scientific results, while conscious all the time of the hostility between the two. Thus W. H. Mallock¹ attempts to hold by the results of science and yet to allow the demands of religion validity; and this attitude was prevalent in the past century.

In psychology the theory of psycho-physical parallelism exhibits the same tendency—a species of eirenicism between phenomenalism and transcendentalism. The results of science are accepted; its principles are unquestioned; and then these same facts are explained as if nothing but psychical data were involved. It is a raised horn of perplexity—a compact that real issues will not be traced on either side. It is not difficult to see how closely related to Kant these tendencies are, for it may not unfairly be said that he himself adopted without questioning the results of science and also the deliverances of a spiritual philosophy due to religion and held them both without consistently uniting them.

Paulsen, one of Kant’s most faithful modern disciples, contends that science will never give up its claim to explain everything mechanically; yet metaphysics must give to this realm of science an idealistic interpretation. One may be the most rigid materialist at one moment, and yet be wholly transcendentalist as a philosopher at another. The scientist will never admit any supernatural agent, and the only way of peace is to admit his claim; yet somehow to transform all into spiritual reality is the task of the philosopher. It is because of this felt dualism that transcendentalism in its pure form as absolutism claims for itself to be the true heir and rightful corrector and interpreter of Kant.

(3) *Absolute transcendentalism.*—‘Transcendentalism’ in modern philosophy is used of that world-view known at times as absolutism, objective idealism, neo-Hegelianism, or rationalism. The term ‘transcendentalism’ traces this system historically to Kant’s theory of knowledge. As we saw above,² ‘transcendental’ to Kant meant at least two things. (a) Those principles in knowledge which in the nature of the case did not originate in sense-experience are transcendental. In this sense of the term Kantianism allied itself with that tendency in British thought which recognized *a priori* or original data both in knowledge and in morality—what may be generically named intuitionism. Leibniz’s famous revision of the empirical formula may be taken as the watchword of this school: ‘Nihil est in intellectu quod non prius fuerit in sensu nisi ipse intellectus.’ The controversy between Hume and Reid, between Mill and Hamilton, is one between psychological empiricism and psychological transcendentalism, just as the controversy between hedonism and intuitionism is a phase of the same in the sphere of ethics. This was the outstanding question in British philosophy for many a day. Masson in his *Recent British Philosophy* gives a readable account of the state of matters in his time, and ‘transcendentalism’ is used by him of those systems which recognize in the mind more than sense-data. Spencer considers it one of the merits of evolution that it supplied a means of reconciliation between these opposing views. According to him, what was native to the individual was the residuary deposit of racial experience. Thus evolution reconciled empiricism and transcen-

dentalism. (b) But 'transcendental' meant to Kant constitutive of knowledge—those principles which, though not due to experience, yet made experience itself coherent, above all, the unity of the self. All the content of knowledge came from experience, but the active self made knowledge. Besides, reason had as regulative principles the ideas of the self, the world, and God, and in its practical working reason got into touch with these realities. It was this side of Kant's teaching that issued in transcendentalism, as it came to be understood in English-speaking countries in the first half of the 19th century. Hamilton welcomed the Kantian system chiefly because he found it in harmony with the limits of our knowledge as propounded by himself, but others welcomed it because in their view it taught that man by his reason was more than a mere creature of the senses. Thus Carlyle, in his paper on Novalis,¹ points out that German transcendentalism denies the absolute existence of matter, that it makes space and time forms of the understanding; therefore to God 'Time and Space are not laws of His being but only of ours,' and so He is omnipresent and eternal; and 'the black Spectre, Atheism . . . melts into nothingness.' Again the transcendentalists recognize a higher faculty than understanding, viz. reason. Thus the invisible world is brought near us, and we feel in every thought that in God 'we live, and move, and have our being.' It was in this way that transcendentalism also at first became known in America.²

The transcendental unity of the self which Kant understood of the individual knower, and which by theoretical reason gave him no substantial subject or soul, was raised by Kant's successors in Germany to the level of a universal principle and an active subject, and thus knowledge was made adequate to grasp all reality. Reality now became subject and object, and epistemology became ontology. The transcendent of Kant vanished completely; it became immanent in knowledge. Fichte laid stress on the creative activity of the self in such a way that the object, the world, was called into being by the subject. Schelling, whose views changed considerably from one stage in his history to another, regarded the Absolute as the background of subject and object alike, but itself a *neutrum* of indifference, and he made intellectual intuition the eye by which intelligence grasped this whole. Hegel tried to do equal justice to both subject and object: 'the real is the rational,' and 'the rational is the real,' and Absolute Spirit is the whole, which becomes conscious of itself through a dialectical process. For some time this mode of thinking, through its novelty and obscurity, was unintelligible and obnoxious to English thinkers,³ but, when it did take a hold in Britain, it was with such force that it conquered the philosophical chairs in our universities with few exceptions, and exercised an orthodox tyranny against which it was difficult to contend. To Hamilton,⁴ who viewed with extreme repugnance the philosophy of the Absolute, must be attributed the revival of philosophical speculation in Britain, and his pupils were able to understand the German philosophy which then was an enigma and a puzzle to others who in Britain interested themselves in speculation.

¹ *Miscellaneous Essays* (People's Edition), London, 1872, ii. 183 ff. The essay was originally published in the *Foreign Review* [no. 7] in 1829.

² See J. Veitch, *Memoir of Sir William Hamilton*, Edinburgh, 1869, p. 421 ff.

³ See J. H. Stirling, *The Secret of Hegel*, 2 vols., Edinburgh, 1865, Preface.

⁴ See his 'Philosophy of the Unconditioned' (*Discussions on Philosophy and Literature*, pp. 1 ff., 605) where he ascribes the theory of Schelling and Hegel to Cardinal de Cusa—a sufficient indication of the value he placed on it.

(4) *Modern developments.*—Ferrier's *Institutes of Metaphysic*¹ was perhaps the first systematic exposition of transcendentalism in our tongue, although others had by that time acquainted themselves at first hand with its varied expositions in Germany—some repelled by it (e.g., John Cairns),² others enthusiastic in their advocacy (e.g., Hutchison Stirling, whose *Secret of Hegel* was an elaborate attempt to make Hegel intelligible to English-speaking students). It was, however, through the teaching and writings of Thomas Hill Green (q.v.) that transcendentalism became a philosophical force in Britain. Evolutionism, while it attempted to reconcile the older empiricism and transcendentalism, did so from below, by trying to relate man's knowledge and man's morality with animal life and animal activity in general, but the new transcendentalism, while acknowledging that in one sense man is a part of nature, yet explained knowledge and morality from above. Knowledge, according to this view, is explicable as the reproduction in man of the eternal self-consciousness of God, and morality is the realization of the immanent Eternal. The following passage from William James describes the spread of this movement in Britain:

'For many years adherents of this way of thought have deeply interested the British public by their writings. Almost more important than their writings is the fact that they have occupied philosophical chairs in almost every university in the kingdom. . . . It follows from their position of academic authority, were it from nothing else, that idealism exercises an influence not easily measured upon the youth of the nation—upon those, that is, who from the educational opportunities they enjoy may naturally be expected to become the leaders of the nation's thought and practice. . . . Carlyle introduced it, bringing it as far as Chelsea. Then Jowett and Thomas Hill Green, and William Wallace and Lewis Nettleship, and Arnold Toynbee and David Ritchie—to mention only those teachers whose voices are now silent—guided the waters into those upper reaches known locally as the Isis. John and Edward Caird brought them up to the Clyde, Hutchison Stirling up the Firth of Forth. They have passed up the Mersey and up the Severn and Dee and Don. They pollute the bay of St. Andrews and swell the waters of the Cam and have somehow crept overland into Birmingham. The stream of German idealism has been diffused over the academical world of Great Britain. The disaster is universal.'³

'Transcendentalism' came to be used of this new movement, although the term was not a favourite one with the idealists themselves. It was used by Henry Sidgwick⁴ especially of the teaching of Green; by A. J. Balfour,⁵ who contributes a chapter of criticism, and who even then could say:

'In English-speaking countries it is within the narrow circle of professed philosophers, perhaps the dominant mood of thought; while without that circle it is not so much objected to as totally ignored.'⁶

William James used it of all objective idealists, however these may differ among themselves, while Caldwell uses it of Bosanquet's teaching in his *Gifford Lectures*, which he describes as 'the last striking output of British transcendentalism or absolutism.'⁷

(5) *Neo-Hegelianism and Christianity.*—What gave this philosophy its vogue, to begin with at any rate, in Britain was undoubtedly the fact that to many minds it appeared as a *defensor fidei*. It seemed to supply an answer to materialism and empiricism on the one hand, and a vague scepticism and agnosticism on the other. It could be preached, and was preached often, by men who adopted the familiar phrases of sacrosanct religious thinking which were associated in the public mind with Christian values, and thus it came to be regarded

as a type of Christian philosophy. Hutchison Stirling found in Hegelianism a new version of Calvinism. Green used it to demolish the traditional English sensationalism and hedonism, and amidst the scepticism which prevailed regarding the historical elements of Christianity used it to rear a Christianity of ideas and ideals, from which dualism we are still suffering—witness the controversies concerning the historic Jesus and the eternal Christ. John Caird, afraid of the inroads of Spencerian and Mansellian scepticism and Huxley's agnosticism, found in Hegel's teaching an ark of refuge and a citadel of defence. It was thus a movement of deliverance, of reform, and of religion. Not a few of its most zealous advocates were men destined for theology who found here a more congenial home. But, as time went on and this system began to be developed, the difficulties, tendencies, and obscurities inherent in it, as well as the dangers, revealed themselves. Just as in Germany Hegel's system allied itself at first with orthodox theology and then, in the hands of Strauss and Feuerbach, swung back to practical atheism and materialism, so also in our own country time has made it plain that this system is no guarantee of Christian faith or morals. Green¹ speaks with philosophic sorrow of those who find in poetry and religion the satisfaction for their ideals and aspirations, though they harbour scientific views which contradict these. He is sorry because such people do not proceed to frame or adopt a coherent philosophical system; forgetting that what gave transcendentalism its interest and vitality among the educated was not its speculative scheme—that was always a puzzle more or less—but the idea that this philosophy conserved spiritual values, and that what is fast loosening its hold on this class to-day is the feeling, rightly or wrongly entertained, that these interests are being betrayed or disregarded in the interests of the coherence of the system itself. To begin with, it is widely felt that transcendentalism speaks too confidently of its own power to present a perfectly explicable view of the world—to exhibit all reality in thought categories. Its manner is apt to strike the observer as being haughty and supercilious, and its language would lead one to think that a claim to something like omniscience is arrogated—a claim so contrary to our broken experience as human beings, and so opposed to that humility which serious thinkers have always regarded as the fitting attitude for all searchers of truth.

(6) *Faith and knowledge.*—No one has done more among our professional philosophers to abate this soaring gnosticism than Campbell Fraser, with his insistence on the function of faith as lying at the very basis of knowledge itself, as accompanying and regulating its advance all along its operations. Reality is richer than thought, nor is it possible to factorize reality into thought terms. The limits of human knowledge are obvious even in the most daring schemes of rationalism, and philosophy has again to face the problem of the relation between faith and reason.

Again, it is felt that transcendentalism does not do justice to the reality of the external world. To it the external world is only an object for a subject, and the tendency of all idealistic schemes is to lapse into solipsism. This solipsism may be of the human individual or of the One Supreme Subject, but in essence it is the same. Sidgwick suggested the term 'mentalism'² as 'a more adequate description of this tendency. Whatever term we use, the tendency itself is undeniable, and

the reaction is seen in the movement known as neo-realism,¹ but the tendency is acutely felt by reasonable idealists, as, e.g., by A. S. Pringle-Pattison;² yet one wonders if his own view of creation is not just a residuum of this old leaven of mentalism which he cannot purge out of his system. He has no difficulty in regard to the creation of souls, which, if it means anything, means something new, but he cannot admit the creation of matter. Yet, if God existed in His fullness before any person now living existed—if such an assumption is tolerable—why should creation as applied to matter be considered incredible? It is futile to try to explain matter as thought-elements, either in the mind of man or in the mind of God. When a philosopher arrives at such a view, it is surely the sane course for him to examine his reasoning again.

(7) *The problem of personality.*—The personality of man in this system, as we see from its modern developments, becomes insecure, or, if that danger is avoided, it is at the price of God's personality that man's is safeguarded. Thus there are those who, like Bosanquet, lay stress on the Supreme Personality or Individuality, and tend to make men but aspects of this Being's life. Others lay stress on man and make God the totality of men—a college or community of spirits, eternal *a parte ante* as well as *a parte post*. To conceive of God as a perfect personality, above and apart from men and the world, and yet originating and sustaining both, seems an absurdity to this scheme of thinking.

'History is the biography of the Absolute; science the natural history of the Absolute; philosophy the self-consciousness of the Absolute, recalling and arranging its past being in unconsciousness, and discovering thereby the laws of its own thought.'³

The outcome is seen in a book like Bradley's *Appearance and Reality*, in which the Absolute is everything—God, men, nature, spirits good and evil—and yet somehow it is all that in the bliss of an absolutely consistent whole. Personal idealism, pragmatism, and, above all, theism, will never take such a theory seriously.

5. *The task of philosophy.*—The modern world is alive to the fact that the intellect alone is not man, and that reality is not to be construed solely by its means. Emphasis is now laid on the will and the emotions as well, with the result that the moral life—the sphere of ideals—is given its own place. When this is recognized, then it becomes clear that reality is not a perfection which the mind has to mirror, but an ideal which has to be achieved. Nothing is more deadening and more untrue than to think of reality from man's point of view as a perfect 'is'; for the moral life at any rate reality is in ideals—'the best is yet to be.' Thus only can man's freedom be saved from the cloudland of illusion, and thus only can evil and sin—the root of all our intellectual as well as of all our moral problems—be faced as our moral nature imperatively calls on us to face them. Our duty in regard to these, unless our whole nature be itself a delusion, is not so much to explain them as to abolish them. To tell us that 'this very presence of ill in the temporal order is the condition of the perfection of the eternal order'⁴ is to treat man's moral nature with insincerity. Transcendentalism has no eschatology, because to it the Absolute—i.e. all that is—is already perfect and cannot be more so, and yet a philosophy or a religion without an eschatology offers nothing to man's needs, imposes a veto on man's passion for reformation, and does away with

² The term 'mentalism' or 'immaterialism' is also used by James S. Ferrier.

his felt need of redemption. These are some of the difficulties that most modern thinking men feel in regard to modern transcendentalism, and the recognition of them has led to a very general revolt against it in recent years from within the philosophic world itself. Pragmatism, neo-realism, neo-Kantianism, personal idealism, are but some of the phases of this revolt. It cannot be said that these views, any or all of them, are free from difficulties; and at the present moment it is impossible to say what the future may have in store for philosophy. The best we can wish for it is that it free itself from the tyranny of phrases and become intelligible and interesting; that it may have the humility to attempt to solve real problems that perplex men; that it be freed from its disdain regarding men's abiding convictions; that it abstain from any language which would throw doubt on the great ideals and values of life; and that it realize the necessity of satisfying the heart as well as the head. God, nature, man—these are the realities. Transcendentalism tends to forget the second, and to make the first and third co-equal; pragmatism forgets the first, and naturalism the first and third. The task of philosophy is concerning these three, and transcendentalism is valuable when the claims of naturalism become exorbitant; but it must not, without becoming false, succumb either to humanism on the one hand or to pantheism on the other.

LITERATURE.—The *OED* gives an idea of the variety of meaning attached to the word 'transcendental,' and R. Eisler,

*Wörterbuch der philosoph. Begriffe*³, 3 vols., Berlin, 1910, gives the philosophical usage. For the pre-Kantian logical usage and the mediæval theological usage the Histories of Philosophy and of Theology must be consulted. For New England transcendentalism see art. EMERSON. Joseph Cook, *Transcendentalism*, Boston, U.S.A., 1877, is a vigorous popular criticism of Emersonianism in the interests of orthodoxy. The literature under art. COLERIDGE and CARLYLE is instructive for the early influence of German transcendentalism in a popular form in Britain.

A short account of the history of British transcendentalism, or absolutism, is given by Robert Mackintosh, *Hegel and Hegelianism*, Edinburgh, 1903, chs. vi. and vii. O. Pfeleiderer, *Religionsphilosophie auf geschichtl. Grundlage*, Berlin, 1878, and *Development of Theology*, Eng. tr., London, 1890, gives the history of post-Kantian idealism from a theological point of view. J. H. Stirling, T. H. Green, John Caird, Edward Caird, J. Watson, H. Jones, W. Wallace, J. Royce, J. Macbride Sterrett, G. S. Morris give a version of Hegelian transcendentalism of a religious character. F. H. Bradley, *Appearance and Reality*², London, 1902, is mainly negative. For the revolt against transcendentalism in Germany see H. Vaihinger, *Die Philosophie des Als Ob*, Berlin, 1911. French philosophy since Cousin and Renouvier, down to Bergson, has been more or less generally anti-rationalistic and personalistic. James Seth, *English Philosophers and Schools of Philosophy*, London, 1912, is instructive for English thinking; an older book by D. Masson (quoted above) deals with Mill and Hamilton—the conflict between transcendentalism and intuitionism. The works of A. Campbell Fraser, Henry Sidgwick, and A. J. Balfour lay stress on primitive convictions and are in spirit against Hegelian gnosticism. See the literature under art. NEO-KANTIANISM, REALISM, and PRAGMATISM. William Caldwell, *Pragmatism and Idealism*, London, 1913, gives ample information as to anti-rationalistic literature in Britain, Germany, France, and America.

TRANSMIGRATION (Introductory and Primitive).—Reincarnation is the passage of the soul from one body to another, usually of the same species, among higher races often with ethical implications, the lot of the soul on earth being determined by its behaviour in a former life. Transmigration, metempsychosis, and other terms are often used in an almost identical sense, but also in a vaguer way, implying at times that the soul itself assumes an animal form, sometimes permanently, sometimes only as a prelude to another reincarnation or to final destruction or absorption. Somewhat different is the creed which may be termed 'alternation of existences'; it involves the belief that man is double, a counterpart in another world corresponding to the earthly body or embodied soul in this world and taking the place of the latter when its turn comes to quit this world. Separate existence, reincarnation, annihilation, and transmigration are the possibilities that present themselves to the primitive mind when it inquires into the fate of the soul. We cannot say why one belief rather than another has been adopted in any specific instance; but it is clear that the resemblance of children to parents (or other relatives) has played some part, especially in W. Africa. The complex of beliefs is therefore to some extent a semi-scientific creed, taking the place of a biological account of heredity, and based on reasoning that we can follow. It seems equally certain that the widespread belief in transformation (or change of bodily form) during life must have had its effect on eschatological doctrine; and here the creed goes back to what must be some of the most archaic elements of human speculation. Those two factors are,

however, at times to some extent combined, when a rise or fall in the scale of existence is put down to the merit or demerit of previous births. Both in reincarnation and in transmigration doctrines the life or lives that succeed the human life on earth are sometimes regarded as limited in duration, sometimes as indefinitely prolonged; where some accident interferes with the due course of reincarnation, the lot of the soul may be a kind of third state, neither reincarnation nor annihilation (or absorption), but separate existence (as an evil spirit).

Many widely distributed customs appear to be connected with the belief in reincarnation. Thus, in Africa and America children are buried by the wayside, near the mother, under the eaves, or in other situations that would in the eyes of the natives facilitate reincarnation; in parts of Central Australia and in Africa people are buried in the place of their birth.¹ But it must be recalled that, generally speaking, the common feeling that it is well to be buried with one's own people implies no more than the view that this is necessary to ensure the solidarity of the family in the future life. The custom of killing the first-born² has been explained for some areas by the belief that this child is, in special measure, an embodiment of the father or grandfather; and the abdication of a king, as in Tahiti, in favour of an infant son has been put down to the same cause. The belief in transmigration again in certain areas has led to the sanctity of certain species, and the totemism (*q.v.*) of some regions, such as S. Africa and Oceania, has been referred to this origin.

¹ See art. DRATH AND DISPOSAL OF THE DEAD (Introductory and Primitive), § VII. 3 (c).

² See art. FIRST-BORN (Introductory and Primitive), § 3.

A well-developed scheme of reincarnation or transmigration, if we except the anomalous case of the Central Australian tribes, as to whose real belief there is some doubt, is generally found only among peoples who either have attained a certain stage of culture, as in India, or have almost certainly been in contact with or influenced by a higher culture, as among W. African tribes. The W. African tribes among which a reincarnation creed has been recorded in more or less detail are the Mandingo, Ewe, Edo, and Ibo. The belief is also known among the Yoruba, who lie geographically between the Ewe and the Edo; but details of their ideas on the subject are lacking.

1. West Africa.—(a) *Mandingo*.—As regards the Mandingo, we have only a summarized account of their beliefs,¹ which differs widely from another account from a portion of the area;² a summarized account is always liable to mislead, and, in view of the large divergences recorded in other areas in the transmigration and reincarnation beliefs, it is prudent to await further details from the French territories before classifying the belief as aberrant.

According to Delafosse, every living being and every natural phenomenon depends for its nature on a *niama*, 'dynamic spirit'; the word *niama* is applied to a genius, *niama* to a spirit, which may be that of a genius, a human being, a sacred object, an animal, a rock, etc. The *niama* of a dead man can reside where it likes—in the corpse, in the hut, in a sacred object, or in the body of a living being whose *niama* it absorbs. Certain magicians attribute their powers to the possession of the *niama* of a genius or of a dead man. The *niama* of a man for whom the due rites have not been performed may reincarnate itself in a solitary animal, or in a human being, who goes mad. It is therefore clear that, though the *niama* may be reincarnated, it is by no means invariably the case, and, where reincarnation takes place, it differs in kind from the reincarnation in which the more easterly tribes believe (see below). Side by side with the *niama* we have the *dia*, or breath of life, which passes at death into another being; it is not the object of any cult; it is found only in living beings and passes only into another being of the same species, save on the rare occasions when it animates the body of a totem. This belief is, in form, on all fours with those of other Negro tribes; but it is hardly possible to speak of reincarnation, which implies some degree of identity, some measure of personality.

According to Montell, the Khassonke believe that *dya* is soul, force, or shadow, while *ni* means breath; if this is correct, the meanings are just the reverse of what they are in the foregoing account of Mandingo beliefs, and it seems clear either that we are in the presence of a far-going disintegration of creed or that, as has probably happened farther east, the belief has come from without and has been worked up by each tribe in its own fashion. In any case it seems improper to give a generalized account of the beliefs of a mass of tribes if such varied views have to be regarded as identical.

(b) *Ewe*.—According to the Ewe belief, every man has two souls—a *luwo agbedo*, or life-soul, and a *luwo kuto*, or death-soul; the former is visible when a man casts a short shadow, the latter when he casts a long shadow. The death-soul accompanies a man into the grave and then goes to the land of the dead; the life-soul leaves the body at death and goes sighing mournfully and seeking for a resting-place; each man has also a breath-soul. That the shadow-soul is more than a shadow is clear from the fact that sleep is attributed to the absence of the shadow-soul, waking to its return, and dreams to its activity outside the body.

The land of the dead appears to be the same as Amedzowe, the place of man's origin—a land not on earth, but in heaven, where everything corresponds more or less closely to the things of this life. In Amedzowe are yams, corn, cotton, bush, and all that surrounds a man in this life, not, however, in bodily form, but spiritually, so to speak; and the human inhabitants of Amedzowe live and thrive on these things in their spiritual form. Life in Amedzowe, however, is more than a duplication of this world; for, when a child dies soon after birth, a priest may declare that it was a great king in Amedzowe and has died in order to

return to the scene of its former glories. Conversely, the things of this world may influence the course of events in Amedzowe; if a man remains too long away from the other world, he will fall ill, for the dwellers there prepare to break down his hut; and, to save him, his associates in this world must each bring a blade of grass and lay it on the roof of his house, as a symbol of the re-roofing of his spiritual house. In Amedzowe a man has a spiritual aunt (*tasi*) and other relatives; from her he must obtain permission to leave the world of spirits and come to the world of men.¹ Some of those who come to this world are so dearly loved by their spiritual relatives that they have to give a promise, called *gbetsi*, to return after a short time; these are the children who die young; this promise has been personified and is regarded as in some measure an evil genius, for it incites men who break it to evil deeds and especially to suicide or to acts that will bring about a violent death. Generally speaking, the lot of a man in this life and his abilities are determined by the fate announced to him by his *tasi*; but here, as elsewhere, there is a fundamental contradiction in the creed of the Ewe, for, as will be seen below, the *aklama*, or genius, is also held responsible for a man's lot in this life.

Side by side with this curiously untheological creed we find the belief that Mawu, the supreme god, is a dweller in Amedzowe and is the king who sits in judgment on the departing soul before it takes up its abode in this world. Not only so, but we find also the view that the lot of man, or at least his term of life, is determined, if not by Mawu, at any rate by Mawu's intercession with Death, whom he begs to spare one of his earthly children. If, as appears to be the case, the Ewe beliefs are the result of syncretism, there can be no doubt as to which are the older elements in their creed; for the god of death, Ogiuwu, is found also among the Edo, from whom they were separated by the Yoruba influx, and whose views as to reincarnation at the present day come much closer to those of the Ibo, their neighbours on the east.

There is, however, another side to the Ewe beliefs; this is the *aklama*, *kla*, or, in the language of the neighbouring Twi, *okra*; it is often identified with the *luwo*, but an older and more correct conception seems to be that it is a genius or tutelary spirit. Another authority says that *kra* is the collective name for *numu*, all the spiritual beings that surround a man, whether they be evil or good, human or demonic. Westermann connects the word *aklama* with Efik *akaña*, a promise to return to the other world. If this derivation is correct, the conception of *aklama* as a tutelary spirit has arisen in the same way as that of its counterpart, *gbetsi*, by the personification of a promise, but Efik is a member of a different group of languages and topographically remote; the derivation must therefore be received with caution; it is none the less possible that both words are derived from the same root or form, especially if it should be the case that the reincarnation idea has been introduced from without or fostered in its growth by foreign influence.

Every man has a *kla*, or, perhaps, properly speaking, one or more, for the *aklama* figurines worshipped by a man are often in duplicate, male and female, in any case with only a single arm, as an indication of the identity of *aklama* and human being. Children sometimes carry an *aklama*

¹ It is perhaps not without significance that the *tasi* is the father's sister; for the Ewe are matrilineal, or at most in a transition stage; and we can hardly suppose that the father's sister has normally such influence in the family; the belief in question therefore either must be young or, more probably, has come to them from without.

¹ Delafosse, *Haut-Sénégal-Niger*, iii. 165.

² C. Montell, *Les Khassonké*, p. 142.

figurine on their backs, and, in the case of twins, each carries the figurine of the other; it is not without importance that these twin figurines are found in areas, such as Sierra Leone, where the reincarnation belief is not found, at any rate at the present day. One name for these figurines is *ame we luwo*, 'the soul of a man'—a phrase which makes clear the present deeply-rooted confusion between *luwo* and *aklama*. The *aklama* lives in Mawuwe, probably the same as Amedzowe, till Mawu gives it permission to enter a man, which it does before birth; the child to which it is assigned is known in advance, however; for the priest can interrogate the *aklama* as to the future lot of the unborn child. In some places the *kla* receives offerings annually, probably on the birthday of the child, for the *kla* is named from the day of the birth and is also known as the younger brother of Mawu. The *aklama* seeks only the welfare of his ward, so long as the latter fulfils his obligations; otherwise he may punish him with disease, madness, or other ills, or, more properly, may allow him to fall a victim to them. The obligations just mentioned include abstention from certain foods, generally, or for a period, or on certain days. In some unexplained way the *aklama* is associated with a man by virtue of his being made by Mawu out of certain earth; for, when a thief has a thievish son, it is said that Mawu formed both of the same earth, and hence their *aklama* are alike. A man comes to the world with his character formed once for all, and it seems in reality to be that of his *aklama*; a man's nature (*dogbe*) is said to leave him at death, and, though it is believed to be conditioned by his *aklama*, it seems difficult to distinguish them.

So far as we have gone, there has been some confusion between *aklama*, *dogbe*, and *luwo*; after death this confusion is increased. The images of the *aklama* are broken in pieces or thrown away, for their owner needs them no longer. The *aklama* seems now, like the *luwo*, to be termed *noli* ('ghost' or 'spirit') and is questioned a few days after death to find out who was responsible for his death. The final destination of the *noli* is Tsie or Agume, the place under the earth, the road to which passes through a river; Kutiamé is the ferryman, and his fee is twelve cowries. Another account says that the dead man meets Liagbe at the entrance of a town, and she questions him as to his deeds in this life; she has a great wound, which he must lick; and, though this is a detail on which we have no other information, it seems highly probable that Liagbe should be identified with the spiritual aunt (*tasi*).

Native beliefs are rarely so clear and unambiguous as a written account commonly assumes them to be; but it is impossible to study the foregoing summary without feeling that syncretism must be reckoned with as a possible explanation. A knowledge of the beliefs of the peoples to the east of the Ewe can only strengthen the probability of this explanation; for here too we find diverse ideas combined, and some of them agree so closely with the Ewe creed that any possibility of separate origin must be rejected; at the same time, the general balance of the elements of the creed is so different, and the terminology so different (except where the creeds agree, as noted above), that we can hardly accept the theory of a common origin of the whole complex as the explanation of the points of agreement, which are not relatively numerous.

(c) *Edo*.—The Ewe language is closely akin to the Edo and forms a member of the group of languages named from the best known member, which is spoken in Benin city and the neighbourhood. It is somewhat surprising that as regards

the subject of this article the terminology differs *in toto* from that of the Ewe, as is made clear by the following table:

	Ewe	Edo	Ibo
Genius . . .	<i>aklama, kla</i>	<i>ehi, ekosi, ina</i>	<i>èi, erì</i> ; cf. <i>ikeñga</i> . ¹
Shadow (soul)	<i>luwo</i>	<i>agogo</i>	<i>onyinyo, nàd.</i>
Breath . . .	<i>gbogbo</i>	<i>eti</i>	<i>ndò, ume, uzu.</i>
Spirit . . .		<i>orio (f)</i>	<i>mwo.</i>
Ghost . . .	<i>noli</i>		cf. <i>akalagoli</i> . ²
Ward . . .			<i>(aw)ago.</i>
Other world .	Amedzowe	Elimi	Owanwo, Okwa.
Promise . . .	<i>gbetsi</i>		<i>akana</i> ; cf. <i>ikeñga</i> .

Broadly speaking, *ehi* corresponds to our idea of soul, for the *agogo* is said to disappear on the day that a man's body is put into the grave; in the Kukuruku country there are traces of belief in a breath-soul (*eti*), which does not, however, correspond to the *dya*, for *eti* is said to be the breath of *ehi*, which dies in Elini before it comes to this world. Osa (god) is said to take a man's *eti* to Elini, where it turns into a man with a body (i.e. *ehi*). Two *ehi* are usually distinguished, *ehinehi* (*ehinowa*) and *ehinoha*, sometimes identified with *ekosi*, sometimes with *ehogai*, the *ehi* of a childless person. Some say that *ehinowa* is in Elini, while *ehinoha* is on the back of a man's neck; others say that *ehinoha* is a man's shadow in Elini, or that *ehinowa* is on the top of a man's head; the latter statement was qualified by the addition that there was another *ehi* in Elini. Some say that *ehinowa* comes to earth when a man dies, thus reproducing the idea of alternation already found among the Ewe, others that *ehinoha* lives in Elini and comes to earth as *ehinehi* when a man dies. It is also said that *ehinowa* goes at death to Elini and returns for sacrifices and offerings; in Elini this *ehi* may lay claim to a woman for whom his earthly counterpart paid bride-price without being able to secure her as a wife. Some say that *ehinowa* is sent by Osa to animate a child already conceived, others that it brings a child to a man, others again that it 'does things for a man,' i.e. is his genius. *Ehinoha's* functions are equally a matter of opinion; it is on the back of a man's neck, or is the servant of *ehinowa* and takes sacrifice to him in Elini, or lives in Elini and comes to earth when its ward dies, or is a man's shadow in Elini, where *ehinowa* is also, or corresponds to *ere*—a man's enemies (perhaps, rather, evil spirits), to whom he sacrifices on the road.

We reach a somewhat different cycle of ideas when we find *ehinoha* regarded as a 'bush soul,' injury to which means sickness for the human being. It is also said to be the 'king of the bush' and to be richer than *ehinowa*; when it receives a sacrifice, it is satisfied and turns its back. The prevailing view is undoubtedly that *ehi* brings a child from Elini but is not identical with it; some say that the dead go to Elini and are reborn seven times in the same or another family, alternately as male and female. Though there is some confusion between the *ehi*, they seem to be clearly distinguished from the man himself; they are real geni, but so far bound up with their human counterpart that his health is sometimes regarded as dependent on the state of the bush *ehi*. On the whole, the *ehinoha* is a bad genius that leads a man astray, spoils things, and, so far as the identity of man and *ehi* is accepted, refuses to remain in this world. The word *ehi* is found in Kukuruku in the form *ezi*, with which may be compared the Ibo *eri*,³ *esi*.

(d) *Ibo*.—Among the Ibo, who number several millions, there is much diversity of view; but only a small percentage of the tribes have been adequately investigated; the following summary relates to the Awka and Asaba districts. West of the Niger the belief is that an entity known as *èi*, sometimes identified with *eri*, sends the new human being into the world; the reincarnated person and the reincarnation are known respectively as *ago* and *iwago*. The *èi* is normally a dead person, but in some areas may be the father or mother of the child. East of the Niger the *èi* is in the main, like *ikeñga*, a personal protective deity, with only slight traces of a connexion with the reincarnation belief; there is no explicit statement that the *èi* sends a child into the world. The *ikeñga* may perhaps be equated with the Ewe *gbetsi*, especially if, as seems probable, it is etymologically connected with Efik *akana*, the promise to return to the other world. The Ibo are quite clear in their belief that a person is reincarnated, normally in his (or her) own family, at any rate if he has been buried with his fathers; children of tender years will assure the inquirer with the utmost solemnity

¹ A personal protective spirit.

² Evil spirit.

³ r represents a breathed r.

that they are their deceased grandfathers or grandmothers; and the identity of the ancestor is determined by divination. A child that speaks before it opens its eyes is said to be relating what it saw in Owamwo and is at once exposed in the *ajoifa*; it is also asserted that a man who has been unlucky in one existence may decide, on opening his eyes for the first time in a new life, that it is the same world in which he was unhappy before, and resolve to give up the struggle, whereupon the new-born child dies on the spot.

The relation between *či* and *ago*, west of the Niger, may be compared with that of godchild and godparent; the relation sets up a bar to marriage, and a man may not even marry into the *umunna* (sept) of his *či*; two people who have the same *či* may not marry, nor yet may their children, though apparently a man may marry the fellow *iwago* of his sister. There is a saying that the child who is one's *ago* (*iwago*) should have been the child of a man's own loins; both must be of the same quarter; if the *či* has no heir of his own, the *ago* inherits the property. Curiously enough, the *onye bi owe*, the reincarnated person, who is sent into the world by the (living) *či*, and who ought by analogy to stand to the child in a closer relation than the *či*, is in point of fact regarded as a comparative stranger; he may come from another *ebo* (quarter) or from a different tribe altogether, and his ritual prohibitions do not concern the child, who has to observe those of his *či*.

There are traces of the view that *či* and *iwago* form two links in a continuous chain, at any rate where the *či* is not a living person, the *iwago* of one generation being the *či* of the next; and this affords a satisfactory explanation of the views as to prohibitions. At the same time, it must be remembered that the *či* is properly a personal protective deity, in fact a personal *alose*, and that the facts are, in other directions, best accounted for on this hypothesis; it must not, however, be forgotten that east of the Niger an *alose* may be the *či*, or, according to another account, may itself be reincarnated. East of the Niger also we sometimes find the view that the *ago* goes to the next world with a dead man, while the *oglisi* pegs that represent it are thrown away; so that here the *ago* is regarded as the *či*; it is, at any rate for a time, to some extent represented by the *ndiñie*, or ancestral figurines. Curiously enough, the *umunna* (sept) claims to have a collective *ago*, just as it has a collective *ndiñie*, though in the nature of things an *ago* which sends to this world a corporation, not individual human beings, is unthinkable.

West of the Niger there is a good deal of confusion between *či* and *eri*, which is properly a genius, and may perhaps originally have been a breath-soul (cf. Kukuru *eti*, 'breath').¹ If this is the case, *eri* is now none the less distinct from the man, for ceremonies are performed to bring it to the house, and in many cases it is identified with *či*. Perhaps two streams of belief flowing together, one placing *či* in Owamwo, the other locating *eri* in this world, have coalesced, so that ideas associated with *či* came to be attached to *eri*, and *vice versa*.

¹ The following forms may be compared :

Edo	Sobo	Kukuru	Ibo
<i>ehi, eti</i>	<i>eri</i>	<i>ezi</i>	<i>eri.</i>

Cf. also the undoubtedly related words for 'ear':

<i>ebo</i>	<i>ero</i>	<i>ezo</i>	<i>nti (=eti).</i>
------------	------------	------------	--------------------

It has been pointed out that the words *akana* and *ikenga* are in all probability connected etymologically; it is by no means unlikely that *kla* and *aklama* are from the same root; for *la* and *na* may well be alternative forms of a suffix, and the transition from *kala* to *kla* is a well-established phonetic change in W. Africa. There is some reason for supposing that the original idea is that of a promise, though in Ewe the term *gbetsi* is now used in that sense, while *aklama* has become a genius; but further research is needed in other areas before any definite pronouncement can be made. It is tempting to connect the root *ka* with the Egyptian *ka*, which was a double of the man and believed to be after death, with the mummy, a denizen of the tomb;¹ but, though there are clear traces of mummification in W. Africa, probably due to Egyptian influence, and though nothing is more probable than that Egyptian ideas in traversing the continent would have undergone fundamental changes, there is no positive evidence to connect any of the beliefs mentioned above with any article of the Egyptian creed.² The possibility of Egyptian influence must, however, be kept in mind, for Egyptologists appear to accept the evidence produced by L. Frobenius³ as to Egyptian influence in the present Yoruba area in the 6th cent. B.C. That the terms of the Yoruba language show no connexion with those cited above is of no importance, for there can be little doubt that the Yoruba tribe has come down from the north and may not have been in occupation of the area in question, if indeed it existed, at the period in question.

2. South Africa.—In many parts of S. Africa, and sporadically in other parts of Africa, there is a belief that the dead are transformed into certain species of animals, or at any rate that they assume this form to appear to the survivors; it has been maintained, not quite convincingly, that some Bantu tribes⁴ suppose themselves to be transformed at death into their totems. This belief is, however, definitely reported from the west coast, among the Siena and the Twi, as well as in the north-east of the Congo Free State. Among the Zulu the transformation is supposed to be into a species of serpent.

3. Madagascar.—In Madagascar the belief in transformation is also found, though here doubtless of Indonesian origin; and we see a different lot in the future state assigned to various social grades; this is of course a common feature of eschatological doctrine not connected with the theory of moral retribution.

4. Central Australia.—According to Spencer and Gillen, the tribes of Central Australia believe that children are reincarnations of their ancestors (totem) and are continually reborn;⁵ but the testimony of Strehlow, a witness well acquainted with the language of the Arunta tribe, directly contradicts this;⁶ for he maintains that the native belief is that the soul of every man goes at death to the Isle of the Dead, there to be annihilated by a flash of lightning; in certain cases it is believed that a totem-ancestor is himself reborn, but after this reincarnation he does not return.

¹ See art. DEATH AND DISPOSAL OF THE DEAD (Egyptian).

² In modern Egyptian folklore the *quarina*, equated by Seligman with the *ka*, is held to be the spiritual counterpart of a man, which has nothing to do with his immortal soul; it plays the part of a good or bad angel. It is of course possible that this resemblance to present-day W. African beliefs is due to convergence; we can hardly assume that both are simple replicas of ancient Egyptian beliefs, nor yet that the course of development has been identical; but there is at least a *prima facie* case for inquiry.

⁶ *Globus*, xci. [1907] 285, xcii. [1907] 123; see also literature below.

Strehlow's account of Aranda (Arunta) belief is as follows:

The totem-ancestors dropped some of their *churinga*, which were transformed into trees, rocks, etc., from which proceed *ratapa*; these are completely formed boys and girls of reddish colour and have both body and soul; they are invisible to ordinary mortals. When a woman passes a spot (*kuanakala*) where the transformed body of an ancestor is, and where consequently the *ratapa* associated with that ancestor dwell, one of the latter, when it recognizes a suitable (*i.e.* of the correct clan) woman, enters her body and causes various symptoms. The child belongs to the totem of the ancestor associated with the spot.

There is a second method by which an ancestor impregnates a woman, but this does not seem to imply any kind of reincarnation, though the ancestor is called in both cases the *iningukua* of the child. The ancestor is said to come out of the earth and throw a small bull-roarer (*namatuna*) at a suitable woman, in whose body it takes human form.

Both kinds of impregnation are said to be equally frequent, and the difference is recognized in the face of the child, which is narrow in the first, broad in the second kind.

An *iningukua* can also, very rarely, enter a woman's body in person; and a child thus originated has light hair; in such a case the soul goes at death like other souls to the Isle of the Dead, and is annihilated by a flash of lightning. There is therefore no question of repeated reincarnations, and only in the third case can we really speak of an Aranda belief in the doctrine, so far as can be seen from Strehlow's narrative.

This account agrees with much of what is reported by Spencer and Gillen;¹ though these authors speak of reincarnation of ancestors, they really mean an incarnation of spirit-children left behind by the totem-ancestors. And even among the Aranda we hear of the totem-ancestors² living in water-holes.

Perhaps it is most probable that large local variations of belief account best for the differences between Strehlow and the English authors. In this connexion the account of R. H. Mathews³ is of interest, though it must be remembered that he is probably relying on information derived from others. Some of the Chingali believe in repeated reincarnations of ancestors, and a change of sex occurs each time;⁴ others say that women are not reincarnated and consequently deny at any rate the change of sex; the northern Chingali deny the reincarnation creed altogether and come very near the doctrine set forth by Strehlow for the Aranda.

5. Other areas.—The totemism of Indonesia⁵ and Oceania⁶ has been traced both by Wilken and by Rivers to the belief that the sacrosanct animal species is the residence of ancestral souls. Transmigration theories are also found sporadically in New Guinea (*q.v.*) and N. and S. America. The Bororo Indians of Brazil believe that they become *arara* birds after death and in dreams; other tribes say they pass into other birds. The *arara* is kept as a pet and mourned at death, though the wild bird may be killed for its feathers; yet the Bororo say, 'We are *arara*.' According to von den Steinen, the earliest form of the belief was that the native said, 'I have a bird,' not 'I am a bird,' which flies at night and which remains as the natural form of the person when a magician or other evil-disposed being hinders his return to human form (*i.e.* causes his death). But it is only in parts of Australia and W. Africa that these forms of eschatological creed are an element of real importance.

TRANSMIGRATION (Buddhist).—Theoretically Buddhism teaches neither the existence of the soul nor its transmigration, but insists on the revolution, or 'stream' (*samsāra*), of existences. In its practical influence on the popular mind, however, this doctrine amounted to much the same as any other doctrine of transmigration. It amalgamated everywhere with the animistic conception of the soul, whether human or other; it inspired the people with the feeling of a certain continuity of life-relationships through various existences; it impressed the popular mind with a degree of fatalism—the belief that every event in one's life was the result of past deeds. The doctrine, when formulated, contained more or less sensuous descriptions of the better lives in the heavens, besides horrifying details of purgatorial existences; and these aspects of the teaching resulted in the growth of a respectable volume of visionary literature during the course of the history of the religion in various countries.¹ Thus, in spite of the higher doctrine of the ideal Buddhist perfection in *nirvāna*, and in spite of the psychological and metaphysical formulations of the teaching of *karma* and *chitta*, the Buddhist conception of transmigration may be treated in the same category as other doctrines of the same kind.

According to the regular teaching, the *samsāra* consists in an indefinite revolution of renewed existences produced and prolonged according to the qualities of the *karma* (*q.v.*), which is the matrix as well as the *vis a tergo* of the enduring existences. It is said repeatedly:

'No beginning is known of the eternal revolution (*samsāra*) of the beings, streaming and flowing to and fro [in the ocean of births and deaths], being covered by ignorance (*avijjā*) and fettered in thirst (*taṇhā*).'²

In this vast ocean of renewed births there are innumerable streams of existences, conditioned by their respective deeds and retributions, flowing uninterruptedly not only in the continuity of the individual being but also in the solidarity of a group of existences. Now the groups of existences are classified into five *gatis* ('courses,' 'modes of life')—the heavenly life, the human life, the animal life, the ghostly life, and the purgatorial (or hellish) life; or into six, by adding the *asura* (or furious spirits).³ Another classification is that of the *bhava* ('being') or *loka* ('realm,' the cosmic installation of beings) into three—the formless heavens, the heavens with forms, and the material worlds with desires and greed.⁴ In this connexion it is to be noted that the Buddhist doctrine of transmigration emphasized the affinity and solidarity of the *karma* and all its consequences within a group of existences, whether a specific world in the cosmic system, the local division of the abode, or the class division in social life; in short, any and every link, material, physical, moral, emotional, intellectual, or social, is the cause and a manifestation of the solidarity of existence due to the common *karma*. The principle of the solid-

¹ In *Sahyutta-nikāya*, ii. 254-262, Mahā-Moggallāna, the great disciple of Buddha, well versed in supernatural attainments, narrates to his fellow-monk Lakkhana his visions of beings tortured and purified in the purgatories and the causes of their sufferings. Thence we have a long series of similar narratives, for which see, e.g., the opening of the *Mahāvastu* (ed. E. Sénart, Paris, 1882-97, i.), or B. Nanjio, *A Catalogue of the Chinese Translation of the Buddhist Tripitaka*, Oxford, 1883, nos. 561, 677, 679, 706, etc.

arity is the *karma*, and its manifestation is the *bhava* or *dhātu*, the latter of which means the characteristics (common to the beings within a group), the specific circle of existence, community, common destiny.

How the different *dhātus* are produced; what are the reciprocal actions and reactions of the psychical factors and environmental factors in the process of the development of *karma*; what are the conditions of the individual *karma* being attracted to and incorporated into the common *dhātu*—these and associated questions gave rise to varied speculations in the Buddhist schools, the whole forming a web of subtle argument and grotesque fancy, in which are mingled Buddhist cosmology, psychology, ethics, and sociology. This is a subject which awaits further investigation.¹

The practical effects of the Buddhist doctrine of *samsāra* were a deepening and broadening of the feeling of the continuity of life. Though often vulgarized through its amalgamation with animistic beliefs, the effect of the doctrine was to extend affection and attachment in human relationships to the former and coming lives, even to animal and plant life, which was held to be continuous and closely associated with human life, and to elaborate those sentiments through the belief in deeper causes, remoter connexions, and wider aspects of being than those of the present life.

This point can be illustrated from the folk-lore and literature of every Buddhist people, and one of the flowers of romantic literature—the Japanese literature of the 11th cent.—is dominated by this sentiment of continuity. There the delicate yet strong tie of human affection was associated with the idea of its continuity through lives beyond death, as well as with the idea of nature as inspired by physical surroundings and their changes. Unfortunately both W. G. Aston and Karl Florenz, in their histories of Japanese literature, hardly touch this point.

Another point in the effect of the teaching of *samsāra* is the belief in the occasional appearance of persons who can remember their former lives. In fact, it seems that Buddha himself regarded this faculty as one of his supernormal attainments (*iddhi*) and one of the criteria of saintliness. Everywhere in Buddhist literature we find mention of the three special faculties (*tevijjā*)—the divine vision, the divine hearing, and the clear recalling of one's former lives (*pubbenivāsa*). This belief gave rise to a rich literature of *Jātaka* (*q.v.*) and the allied literature of *Nidāna* and *Avadāna*, which aimed at supplying that belief with concrete illustrations and impressing believers with the close association of the lives of Buddha and Buddhist saints with those of all other beings, besides inculcating morals by the stories. Thus it was no wonder that some persons claimed to have the same faculty, whether by chance or as a result of training. The folk-lore and legends of Buddhist countries are full of instances, and a noteworthy point in them is that many of those endowed persons are children, whose remembrance of their own former lives is mostly said to lose its vividness as they grow older.²

M. ANESAKI.

TRANSMIGRATION (Celtic).—1. There are two passages which clearly assert the belief in metempsychosis among the ancient Celts. Cæsar (*de Bell. Gall.* vi. 14) tells us that the principal point in the teaching of the druids is that the soul does not perish, but, after death, passes from one body into another. Diodorus completes the evidence of Cæsar and states it precisely:

'Among the Galatæ [Gauls or Germans] the doctrine of Pythagoras prevails, namely, that the souls of men are immortal and after a fixed number of years begin to live again, the soul entering into a second body' (v. 28).

But is Diodorus giving the teaching of Pythagoras or that of the Celts? If the former, it would be wise to attach only a relative importance to the

¹ Cf. *Sahyutta-nikāya*, ii. 140-177, and artt. ABHIDHARMA KOŚA VYĀKHYĀ, COSMOGONY AND COSMOLOGY (Buddhist).

² See Lafcadio Hearn, *Gleanings in Buddha-Fields*, Boston and New York, 1897, ch. x.; H. Fielding, *The Soul of a People*, London, 1898, pp. 324-343.

precision of his words; if the latter, it must be admitted that, according to the belief of the Celts, the passage of the soul into another body does not follow immediately upon death, and that, while the soul awaits its reincarnation, it continues to live, though under conditions which are not those of the life on earth. This interpretation would make it possible to reconcile the passages in Cæsar and Diodorus with the evidence of ancient writers who have transmitted Celtic conceptions regarding the future life in which the idea of metempsychosis does not occur.

Diodorus goes on to say:

'Therefore, during the funerals of the dead, they throw into the funeral pyre letters written to the dead relatives in the expectation that the dead will read them.'

It seems, therefore, that the man whose body was burned acted as a messenger between the living and the ancestors whom he was about to meet again in the other world. It is the idea of the immortality of the soul and of another world that is emphasized by the Latin writers.

Valerius Maximus (II. vi. 10) tells that there was an ancient custom among the Gauls of lending each other sums which were repayable in the lower world, so firmly were they persuaded of the immortality of the soul. Pomponius Mela (iii. 2), after stating that, according to the druids, the soul is eternal and that there is a second life among the *manes*, adds that they burn and bury along with the dead things which are useful to the living, and that, formerly, they postponed the settlement of business affairs and debts until the time when debtors and creditors would meet in the lower world; there were even people who voluntarily cast themselves into the funeral pyre of their kindred in the expectation that they would rejoin them in the new life. The idea of a new life after death and before reincarnation was thus one of the most cherished and deep-seated beliefs of the ancient Celts. As to where that new life was spent, Valerius Maximus and Pomponius Mela employ the ordinary terms of Roman mythology for the other world (*inferos*, *manes*); but Lucan is not content with that superficial assimilation:

'You assure us, Druids, that it is not the silent dwellings of Erebus nor the pale kingdoms of Dis who inhabits the depths, at which the souls arrive; the same breath directs their members in another world ['orbe alio'], and, if your songs declare what can be known, death is in the heart of a long life' (*Pharsalia*, i. 440-456).

There has been an endeavour to fix the meaning of 'orbe alio.' In the Latin of the time of Lucan it can mean only 'another region of the earth' and not 'another celestial globe' (see S. Reinach, *RCel* xxii. [1901] 454).

The commentaries on the few and vague Greek and Latin texts which bear upon the ancient Celtic belief in metempsychosis do not lead to any further precision. In particular, we cannot determine whether the teaching of the Celts was borrowed from the Pythagorean school. Such was, however, a tradition of antiquity. The passage from Diodorus quoted above lacks clearness, but as early as the beginning of the 1st cent. B.C. Alexander Polyhistor (frag. 138 [*PHG* iii. 239]) wrote that Pythagoras had the Gauls (*Γαλάτας*) as disciples. Timagenes (*ap. Ammianus Marcellinus*, xv. 9) seems to connect the organization of the druidic corporations with Pythagoras with regard to the doctrine of the immortality of the soul. Valerius Maximus (II. vi.) declares that he would consider the belief in the immortality of the soul a foolish thing if it were not for the fact that the belief of the Gauls on that matter agreed with that of Pythagoras. But the Celtic doctrine, though showing analogies with the Pythagorean doctrine, was not identical with it; it did not distinguish between the fate of the wicked and

that of the just; the other life is neither a punishment nor a recompense, and, in fact, the idea of justice is entirely absent from the Celtic conception.

2. We have another source of information in the legends preserved by Irish epics, which tell of historical personages and seem for the most part to be anterior to Christianity.

In the middle of the 6th cent. of our era St. Finnen met at Mag Bile (Moville, Co. Down) a warrior named Túan Mac Cairill, who lived all alone in his den; at first he would not allow the saint and his disciples to enter his dwelling, but he ended by making them welcome and showing them hospitality. They refused to accept anything from him, however, until he had told them of his adventures, which were by no means ordinary. Túan Mac Cairill had come from Spain to Ireland 312 years after the Flood along with the first inhabitants, Partholon, the son of Sera, and 24 couples. When the number of immigrants had increased to 5000, an epidemic destroyed them one after another, until only one survived to tell the tale, that one being Túan Mac Cairill. For 22 years he was the only inhabitant in Ireland; then Nemed, son of Agnomán, who also came from Spain, landed on the island, after a storm, with four men and four women. On his arrival Túan went into hiding; he fasted for three days, and, having lain down to sleep one night, he awoke in the morning in the form of a stag. He led the herds of deer in Ireland until the extinction of the race of Nemed. Then he became a boar, and remained in that shape as long as the men of Semion, son of Stariat, from whom the Firbolg are descended, were in possession of Ireland. He next became a vulture during the reign of Beothach, son of Iarbone, an ancestor of the Tuatha Dé Danann; and, once more, a fish, when the sons of Milé conquered Ireland. One day he was caught by a fisherman, brought to the wife of king Cairill, cooked, and eaten by her. At the end of the usual period he was born again as an infant and was called Mac Cairill, i.e. son of Cairill. Up to his second birth as a man Túan had lived 320 years: 100 as a man, 80 as a stag, 20 as a boar, 100 as a vulture, and 20 as a fish.

Certain details of this metempsychosis should be noticed: in all his successive shapes Túan preserved the consciousness and recollection of his previous existences, and his human intelligence persisted during his lives in the bodies of animals; his metamorphosis took place only when he had reached the extreme limits of old age and decrepitude; it occurred only in the neighbourhood of the house in which he lived during his first life as a man; and, finally, his change of body took place only after a fast of three days.

There is another Irish legend dealing with metempsychosis, though in a less varied and definite manner than that of Túan—the history of Mongán, son of Fiachna.

One day Mongán had a discussion with his *fiú*, Forgoll, as to where king Fothad Airgdech, who was slain by the Fian Caoilte, had fallen. It was agreed that if, in the space of three days, Mongán failed to prove that Fothad had fallen at the river Larne in Ulster, and not at Duffry in Leinster, as Forgoll maintained, his goods and his person should become the property of the *fiú*. Mongán's wife broke into lamentations which increased as the time went on, but Mongán waited calmly in the firm belief that a witness would come from a distant country to attest the truth of his statement; for Mongán heard the steps of the mysterious traveller from afar. On the third day, at nightfall, a warrior appeared, who, when brought into the presence of Forgoll, pointed out the exact spot where Fothad had been buried, and even gave the inscription on his tomb. While narrating the death of Fothad, the warrior called Mongán as witness to the truth of his story, and named him by the name of Fionn. The warrior was Caoilte, and Mongán was thus a reincarnation of Fionn, living about three centuries after him. The legend gives us no information about the incarnations of Fionn between the end of his first life and his reincarnation in Mongán, but probably they were similar to those of Túan Mac Cairill.

Other Irish legends allude to cases of metamorphosis, but they do not seem to take place at the end of a life. There are also epic stories presenting beings which have had a second birth, but those beings belong to the world of fairies and have no bearing upon the study of human metempsychosis.

3. The Welsh romances also contain numerous examples of metamorphosis. Perhaps there are traces of metempsychosis in the romance of Taliesin, in which he tells in verse of all the places where he has been since the beginning of the world, and in the poem entitled *Kat Godderu* ('Battle of Goddeu'), in which the poet enumer-

ates all the shapes which he has taken: sword, star, book, eagle, ship, serpent, etc. But the story of Taliesin is preserved only in MSS of the 17th cent., and the ancient poems attributed to the celebrated bard of the 6th cent. cannot be earlier than the 12th. It is difficult to disentangle the real archaic elements contained in them.

To sum up: it is practically only in the texts of the writers of antiquity that definite evidence is found of a Celtic belief in metempsychosis: among the Irish, metempsychosis is an exceptional phenomenon, a kind of privilege enjoyed by heroes; what we find among the Welsh is a literary tradition rather than the traces of an ancient belief. Whatever may be the ingenuity of modern scholars, it cannot on this subject make up for the lack of documentary evidence.

LITERATURE.—H. d'Arbois de Jubainville, *Le Cycle mythologique irlandais et la mythologie celtique* (Cours de littérature celtique, ii.), Paris, 1884; *The Voyage of Bran, son of Febal*, ed. K. Meyer, 'With an Essay upon the Irish Vision of the happy Otherworld and the Celtic Doctrine of Rebirth,' by A. Nutt, London, 1895-97. G. DOTTIN.

TRANSMIGRATION (Egyptian).—There are three different ideas which refer to changes of personality: (1) the union with a god, (2) the transmigration of the soul into an animal for a life-time, (3) the voluntary metamorphosis of the person temporarily into another form for his own benefit.

(1) The *divine union* is often stated in the *Book of the Dead*, as 'I am Ra' or 'I am Thoth'; this was the person entering into such union with the god that he had all the compelling power and safety of the god. Even in the earliest inscriptions, on the cylinders before the 1st dynasty, the dead is *sen*, or brother, to a god; or *sensen*, allied, associated, in touch, or united, with a god.

(2) The question of *transmigration* has been disputed. The Greek authors refer to it as an undoubted belief; but there seems to be no Egyptian text which refers to the idea. Two scenes have been supposed to indicate it; these are judgment scenes (Seti I. sarcophagus and tomb of Rameses III.)¹ showing a pig being driven from the judgment. Yet, as referring to justified men, it cannot be the soul driven away as a pig. In most judgment scenes there is present the devouring monster, a blend of hippopotamus and crocodile, waiting to devour the guilty; but no such monster appears where the pig is, and so it seems likely that the pig is the flesh-eating animal, driven away so as to be quite apart from the justified king. The Greek testimony is so strong that it seems unlikely to have all been derived from the metamorphoses. As all the authors are post-Persian, it is possible that the idea really did blend with Egyptian belief during the Persian occupation, when other Indian ideas came into Egypt, such as asceticism. Transmigration is plainly stated in the *Koré Kosmou*, of the Persian period, probably about 500 B.C.² After this it is natural that the Greek writers, Herodotus, Plato, Theophrastus, Plutarch, and others, should ascribe the belief to the Egyptians of their times, unconscious that it was a new importation.³

(3) The belief in *metamorphosis* (*q.v.*) was general, as a magic process. The earliest Egyptian tale turns on a wax model being transformed into a living crocodile. The *Book of the Dead* has a series of magic chapters (76-89) to give power to the dead person to be transformed into 'whatever form he pleases,' into a golden hawk, a divine hawk, a god, a lily, the god Ptah, a phoenix, a heron, a swallow,

³ See passages quoted in Wilkinson, iii. 462-464.

an earth-worm, or a crocodile; and lastly the power of being united to its own body. The following examples are parts of chs. 86, 89, and all of 88:

'I am the Swallow; I am the Swallow. I am the Scorpion-bird (or white bird), the daughter of Ra. . . . And that which I went in order to ascertain, I am come to tell. Come, let me enter and report my mission. And I, entering, and ascertaining who cometh forth through that gate of the Inviolable one, I purify myself at that great stream, where my ills are made to cease, and that which is wrong in me is pardoned, and the spots which were on my body upon earth are effaced. . . . Here am I, and I come that I may overthrow mine adversaries upon earth, though my dead body be buried' (86). 'For I am the Crocodile god in all his terrors. I am the Crocodile god in the form of man. I am he who carrieth off with violence. I am the almighty Fish in Kamurit. I am the Lord to whom one bendeth down in Sechem' (88). 'Oh, thou who bringest; oh, thou runner who dwellest in thy Keep, thou great god; grant that my soul may come to me from whatsoever place wherein it abideth. . . . Let my soul (*ba*) be caught and the spirit (*khu*) which is with it, wheresoever it abideth. Track out among the things in heaven and upon earth that soul of mine, wherever it abideth. . . .' (89).

TRANSMIGRATION (Greek and Roman).—**I. GREEK.**—The notion of transmigration (*παλιγγενεσία*),¹ i.e. the passage after death of the human or animal soul from the mortal body to a new incarnation in another body of the same or another species, necessarily rests upon a belief that the soul itself is immortal, or at any rate more lasting than the body. Pherecydes,² who was born about 600 B.C. and is reputed to have been the teacher of Pythagoras³—which does not necessarily mean more than that he was earlier in time—is said to have been the first to introduce the doctrine. On the other hand, Herodotus⁴ declared that it was the invention of the Egyptians and was derived from them by those Greeks who adopted it, and whose names, though he knew them, he declined to mention. It has been recognized that this is an allusion, at least in part, to Empedocles; for Herodotus would have had no scruple in giving the names of Pherecydes and Pythagoras, who were already dead. It is, however, impossible to accept Herodotus' account, because (1) the best authorities are inclined to doubt whether the Egyptians ever held the doctrine in question,⁵ and (2) the Greek evidence indicates that the belief, if not indigenous, goes back to a remote past. Moreover, the notion that Pythagoras was influenced by Indian modes of thought with which he became acquainted in Ionia or elsewhere⁶ is altogether unconvincing. The truth seems to be that a belief in the transmigration of human souls into other bodies after death was a relic inherited from the primitive or savage ancestors of the European peoples. It is expressly attributed to the Gauls,⁷ and less explicitly to the Thracians and Scythians.⁸ In fact it must have developed independently in many parts of the world,⁹ without direct transmission from place to place, especially in connexion with the idea that the limited supply of souls necessitates the reappearance of the same soul in various earthly bodies. Thus in popular tales the change of a man into a beast involves the assumption that, though the body is different, the soul remains the same; e.g., in the metamorphosis of Odysseus' companions into swine their intelligence remained unaffected.¹⁰ Not that this popular tradition ever became widely effective: except for

one not very clear example,¹ stone inscriptions show no trace of a belief in transmigration, while Euripides refers to a second incarnation as an actual impossibility, whose realization might have been welcome as a divine instrument of discrimination between the good and the bad.² But, although there is nothing to show that the belief struck deep, or was cherished outside certain particular circles, it was brought into prominence by the religious upheaval which undoubtedly took place in the 6th cent. and became associated with the worship of Dionysus and the Orphic cults. Thus the notion that the soul is imprisoned in the body as in a dungeon is attributed by Plato and his commentators to the Orphic mystics.³ Two famous passages in Pindar presuppose the doctrine of transmigration. In one of these Persephone sends the souls back to earth in the ninth year when they have been purified from their ancient sorrow;⁴ and in the other those who have thrice made their abode on either side of death are destined at last to reach the islands of the blest.⁵ It seems more likely that Pindar derived this doctrine from the Orphic mysteries than indirectly through the Pythagoreans.⁶ The prevalence of this mystical belief and its religious potency are illustrated with remarkable clearness in certain inscriptions on golden tablets found in S. Italy, near Rome, and in Crete, which are chiefly attributed to the 4th or 5th centuries B.C. and published as an Appendix to J. E. Harrison's *Prolegomena to the Study of Greek Religion*, Cambridge, 1903, p. 660 ff. One of these contains some words which form part of the appeal of the purified soul: 'I have flown out of the sorrowful weary Wheel; I have passed with eager feet to the Circle desired.'⁷ This refers to the mystical Wheel of Fortune which in its revolutions symbolizes the cycle of successive lives necessary to be traversed by the harassed soul before its final release. This specific cycle of progress, as well as the more general conception of a *kóκλος* in human affairs, is traditionally attributed to the Orphic-Pythagorean sphere of thought.⁸ In the Orphic hymns⁹ this has so far developed as to include a statement that an exact reproduction of the movements characteristic of the present world-era may be expected when the revolving wheel comes round to the same point again; but it is not easy to reconcile this with the opportunity which, as we have seen, is given to particular souls to obtain their release.⁹ Aristotle's reference to the Orphic poems as an authority for the opinion that the soul enters the body from outside in the process of respiration accords well enough with the doctrine now under discussion.¹⁰ Further, the Orphic prohibition of a diet of animal flesh, evidenced by Euripides and Aristophanes,¹¹ points in the same direction.

In popular estimation¹² transmigration is particularly associated with the name of Pythagoras. Much of what has been established as belonging to the Orphics, the imprisonment of the soul in the body as a retribution for past ill-deeds, the undeviating recurrence of the cycle of existence,¹³ the prospect offered of ultimate escape after purification,¹⁴ and the abstinence from a flesh diet—limited, however, by the reservation that it did not apply to the flesh of such animals as are

offered in sacrifice to the Olympian gods¹—is established for the Pythagoreans by not less convincing testimony. It would seem, therefore, that, when founding his brotherhood, Pythagoras appropriated much that was characteristic of contemporary religious asceticism. Nevertheless the reincarnation of souls in various bodily shapes is so closely associated with the person of Pythagoras that he must be held to have inculcated it with peculiar vigour. There is a good deal of legendary matter relating to him, most of which can be traced to the authority of Heraclides Ponticus.²

To this source we owe the famous story that it was permitted to Pythagoras to retain the memory of his previous incarnations, and that he established his credibility on the occasion of a visit to the Heraeum at Argos by identifying as his own, before seeing the inscription, the shield of Euphorbus, son of Panthus, which he was bearing when slain by Menelaus before the walls of Troy.³ Heraclides was also responsible for the statement that Pythagoras claimed to have lived as Æthalides, the son of Hermes and herald of the Argonauts, before he became Euphorbus, that as Æthalides he obtained from his father Hermes the offer of any gift he might choose save immortality, and that thus he received the privilege of remembering his previous fortune while on the earth and in Hades. After Euphorbus died, he became Hermotimus and subsequently Pyrrhus, the Delian fisherman, before his final re-birth as Pythagoras.⁴ Further, Pythagoras declared that after the lapse of every 207 years his soul returned to the light of the sun.⁵ Accordingly, if the birth of Pythagoras is placed in 572, the date of Euphorbus will be 1193 and of Æthalides 1400.

There is, however, much better evidence than these fables that Pythagoras seriously taught the doctrine in the almost contemporary verses of Xenophanes:⁶ they say that once, as he was passing by, he pitied a dog that was being beaten and exclaimed: 'Beat him no more; for his soul is my friend's, as I recognized when I heard his voice.' It was therefore his belief that the same soul could dwell in a beast as in a man, and that there is a universal kinship between all living things.⁷ He did not hesitate to ascribe reasonable souls to animals, holding that the activity of their reason was impeded by the unsuitability for its exercise of their physical organs.⁸ Aristotle describes the possibility of any soul taken at random passing into any body as a Pythagorean fable.⁹ The punishment of souls for their misdeeds by successive incarnations in corporeal dungeons was a theme developed by the Pythagoreans in a manner hardly to be separated from the Orphic,¹⁰ and the results of their joint influence are to be found in the Platonic myths.

Empedocles in his poem entitled 'Purifications' (*καθαρμοί*) took over the doctrine of transmigration from the Orphic-Pythagorean school without making any attempt to combine it with his philosophical system. Indeed it is difficult to see how it was possible for him to advocate the immortality of the soul consistently with his doctrine that the vitality of the soul is the result of an aggregation of corporeal substances. Thought and consciousness are concentrated in the blood which envelops the heart.¹¹ Aristotle's assertion that, according to Empedocles, the soul is compacted from all the elements¹² is generally discredited as a misconception; and his further remark in the same passage that each of the elements is soul is equally misleading. But, even if the materialism

of Empedocles is somewhat less explicit than is sometimes represented, logical justification is still to seek for his pronouncement concerning the punishment of guilty souls in a purgatory lasting for 30,000 years¹ and his personal experience of the wretchedness of the wandering spirit which is harassed by its weary passage through air and sea and earth: 'Ere now have I been a youth and a maiden, a bush and a dumb fish in the sea.'² A discrimination of the degrees of transgression is involved in the assignment of the less base souls to the higher forms of animal or plant life: these inhabit the bodies of lions among beasts or appear as bay trees in the world of vegetation.³ The best of them become prophets, bards, physicians, and chieftains, and at last return as divine beings to the company of the gods.⁴ As a consequence of this doctrine Empedocles, like the Pythagoreans, prohibited the eating of flesh and the slaughter of animals, which he stigmatized as the shedding of kindred blood, the murder of a son by his father or of a father by his son.⁵

In several of his dialogues, particularly in the *Phædo*, *Phædrus*, *Republic*, and *Timæus*, Plato associates the doctrines of the immortality and pre-existence of the soul with its transmigration. The variations to be found in his descriptions are not of serious moment and do not admit of being discussed in detail.

According to the *Phædo*,⁶ those who in this life have failed to emancipate themselves from the burden of the corporeal element cannot rise to the purer element above, but, being dragged down into the visible world, haunt burial grounds as ghostly apparitions until they are again imprisoned in another body. Of these the sensual become asses or similar animals, the violent and unjust wolves or kites, but those who, though lacking the philosophic impulse to virtue, have lived an ordinary respectable life may become bees or ants, or even men who in their next incarnation prove themselves just and moderate. Only those who have devoted themselves in this life to philosophy are entirely exempt from any further incarnation and pass to the pure ethereal homes destined for them in the upper world.⁷ In the *Phædrus*⁸ the souls of the dead are punished or otherwise treated according to the measure of their human actions for 1000 years, until the period of reincarnation arrives, when they are allowed a limited area of choice, so that it often happens that the soul of a man comes into life as a beast, and that of a beast which had formerly been human again enters into the body of a man. A much more elaborate account is given in the myth of Er the son of Armenius, how a great variety of choice comprising the lives of every animal and of men in every condition is offered to the allottees whose time for reincarnation has arrived. The order of choice is determined by ballot, but even the soul which drew the last lot had plenty of opportunities for selection left. The narrator of the myth was a witness of the choices made by some of the famous heroes of antiquity; how Orpheus chose to be a swan, Thamyras a nightingale, Ajax a lion, Agamemnon an eagle, and Thersites a monkey, while Odysseus, who drew the last lot, wearied of his former ambition, was delighted to find still available for him the life of an ordinary man free from all anxiety.⁹ In the *Timæus*¹⁰ the creator fashions as many souls as there are stars, and distributes one to each star, in order that later, after a period of contemplation, they may be embodied in human form. If during the time of probation the soul lived well, he would return to his ethereal habitation; but, if he failed, he would suffer a new incarnation as a woman; and, if his wickedness continued, he would sink down among the beasts until his corporeal taints had been thoroughly purged away. In the same dialogue Plato explains the evolution of birds and other animals as arising from the deterioration of human souls. Birds, with their feathers taking the place of hair, are developed from men who are harmless but light-minded. The four-footed beasts of the earth were originally men who had never given themselves up to the study of philosophy, since they no longer heeded the revolutions in the head, but followed the impulses of those parts of the soul which are situated in the breast.¹¹

Critics have not been entirely agreed as to how far Plato was a serious believer in transmigration,¹² some holding that the entire description was purely a play of fancy, and others that, though he may have credited the successive incarnations

of human souls, he cannot have extended his belief to their passage into animal shapes. It should of course be noticed that all these descriptions, if not actually parts of a myth, have a mythical colouring, and must be read subject to the warning given by the Platonic Socrates in the *Phædo*:¹

'No sensible man will affirm that these matters took place exactly in the way that I have described. But to hold that either this or something like it is the truth in regard to our souls and their habitations, appears to me, now that the soul has been shown to be immortal, to be no unreasonable or unworthy venture.'

So long as this limitation is borne in mind, there is no valid reason for mistrusting Plato's sincerity.

Transmigration does not cohere with the Stoic doctrine of the soul's nature; but there are some grounds for thinking that Posidonius held the pre-existence and immortality of the soul in the limited sense in which it was possible for a Stoic to affirm them consistently with a belief in the *ἐκπύρωσις*.² It was, moreover, natural that a Stoic should speak of a periodic reincarnation³ as a consequence of the dogma that every conflagration introduces a new era in which the experience of the past will be exactly repeated. But that either Posidonius or any of the Stoics believed in a series of successive incarnations within the limits of the current world-period is, notwithstanding the isolated statements of certain of the doxographical sources,⁴ open to very grave doubt.⁵

According to Plotinus, the future destiny of the soul depends on the use it has made of its several functions and capacities during each particular incarnation. Hence we should constantly strive upward, not yielding to the images of sense or carnal cravings.

Thus he who has exercised his human capacities again becomes a man, but those who have lived by sensation alone become animals. If, without yielding to active passion, they have remained immersed in sluggish perversity, they may even become plants.⁶ There is always retribution for an ill-spent life: the bad master becomes a slave, the abuser of wealth a poor man; the man who has murdered his mother becomes a woman and is murdered by a son.⁷ On the other hand, those souls which are pure and have lost their attraction to the corporeal will cease to be dependent upon body. So detached, they will pass to the region of being and the divinity, which cannot be apprehended by a human vision as if it were akin to the corporeal.⁸

II. ROMAN.—There is no evidence among the Romans of an indigenous belief in transmigration, but several of their poets acknowledged the influence of Greek speculation, and of Plato and Pythagoras in particular. Horace mentions⁹ the 'Pythagorean dreams' of Ennius, who thought that his soul had once inhabited the body of Homer and earlier that of a peacock.¹⁰ Vergil, in a famous passage,¹¹ takes more serious notice of Pythagoreanism, when he describes the purification of souls in the under world, and their return to human bodies after the completion of the cycle of 1000 years. Ovid¹² introduces Pythagoras himself making an eloquent appeal against the slaughter of animal life, based upon the identity of the soul-substance which permeates our bodies and theirs.

sumption which underlies not only Buddhism and Jainism, but also the philosophical systems of the Brāhmins and the whole of Hinduism. In the ancient Vedic period it had as yet no existence. At that time the Indian peoples were still filled with a keen delight in life, and the righteous man looked forward to eternal continuance of existence after death. They believed that good men ascended to heaven to the companionship of the gods, and there led a painless existence, free from all earthly imperfections—a happy life, which was usually depicted as an enjoyment of sensual pleasures, but was yet occasionally conceived in a higher spiritual sense. The necessary consequence of this belief was the view (very rarely expressed in the Veda) that the souls of the wicked sank down into the abyss of hell. This naive representation of the soul's fate after death experienced a real change when, suddenly and without any transitional stages that we can perceive, the Indian people was seized by the oppressive belief in transmigration, which holds it captive to the present day. The conviction that every individual enters again after death upon a new existence, in which he gathers the fruit of merit earlier acquired, and has to endure the consequences of sins previously committed, meets us for the first time in a work belonging to the second period of Indian literature, the *Satapatha Brāhmaṇa*, 'the Brāhmaṇa of the hundred ways.' Since then this thought has been regarded in India as a doctrine that needs no proof, which only the adherents of a crude materialism could doubt. It is a significant fact—to which H. Oldenberg first drew attention—that belief in transmigration assumed the form of the harassing thought of a continual recurrence of death. How this belief, which lies at the root of Indian pessimism, could take the place apparently immediately of the innocent joy in life which greets us in the ancient times in the hymns of the Rigveda is an interesting question, but one that can be answered with only a certain measure of probability. Certainly the Indian doctrine of transmigration is not to be derived from one definite source alone; there are undoubtedly several streams of thought, which hardly admit of being definitely traced, but which were distinct in their origin. In order to ascertain the main source, we must have recourse to general folk-lore.

Among peoples in a low stage of civilization in very many parts of the earth there is found the belief that the souls of men after death pass into the trunks of trees or the bodies of animals, but especially into the bodies of birds, reptiles, and insects. Hence a choice is open to us between the following alternatives. We must suppose either that the Aryans of India, when they came into closer contact with the rude aboriginal inhabitants of the Indian peninsula, received from them the idea of the continued existence of men in animals and trees, and appropriated it to themselves; or that this conception had maintained its hold upon the lower strata of the Aryan people themselves from savage times, and then in an age adapted to constructive speculation thoughtful men had set themselves to develop from it the theory of transmigration. The second of these two possibilities is the more probable. Whatever view, however, may be accepted as correct, under any circumstances the primitive belief—whether it be that of the Indian aboriginal tribes or that of the lower strata of the Aryan people—gave merely the first impulse to the formation of the doctrine of transmigration; for no primitive people possesses more than the conception of the immediate prolongation of human existence in animals and trees. Among

the Aryans of India the theory, as it meets us for the first time in the literature, appears already fully formed in the shape of belief in a permanently continued but ever-changing existence. And the different forms under which the individual lives are in their rank, and the measure of happiness or misery which they experience is regarded as dependent on moral conduct. At the basis of the Indian conception of transmigration lies the immovable conviction that there is no unmerited happiness and no unmerited misery, that each man shapes his own fortune down to the smallest details. This conviction has given to the Indian people a power to endure suffering which has often enough excited the wonder of foreign observers.

Since the Indian recognized that no explanation of the apportionment of happiness and misery, of joy and sorrow, by the moral state of the individual was to be found in the present life, he concluded that man's fate is determined by his good and evil deeds in a former existence. A moral qualification, therefore, according to this view, attaches to the soul; and this corresponds exactly to the sum of its good and evil deeds, and demands reward or punishment in the next existence, if not in the present.

Granted, then, that we endure in the present life the consequences of our own behaviour in the past, the conditions must have been precisely the same in the previous existence; the joy and sorrow that we experienced therein were again the consequences of our own actions in a preceding life, and so on without end. For that part of the individual, therefore, which was involved in the cycle of existences no beginning could be assigned. It was thus that quite early in India the theory of the endless pre-existence of the soul was developed; and the doctrine of the soul's eternal duration in the future was inferred according to the law that that which is without beginning is also endless, and in accordance with the ancient popular view of the permanence of personal existence in heaven. The belief in the eternity of soul was followed by belief in the eternal existence of the universe.

Life for the ease-loving Indian was overshadowed by the belief in transmigration. The thought of wandering perpetually through the bodies of men, animals, and plants, of being compelled in each existence to experience more pain than joy, and perpetually to renew the pangs of death, occasionally also to sojourn for a time in hell—this thought must have been dreadful for the Indian. Nor would he be sufficiently compensated by the prospect of being able to gain heaven by his merit, and to raise himself to divine honours. For with the very ascent to divine honours no more than a transitory success has been gained. Even the gods, according to the transmigration theory, are involved in the cycle of existence, the *samsāra*, and must again descend to lower forms of life when their time comes round, that is, when the power of former merit is exhausted through the enjoyment of divine position and honours. The popular gods, therefore, have ceased to be eternal and omnipotent beings, as they were in Vedic times.

According to this view, therefore, the wheel of existence rolls on without rest or intermission, and hurries living creatures perpetually to renewed suffering and renewed death. Naturally, then, the question must have been raised whether there is no deliverance, no release, from this constantly renewed existence upon earth.

The hypothesis that once in the course of time the previous deeds of a living being may meet with their complete reward or punishment, and that, therefore, the basis for a re-birth may and will disappear, was not made in India. According to the Indian view, when a living being dies there always remains a remnant of merit and guilt still

unrewarded and unpunished, from which is derived the germ of a new existence. Even sacrifice and deeds of piety or asceticism cannot deliver from the necessity of renewed birth and death. In the *Śatapatha Brāhmaṇa* it is said that the powers of death which pursue men from one existence to another may be appeased by sacrificial offerings, and that by such offerings release may be obtained from the return of death. This thought, however, is soon abandoned, and is supplanted by the conviction that no sacrifices can do more than secure temporary happiness in higher forms of existence.

Since, then, in India it had become the supreme aim of spiritual endeavour to find this release, the issue could not fail to be the conviction that success had been attained; not by the way which had been previously followed and which no longer afforded inward satisfaction, but by the way of *knowledge*, which, in fact, might be trodden only by a few. In the knowledge of the essential nature of things, which is veiled from ordinary sight, was found the means of deliverance from the pressure of worldly existence. This saving 'knowledge' removes 'ignorance,' *i.e.* the empirical view of the universe which is natural to man, but is mistaken and perverted. With ignorance disappears also desire, which fetters man to existence, and is the cause of all action; as, on the other hand, successful resistance to the desires of the senses promotes the entrance of knowledge. Saving knowledge has the power—to use the technical Indian expression—of 'consuming the seed of works,' and so making impossible for all future time a continuance of migration.

The entire course of thought as hitherto developed is already contained in substance in the ancient *Upaniṣads* (*q.v.*). For them saving knowledge consists in the recognition of the sole existence of the Brahman, the soul of the universe, of the illusory nature of the phenomenal world, and especially of the identity of the individual soul, the *ātman*, with the Brahman. In what way the saving knowledge is conceived in Buddhism, in the religion of the Jains, and in the philosophical systems of the Brāhmins (*Sāṅkhya*, *Yoga*, *Mīmāṃsā*, *Vedānta*, *Vaiśeṣika*, *Nyāya*), must be ascertained from the respective articles. Cf. also art. *MOKṢA*.

TRANSMIGRATION (Jewish).—Metempsychosis, or the migration of the soul (Heb. *gilgūl*, 'rotation' or 'cycle'), is a doctrine which forms part of a system of esoteric mysticism tolerated rather than approved or furthered by Judaism. Its beginnings are difficult to trace. Whether they were Egyptian or Indian—probably through Gnostic or Manichæan intermediaries—this doctrine, no doubt, had to accommodate itself to other Jewish conceptions before it could be assimilated and adopted, and it had to undergo such a profound modification as to give to Jewish metempsychosis a character of its own.

The belief in the migration of the soul presupposes the existence of the soul; and a whole esoteric system about the creation of the soul, and the conception of sin and redemption, are the fundamental principles upon which such a doctrine must rest. The relation between spirit and matter, soul and body, must be determined, as must the question of pre-existence as well as that of the finality of soul and body. An attempt will here be made to do justice to these problems, however succinctly. The questions of punishment and reward, of God's

justice and mercy, are also involved. It must be borne in mind that any theory, if it was to be accepted by Jews, had to be subjected to a process of close adaptation to the fundamental principles of Judaism, and must not run counter to the Law. Now, if migration of the soul is to be accepted as a part of philosophic speculation concerning sin and redemption, it has to formulate its theory in accordance with Judaism.

1. **Creation of souls.**—God is the creator of everything; therefore souls are His creation. But does God continue His act of creation? Does He continually create souls as soon as any human being is on the point of being born? The answer of the believer in metempsychosis is that He does not. His creation came to an end with the close of the sixth day. At the beginning the souls were created. The power of God is thus limited to what He had done on that occasion. Before creating Adam, God had finished the creation of all the souls of man, but, His work of creation being overtaken by the end of the sixth day, He did not continue it, and produced only those evil spirits which hover between the pure divine soul and the earthly matter (the *mazziqim*; see art. MAGIC [Jewish]).

A distinct line of demarcation is not drawn, however, and, as will be seen, a soul can assume the form of a demoniacal spirit. The souls created, then, are of a limited number, as the creation was only a limited act, and had to come to an end at a definite period of time. These souls are God's creation, not any emanation from God. This very essential point should be remembered, for it separates Jewish metempsychosis widely from Buddhist. The souls at the end of the migration are not absorbed into a kind of divine pantheistic fluid; they are conceived as having an individual existence; they live separately and fully conscious of their individuality; they dwell in the heavenly halls or in Paradise in rapt contemplation of the divine glory; thither they are allowed to return at the end of their peregrination through the lower world. The souls of the born and the unborn, of those who have already been in the sublunar world and of those who have not yet been in that world, are dwelling together in the heavenly halls, or in the treasury of God (Dt 32²⁴). No clear distinction is made between these two categories of souls. It is all so vague in this world of theosophic speculations, and contradictions are not seldom found; schools of thought have sometimes blended their teaching without any successful attempt at harmonizing contradictory views. All that comes is readily accepted, so long as it is not diametrically opposed and so long as it comes as an ancient mystical tradition. Thus the pre-existence of all human souls affects the Messianic eschatology. The soul of the pre-existing Messiah is fully conscious of its own individual pre-eminence in this world. Though a spirit, the Messiah dwells among the other souls, and He is fully aware of the tribulations of the people of Israel; He weeps over their sufferings and anxiously asks the angel who is in His company when the time will arrive for His revelation (M. Gaster, *Chron. of Jerahmeel*, London, 1899, xx. 9). Moses in his ascent to heaven sees the souls of the great and pious, of those who have lived upon earth, and of those who are to come to life hereafter—among others David and Aqiba (*ib.*). This view is found also in the book of Enoch and in other Apocalypses, though the theory of migration is not there clearly connected with it.

The one definite outcome is that no new souls are created for each child that is born, the number of souls being limited. Everything created has a specific purport. Even the angels have not

been created without purpose. They are God's messengers; they carry out His wishes and commands in the heavens above and on the earth beneath; above all, they are created for the purpose of singing to their Master and of praising Him in angelic choirs. Such, then, is the purpose of the entire creation. The angelic action is typical of the human man, the highest and most perfect creature after the angels. He must by his action approach the divine, and his whole life must be a long-sustained hymn of praise to God. But man, made of the dust of the earth, cannot rise to such perfection unless the divine soul lifts him up and unless the divine Law guides him steadily upwards towards heaven. His life is a constant struggle between the grossly material inclinations inherent in his earthly nature and the high spiritual promptings of his divine soul. According to the way in which he inclines, his soul will become more or less contaminated by the contact with matter; it will lose more and more of its spiritual lustre and purity. For man has absolute free will; he is master over his own actions. This is an axiom; otherwise the whole principle of reward and punishment has to be abandoned. And yet, with that naive inconsistency so characteristic of this mystic philosophy, predestination is not excluded. Nothing happens which has not been pre-ordained, yet no attempt is made to bridge this gulf.

2. **Incarnation of souls.**—The souls have been created for a specific use; they must enter human bodies; but the choice is not left to them, either of the bodies to be selected or of the time of entry and the time and manner of exit. As soon as a woman conceives (see art. BIRTH [Jewish]), an angel appears before God with the sperm, and God decrees the future life of the yet unborn babe. Its whole life is thereby determined—whether it will be rich or poor, high-stationed or lowly, wise or foolish, long-lived or short-lived, good or bad, pious or wicked; even its future helpmeet is proclaimed in heaven to the joy and satisfaction of the heavenly hosts. In order to obviate too glaring a contradiction in a later version of this legend of the 'Creation of the Child' (see Gaster, *Jerahmeel*, ix. 19f.), the moral qualifications of the future man and woman have been omitted. The soul, which is very reluctant to give up its heavenly abode and enter the human body, especially if the shell is that of a wicked one, is forcibly seized by the angel and carried through the bliss of heaven and the agony of hell, to see the reward for good actions and the punishment for evil deeds. Although the soul forgets it all with entry into this world, yet a dim recollection remains, a subconscious image, which is the guiding principle in elementary recognition of good and evil. Every man has within himself a standard of right and wrong given to his soul in its premundane existence. Another version (*Zohār*, ii. 96b ff.) describes the incarnation of the soul in the following manner:

God created all the souls from the beginning, in the very form in which they would afterwards appear in this world. He beheld them and saw that some of them would be wicked. At the time when the soul is to descend, the Lord calls it and says, 'Go to such and such a place.' The soul replies, 'Let me remain here and not be defiled in that other world.' The Lord answers, 'From the beginning thou hast been created for the purpose of getting into this world.' Then the soul submits, and descends against its will. The Law which helps the soul says to it, 'See how the Lord had mercy on you. He has given you His precious pearl (the Law) to help you in this world, so that ye may return pure.' But, if laden with sin, the soul must obtain purification so as not to be delivered to Gehinnom; for two rows of angels and demons are waiting for the soul; the good to lead to Eden and the evil spirits to Gehinnom; and to be saved from punishment the soul migrates from body to body.

3. **Life of the soul on earth; migration; defeat of evil spirits.**—Now the soul begins its course upon earth. It must endeavour to obtain the

absolute mastery over the body and not to become its slave. In the first entry the soul is absolutely pure and without blemish. It is not met by the obstacle of 'original sin.' The principle upheld throughout is that 'each man dieth by his own sin' (Ezk 18²⁰). But the weakness inherent in matter soon makes itself felt, and, moreover, there are the temptations placed in its way through the envy and spite of the evil spirits (*mazziqim*), who, though they partake of some spiritual character, are imperfect compared with the pure soul, and are anxious to drag it down to their own level.

A still greater cause lies at the root of this attempt of the evil spirits to lead the pure soul away—a desire to frustrate by the means of sin and transgression the divine plan of creation. God has created the world and man in it for His glory. Through trial and trouble man must win the crown of eternal bliss. The finite number of souls forms part of this divine plan. A term is thereby set for man's spiritualization, for an infinite number of souls might make that end impossible of being reached. But, as there is a limited number, it is obvious that the desired consummation would set in as soon as the last soul had passed through the human body, or, rather, had entered the last human body. For then all the souls created would have fulfilled their mission upon earth, and all the human beings through whom they had passed would have reached the highest degree of moral development of which they were capable, so that the progress of mankind and of the world would have attained its ultimate goal, or, to put it in the words of the mystics, the Kingdom of Heaven upon earth would then be established, the time reached for the advent of the Messiah. Already in the Talmud the saying is found, 'The son of David will not come before all the souls in bodies will come to an end.' The power of the evil spirits would then be entirely broken, and only good would reign in the world. The spirits, therefore, try to entice the soul and defile it by all manner of temptation and sin. The result is that the contaminated soul must be kept out of the heavenly bliss, and the divine plan is effectively checked. Like a 'shell' (*q'lifāh*), the evil spirits surround the soul, making the material covering still more impenetrable to light and truth, as they are clinging close to the body like an additional covering. In the later development of this system the evil spirit 'cleaves' to the body of the person whose soul is to be obstructed, and the spirit is then called *dibbūq*. It has entered into a more intimate connexion with the body, and is no longer an outer covering, or *q'lifāh*, originating from the 'other camp,' the *sitrā ḥarāh*.

But the demons strive in vain to impede the steady development and unfolding of God's plan. They may delay its speedy consummation; they cannot indefinitely frustrate it. The soul which has been contaminated can be purified again; the sin committed can be atoned for, and even here the means is given to the soul to achieve its own purification. The soul retains its own consciousness and is sensible to its own failings; it realizes the bitterness of punishment and the tragedy of not being allowed to ascend on high and stand again before God in its pristine purity. For it flits about the world as a disembodied spirit, hovering between heaven and earth, and waiting for the chance of atonement or punishment. This comes to it by being re-embodied, and thus the soul migrates from one being to another. It is not made clear, however, whether the soul in this new incarnation remembers its former existence or whether it realizes it when it is leaving this second body, and continues its migration until all the blemish has been eliminated. This transmigra-

tion is thus the means of defeating the work of the evil spirits, of hastening the emptying of the divine treasury of unborn souls, and of bringing about the close of the cycle and the advent of the Messiah.

4. The justice of God.—(a) *Theories of rewards and punishments.*—The migration of souls is made to serve another and still higher and more direct purpose, the justice of God. The grave problem which has haunted every form of faith has been: how to reconcile the happiness of the sinner and the trials and sufferings of the pious and good with the justice of God. Every religion has endeavoured to form a theodicy. Most of them have relegated the solution of this problem to the life after death, finding the answer in rewards and punishments to be meted out in another world filled with bliss and unutterable torments. Such teaching presupposed the eternity of the soul, and in some form or another a combination of soul and body if the latter is to suffer the torment of hell, unless it was supposed that the souls would continue an individual conscious existence capable of enduring torments as well as rejoicing in heavenly bliss. This is, however, not the place to follow further this extremely complicated problem. It was, after all, a subtle way out of the difficulty, and it was not quite free from a possible reproach of selfishness. The goodness of the soul or the purity of life obtained for that individual soul alone happiness and bliss. No one else was directly benefited by it, except perhaps that such a good and pious man served as an example to others. But the world in general apparently had nothing from him, and his virtuous life led nowhere except to his own exaltation. Not so with the belief in the migration of the soul. Here, upon earth, in the sight of all, the sinner—whosoever he might be—had to expiate his sins. Here he had to suffer for the wrong committed, and here obtain, as it were, the pass for the heavenly regions. By this slow purification and reunion with the other purified souls, moreover, a cycle was completed, at the end of which the Messianic period would begin. By his actions the whole world would benefit, and the general progress and welfare of mankind would be hastened and consummated.

Thus the soul of Adam, because he had sinned, had to begin a period of migration through other bodies and thus pass through David, who, by the sin which he had committed with the wife of Uriah, impeded the complete purification of Adam's soul. But, by its final entry into the last descendant, the Messiah would also bring about the desired result meant by the divine plan when Adam, the first man, was created.

The soul of Abel passed into Moses, or, according to another theory, the soul of Adam passed into Moses, who sinned at the rock, and then into David, who sinned with Uriah's wife, and, finally, into the Messiah, thus linking the first with the last.

There are, as it were, successive incarnations of the same pre-existing soul, and for their sakes the world has been created. There cannot be any doubt that these views are extremely old. Simon Magus raises the claim of former existences, his soul passing through many bodies before it reaches that known as Simon. The Samaritan doctrine of the *tahēb* teaches the same doctrine of a pre-existing soul which was given to Adam, but which, through successive 'incarnations' in Seth, Noah, and Abraham, reached Moses, for whom it was originally formed and for whose sake the world had been created. The element which is absent here is that of migration for the purpose of purification. The latter gives to 'migration of souls' a peculiar character. Not only is the world perfected thereby (*tiggūn*), but the sinner expiates his sin in this world in the new existence in which his soul reappears. It may enter the body of a pious man, and by his good deeds he will cleanse the dross still adhering to the soul and facilitate its ascent

on high. If the pious suffer, it is only and solely for sins committed in a previous existence, and thus suffering is not a punishment for sins now committed, but a 'purgatory' for evil deeds of a former life. The explanation of the prosperous sinner is not quite so clear. Here use had been made of the other doctrine of punishment and reward after death. The sinner benefits from the good deeds that he had performed in a previous existence. He prospers now, so that *all* his reward is eaten up by him in this world, and nothing but punishment and tortures is reserved for him in the life after death. This presupposes that the soul of the wicked is beyond 'redemption' in this world, and is sent to Gehinnom for punishment. This seems to be the view taken by 'the Saba' in the *Zohār* in the passage quoted above (§ 2). The cycle of the soul is thus broken. It is not made quite clear how it is to be completed; but it seems that, according to some, a soul which has just sunk to this lowest level of contamination, instead of being sent to Gehinnom, becomes an evil spirit in this world, which is anxious to enter living bodies for torment or for that punishment which starts from the lowest rung of the ladder and is to lead up to the highest without recourse to punishments in 'hell.' Such a soul becomes a *dibbiq*. To exorcize it, to free it from this temporary existence as quickly as possible, and thus hasten the new cycle of evolution, is a meritorious deed, a real *tiggūn*, an 'improvement' and perfection.

No attempt is made to reconcile these two separate systems of punishment and reward; they are often mentioned side by side in the *Zohār* and other kabbalistic treatises. In the Targum to Ec 8^s the suffering of the pious and the happiness of the wicked have already been explained in a somewhat similar manner, inasmuch as the pious suffer for small sins in order to enter afterwards directly into heaven, and the sinner enjoys the fruit of some good deeds here, so that hereafter he is to go straight to torment and punishment.

(b) *Kabbalistic theory.*—The kabbalist, however, adds and superimposes the new theory of suffering and happiness, not for sins and good deeds performed in the person's lifetime, but for sins done during previous existences. The punishment was expected to fit the crime. Thus, if a man had sinned by his eyes, he would be reborn blind or suffering with his eyes, and, similarly, every other part of the body would then be affected by the sin committed through that part in the previous existence. Moral sins would have to be expiated in a similar manner; for, according to some of the oldest and most accredited teachers, transmigration is not limited to that from one human body to another human body. The soul of the wicked passes also into animal bodies corresponding with the character of the sin. In later schools the transmigration has been extended also to plants, stones, and metals. As an example of the former it may be stated that the soul of an adulterer passes into the body of a female stork, for it is believed that the storks punish adultery with death.¹ Thus an explanation was found for the prohibition of mixing various kinds of seeds and the cross-breeding of animals, for they disturbed the normal laws of nature and caused great suffering to the souls of such mixed products. Similarly, the peculiar command of marrying the deceased brother's wife (*yibbūm*) has its reason and justification in this doctrine of migration. The soul of the childless man cannot return to its source, for the soul has remained barren and is cut short in its earthly career before it has been able to pass through all the

stages of purification. Hence the reason why the child born was to be called 'in the name' of the deceased, though it does not follow that it must bear the same name. In fact, the child of Ruth, which was a 'restorer of souls' to Naomi, did not bear the name of Ruth's dead husband. The new-born babe would receive the soul of the dead and continue his earthly life.

5. *Number of migrations.*—There is a difference of opinion as to how many times a soul would migrate before it had run its entire course. The majority of kabbalists incline to the opinion that no soul migrates through more than three bodies. The real course is that in which the soul has performed the whole of the 613 commandments of the Law, by which alone perfection is attained. For the shortcomings in one existence the soul is punished in the next, and then also performs some good deeds. Others think that the soul passes through a greater number of changes. It is held that the fate of the soul of the sinner is decided after three migrations, at the end of which a thoroughly wicked soul becomes an evil spirit—a demon—while that of the pious may be reincarnated times without number. In this case the ascent of the soul from the lower to the higher degree of purity and perfection is asserted.

6. *Various other theories; purposes of metempsychosis.*—It is held that builders of the Tower of Babel were divided into three categories, which were punished in accordance with the degree of wickedness of which they were guilty. The first lost the unity of language, and were dispersed upon the face of the earth. The second—a more daring category—were changed into all kinds of animals, and their souls were sent into animal bodies. The third—the thoroughly wicked section—were changed into demons. The change of the body of Nebuchadrezzar into a wild animal, as told by Daniel (Dn 4³⁸), lent further countenance to the possibility of a human soul dwelling in an animal body. The rules for slaughtering special animals and for the blessing by which the cutting is accompanied rest upon the same principle of thereby possibly saving a penitent soul from dwelling too long in the body of an animal. It is liberated by a religious act which assists it in its further migration. All this forms part of the *tiggūn*, the improvement and perfection of the world, the preparation for the Messianic rule. The covenant before Mt. Sinai was made by God with *all* the souls which He had created: 'Neither with you only do I make this covenant and this oath; but with him that standeth here with us this day before the Lord our God, and also with him that is *not here with us* this day' (Dt 29¹⁴), for He did not speak only to those who were there, but also to those who were not there on that day, in their material form, *i.e.* in human bodies.

By this migration of good souls to good men and contaminated souls to sinners and evil-doers a certain affinity of souls was established, which led to the identification of such souls in the various stages. As mentioned before, the soul of Abel or of Adam was that of Moses, and the souls of the ten brothers of Joseph became the souls of the ten martyrs whom the legend described as contemporaries. In fact, this tendency of recognizing the older souls in more recent bodies developed in the later schools of kabbalistic speculations established by Luria, Vital Calabrese, and others into a regular system. Lists have been drawn up and books have been compiled (*Sēpher hag-Gilgālm*, Frankfort, 1684), in which the reincarnations of the good and evil men of the past have been duly recorded. Such spiritual genealogies—if we may use such a term—have found their way even into bibliographical and historical compilations. In

¹ The Heb. name for stork is *hāstāhāh*, which, by a popular etymology, may be explained to mean 'the chaste' or 'the pious.'

addition to the complete reincarnation, there came the newer doctrine of impregnation (*'ibbār*). The soul of a good man is sometimes not strong enough to fight successfully the temptations of the world, and another soul is temporarily grafted upon that which he already possesses, so that it is made almost unassailable. The older teaching runs that the spiritual forces of man are regularly heightened on Sabbath eve by the temporary addition of a new soul, which departs with the close of the Sabbath. In the same manner a soul is grafted temporarily on to the pious man. The object of all this is to hasten the perfection of the world and the advent of the Messiah. By means of migration the soul has fulfilled the object of its creation—to pass through man and to lift man higher and to bring him nearer the divine. This doctrine, being a justification of God's ways with men, is, at the same time, a source of comfort to the pious, and a source of terror to the sinner. It reconciles man to suffering and trials, and at the same time explains the hidden meaning of many a law and ceremony which seem obscure. It is a vindication of the divine character of the Law, for its ultimate result is to be the rule of heaven upon earth.

7. **Date and origin.**—This doctrine of migration is nowhere to be found systematically developed. Wherever it occurs, it is tacitly assumed as well known, and no explanation is given in detail. It has, therefore, been pieced together and reconstructed by the present writer mostly from the Zoharistic literature, viz. the *Zōhār*, the *Zōhār Hādāsh*, and the *Tiqqūnīm*, which represents a more or less homogeneous view on migration, whenever it is referred to. While these are by far the most complete writings, they are by no means the oldest. This brings us to the question of the date and probable origin of this doctrine among the Jews.

All the beginnings of esoteric teachings are lost in the mist of antiquity, and, when such doctrines finally see the light of day, they have, as a rule, a long history behind them. It is, therefore, a fallacy to date the origin of metempsychosis among the Jews from the time when it becomes known publicly in the 9th or 10th century. The masters of the occult science never doubted its Jewish character or its old origin. Was it not part of that heavenly mystery handed down from Adam on through all the great men of the past? With great ingenuity they endeavoured to find proofs for it in the Scriptures by means of an exegesis which was fantastic in the extreme. A few examples will suffice. They are taken at random from the *Zōhār*, and they are found in large numbers in Manasseh ben Israel, *Nishmat Hayim*, bk. iv. chs. 8–10.

'Till thou return unto the ground' (Gn 3¹⁹) is interpreted to mean that the body alone returns to the ground; the spirit, however, is reborn.

'Naked shall I return thither' (Job 1²¹) is interpreted literally as meaning 'to the womb,' i.e. being reborn.

'The word which he commanded to a thousand generations' (Ps 105⁹) is interpreted to mean that it refers to the same soul passing through innumerable generations, for God's command had been given once to all the souls, and these souls are reincarnated over and over again.

'One generation goeth, and another generation cometh' (Ec 1⁴). The fact that the passing away of the generation is mentioned first is a proof that this must have existed before; otherwise it ought to read 'one generation cometh and another generation goeth.'

'Which are already dead more than the living which are yet alive' (Ec 4²) is interpreted to mean that the living are still uncertain as to the future fate of the migration of their souls.

A proof of 'impregnation,' or the addition of a soul, is also deduced from the following verses: 'Ye shall therefore separate between the clean beast and the unclean,' etc. (Lv 20²⁵), meaning that a clean soul shall be added, not an unclean. 'Shall flocks and herds be slain for them, to suffice them?' etc. (Nu 11²²), is taken to mean the addition of souls. 'O God, the God of the spirits of all flesh,' etc. (Nu 16²²), means also those that

are added to strengthen them 'should one man sin' whose soul proved too weak, as it had no support. 'Doeth good to his own soul' (Pr 11¹⁷) means that a man attaches another soul to himself.

The letters of the name of Ad(a)m have been taken as the initials for Adam, David, Moses, and Messiah; hence it was proved that the soul of Adam passed through all these. The letters of the name M(o)sh(e)h (Moses) are the initials of Moses, Seth, and Habel (Abel); hence the soul of Abel passed through Seth to Moses. The numerical value of the letters of the names of the ten tribes corresponds to the numerical value of the names of the reputed ten sages who suffered martyrdom. These examples could easily be multiplied from later kabbalistic literature, but they all follow the same line of argument. There cannot, however, be the slightest doubt that the doctrine of metempsychosis was borrowed from other religious systems, and is not Jewish at all. It will remain an open question whether the denial of the resurrection of the dead attributed by Josephus (*Ant.* xviii. i. 4 [16]) to the Sadducees implies denial also of reward and punishment, or whether it extended only to the life beyond the grave, and that they believed in the reward and punishment in this world. His allegation that they believed that the soul died with the body is too strange to be accurate. The vindication of God's justice would most easily be found if it means that the soul migrates from one body to another, as they did not deny the divine origin of the soul. Whatever the remoter origin of it may be, it cannot be gainsaid that the atmosphere of Palestine was saturated with mystical and esoteric teachings of every kind, one among them being that of metempsychosis. The Gnostics and Manichæans held fast to it; Neoplatonism did not deny its possibility, and thus almost insensibly it crept into Judaism. The Palestinian Targumim show traces of it, inasmuch as in some places they speak of a second death (so Dt 33⁶), which can only mean at least a life twice repeated upon earth; this is possible only if the soul migrates from one body to another (so also Bahya, *ad loc.*; cf. also Targum to Is 22¹⁴). Saadya Gaon (†942) in the 10th cent. inveighs against such tenets, held, as he says, by a certain Karaitic sect, although it was probably rather a mystical heterodox section of Rabbanite Jews who believed also in the migration of souls. A few centuries later Abraham Bedaresi (1280), a rationalist philosopher, in his letter to R. Solomon ben Adreth, no. 8, protested against this doctrine; but they were the only opponents, for the wave of mysticism was rising steadily with the narrowing of the political outlook and the change of social conditions. With the appearance of the *Zōhār* the older kabbalistic literature was pushed into the background, and many an ancient mystical treatise was forgotten, unless it became embedded in the *Zōhār*—e.g., the treatise by 'the Saba,' 'the venerable' (i.e. Rab. Hammuna), in the form of a commentary on the Biblical section '*Mishpātīm*,' Ex 22, which is found now in the *Zōhār* Ex 94²–114⁴. In older writings, *Qānā* and *Bāhūr*, and in those of Naḥmanides (1263), R. Solomon ben Adreth (c. 1300), and Isaac of Akko (c. 1330), faint traces of this doctrine can be detected. They show that in these mystic schools echoes of the older theory of metempsychosis had been heard and recorded. Whenever referred to, it is always an ancient tradition. Since the 13th cent. the *Zōhār* has swayed the mind of the larger section of a Jewry despondent and broken by ruthless persecution.

The dark Middle Ages began for the Jews when they came to an end for the other nations in Europe. The writings of Rekanati (14th cent.)

and Bahya (14th cent.) prepared the way for the development.

Palestine—in a lesser degree the adjoining Babylon—seems to have been throughout the centre of mystical speculations. Thither Nahmanides had gone, and a great school flourished in Akko for some centuries to the 12th onwards. The flow of the Spanish emigrants at the end of the 16th cent. was also towards Palestine. In Safed there arose the school of Luria (1534-72; commonly known by the initials of his name Ari=Rabbi Isaac Ashkenazi), Vital Calabrese, Cordovero, Poppers, and others. Among other doctrines, they developed, in the writings *Kavvanôth*, 'Ês *Hayim*, etc., much further the tenets of metempsychosis as a punishment for the wicked and an exalted reincarnation for the pious. The *tiqqûn*, or improvement of the world by delivering souls from the chain of migration, became one of the prominent features of this school, which led to that of the Hasidim. Remarkable legends of such deliverance are henceforth told. Every pious and great kabbalist performed them, none, however, so effectively as the master Luria himself. The history of the deliverance of such a soul in Safed is one of the most vivid autobiographies of a 'wandering soul' (first published in the 'Êmeq *ham-Melekh* of Nâphtali Herz, Amsterdam, 1648). The belief that certain persons are the *gilgûl* of other persons who had lived before them is still strongly held by those to whom the *Zôhâr* is an inspired book and the teaching of divine revelation. This belief strengthens in them the concept of God's righteousness, and the conviction that, if the time were hastened for all the created souls to pass through the human body, the advent of the Messiah and the Kingdom of God upon earth would be hastened.

LITERATURE.—The books mentioned in the course of this attempt at a syncretical exposition of the doctrine of metempsychosis—the first of its kind—form the only literature that can profitably be mentioned. Manasseh ben Israel, *Nishmat Hayim*, bk. iv., treats it apologetically. A. Franck, *La Kabbala*, Paris, 1892; A. Jellinek, *Beitr. zur Gesch. der Kabbala*, Leipzig, 1851-52; D. H. Joël, *Sohar*, Leipzig, 1849, have incidentally, of course, referred briefly also to this apparently unimportant section of kabbalistic Zoharistic speculation. See also literature to art. KABBALÁ.

M. GASTER.

TRANSMIGRATION (Teutonic).—It is clear that the doctrine of metempsychosis was held by the early Teutonic peoples, though the amount of evidence is limited and for the most part dates from a time when heathen beliefs, if not forgotten, were at least misunderstood. Such evidence as exists is chiefly derived from Scandinavian records. The only reference in early poetry is to be found in *Sigurðarkviða hinn skamma*, 45, where Hogni refuses to hold Brynhild back from self-destruction:

'Let no man stay her from the long journey, and may she never be born again (*aptrborin*).'

More striking evidence for the belief is furnished by the prose passages contained in *Helgakviða Hjorvarðssonar* and *Helgakviða Hundingsbana*, ii. At the end of the former it is said that Helgi and Sváva, the hero and heroine, were born again (*endrborin*); in the latter we are told that the heroine Sigrún was Sváva reincarnate, and later that both she and her husband Helgi Hundingsbani were born again as Kára and Helgi Haddingjaskati. A reference is given to *Káraljóð*, a poem now unfortunately lost, which dealt with the adventures of these persons. Moreover, in the *Gautreks Saga*, c. vii., Starkaðr is reviled as an *endrborinn jotunn*, a 'giant' reincarnate; his grandfather Starkaðr is said to have been a *jotunn* (c. iii.).

With the introduction of Christianity metempsychosis came at last to be regarded as 'an old

wives' tale.' For a time it still survived among the half-heathen population: to his horror St. Olaf found himself regarded as the reincarnation of a legendary king, one Olafr Geirstaðarálfr (*Flateyjarbók*, ii. 135).

It is not to be overlooked that in all these cases the men—though not the women—bear the same names in each incarnation. As among certain primitive peoples of the present day, the name is regarded as something more than a mere label; it is intimately connected with the soul of its possessor, so that a child inheriting the name of a dead person necessarily inherits the soul as well. An interesting reference to this belief may be cited from *Flateyjarbók*, i. 255: Thorsteinn Uxafót, a follower of Olafr Tryggvason, is visited in a dream by the ghost of a man called Brynjarr; it bestows a treasure on him and asks in return that one of Thorsteinn's children should be baptized under the name Brynjarr, since it desires a Christian reincarnation for its heathen soul.

In the *Islendinga Sogur* there are no actual references to metempsychosis, though the practice of naming children after lately deceased kinsmen (*Njals Saga*, ch. 89, *Eyrbyggja Saga*, ch. 12, *Laxdæla Saga*, chs. 36, 56) points to the existence of some such belief. But the passage in *Sturlunga Saga*, ix. 42—*þótte þeim nu Kolbeinn aptr kominn ok endrborinn*—is no true instance of this kind, since Thorgils Boðvarsson, referred to here, was born in 1226, nineteen years before the death of Kolbeinn Arnorsson, of whom he seemed to be the reincarnation. To the present day, however, it is believed in Norway and Iceland that, if a ghost appears to a pregnant woman in her sleep, it is seeking a namesake (*gaar efter Navnet*); and accordingly the child is baptized with the name of the dead person (cf. K. Maurer, *Zeitschrift des Vereins für Volkskunde*, v. 99). Sophus Bugge, moreover, states that he had heard *reise upp atte* ('raise up again') used in the west part of Telemarken with reference to the naming of a child after a dead person (*Home of the Eddic Poems*, London, 1899, p. 333).

Among the other Teutonic peoples the evidence for anything in the nature of metempsychosis is very meagre. An Anglo-Saxon charm (T. O. Cockayne, *Leechdoms, Wortcunning, and Starcraft of Early England*, London, 1864-66, iii. 66 ff.; C. W. M. Grein, *Bibliothek der angelsächs. Poesie*, Göttingen, 1857-65, i. 326 ff.) advises a woman who cannot bring forth a child to step thrice over the grave of a dead man, using an incantation for the safe delivery of her offspring. It is a question much in need of investigation whether the same idea can be traced in certain usages said to be practised in connexion with burial-places of the heathen age in various parts of Northern Europe.

It may be mentioned in conclusion that Appian (*Hist. Rom.* iv., 'de Rebus Gallicis,' 3) describes the Germans who followed Ariovistus as 'scorning death because of their hope of rebirth' (*θανάτου καταφρονηταί δι' ἐλπίδα ἀναβιώσεως*). In view of what is said of the Gauls by Diodorus, v. 28, and Lucan, *Pharsalia*, i. 454 ff. (with the scholia), it is not unlikely that the reference here is to a belief in metempsychosis, though one cannot deny the possibility that Appian's statement may be due to a misunderstanding of the Valhalla doctrine.

TRANSSUBSTANTIATION.—See EUCHARIST.

TRAPPISTS.—Trappists is the popular name for the Reformed Cistercians, or Cistercians of the Strict Observance, now the chief division of the order.

The art. **MONASTICISM**¹ outlines the successive reforms named after Benedict, Cluny, Cîteaux. By 1600 the Cistercians themselves had yielded to the spirit of luxury, despite the restoration in Spain promoted by Martino de Vargas. Though Richelieu and Mazarin furthered many attempts to recall them to the letter of their vows, and though their centralized constitution might have facilitated this, a general reform was refused. Here and there a few abbays did return to the ideals of St. Stephen Harding, the Jansenist reform of St. Cyr and of Port Royal being well known. Armand-Jean le Bouthillier de Rancé (1626-1700), abbot in *commendam* of La Trappe from the age of ten, abandoned court life in 1662 and entered one of the reformed abbays as a novice. Two years later, having again professed, he came to take charge of his own inaccessible Norman abbey. Finding that the few monks had not shared his experience and would not share his ideals, he pensioned them off and colonized the place from other reformed abbays. The community improved on the original austerities, taking only one vegetarian meal daily, abstaining from literature and from speech except for urgent purposes. The ideals were published by de Rancé in his *Traité de la sainteté et des devoirs de la vie monastique* (1683), and in his posthumous *Règlements généraux de l'abbaye de la Trappe* (1701); but only a single community of nuns and two Italian monasteries adopted them. For a century they were unimportant, though other Reformed Cistercians undertook missions to Africa which had some temporary success.

The French Revolution broke up the home; the abbey was suppressed, and the premises were converted into a foundry for cannon. This was the real birth of the order. In 1791 Dom Augustine de Lestrange, master of the novices, took a score of monks to Val Sainte, Switzerland, imposing a rule stricter than ever; postulants flocked in; colonies were sent to many lands; a congregation was formed, and Dom Augustine was appointed father abbot. When the Trappists were hunted to Poland, Germany, and Italy, their zeal only increased. A nunnery was formed at Stapehill near Wimborne; a party of monks that wandered through Pennsylvania, Kentucky, Missouri, and Illinois returned to France on the fall of Napoleon, occupying La Trappe and Belle Fontaine; presently five priories were established in France, and a great college at Soligni. Before his death in 1827 Dom Augustine saw abbays grow up in Belgium and Italy, besides two more in France. One was founded at Coalville in Leicestershire and named after the great Bernard. The cowl of his friend Alberic was taken in 1848 by an expedition from La Meilleraye in Brittany, which settled in Kentucky at an abbey named Gethsemane. Mount Melleray in Ireland sent another colony to Dubuque in Iowa, and both establishments thrive, though all the fathers are aliens. A second Irish abbey arose at Roscrea in Co. Tipperary.

Outward disasters again intensified the spiritual life. La Trappe was destroyed by fire in Aug. 1871; 1450 fathers and brothers were again expelled from France in 1880; but the austere ideals were embraced by nearly all Cistercians outside Austria-Hungary. After two constitutional changes they were formally recognized in 1892 as the Order of Reformed Cistercians, with an abbot-general at Rome; and this success was crowned six years later by the purchase of the

¹ Vol. viii. p. 792f.

original premises of Cîteaux. In 1903 they were expelled from France in common with most other congregations; two communities went to Nova Scotia and New Brunswick, one to Oregon, one to Brazil; two tiny groups have taken refuge near Kingsbridge and Salisbury. Belle Fontaine has endeavoured to uphold the agricultural ideals of St. Benedict, especially by its Canadian offshoots at La Trappe, where the Ottawa joins the St. Lawrence, at Lake St. John, and in Manitoba. No establishment in England offers even to its co-religionists any educational, medical, or philanthropic service. Settlements in Japan, China, Syria, Asia Minor, Algeria, Belgian Congo, and Natal have undertaken mission work, but no impartial observer has anything to say as to results. The finest Protestant tribute is that an abbey is 'an asylum for the poor and helpless, the shipwrecked, the conscience-stricken, and the broken-hearted.'¹

Attached to each of the 71 monasteries and annexes is a body of brothers who do the rougher field work; in all there are about 2000 of these, and 1600 professed fathers. Twenty-one priories contain 2000 nuns and lay sisters. Three Italian monasteries still follow the rule of de Rancé as once used at La Trappe, but do not belong to the Reformed Cistercians; they have only 50 members.

TRAVANCORE.—Travancore (Malayalam Tiruvitānkūr, 'place where the goddess of prosperity resides'), a native state in the extreme south-west of the Indian peninsula, takes its name from Tiruvankod, 30 miles south of the capital, Trivandrum.

'It has been truly remarked that "it will be difficult to name another land which, within so narrow limits, combines so many, so varied, and such precious natural blessings."²

1. History.—Travancore is said to have formed part of the ancient kingdom of Kerala. During the 11th cent. A.D. it was conquered by the Cholas; in the 13th cent. it was invaded by the Pāndyās of Madura. The present kingdom was founded in the first half of the 18th cent. by Mārtāṇḍa Varma, and in 1795 it became a protected state under the British Government. Since then it has enjoyed prosperity under a well-regulated government, and it has been conspicuous for the maintenance of order, religious toleration, and encouragement of education.

2. Area and population.—The area of the state is 7593 sq. miles, and the total population at the census of 1911 was 3,428,975, of whom 93·8% are rural and 6·2% urban. The density of the population is high: 452 per sq. mile for the whole area, and 686 if mountains, lakes, and forests are excluded.

¹ J. L. Allen, *Century Magazine*, new ser., xiv. 484.

² *IGI* xxiv. 2f.

cluded. The people are of the usual S. Indian Dravidian type, and they preserve many characteristic usages, in particular the matriarchal forms of the household and system of marriage.

'Among the Marumakkatāyom [Malayālam *maru*, 'next,' 'other,' *makkal*, 'children,' *tāyam*, 'portion'] Hindus the family is matriarchal, i.e., traces its descent from a common ancestress. The Tarwād [Malayālam *taravātu*, *tara*, 'village,' *pātu*, 'place'], as the family is called, consists of brothers and sisters and the descendants of the latter along the female line. The eldest male member, called the Kāranavān ['originator'], manages the Tarwād. In such a system the wives and children of the male members have no place. It may happen, however, that a Kāranavān may be allowed to bring in his wife and children to live in the Tarwād, but this is not necessary, nor have they any legal status in the family. The male members who are married usually visit their wives in the houses of the latter. When, however, under modern conditions, they feel able and inclined to support themselves, living apart from the Tarwād, they settle with their wives in houses of their own. In this way the putting up of separate homesteads receives a stimulus. But the Tarwād, as such, is split up only when a partition takes place with the consent of all the members. Among Makkatāyom Hindus the joint family does not generally continue single after the lifetime of the parent, especially the male parent. At the death of the father the sons divide and go and live in separate houses with their wives and children, the mother residing with one of the sons in the original household. The unmarried sons, if any, usually live with the mother. In regard to the Nampūtiri Brāhmins, however, the eldest son alone marries, the other sons living with him in the family.'¹

The chief castes are the Nāyar ([*q.v.*] honorific plural of Nāyan; Skr. *nāyaka*, 'leader') numbering 592,655, best known on account of their peculiar marriage customs.² The Izhuvans or Ilavans, who take their name from Izhām, the Malayālam name for Ceylon, are immigrants from that island, cultivate coco-nut and palmyra palms, make the drink known as toddy (Skr. *tāla*, 'the palmyra tree'), and distil country spirits; they number 546,265. The Pulayans (*pula*, 'pollution'), numbering 185,314, are agricultural labourers. The Channān or Shānān (Tamil *shānu*, 'toddy') cultivate the palmyra palm and make coarse sugar. Brāhmins number 55,643; among them the most remarkable are the Nambūri, Nambūtīri, or Nambūdri (Malayālam *nambu*, 'the Veda'; *othu*, 'to teach'; *tiri*, Skr. *śri*, 'holy'), who aim at following the original Vedic rites and practise elaborate rules of purification, while they allow the younger sons of the family to enter into polyandrous relations with Nāyar women.

3. Religion.—Classified by religion, the population consists of: Hindus, 2,282,617, 66.57%; Christians, 903,868, 26.36%; Muhammadans, 226,617, 6.61%; animists, 15,617, .46%; Jews, Buddhists, and Jains, 100.

(a) *Hindus.*—Of the triad, Brahmā, Viṣṇu, Śiva, the cult of Viṣṇu is most popular; in the form of Ananta Padmanābha ('the endless, from whose navel springs the lotus') he is the patron deity of the state, with a famous temple at the capital Trivandrum, which is visited by crowds of pilgrims. Among the minor deities the following are the chief: Vighneśvara ('obstacle Lord'), the Gaṇeśa or Gaṇapati of other parts of India; Subhramanya, Skanda, Kārttikeya, or Velāyudha, like Gaṇeśa a son of Śiva, the guardian who protects the helpless and punishes the wicked—a cult special to the Tamil and Malayālam peoples; Śāsta ('ruler'), Aiyappan or Aiyānār ('honourable father'), the most popular minor deity, chief of the ghosts (*bhūta*), who rides over the land mounted on a horse or elephant, sword in hand, to disperse all obnoxious spirits. Besides these the lower classes worship a host of godlings or minor spirits, male and female, the females attendants of the goddess Bhadrakālī, the males classed as followers of Śiva.

Nagam Aiyar, *Travancore State Manual*, II. 352 ff.; E. Thurston, *Castes and Tribes of S. India*, Madras, 1909, v. 307 ff.; E. Westermarck, *The Hist. of Human Marriage*, London, 1891, pp. 116 t., 452 t.

(b) *Christians.*—These show a notable increase, from 498,542 in 1881 to 903,868 in 1911. The Hindu compiler of the *Travancore Census Report* for 1911 writes:

'It may be remarked here that the degeneration of the socio-economic institution of caste that showed itself in the sequestration and neglect of the labouring classes, the indifference of lay and ecclesiastical Hindu bodies in the matter of the preservation of their faith as a living force in the intellectual and moral life of the people, the atmosphere of unsuspecting toleration one breathes on all sides, the great sympathy and help accorded by the rulers of the State, the status which the religion itself enjoys, and last but not least, the self-sacrificing zeal and devotion of the missionaries as a class and of the pioneers in particular—all these gave vigour to the work and assured the results. While natural increase has been unsteady and irregular, propagandist activity has been such as to make it difficult to reduce to definite proportions the augmentation which it succeeds in bringing about—so rapid and great it has been.'¹

The following are the details of the Christian population: Syro-Roman, 293,407; Syrian Jacobite, 202,059; Roman Catholic, 173,724; Congregationalist, 81,573; Reformed Syrian, 74,866; Anglican, 56,251; Salvationist, 16,794. The Church Missionary Society commenced work in 1816, the London Missionary Society in 1806, the Salvation Army in 1891.

(c) *Muslims.*—Muhammadan missionaries are said to have visited Malabar as early as A.D. 710, and the story of the conversion of the last of the Perumāls suggests that traders from Arabia arrived as early as the 8th cent. A.D.² In more recent times, under the rule of Haidar 'Alī and Tipū Sultān of Mysore (A.D. 1761-99), compulsory proselytism added large numbers to the faith. The present Muhammadans are either indigenous, immigrants from the Coromandel Coast, or recent settlers from Arabia, Sindh, Gujārāt, Kachh, or Bombay, who came for purposes of trade. The first differ little from the Hindu population except in matters of belief. Those who were converted by the Musalmān kings of Mysore are known as Moplah (Malayālam Māppila, probably 'great child,' an honorary title conferred on converts), or Jonaka, Shonaga, a corruption of Yavana, 'Greek.' The Moplahs are notorious fanatics, and in several cases bodies of them have fiercely resisted British troops. The Mettan are descendants of old Musalmān merchants and of their converts. The Tulukān (Skr. Turashka, 'Turk') belong to the immigrant class.

(d) *Animists.*—Animism prevails widely among the hill tribes. Spirits (*chāvu*, *chāvar*, 'death,' 'the dead') are invoked by those afflicted with disease or suffering from starvation, a long string of the names of ancestors being recited. These spirits are of two kinds: (1) those who have met with a violent death from wild animals; (2) those who have died before the age of seven. They are propitiated by animal sacrifice and oblations of spirituous liquor on a platform erected for the purpose. The forest spirits must be propitiated before a tree is cut, and special patches of the forest are left uncut because they are supposed to be inhabited by some spirit. The hill people also worship godlings who possess neither priests nor temples, the oldest member of the family offering sacrifices and oblations to trees in which they are believed to dwell. Totemism has not been recognized among the hill tribes, but they respect the cow and will not kill the elephant, the vehicle and manifestation of Śāsta. In November-December, the harvest season, they worship their weapons and tools, bows, arrows, sickles, and knives.

TREASON.—See CRIMES AND PUNISHMENTS.

TREATIES.—I. Their place in international law and ethics.—The history of treaties, as formal agreements between nations, ratified by the respective governments, throws some light on the development of international ethics; and the formulæ and ceremonies connected with the sanctions employed at various times, to give validity to the pacts, are of interest to the historian of religion. Throughout the whole of antiquity the gods presided over all treaty-making, and the oath was a predominant factor; the transition from ancient to modern times is marked by a steady decline of this religious element. For the present purpose the juristic aspect of treaties may be ignored. But it is necessary to define their general position in regard to law. They belong to the sphere of what is known as 'international law'; but the rules known as international law 'lie on the extreme frontier of law,'¹ and it is only more convenient, not necessarily more correct, to treat them as a branch of law rather than of morals. The difficulty of regarding them as properly a branch of law lies in the fact that there is no fixed authority (unless it be a universal League of Nations) that can lay down and enforce these rules as between nations, and the rules are liable to be broken with impunity by any nation that has the power and the will to defy them. No pact between two nations can bind a third which was not a consenting party. But treaties, which are one of the most important means by which 'international law' is laid down, are valuable as a record of the development of morality, for the very reason that they 'express national opinion in a peculiarly deliberate and solemn manner.'² The history of treaties accordingly illustrates the growing sense of nations—which, by a legal fiction or a bold metaphor, are moral persons³—for morality in international relations. It also illustrates the constant struggle to discover some means of enforcing the observance of pacts.

¹ Upon a scrupulous fidelity in the observation of Treaties, not merely in their letter but in their spirit, obviously depends, under God, the peace of the world. *Pacta sunt servanda* is the pervading maxim of International, as it was of Roman Law.⁴

In the earliest times of which we have record this fidelity was reinforced by religious ceremonies, calling of the gods to witness, with oaths and imprecations.⁵ In modern times these religious appeals, as also the giving of pledges, hostages, and the like, have generally fallen into desuetude except in the case of treaties with savages, and the observance of treaties has been left to the conscience of the parties; but, as this could no more be relied upon than when it required to be fortified by oaths, one of the chief objects of treaties in modern times has been the establishment of a balance of power in one form or other, so as to make the violation of them a risky undertaking. Finally, the impossibility of obtaining permanent equilibrium between groups of nations has raised the question of a universal League of Nations, which, in the form which it has assumed in the Treaty of Versailles of 1919, may be regarded as the highest development that the treaty has so far reached, since, by creating a determinate authority capable of enforcing the rules, it seeks

¹ W. E. Hall, *Treatise of International Law*, Oxford, 1895, p. 17.

⁴ R. J. Phillimore, *Commentaries upon International Law*, ii. 56.

⁵ See artt. OATH.

to merge international law and (so far as law can make men moral) international morality in one. Previously to this treaty, little had been done in this direction beyond the general recognition that promises and signatures are futile, and that the only security lies in 'the establishment of a just and stable order.'¹ But how to ensure that the wrongdoer who, feeling himself strong enough, wantonly violates his word and destroys the peace of the world or breaks the laws of war shall be punished has seemed an insoluble problem, since his very act implies an assurance of impunity. W. G. F. Phillimore suggested² that each state that is a party to a treaty should contract with each and every other state that is a party, that, in the event of war between it and any other state that is a party to the treaty, it will observe towards the state with which it is at war all the agreed rules of the laws of war; and, if the rules are violated, then any other state party to the treaty may consider it an offence against itself that the law has been violated, such violation being considered an indirect injury, by reason of the lowering of the standard of conduct. The weak point of this arrangement is that interference on the side of law and order is merely permissive; it requires to be made imperative, and its scope extended so as to cover the maintenance of the peace of nations, and not merely the observance of the laws of war.

It is generally agreed that 'international morality—if not international law—calls upon every State to use every means at its disposal, without giving offence—for example, friendly suggestion, moral suasion—to prevent the outbreak of war, or, when it has begun, to help the contending parties to compose their differences. A war between two nations directly or indirectly concerns all nations, members as they are of the international community. There is not and there cannot be any principle of law, of ethics or of religion, prohibiting peaceful States from doing their utmost to bring about a cessation of carnage and devastation.'³

The League of Nations converts this negative into a positive injunction to interpose, and removes the offence from the most forcible methods of doing so. For art. 16 of the Covenant of the League declares that any resort to war in breach of its covenants by a member of the League is an act of war against all other members, which is to be met by a complete severance of relations of every kind, personal, financial, and commercial, with the offender, supported by the necessary military force. The provisions of this article may even be extended to cover the case of a state which is not a member of the League and refuses, in the case of a dispute, to adopt the obligations of membership. It is obvious that even this machinery will not suffice to suppress the ambitions of a state that feels itself strong enough to defy the greater part of the world; but it is equally obvious that such a state will be less ready to take the plunge than it would be if no such machinery existed.

Although the experience of the Great War of 1914–18 dashed the high hopes which were entertained as a result of The Hague Conferences of 1899 and 1907, it is unreasonable to regard those proceedings as a mere 'misprint in the world's history.' They were attended by the representatives of nations so numerous and so important that it was possible to say that in the result of their deliberations 'we have what may be regarded as the common judgment of mankind expressed in the most solemn manner in which an international engagement between nations is capable of expression' on such vital questions as the desirability of substituting arbitration for war.⁴ For the first time, too, an international court was established

¹ W. G. F. Phillimore, *Three Centuries of Treaties of Peace*, p. 146.

² *Ib.* p. 167.

³ Coleman Phillipson, *Termination of War*, p. 75.

⁴ Choate, *The Two Hague Conferences*, p. 34.

to give effect to the principle agreed upon by the conference. Now it is true that this solemn judgment was abrogated by the wanton action of a single one among the signatories, and the whole fabric of international relations tottered. But the foundation remains, to which The Hague Conferences contributed certain elements of solidity, if only by producing unanimity among a greater number of nations than had ever before been parties to a treaty. Such unanimity was secured again among an even greater number, and, when a fresh start was made in 1919, the problem of securing adequate sanction for the engagements between the nations by means of a League of Nations was attacked with the more insight and chance of success, because it was known wherein the old conferences had failed.

Among the chief reasons for the failure of treaties to preserve the peace are the misconception of their object as the termination of war merely, and not also the establishment of permanent peace, and the lack of elasticity in their terms. If they are drawn merely to settle the questions outstanding at the time, without care being taken not to sow the seeds of fresh conflict by imposing harsh conditions, restraining progress and liberty and ignoring the claims of the peoples concerned, they do little more than temporarily suppress forces which break out with the greater violence at the first opportunity. For the same reason, they should not be so rigidly drawn as to prevent reconsideration in the light of new conditions, and should include the necessary machinery for such reconsideration.¹

2. Historical development: antiquity.—(a) The earliest treaties of which we have any detailed record relate to the two cities of Lagash and Umma, on either side of the Shatt-el-Hai in Babylonia.²

Entemena, patesi of Lagash (about 2850 B.C.), records an arbitration of earlier date in the time of Mesilim, king of Akkad. The actual patesis of Lagash and Umma are not named; the dispute is settled by the gods; the god Enlil presides over the conference and invites the parties to make the treaty; the boundary is fixed at his command by Ningirsu, god of Lagash, and by the city-god of Umma; even Mesilim acts only at the command of his goddess Kadi. This is obviously an extreme instance of the religious sanction; the parties are supposed to live and move and have their being entirely in their local gods.

A second treaty between the same two cities was made about 2900 B.C. by Eannatum, patesi and king of Lagash, and Enakalli, patesi of Umma. A great boundary-ditch was dug, and the plain of Gu-edin, which was in dispute, was restored to Ningirsu, god of Lagash. Shrines to Enlil, Ningirsu, and other gods were erected along the new frontier beside the pillars of delimitation, and it was doubtless at the altars of these shrines that the parties took oaths in ratifying the treaty: 'On the men of Umma have I, Eannatum, cast the great net of Enlil. I have sworn the oath, and the men of Umma have sworn the oath to Eannatum.' He invokes the vengeance of Enlil on the men of Umma if they 'alter this word.' He also invokes other gods, to whom he has made suitable offerings, to enforce the treaty.

In the third treaty, the terms of which were imposed on Umma by Entemena of Lagash (about 2850 B.C.), we have a similar imprecation: 'If the men of Umma ever violate the boundary-ditch of Ningirsu or that of Nina, in order to lay violent hands on the territory of Lagash. . . then may Enlil destroy them, and may Ningirsu cast over them his net, and set his hand and foot upon them.' The imprecations recall those which are invoked on the violators of Babylonian boundary-stones; naturally the same means were employed to secure the validity of legal engagements of all kinds.

(b) The famous treaty between Rameses II. and Khetasar (Hattusil), prince of the Hittites (c. 1300 B.C.), is recorded in three copies, of which two are hieroglyphic, at Karnak and in the Ramesseum, while the third is the Hittite-Babylonian version, or rather fragments of two copies thereof, from Boghaz Keui.³ Two Hittite envoys brought the

text of the treaty written on silver tablets, the design of which is described:

On one side 'a figure in the likeness of Setekh, embracing the likeness of the great chief of the Kheta, surrounded by the words: "The seal of Setekh, the ruler of the heavens; the seal of the treaty which Khetasar . . . made." That which is within the frame of the design is the seal of Setekh, the ruler of the heavens. That which is on its other side is a figure in the likeness of the goddess of Kheta, embracing the figure of the princess of Kheta, surrounded by the following words: "The seal of the Sun-god of the city of Arinna, the lord of the land; the seal of Petkhep, the princess of the land of Kheta, the daughter of the land of Kezweden, the priestess (?) of Ernen, the mistress of the land, the votaress of the goddess." That which is within the frame of the design is the seal of the Sun-god of Arinna, the lord of every land.'

Thus the treaty is reinforced by being placed under the seals of the gods themselves. In addition we find the following invocations, corresponding to similar paragraphs usually attached to other documents which were intended to be permanently valid:

'As for the words of this contract . . . a thousand gods, male gods and female gods, of those of the land of Kheta, together with a thousand gods, male gods and female gods of those of the land of Egypt, they are with me as witnesses to these words: "the Sun-god, lord of the heavens," and various other gods, including those "of the mountains and the rivers of the lands of Kheta and of Egypt, of the heavens, the earth, the great sea, the winds, and the clouds." These are invoked to desolate the house, the land, and the subjects of the violator of the treaty, and, as for him who keeps it, to preserve his health, and his life, together with his issue, his land, and his subjects.

(c) The covenants recorded in the OT are for the most part between single persons; but certain forms and ceremonies were doubtless common to such covenants and international treaties. Such were the setting up of a pillar and a heap of stones as witness, the invocation of the God of Abraham and the God of Nahor, Jacob's oath 'by the fear of his father Isaac,' and the sacrifice and eating of bread in the mountain, in the covenant between Jacob and Laban (Gn 31⁴⁴⁻⁵⁴). The treaty between Isaac and Abimelech (Gn 26^{28ff.}) is similarly accompanied by feasting and oath-taking. In Joshua's peace with the people of Gibeon the princes of the congregation swore by the Lord God of Israel (Jos 9^{15, 19}). The ceremony of cutting an animal in twain and passing between the halves was used by the Hebrews in covenants between God and man (Gn 15^{7ff.}, Jer 34^{18ff.}),¹ as by other nations in connexion with purification and oath-taking; but the derivation of the phrase כרת ברית from this division of a victim is doubtful, to 'cut a covenant' being rather parallel to *ἔκτατα ῥάμνευ* and *fœdus ferire* or *percutere* or *icere*;² whether these phrases refer to the cutting down of the victim, however, seems uncertain.

(d) The writers of antiquity give details of a number of more or less picturesque ceremonies accompanying oath-taking in treaties between less civilized nations. Of these the most important is the blood-covenant.³

The Scythians mixed wine with their own blood in a bowl, dipped their weapons into it, took oaths and uttered imprecations, and finally pledged each other in the mixture.⁴ The Arabians made the incision with a sharp stone, smeared the blood on seven stones, and invoked Orontak (Dionysos) and blood on seven stones, and invoked Orontak (Dionysos) and blood on seven stones, and invoked Orontak (Dionysos) and blood on seven stones. The *locus classicus* is Tac. *Ann.* xii. 47 (the Armenians suck each other's blood): 'id foedus arcanum habetur, quasi mutuo cruore sacratum.' It was also in later days a Saracen custom, and it was a reproach to Isaac Angelus that he conformed to it in making peace with that nation.⁵ Other ceremonies are collected by Dumont.⁷ In China the

Ancient Records of Egypt, Chicago, 1905-07, iii. [1906] 373-391; S. Langdon and A. H. Gardiner, *Journal of Egyptian Archaeology*, vi. [1920] 179-205. The passage quoted is from the Egyptian version, in which the Egyptian scribe has turned the Hittite sun-goddess into a male deity.

blood-covenant was also in use, and treaties were confirmed by oaths and imprecations and accompanied by the sacrifice of an ox. In a treaty of 544 B.C. the formula is: 'May the gods of the hills and the rivers, the spirits of former emperors and dukes, and the ancestors of our seven tribes and twelve States watch over its fulfilment. If any one prove unfaithful may the all-seeing gods smite him, so that his people shall forsake him, his life be lost, and his posterity cut off.'¹

(e) Coming to the Western nations, we find that the international relations depicted in the Homeric poems, though primitive, include the making of truces, with oaths, for the burning of the dead;² oaths, invocation of the gods, imprecation on the treaty-breaker, with sacrifice and feasting, also accompany a treaty between Greeks and Trojans.³ In the historical period in Greece we find certain primitive survivals, as when Aristides administered the oath to the Greeks and took it himself on behalf of the Athenians, throwing pieces of hot iron (*μύδροι*) into the sea. But as a rule the oaths are the ordinary ones (*νόμιμοι ὄρκιοι*) in the name of the chief gods (*ὄρκοι*); or, as in the alliance between Athens, Argos, Mantinea, and Elis (420 B.C.), the instruction is that each party should swear its most binding national oath over perfect victims (*τὸν ἐπιχθρόν ὄρκον τὸν μέγιστον κατὰ ἱερῶν τελείων*). The tendency is to increase the number of gods invoked, in the futile hope of increasing the force of the oath.

In a treaty between Carthage and Philip v.4 in 216 B.C. the following deities are invoked: Zeus, Hera, Apollo, the Genius (*δαίμων*) of the Carthaginians, Heracles and Iolaos, Ares, Triton, Poseidon, the gods of the army (*θεοὶ οὐ στρατηγούμενοι*), the Sun, Moon, and Earth, the rivers, harbours, and waters, all the gods who rule Carthage, all the gods who rule Macedon and the rest of Greece, all the gods who preside over the campaign (*οἱ κατὰ στρατείαν*). The Magnesians in allying themselves with Smyrna (mid. 3rd cent. B.C.)⁵ swear by Zeus, Earth, Sun, Ares, Athene Areia, Artemis Tauropolis, the Sipyrene Mother, Apollo ὁ ἐν Πιάδος, all the other gods and goddesses, and the Good Fortune of King Seleucus. The Smyrnaeans substitute Aphrodite Stratonikis for Apollo and omit the Good Fortune of the king.

The inscriptions frequently omit the instructions as to the gods in whose names the oaths are to be taken, prescribing merely the nature of the undertaking, as:

'I will fight for the Bottiaens who enter into the pact, and will keep the alliance with them faithfully and without guile, showing all zeal according to the pact; and I will bear no ill-will because of what has happened in the past.'⁶

Formulae of imprecation frequently accompany the oath; in the simplest form (as in the alliance between Athens and Corcyra in 375 B.C.)⁷ it is: 'If I keep the oath, may much good befall me, but if not, the contrary'; but destruction is sometimes invoked on the perjurer and all his house.⁸ The inscriptions give some information as to the machinery for administering the oath.⁹ The more distinguished the oath-taker, the more solemn was the oath. Frequently the oath was taken *en masse*; thus in the peace with Selymbria (408 B.C.)¹⁰ the Athenian generals, trierarchs, hoplites, and 'any one else who was there' took the oath for Athens, while the whole people of the Selymbrians swore on the other side. Provision was sometimes made to keep the consciences of the parties alive by a periodical renewal of the oath—e.g., at each Olympiad (Eretria and Histiaea)¹¹ or every year (Athens and Dionysius I.).¹²

The gradual moralization of international rela-

¹ C. Phillipson, *Internat. Law and Custom of Anc. Greece and Rome*, I. 387 f., who adds that 'amongst the uncivilized races of to-day the formal oath, imprecation, and sacrifice—sometimes of human victims—are the invariable accompaniments of the conclusion of treaties.'

tions in the Greek world is well illustrated by the treaties of *asylia*, which have for their object to do away with the rough-and-ready methods of reprisals between individuals or states.¹ The most famous instance is the treaty between Æantheia and Chaleion (5th cent.), restricting seizures to the open sea, imposing fines for breach of the regulations, and prescribing the proper tribunals for trying cases.² The Greek attitude to the ethics of treaties does not differ from that of other nations; practice also, as usual, fails to conform to precept, and there is the customary laying of the blame for breach of oath on the other party.

Archidamos before Platæa calls the gods and heroes of the Platæans to witness that it was they and not the Lacedæmonians who first broke their oath.³ The Athenians took the trouble to record a breach of faith by the Lacedæmonians on the stone on the Acropolis which bore the text of the broken treaty.⁴ Again, the Athenians and Cæians inscribed on a stone the names of certain people of Iulis who had broken faith and been condemned to death; these people, however, returning to Ceos, tore up the stone; and, finally, the Athenians again provided for the restoration of the stone with the names of the offenders (363 B.C.).⁵

(f) Roman usage shows, as might be expected from the Roman legal genius, a more highly organized conception of international relations. The whole procedure of making treaties was laid down, and carried out by a definite body of officials, the college of *fetiales*, whose function was⁶ to be the guardians of good faith in international relations.⁷ This religious body represented the Roman people in all public international acts, such as making war and peace. Their origin was early, and was attributed to one or other of the kings; in fact neighbouring communities, such as the Latins and Samnites, had analogous magistrates, so that the institution must have been Italic in origin. The derivation of their name is uncertain. There were twenty in the college, one from each *curia* of the two primitive tribes, Ramnes and Titienses, men of good family, in early days at least of course non-plebeians. Their head was known as the *magister fetialium*. A fetial mission for contracting a peace consisted of at least two, the *pater patratus* and the *verbenarius*. The procedure was as follows, supposing that the peace was to be made outside Rome.

The *verbenarius* inquired whether he and the *pater patratus* were to make peace; if so, he asked leave to take the *verbene* (*herba pura*, or *sagmina*), i.e. a piece of turf from the soil of the Capitol, which rendered the persons of the mission inviolable (we may compare the legal fiction by which the site of an embassy is now considered to be the territory of the nation it represents). The fetials also carried with them sacred vessels, the sceptre of Jupiter Feretrius, and a flint knife (representing Jupiter Lapis, a primitive touch) from his temple. The *pater patratus* wore priest's clothing, not of linen, and a woollen fillet on his head. The *verbenarius* selected him from his colleagues by touching his head with the *sagmina*. They proceeded to the place selected, and, in presence of the generals and armies, and the fetials of the enemy, the terms of peace were read, and the *pater patratus* swore to them on the sceptre of Jupiter Feretrius, calling to witness Jupiter, Mars, Quirinus, and all present. He then slew a pig⁸ with the flint knife, invoking death on the Roman people if they should break the peace. Then he threw away the stone (a detail recalling the throwing away of the axe in the Attic *Buphonia*) saying: 'If I wittingly violate my oath, may all others prosper, while Jupiter casts me out, even as I cast away this stone.'

The scene of the swine-sacrifice by fetials is represented on Roman coins of the time of Augustus commemorating the ancient treaty between Rome and the Gabines, and an analogous sacrifice by warriors, evidently engaged in making a treaty of some kind, is a common type on other Roman coins, as well as on those of the Italic revolt.

against Rome in 91–88 B.C.¹ When Livy² describes a similar ceremonial among the Carthaginians, substituting a lamb for a pig, he is perhaps only attributing Roman customs to them; Polybius³ is careful to distinguish, saying that the Carthaginians swear by their own gods, while the Romans perform the ceremony evidently regarded as peculiar to themselves. After the ceremony the fetials signed the text and brought it to Rome, and the whole college pledged itself to secure that it should be duly observed. It is hardly too much to say that the account given of the functions of the fetials reveals as highly organized a system, and as dignified a conception of the legal essence of the treaty, as has ever been realized. But it is a mistake to suppose that this organization is the expression of a high ethical standard.⁴

3. Middle Ages and modern times.—(a) The *Pax Romana* makes records of treaties during the empire scanty.⁵ The swearing of oaths lingers on into the modern period.

In the treaty between Justinian and Chosroes (A.D. 561) the 12th article contains the invocation of God and the prayer that God may be compassionate to him who keeps the peace and may fight on his side, but that he may be the adversary of the deceitful man who seeks to overthrow the pact. The oath taken in the treaty of Andelot between Guntram, king of Burgundy, and Childebert, king of Austrasia (A.D. 567), is 'by the name of Almighty God and the indivisible Trinity, and all things divine, and the awful Day of Judgment.' In 842 Louis II. of Germany and Charles II. of France swear 'per Domini Dei amorem et Christiani Populi et nostram communem conservationem.' A treaty made in the 12th cent. by the city of Spalato⁶ contains an imprecation: 'in the name of the Triune God, of the 113 Fathers, the 12 Apostles and all the Saints.' The oath is sometimes taken over relics, but most commonly over the Holy Gospels; e.g., in the peace between Pope Alexander III. and the Emperor Frederick I. (1177) the representatives swear: 'Iuramus in manibus vestris super haec sancta Dei Evangelia quod pacem . . . bona fide servabimus, et absque fraude. Sic Deus nos adiuvet, et haec Sancta Dei Evangelia.'

The formula 'Iurer en son âme,' 'Iurare in animam suam,' appears frequently in treaties between England and France or the Low Countries.

Excommunication was the logical sequel to violation of a treaty-oath (as specified, e.g., in the truce for the renewal of the *Treuga Domini* at the Council of Narbonne, 1054). Gradually the oath fades away into the promise.

In the treaty of commerce between Henry VII. and Philip, Duke of Burgundy (1495), the commissioners, in a declaration 'to all faithful Christians . . . Eternal Greeting in the Lord,' *bona fide* promise and oblige themselves, on the pledge and obligation of all their goods present and to come, to procure the observance of the treaty; their obligations are to be delivered to the deputies of each side in the church of the Virgin Mary at Calais. The king's undertaking to ratify the agreements made by his commissioners is given '*bona fide* and on the word of a King,' and the duke promises '*bona fide* and on the word of a Prince.' In the treaty of 1604 between Philip III. of Spain and James I. of England the gradual obsolescence of the oath is markedly visible in the clause: 'They shall make a like promise on the word of a King and Prince, and even swear on the Holy Gospels, if they are thereto required by the other party.'

The most modern example of an oath is said to be that taken in the cathedral of Soleure in the alliance between France and Switzerland in 1777. Thus finally disappeared that element which was, 'in a certain sense, the underlying basis of the whole body of the ancient laws of nations.'⁷

It was not uncommon for a party to a treaty to obtain absolution from his oath.

Thus Maximilian I., a few months before the League of Cambrai (1508), had made a treaty with Venice; one of the articles of the League summoned him by a papal brief to the

aid of the Church and gave him reasons for breaking his oath. The pope dispensed François I. from his oath taken in the Treaty of Madrid (1526) and Henri II. from his oath at Vaucelles (1550).

A second clause was sometimes inserted, intended to prevent any party from seeking, or accepting the offer of, dispensation from his oath (e.g., in the cession of the Spanish crown to Charles III. in 1703).¹ But, since release from this second obligation could obviously be obtained in the same way as from the first, it was as futile as an attempt to prevent the repeal of a law by inserting a clause imposing a death-penalty on any one who should propose such repeal. Modern treaty-custom recognizes the vanity of all such artificial supports to good faith.

The most sweeping and perhaps most futile example of absolution from a treaty-oath is provided by the bull of Pope Innocent X. describing numerous articles in the Peace of Westphalia (1648) as 'null, vain, invalid, iniquitous, unjust, condemned, reprobated, frivolous, void of force and effect,' and dispensing anybody who pleased from his oath taken thereto.² The explanation of this outburst lies in the fact that this treaty was 'the first fundamental pact of Europe which struck at the root of the foreign temporal authority of the Pope.'³

The king in recent treaties merely engages and pronounces upon his royal word that he will sincerely and faithfully perform and observe the terms of the contract.⁴ Finally, the parties to the Treaty of Versailles (1919) merely 'agree' to the covenant of the League of Nations and the closing formula is simply: 'In Faith Whereof the abovenamed Plenipotentiaries have signed the present Treaty.'

(b) Religious formulæ are also used to a considerable degree as introductory clauses from mediæval times onwards, but in this feature treaties merely fall into line with all important documents. The commonest introductory formulæ are 'In the name of the Most Holy and Undivided Trinity' (e.g., in the treaty between Charles the Simple and Henry I. of Germany, 926, or in the Treaty of Vienna, 9 June 1815) and 'In the name of our Lord Jesus Christ.' A more florid style is naturally observable in the treaty between Frederick II. and Abu-Zakaria-Yahia, king of the Saracens of Tunisia, in 1231.

'In nomine Dei misericordis, miseratoris. Incipimus cum laude Dei maximi et invocatione illius prelaudata, petimus prosperitatem. Laus Deo, scienti abscondita, futura, extantia, qui est eternus, post finem omnis viventis.'

The importance of the religious sanction made it long a moot point whether nations of different religions could make valid treaties with each other (a point, however, which Grotius decided in the modern sense), or, again, whether it was obligatory on all Christian nations to be leagued together against the infidel. In modern times it is recognized that treaties are governed by natural law alone, and the religious element, either in the content or in the phraseology of treaties, has naturally become much less discernible—to such a degree that the profession of Christian principles in the Holy Alliance (26th Sept. 1815) between Austria, Prussia, and Russia makes a deep and justifiable impression of insincerity.

In this remarkable alliance (the real object of which was anti-revolutionary) the contracting parties 'solemnly declare that the present Act has no other object than to publish in the face of the whole world their fixed resolution, both in the administration of their respective States and in their political relations with every other Government, to take for their sole guide the precepts of the Holy Religion, namely the precepts of Justice, Christian Charity and Peace, which . . . must have an immediate influence on the Councils of Princes and guide all their steps as being the only means of consolidating human institutions and remedying their imperfections.'

It is significant that the pope was not invited to join this alliance, and that Britain was prevented

⁶ Dumont, *I. Int.*

⁷ Phillippson, *Int. Law and Custom of Anc. Gr. and Rome*, i. 389.

from doing so 'by the forms of the British constitution.'¹

(c) Apart from professions of this sort, the actual protection of the religious freedom of peoples involved in a settlement by treaty has often formed the subject of special articles.²

An early and remarkable instance is in the treaty between Justinian and Chosroes, in A.D. 561, in which a special article provided that Christians in Persia should enjoy freedom of worship, and on their own part should not attempt to make proselytes among the Magi. In modern times the Treaty of Westphalia marked an advance in religious toleration. The Treaty of Paris in 1763, recognizing the conquest of Canada, made special provision for liberty to the new Roman Catholic subjects of the king of Britain to follow their own religious worship. The Treaty of Oliva in 1660 (between Poland and Sweden) protected the co-religionists of either power in the territory of the other. In 1867, when Russia ceded Alaska to the United States, it was provided that the civilized inhabitants should not be interfered with in their religion. And in 1913, by the Treaty of Constantinople, Muslims resident in Bulgarian territory were guaranteed the enjoyment of religious liberty, and the name of the sultan as khalif was to continue to be pronounced in their public prayers. 'It is incumbent on the acquiring sovereign to allow to the inhabitants of the annexed territory the free exercise of their religion when it is not incompatible with good order and the fundamental dictates of morality. The obligation is not, of course, a legal one, but its sanction is rooted more deeply than that of positive enactments.'³

Hence the necessity of actual stipulations, such as those enumerated, is not usually felt.

(d) Of more importance, as indicating moral progress, than professions relating to religious principles, or even than provisions for religious freedom, is the degree of solicitude shown by the contracting parties for the general interests of the people. W. G. F. Phillimore⁴ remarks that, except in the matter of religious toleration, the Treaty of Westphalia paid scant regard to the interests of the people. From 1648 to the recognition of American independence in 1783 the chief consideration in treaties is paid, as in older days, to the rights and interests of sovereigns and reigning families. In the next period, down to 1859, there is increased recognition of the rights of states. Still, by the General Act of the Congress of Vienna, *e.g.*, states and populations were trafficked in, with absolute disregard of the peoples concerned, who might as well have been slaves or cattle.

Since 1859 'little regard is paid to the supposed rights and interests of individual sovereigns or reigning families, and a new principle has arisen, viz. the rights of nationalities.'⁵

4. Conclusion.—Certain moral considerations which arise in connexion with treaty-making and treaty-breaking may be stated, though no solution is necessarily offered of the questions involved.

(a) The construing of treaties is a matter of equity. They are covenants *bonae fidei*, and are not therefore to be technically construed.

'Discrimen actuum bonae fidei et stricti juris, quatenus ex jure est Romano, ad jus gentium non pertinet.'⁶ The principle of the *Digest*, 'voluntatem potius quam verba spectari placuit,' applies with especial force.⁷ 'There is no place for the refinements of the courts in the rough jurisprudence of nations.'⁸

In antiquity a famous instance of the breach of this principle was the murder of Hippas by Paches.⁹ The classical example in modern writers, however, is the action of the French who, having destroyed the fortifications of Dunkirk in accordance with the Treaty of Utrecht, proceeded to construct a still stronger place at Mardick, a few miles away. The principle by which a provision may be 'extended' so as to include a case to which the same reason applies as applied to the case

⁹ Hall¹, p. 356.

originally envisaged, or may be 'restricted,' so that an ally excludes the application of a provision to a case obviously improper (as when, having promised to aid an ally in all its wars, it is asked to join in an unjust war)—this principle of extensive or restrictive interpretation assists contracting parties in adhering to the spirit rather than the letter of the treaty.¹

(b) Since governments are representatives of justice, morality, and religion, it is assumed² that a treaty containing an engagement to do or allow that which is contrary to morality or justice is invalid. 'Pacta, quae turpem causam continent, non sunt observanda.'³ Since a large number of treaties are forcibly imposed on a conquered by a conquering state, it is obvious that this principle provides innumerable opportunities for dispute and repudiation, under the next heading.

(c) How far is a treaty invalidated by the employment of force on the part of one of the parties? To this it is generally agreed to answer that there is no force in the plea that one of the parties consented through fear, or in face of superior force, such as would invalidate a private contract, since such treaties are only a way of terminating war, which is entirely determined by force. 'No inequality of advantage, no lesion, can invalidate a Treaty.'⁴ But it is equally clearly held that treachery or duress exerted against the representative of a state amply justifies the repudiation of a treaty. The classical instance is Napoleon's extortion of terms from Ferdinand VII. at Bayonne.

(d) Fraud is also clearly held to invalidate a treaty, for then there is no real freedom of consent on the part of the deceived party.⁵ The distinction is sometimes a little delicate between positive fraud and *suppressio veri*.

In the negotiations for the Webster-Ashburton Treaty (1842) Webster suppressed a map which was favourable to the British cause. The map could have been found, as Greville admitted, if the British authorities had caused proper search to be made, and Lord Ashburton agrees that he had no legal cause for complaint.⁶ Yet it is to such cases as this that the remark of Hall⁷ may be applied: 'It is recognized that there is an international morality distinct from law, violation of which gives no formal ground of complaint, however odious the action of the ill-doer may be.'

(e) The question of how far a party can liberate itself from obligations has been brought into special prominence by Germany's repudiation of its pledge to Belgium in 1914. To the doctrine that 'necessity, when real and *bona fide*, overrides the obligation of the promise' R. J. Phillimore⁸ replies:

'It is manifest that the State, like the Individual, which takes advantage of every change of affairs to disengage itself from the obligations of a solemn covenant, weakens the foundations of that good faith on which the peace of the world depends.'

So too Hall:⁹

'Modern writers, it would seem, are more struck by the impossibility of looking at international contracts as perpetually binding, than by the necessity of insisting upon that good faith between States without which the world has only before it the alternatives of armed suspense or open war, and they too often lay down canons of such perilous looseness, that if their doctrine is to be accepted, an unscrupulous State need never be in want of a plausible excuse for repudiating an inconvenient obligation.'

Pedants such as those on whom Frederick the Great relied to justify his acts are to be found in all ages and countries. The Conference of London (1871) made the declaration:

'It is an essential principle of the law of nations that no Power can liberate itself from the engagements of a treaty, or modify the stipulations thereof, unless with the consent of the contracting Powers by means of an amicable arrangement.'

This declaration, which was signed by all the

leading Powers of Europe, was provoked by Russia's attempt to evade its obligations under the Treaty of Paris of 1856, on the ground that lapse of time had changed the conditions. Although no specific declaration to the same effect appears to be included in the covenant of the League of Nations or in the treaty with Germany, the case seems to be covered by article 16, which provides for the prevention or punishment of breaches of covenant in general.

(f) How far does honour demand the intervention of one of the guarantors, in the case of a collective guarantee, when agreement is not reached between all parties?¹ Bluntschli holds that each guarantor is bound to act separately in such a case. Lord Derby (in connexion with the Luxembourg Convention of 1867) held that honour (but not legal obligation) compelled each guarantor, in concert with the others, to maintain the engagements; but that, if concerted action was not obtainable, then a guarantor would have the right, but not necessarily the legal obligation, to act. It is obvious that this difficulty could be avoided by care in drafting, and that, unless Bluntschli's view be accepted, the collective guarantee is not likely to be very valuable until we have reached a higher code of international honour than prevails at the present time. The covenant of the League of Nations meets the case by making joint intervention obligatory on all its members.

TREES AND PLANTS. — I. Introductory. — All plants are sacred. This principle of the followers of Zoroaster lies at the root of all plant-lore, all tree-cults. All plants possess the gifts of immortality and health.² The subject enters into every form of religion, and its ramifications are traceable in different aspects and degrees from the tree of life to the May-pole. It rests on the earliest conceptions of the unity of life in nature, in the sense of communion and fellowship with the divine centre and source of life. The oak of Mamre, the ash Yggdrasil, the *ashêrâh*, the oak of Dodona, the *Ficus ruminalis*, the Bodhi-trees,

the pine-cones, and the seven-branched candlestick, even the modern Christmas-tree with its lights and its fruit and its filets, are instances of the vast area in folk-lore, tradition, and social custom which has been influenced by early reverence for the sacred tree.

The sacred tree is thus deeply rooted in the primitive religious ideas of the human race. The spring, the rock, the tree are all visible manifestations of the divine spirit. They are found associated in the most ancient sanctuaries as different symbols of life; and this life, in earth or water or tree, is one with human life. The same divine spirit lives and works in all and manifests itself in each and all. The secret of religion is the recognition of this life as divine; its duty is the obligation of fellowship and worship which comes of this recognition.

In the earliest stage the sacred tree is more than a symbol. It is instinct with divine life, aglow with divine light. It is at once the tree of life and the tree of the knowledge of good and evil. This animistic stage is traceable in folk-lore and myth, in traditional survivals in later ritual, and in savage cults in more recent and even modern times. In the history of religious development it lies behind the historic era. The burning bush, living and aglow with the divine voice, gives a conception of this earliest stage.

In the second stage the sacred tree is planted in holy ground. It is representative of the deity. It is the dwelling-place of the deity. The priest-king is its champion, and is himself the embodiment or incarnation of the god.¹ It is as priest-king at Mamre that Abraham arms his trained servants and leads them against the kings of the earth. It is an archaic survival in an archaic fragment (Gn 14^{18a}). The champion of the tree-god must be loyal to the cult. A new sanctuary must be consecrated by the planting of the sacred tree, though not always of the same tree. The oak-Zeus of Dodona adopted under certain conditions the white poplar and the plane. Abraham, the champion of the oak or terebinth of Mamre, planted a grove, i.e. a tamarisk, at Beersheba. Agamemnon, as guardian of a sacred tree, and himself enjoying the divine title *ἀναξ ἀνδρῶν* and worshipped as a chthonian Zeus in Laconia, planted a plane-tree at Delphi and another at Caphyæ in Arcadia.² These plantings are examples of the second, or representative, stage of tree-worship.

The third is the symbolic stage. The 'grove,' or *ashêrâh*, the common adjunct of the Canaanite shrine, is the most familiar example of this stage. It was a wooden pillar, representative like the living tree of the deity, 'the token of the deity's presence or a magnet for attracting it.'³ There are traces of it in the sanctuaries at Samaria (2 K 13⁶), at Bethel (23¹⁵), and even in the Temple at Jerusalem (23⁶).

The differentiation of the one deity into the 'gods many and lords many' of local and national cults led to the iconic representation of the tree-god. The stump takes human shape. The Hermæ, wooden or stone pillars swelling towards the top, were crowned with the head of Hermes. The rude figure of Priapus as protector of gardens was of a similar character. The *caduceus* of Hermes, a wand with a triple shoot, may refer also to his origin as a tree-god.⁴ Silvanus is represented in a similar form, with his sacred pine and also with the *caduceus* as a symbol. And in this connexion the statement of Pausanias

and Pliny is significant, that in ancient times the images of the gods were made of wood.¹ And with the differentiation of the deity into the gods of the nations there came the differentiation of the tree into the trees sacred to the several gods. The oak was specially sacred to Zeus. The *Ficus ruminalis* of the Palatine was originally the sacred tree of Rome, though Jupiter was associated with the oak on the Capitoline Hill.² The cult, in early times as wide as the world, was narrowed when no sanctuary could be dedicated to Apollo which was unfavourable to the growth of his sacred laurel.³

Primitive worship was essentially an act of fellowship and communion with the deity. The vestment of the worshipper was the sheep-skin or the goat-skin specially sacred to the deity worshipped, as the white robe of righteousness is the symbolic vestment of the Christian worshipper. This is generally traceable in theriomorphic cults, as in the Lupercalia. But it is traceable also in tree-worship. The victor in the Olympic games was treated as the human representative of the tree-god. He was decked with olive and crowned with a helmet filleted and crested with the twig of the sacred tree.⁴ The English Jack-in-the-Green of the old May-day sports and the Kentish Holly-boy and Ivy-girl of the Shrove-tide revels⁵ are reminiscences of this worship.

Sacrament and worship are closely linked together. In the archaic tradition of Abraham (Gn 14¹⁸) Melchizedek, king of Salem, brought forth bread and wine; and he was 'priest of the most high God' (El Elyon). Sacramental communion with the deity is the essence of the mysteries, and the mysteries belong to the primitive stages of religion: 'I fasted; I drank the kykeon; I took from the basket.' This was the touching of the *saera*, the sacramental core of the mysteries of Eleusis. They were rites sacred to Demeter the Earth-Mother.⁶ She is the Mountain-Mother (*g.v.*), the mother of the gods, represented with her pillar-shrine, the pillar of her sacred tree. She may be compared not only with Isis, but with Hathor and her sacred sycamore. Hathor nourished the wandering souls in the cemeteries of Egypt with food and drink. The Cretan Demeter in her mysteries nourished her mystics in life. The mysteries of Dionysus belong to the same cycle of ideas. Dionysus combined in himself the rites of the beer-god Sabazios of Thrace and of the mystery-god Zagreus of Crete.⁷ The *haoma* of the Persians, the *soma* of the Hindus, the *ambrosia* of the Olympian gods, were all means of sacramental communion, a partaking of the tree of life.⁸

The sacred tree, instinct with the divine life, is vocal with the word and the will of the deity. A prominent feature of the Zeus-cult of Dodona was its oracle. 'And the giving of oracles was a chthonian prerogative.'⁹ David is to consult the oracle of the mulberry-trees before he attacks the Philistines (2 S 5²⁴). God called unto Moses from the midst of the bush in Horeb (Ex 31⁴). The sacred tree is alight with the wisdom of God. To partake of the acorns of Zeus was to acquire wisdom and knowledge.¹⁰ The burning bush points to the symbolic meaning of the seven-branched candlestick in the Temple. It is a budding and blossoming almond (Ex 37¹⁷⁻²⁴). The imagery of the rod out of the stem of Jesse, and the Branch growing out of his roots, the setting of

the sevenfold gift of wisdom, is another illustration of the same truth (Is 11¹⁻³; cf. LXX). And this again illuminates the meaning of the tree of the knowledge of good and evil (Gn 2¹⁷). It is the oracle of the God of righteousness, as the seven lamps are 'the eyes of the Lord . . . beholding the evil and the good' (Ps 15³; cf. Zec 4¹⁰, 2 Ch 16⁹). The tree of knowledge is the oracle of religious and moral wisdom.

2. The animistic stage in tree-worship.—The tracing of this stage in its original simplicity is almost as elusive as animism itself. In pre-historic times it was already being absorbed in higher religious conceptions and revelations, in the higher physical and religious and ethical development of the human race. Jahweh 'finally triumphed over the *be'ālim*, not by avoiding them, or by destroying them, but by absorbing them.'¹ This is the principle in all religious development. The burning bush was not merely the oracle of Horeb; it was the dwelling-place of Jahweh (Dt 33¹⁶). The fable of the trees and the bramble king was spoken 'by the plain [oak or terebinth] of the pillar that was in Shechem' (Jg 9⁶⁻²¹). It is a survival of ancient religious conceptions, an apologue or parable familiar in early tree-worship. The story of the thistle and the cedar is another (2 K 14⁹).²

¹Tree-worship pure and simple, where the tree is in all respects treated as a god, is attested for Arabia . . . in the case of the sacred date-palm at Nejran. It was adored at an annual feast, when it was all hung with fine clothes and women's ornaments.³

The sacred *erica* in the temple of Isis at Byblos was said to have grown round the body of Osiris. It was a stump wrapped in a linen cloth and anointed with myrrh. It represented the dead god. It is suggested that this explains the mystery of the draping of the *ashērāh* (2 K 23⁷).⁴ There are similar survivals in Greek ritual. Incense was burned and the tree was decked with fillets and honoured with burnt offerings. Mrs. Philpot gives⁵ an illustration of a fruit-tree dressed as Dionysus—another example of draping as part of this early ritual. Cook in his exhaustive monograph on the cult of the oak-Zeus⁶ has traced it through all the earliest sanctuaries of the Mediterranean area, especially in Dodona and Crete, and has given his conclusion as follows:

'Zeus was at each of these cult-centres conceived as a triple divinity (sky-god+water-god+earth-god) dwelling in a sacred oak and served by a priestly-king, who was regarded as an incarnation of Zeus himself and whose duty it was to maintain the sun's heat by magical means.'⁷

The Minotaur, the Ægean horns of consecration, and the axe⁸ are also features in this ancient ritual.

This survey of the primitive cult is a key to the early worship of the sacred tree, not only in Celtic folk-lore and Gaulish sculpture, but in the survivals of pagan worship. E. Clodd gives a study of the 'primitive pagans' of S. Nigeria which sums up the animistic conception of tree-worship.

'A recent traveller among the "primitive pagans" of Southern Nigeria reports this speech from a native: "Yes, we say, this is our life—the big tree. When any of us dies his spirit does not go to another country, but into the big tree; and this is why we will not have it cut. When a man is sick, or a woman wants a child, we sacrifice to the big tree, and unless *Oso'wo* wants the sick man, our request is granted. *Oso'wo* lives in the sky, and is the Big God. When any of us dies away from this place, his spirit returns to the big tree."⁹

Among the Hamitic tribes the crude animism has developed into a sort of polytheism with one highest god, *Wāq*.¹⁰ He is the big god of the big tree of Nigeria.

The tree-cult of the aboriginal Africans is today largely associated with ancestor-worship. Trees planted round the graves of their ancestors acquire a sacred character. The great tree on the verandah of a dead man's home becomes the shrine of his spirit. And it is held that the highly-developed tree-cult of the Hereros is a direct offshoot of ancestor-worship. One tree is hailed with the words: 'Holy art thou, our ancestor.'¹ The facts must be accepted, but the inference may be questioned. The polytheism and the ancestor-worship are both to be traced to the more primitive forms of animism represented in Ægean evidence as the cult of the Great Spirit or the oak-Zeus. They are both due to the principle of differentiation in the development of religious conceptions.

'Anthropomorphism is in some cases preceded by theriomorphism, but theriomorphism is never generated out of anthropomorphism.'²

All life in primitive ages is one, and in its movement inspires fear, not only the fear of God, but the 'fear' of Isaac (Gn 31⁴²). It is Jacob who 'swore by the fear of his father Isaac' (31⁵³). And Jacob by his wrestling attained the title of Israel (32²⁸). Abraham was the priest-king of Mamre, Melchizedek the priest-king of Salem. At Olympia and probably at Dodona the challenge of the priestly king gave rise to a regular athletic contest.³ Minos as priest-king of Cnossus had a reign of limited duration. He was king for a period of nine years, when he withdrew to the Idaean cave to hold converse with Zeus.⁴ Theseus, by his victory over Minos under the guise of Taurus, succeeded to the sun-king's rights as champion of the oak-Zeus.⁵ Is it not evident that, behind and prior to the hero-worship of Theseus and the veneration for Israel, there is the ritual and there are the *sacra* of the deity, whether Zeus or El Elyon or Jahweh, the Great Spirit of primitive animism?

3. The sacred plantation.—The planting of the sacred tree or grove is a farther step in the development of tree-worship. The primitive priest-king does it as champion of the tree-spirit, under the conscious guidance of God. Eden is the most familiar example of a sacred plantation (Gn 2⁸⁴). The practice of primitive religion colours the language and imagery of poet and prophet (cf. Nu 24⁵⁴, Ps 104⁶, Is 61³). The riddle and parable of Ezekiel has new meaning when read in the light of early ritual:

'A great eagle . . . came unto Lebanon, and took the highest branch of the cedar: He cropped off the top of his young twigs, and carried it into a land of traffic; he set it in a city of merchants. He took also of the seed of the land . . . ; he placed it by great waters, and set it as a willow tree. . . ; and it grew, and became a spreading vine of low stature' (Ezk 17³⁻⁶; cf. vv. 22-24).

In Ægean art the living tree is represented sometimes singly, sometimes in groups of three, or in groves. It is at times close to an altar, or even growing from it; in one case the goddess sits under it. The palm-tree, the fig, and the cypress are most frequent; but the pine, the plane, and the vine also appear.⁶ It may even spring from the *bucrania*, or 'horns of consecration,' which themselves represent the sacred bull, the theriomorphic representation of the oak-Zeus.

At Athens the original cult was that of the oak:

'Nondum laurus erat; longoque decentia crine
Tempora cingebat de qualibet arbore Phoebus.'⁷

There are in the Caryatides, or nut-maidens, traces of a nut-grove, the nuts themselves being known as the acorns of Zeus. Later, after this first stage of substitution, 'Zeus took over the olive.'⁸ These

⁸ Cook, *CIR* xviii. 86.

ἀθήναι, or nurses of Zeus, gave their name to the city, and later to the goddess whose cult overshadowed that of Zeus on the Acropolis.¹ In the Academy at Athens there were twelve sacred olives in the precinct of Athene.² Demeter had her sacred oaks, and the boy who pronounced the Eleusinian formula at Athenian weddings, *ἐφύγον κακόν, ἦδρον ἀμεινον*, was wreathed with oak and thorn.³ There was a grove planted for Demeter at Dotium by the Pelasgians before they migrated from Thessaly to Cnidus. And Ovid, telling the story of the judgment on Erysichthon, speaks of the tree of Demeter as an oak, adorned with fillets and tablets by the people.⁴

These plantings are wide-spread, and traceable to the earliest sites. Hercules planted two oaks at Heraclea Pontica in Bithynia.⁵ Æneas planted a huge oak-tree, lopped and decked as a trophy, on the tomb of Mezentius the Etruscan. The crown of golden oak-leaves from Vulci implies that the Etruscan kings were representatives or champions of the oak-Zeus. The tree planted by Æneas was itself identified with the king: 'manibusque meis Mezentius hic est.'⁶ The identification of tree, god, and king is general. Romulus and Remus were worshipped in the Comitium under a sapling planted from the *Ficus ruminalis* on the Palatine. The Bodhi-tree of Anurādhapura, long the capital of Ceylon, is over 2000 years old. It was planted by Tissa—a branch of the original Bodhi-tree, at Gayā in India.⁷ The sanctuary of 'Uzzā at Nahlā near Mecca consisted of three trees⁸—another link with the wide-spread cult of a triple tree-god, as sky-god, water-god, and earth-god in one.

The chain of evidence is unbroken from East to West; the triple-headed gods of Gaul, sitting cross-legged on their throne as in India, point to closer contact with the neolithic age than even Greece and Syria. The sacred flint of the temple of Jupiter Feretrius on the Capitoline Hill at Rome, the 'antiquum Jovis signum,' the home of Jupiter Lapis, has been regarded as an unhafted neolithic celt, preserved among the aborigines of Latium from an immemorial past.⁹

The sacred tree, the sacred plantation, was the seat of authority, the seat of judgment. The Romans met for council 'in aesculeto.'¹⁰ The senate of the Galatian Celts met at a place called *Δρυμέμετος*, doubtless sacred to their national cult: *κεῖνοι σέβουσι μὲν Δία, ἑγαλμα δὲ Διὸς κελετικὸν ὑψηλῆ ὄρεως*.¹¹ Deborah the prophetess 'dwelt under the palm tree of Deborah, . . . and the children of Israel came up to her for judgment' (Jg 4⁵; cf. 1 S 22⁶, Jg 6¹¹). In 458 B.C. the Roman envoys were sent to complain that the Æqui had broken a treaty concluded in 459. They were bidden to make their complaint to a huge oak on Mount Algidas under the shadow of whose branches the Æquian commander had his quarters.¹² The *prætorium* under the sacred oak is certainly a primitive trait.¹³

A sacred rowan-tree in Ireland derived its origin from the rowan of Dubhros, the Black Forest, in Co. Sligo.

The tree had grown from a quicken-berry dropped by the Tuatha Dé Danann, who had brought it from the Land of Promise. It was guarded by a giant named Searbhan, who could only be slain by three blows from his own club, and had a single broad fiery eye in the middle of his black forehead. He was overcome by Diarmait, the culture-hero of Irish folk-lore.¹³ He

dwelt in a hut among the branches and was so great a magician that he could not be killed by fire, water, or weapons of war.

Here again there is the sacred tree, the fierce-eyed guardian, triply inviolate, the challenge, and the contest so frequently met with in the legends of the sacred grove. And in Danu (the Welsh Don), the goddess-mother of the Tuatha Dé Danann, is there not a link with the Demeter of Greek myth, and in the name itself an echo of the *Δάν* (acc. *Δάν*) of the oak-Zeus, and of Jana, Diana, Artemis on the slope of the Aventine? She is the earth-goddess, the Dea Dia of the Romans, the Dan of the Dorian Greeks: *οἱ γὰρ Δωριεῖς τὴν γῆν δᾶν λέγουσι καὶ δῖαν*.¹

4. The sacred stump.—The Lion Gate at Mycenæ is one of the earliest aniconic representations of the worship of the sacred tree. The pillar of which the lions are the supporters tapers downwards like the ancient Herm.² The subject has been very fully treated in art. POLES AND POSTS; but some further links may be noted.

The pillar-shrine of Cnossus with its sacred doves is recognized by Cook as a 'conventionalised but still aniconic form of a triple tree-Zeus.'³ The Lydian cult of Zeus *ἀσκραῖος* was connected with the oak. A coin of Halicarnassus represents him 'as a bearded god crowned with rays and standing between two oak-trees, on each of which is a bird.'⁴ In the same city there was a cult of Aphrodite *ἀσκραία*. This cult gave its name to the city of Aphrodisias.

The coins of this city 'show the leafless trunk of a tree with three branches. Sometimes the three branches rise separately from an enclosure of trellis-work. Sometimes they spring from a single trunk, on either side of which is a naked man wearing a Phrygian cap: the one on the left wields a double-axe; the one on the right kneels or runs away, turning his back upon the tree [a feature still preserved in folk-lore]. Sometimes . . . the tree is flanked by two lighted altars.'⁵

The priest of the Cappadocian cult of Bellona at Rome is represented with a branch in one hand and the two-headed axe in the other—a further link with the oak-cult of Crete.⁶

Amid the early rites of Etruria and the *sacra* of Rome there are further associations with this cult. Hermes is represented in a fragment of Aristophanes as *τρικέφαλος*; so also is Janus on a coin of Hadrian.⁷ Janus is also represented with a spear; and his title Quirinus is understood in reference to the oak-god. The Sabine *curis*, the oaken spear, the Quirites, the men of the oaken spear, are thus related to Janus Quirinus or Jupiter Quirinus.⁸ The spear is a variation of the sacred stump. The tree-god is often represented by a post, sceptre, or spear.

The *trixylon* associated with Juno Sororia and Janus Curiatius is a symbol of this triple Janus. It consisted of two vertical beams and a cross-bar, the rude form of a cross. The 'yoke' under which the conquered were forced to march was of three staves or spears, and is also traced to the cult of Janus Quirinus. The door-posts (*januæ*) were sacred to him, as the threshold was to the Earth-Mother.⁹

The sprinkling of the blood on the door-posts in Hebrew ritual (Ex 12^v, Ezk 45¹⁹) and the shaking of the threshold in the vision of Isaiah (Is 6⁴ RV) are examples of the same cycle of ideas—the sacredness of the posts and the threshold as tokens of the Deity.

The *caduceus* is another variation of the sacred rod. It consisted of a triple shoot, the central shoot forming the handle, the two side shoots being folded back into a double knot. The elder lends itself to this by its opposite shoots, and the tree is tabu in the folk-lore of the West. It is not lucky to burn it. Judas hanged himself from an elder-bush. The *lituus* of the augur is another variation

of the sacred rod. So also the mysterious twisted rods used in what is probably a funeral procession in the decoration of Etruscan tombs at Norchia and Tarquinii.¹ In the fresco at Tarquinii, while most of the figures have the twisted rod, 'the symbol of the Etruscan Hades,' one of the leading figures has the *lituus*, and prominent among these is the hammer borne aloft, 'a frequent emblem of supernatural power.'² The figure of the god with the hammer is frequently met with on Celtic monuments.³ The Y cross with its mystic Pythagorean meaning has also some ancient link with these Etruscan rods.⁴ A hazel-twig of this shape is in use as the divining-rod for tracing water.

The Etruscan *lucumones*, or kings, were representatives of Jupiter. Their crown was of golden oak-leaves, with acorns, gems, and fillets. They acted as vice-gerents of the oak-god. Their golden *bulia* was the symbol of the sun-god—another link with the oak-Zeus. They used a sceptre with an eagle, and were preceded by the lictor bearing the axe with the bundle of rods. Cook suggests that these may be a conventional substitute for the trees of the tree-god.⁵ These were all part of the royal insignia of the ancient king. Is it not possible to trace the origin of the English regalia to the same source?

In the Inventory of 1649 are enumerated the 'large staff with a dove on the top, formerly thought to be all gold, but upon trial . . . found to be the lower part wood within and silver-gilt without'; the 'small staff with a fleur de luce on the top . . . found to be iron within and silver-gilt without'; 'one staff of black and white ivory with a dove on the top'; and the two sceptres, one with the cross, and one with the dove.⁶

These are all symbols of authority, such as are found in the *sacra* of the ancient races of Europe. The sceptre with the cross, the wooden rod with the dove, the rod with the 'fleur de luce' may be compared with the tau-cross, the blossoming stump, and the dove-pillars of the Etruscan and Ægean cults. The rods laid up before the Lord in the tent, 'one for each father's house' (Nu 17² RV), 'twelve rods,' and the budding of Aaron's rod (v.⁸) point to similar associations on Semitic soil. And the cross with its *spolia opima* was the most honoured sign of Jupiter Feretrius at Rome. The *feretrum*, from which he took his name, was the lopped trunk of the ancient oak, venerated by the shepherds of old, forming a wooden cross to which votive armour was attached.⁷ The cross in the folk-lore of Rome was a sign of the primitive oak-cult—a token of the presence of the oak-king, a shrine for the offering of the trophy of right to the oak-god.⁸ Was Pilate altogether unconscious of this when he said: 'What I have written I have written' (Jn 19²²)? And was St. Paul too in his 'foolishness of preaching,' and in his witness to the power of the Cross and of Christ crucified, unconscious of the other tradition of the power of the cross, when he wrote:

'Unto the Jews a stumblingblock, and unto the Greeks foolishness; But unto them which are called, both Jews and Greeks, Christ the power of God, and the wisdom of God' (1 Co 12^{2f})?

5. Trees many and gods many.—The sacred tree signified universally in primitive ages the presence of the deity. The one tree with its nursery-grove was the shrine of the one God. But east and west, in hill or in valley, in north aspect or in south, the tree varied.⁹ And, as the tree varied in species, the god varied in name. Then the tree and the god of the clan grew to be the tree and the god of

the district, and in turn the tree and god of the nation. The parable of the bramble king (Jg 9^{sup}) is true to fact. The olive, the fig, the vine had established their fame and their rule; they would not submit to another; the bramble had ambition to rival even the cedar of Lebanon.

Trees many led on to gods many.¹ The oak-Zeus at Athens took over the olive. Apollo remained true to his sacred laurel. This development is most marked in Greek art and Roman verse:

'Populus Alcidae gratissima, vitis Iaccho,
Formosae myrtus Veneri, sua laurea Phoebus.'²

The Semitic nations stand apart from this tendency to assign a particular tree to a particular god,³ whether from reaction to monotheism or from adherence to the primitive conception of the oneness of the divine spirit. They had sacred trees in great number, but they were all sacred to one god localized in village, clan, or nation. In India each Buddha had his own tree, and Gautama himself, after having passed through 43 incarnations as a tree-spirit, eventually found wisdom under the sacred tree of Brahmā, the *pipal-tree*, or *Ficus religiosa*.⁴

This triumph of the gods over the nations and the consequent interlacing of the tree-cults, sometimes by expansion, sometimes by absorption, resulted in certain cases in the distinction between tree-gods and tree-demons. As the *jinn* or *genii* of the Arabs were gods out of touch with men, outlaws, dehumanized, 'abominations of Moab and Ammon,' so the wood-demons of the German forest or the Polynesian islanders were the foes and the dread of their conquerors—or their neighbours. And in the controversy between the supporters of ancestor-worship and the supporters of animism based on the presence in nature of the divine spirit this wide-spread belief in wood-demons and unlucky trees is in favour of the latter. In an age when 'every valley had its king,'⁵ and every hill its shrine and its sacred tree, as in these islands in Celtic times, and when feuds were frequent between clan and clan, the jealousy of the clan would separate between god and god, and between tree and tree, and people the forest-clad hills with every form of terror and danger. The only bond of safety was in the nation's god and in the king as the champion of his rights. All around was danger and death: 'for I the Lord thy God am a jealous God' (Ex 20²; cf. 2 Co 11²). This is the language of religion, not the language of ancestor-worship; and it may be traced in tree-worship and demon-lore from earliest times.

A blasted or stricken oak might be the messenger of misfortune:

'De caelo tactas memini praedicere quercus.'⁶

The Abors in Assam regarded the rubber-tree as the abode of two malignant spirits; another haunted the plantain and stinging-nettle.⁷ The satyrs and devils of the OT, the *jinn* of the Arabian stories, the centaurs and cyclops, fauns and dryads of Greek and Latin mythology, the wood-maidens, wild-men, and elves, the wild-women of the Tyrol, and the green-ladies of Neufchâtel, in their different degrees of mischief or maliciousness, were haunting terrors of the old world.⁸ The Neraides of Macedonian folk-lore are tree-spirits. It is not well to lie down in the shade of a tree, for it is there that the tree-demons appear. At this day the country-folk avoid especially the plane, the poplar, and the fig-tree, for these are favourite haunts of fairies.⁹

In Ireland ghosts and apparitions haunt isolated thorn-bushes.¹ To call up the Tolcarne troll near Newlyn, an incantation was necessary, and three dried leaves must be held in the hand, 'one of the ash, one of the oak, and one of the thorn.'²

'Sing Oak, and Ash, and Thorn, good Sirs,
(All of a Midsummer morn!)
England shall hide till Judgment Tide,
By Oak, and Ash, and Thorn!'³

The creation myth of the Tanganarin natives in Australia holds that Punjil fashioned man out of the bark of a tree. Another tree was tabu, and haunted by a bat; the tabu was broken; the tree was violated; the bat flew away, and death came into the world.⁴ Daphne is the name both of the laurel and of the spirit within it. The *numen* of a palm-tree is not called Tamar, but Ba'al Tamar. The former conception is Indo-European, the latter Semitic.

'The Indo-European could never free himself from the identification of his gods with nature. . . . The Semite, on the other hand, was accustomed from the earliest times to distinguish between the object and its *ba'al*.'⁵

Among the nymphs were Philyra, the linden, Rhœa, the pomegranate, Helike, the willow, and Daphne, the laurel. Mrs. Philpot notes:

'In later times an attempt was made in some cases [*e.g.*, Daphne in Laurus, Lotis in Lotum, Dryope in Arborem]⁶ to explain the connection by metamorphosis . . . but it is extremely probable that this was an inversion of the primitive nexus.'⁷

The classic passages for the oak of Dodona are Hom. *Od.* xiv. 327 f., xix. 296 f. In Hom. *Il.* xvi. 233 f. the oracle is mentioned; Vergil refers to it in *Georg.* ii. 15 f. The oak was also sacred to Ceres;⁸ before harvest worship must be rendered to her, and the worshipper must be crowned with a wreath of oak.⁹ The willow is associated with Hera at Samos, and with Artemis at Sparta. Artemis was the goddess of the nut-tree and the cedar in Arcadia, of the laurel and the myrtle in Laconia.¹⁰ The laurel is sacred to Apollo; the priest-king Anius is guardian of the tree and the shrine.¹¹ The olive is specially connected with the cult of Athene at Athens. The pine is associated with Pan and Silvanus, the cedar with the Accadian deity Ea, the sycamore with the Egyptian goddess Nuit (Hathor). The cypress was sacred among the Persians, and in the West, together with the poplar, it belongs to the chthonian deities. The vine and the ivy were closely connected with the rites of Dionysus.¹² The ash and the elm appear in Scandinavian mythology as the first man (Åsk) and the first woman (Embla), and the ash Yggdrasil is connected with the court of the gods.¹³

Celtic folk-lore has many points of contact with the ancient oak-cult of the Mediterranean area, with variations due to local developments under northern conditions. The *δρυόμοιοι* of Dodona, the *αἰγυροτόμοι*, or poplar-fellers, at Athens, the *κισσοτόμοι* at Phlius,¹⁴ have their representative in the tree-felling god Esus of the Paris monument.¹⁵ The ancient axe-ritual of Dodona, Crete, and Etruria appears in the sculptures of Succellos and other deities in Celtic lands.¹⁶ On the Trier monument the deity is felling an oak-tree on which are three cranes. The Tarvos trigraranus, the bull, before the oak-tree, with two cranes on the back and one between the horns, is another variation of the Paris altar.¹⁷

The cult of Cernunnus supplies another link. He is represented in the Cluny Museum with stag's horns, the ring on each horn referring to the sun.¹ In the silver bowl from Gundestrup in Denmark he is cross-legged, Buddha-like, with stag's horns, and on his right a stag and a bull.² In a wax tablet at Pesth he is called Jupiter Cernenus; on a Rheims monument he is with a stag and an ox, and at Saintes with several *bucrania*. The presence of the sun-wheel in Paris, and the bull-masks at Saintes, point to his original identity with the Zeus of Crete. In one case he is represented with a chain.³ His name is almost certainly connected with the horns. In folk-lore he probably survives in Windsor Forest as Herne the Hunter, who walks

'round about an oak, with great ragg'd horns;
And there he blasts the trees, and takes the cattle,
And makes milch-kine yield blood, and shakes a chain
In a most hideous and dreadful manner.'⁴

It is not unlikely that the Horn-dancers of Abbots Bromley in Staffordshire commemorate some early pagan rite connected with the oak-cult of Zeus Cernunnus. Bagot's Park is a celebrated oak-forest. The village-games in old times took place round the Beggar's Oak. Though now held early in September, in Robert Plot's time (1641-96) they took place about Christmas. The dancers wore stag-horns (reindeer, kept in the church). It is noteworthy that the Pesth tablet of Jupiter Cernenus has also an echo in a modern dance—a horned figure among the mummers of Mohacs on the Danube.

The oak also entered into the ritual of invoking Zeus as a rain-god. On the Lycaean mountain of Arcadia was a shrine sacred to Zeus, in which was a spring to which the priest went in time of drought. He touched the water with a sprig of oak, when a vapour would rise and spread in fruitful showers over the land. In Brittany the fountain of Barantin in the Forest of Brécilien served the same purpose. Water was thrown on a slab near the spring, and rain would then fall in abundance, accompanied by thunder and lightning. The well was near the fabled shrine of Merlin, one of the Celtic types of the sun-hero, and it was overshadowed by a mighty tree. Rhys suggests that the spring, the tomb, the slab, and the tree 'all belonged to the Celtic Zeus.' There is a similar story connected with the Snowdonian tarn Dulyn, the Black Lake, where the slab was called the Red Altar.⁵ There is also in the moorlands of Staffordshire, near Ipstones, a strong spring overshadowed with oak and mountain-ash long known as the Thundering Well. The name alone remains, but it may be grouped among the sites sacred to the Celtic Zeus as rain-god. Within the last few years a Celtic chambered tomb has been discovered within a short distance of the well.

The ash is also among the sacred trees of Ireland. In the parish of Borrisokane, Co. Tipperary, there was in 1833 a huge ash called the Big 'Bell' tree.⁶ The name is derived from the word 'Billa,' which occurs in Magbile, 'the plain of the old tree,' the present Moville.⁷ This name has been connected by Windisch with *bile* or 'Beli,' king of Hades, the consort of Dann. This Beli represents Cronos in his darker character as Death, and suggests that the Big 'Bell' trees of Irish folk-lore were ash-trees sacred to the Celtic Cronos.⁸ The ash was also sacred to the Celtic Silvanus: 'Silvane sacra semicluse fraxino.' He presided over woodlands, clearings, and gardens.⁹

The white-thorn has also its sacred associations. It is unlucky to cut it down. A 'lone thorn' is regarded with special veneration. Christianity took over its sanctity. The Crown of Thorns was said to have been made of white-thorn. An old thorn near Tinahely, Co. Wicklow, is still called 'Skeagh Padrig,' or 'Patrick's book.' In Britain 'the holy thorn' of Glastonbury has similar venerable associations. The hazel appears in Irish romance as the tree of knowledge. The yew among the Druids was a symbol of immortality.¹ Celtic folk-lore has many other traditions of tree-worship. The first man sprang from an alder, the first woman from a mountain-ash. The berries of the rowan are a charm against all disease. There are also trees which were inauguration trees. One, an old sycamore in Coolmeoneen in the parish of Killadown, is called 'the honey-tree.' A tree in the parish of Kilmactaign is called 'the fern-tree,' *i.e.* the alder.

6. Tree-offerings and tree-rites.—The cult of the sacred tree had its offerings and its rites. There are even survivals of the offering of the highest sacrifices. The natives of the Vindhyan uplands of India until lately offered human sacrifices to trees.² In the animistic worship of the Ainus the worship is vocal.³ At the close of the bear-festival the head of the bear is set up on a pole, called 'the pole for sending away,' and the skulls of the other animals which are hung up with it are called 'divine preservers' and are at times worshipped.⁴ This is a link with the *bucrania* which form so integral a part in the sacrificial tokens of Aryan worship. Plutarch states that Theseus on his return from Crete put in at Delos, and instituted a dance in imitation of the mazes of the labyrinth.

'He danced it round the altar Keraton which was built entirely of the left-side horns of beasts.'⁵

This was known as the 'crane dance,' and is certainly in some way associated with the cult of the Celtic tree-god Sucellos or Esus with his three cranes, and with the Tarvos trigaranus of the Paris monument.⁶ A note in Langhorne's Plutarch states that the crane commonly flies in the figure of a circle, which together with the *swastika*, or conventional labyrinth sign, is symbolic of the sun-cult. The dance round the May-pole and the Jack-in-the-Green festivities within our own memory in May Fair, London, are survivals of the same rites.

The griffins in Assyria and in Asia, in their attitude of devotion,⁷ have their counterpart in the vision of the Temple in Ezekiel:

'And it was made with cherubims and palm trees, so that a palm tree was between a cherub and a cherub' (41²³).

In a Mexican MS the tree breaks into two branches in the shape of a tau-cross, each branch with three blossoms; the tree is surmounted by a parrot, and is supported by two men, standing, each with his right hand raised in the attitude of devotion.⁸

Trees were hung with votive offerings. In India the sacred banyan-tree is represented with six elephants in the act of worship.⁹ In Egypt it is the sycamore with jars and fruit, and the worshipper before it has the right hand raised.¹⁰ Elsewhere it is a tree sacred to Artemis, hung with the weapons of the chase.¹¹ Wreaths were worn and garlands were carried in various Greek rites; and this use of wreaths points to some analogy with tree-worship in the two pillars before the Temple at Jerusalem.¹² Robertson Smith gives a coin from Paphos with similar detached pillars before a temple, each surmounted above the cornice by a dove as in the rude pillar-shrine of Crete. Whether

they were candlesticks or not, they were wreathed in pomegranates.¹ On the eastern gateway of the Buddhist tope at Sanchi the sacred tree is represented with worshippers. It divides into two main branches, like that in Mexico, and there are two smaller trees, one on either side. The central tree is being wreathed in garlands.² The Bodhi-tree of Kanakamuni breaks into three branches and is also hung with festoons.³ This custom still survives in the West. Rhys has collected recent evidence from Glamorganshire of holy wells overshadowed by thorn or other trees, on which rags were fastened.⁴ And the present writer some thirty years ago saw a bush hung with red rags in one of the islands of Aran off Galway. It is one of the last relics of the cult of the sacred tree, like the practice of 'touching wood' to avert a change of 'luck,' still in use in this country.

The tree is also a trophy of victory. As late as the 4th cent. of the Christian era a pear-tree at Auxerre was hung with trophies of the chase and venerated as a god.⁵ The 'Stock-in-Eisen' in the centre of Vienna is the stump of a sacred larch, now studded and bound in iron, the last remains of trophies with which it was originally hung. The Irmensul had a similar origin.⁶ Komulus celebrated his victory over the Cæminenses by his institution of the *spolia opima* in honour of Jupiter Feretrius:

'He cut down a great oak that grew in the camp, and hewed it into the figure of a trophy: to this he fastened Acron's whole suit of armour, disposed in its proper form. Then he put on his own robes, and wearing a crown of laurel on his head, his hair gracefully flowing, he took the trophy erect upon his right shoulder, and so marched on, singing the song of victory before his troops. . . . This procession was the origin and mould of future triumphs.'⁷

The 6th cent. Gallican poet Venantius Fortunatus, author of the *Vexilla regis*, who lived when the honour of the sacred tree was still more familiar to the Gauls than the shame of the Cross, lifts up the old faith in his great hymn of the Passion:

'Paige lingua gloriosi proelium certaminis
Et super crucis tropæae dic triumphum nobilem,
Qualiter redemptor orbis immolatus vicerit.

Crux fidelis inter omnes arbor una nobilis
Nulla tamen silva profert fronde, flore, germine:
Dulce lignum dulci clavo dulce pondus sustinens.'⁸

7. The tree of life.—The sacred tree was the source and the sustenance of life. Worship, sacrament, and mystic charm are closely linked together. The *soma*-plant, the Iranian *haoma*, is the sacred food of the gods in Asia, and corresponds to the *ambrosia* of the Greek world.⁹ The Vedic *amṛta* or *soma* had in it the principle of life and was withheld from ordinary men: it was, however, to be taken by the initiated.¹⁰

In Sparta, in early times, the dead were laid upon palm branches and leaves of the olive. In the forest land of northern Europe hollowed oaks were used in the burial of the dead.¹¹ The practice among the Oddfellows of each member dropping a sprig of sweet herbs on the coffin in the grave is a survival of the same early rites. In Abyssinia the branches and twigs of the ghost-tree are used by the pagan Kunamas as a protection against sorcery and as charms and amulets at childbirth and death.¹² In Babylonia the idea is more strictly defined. The god Nin-gish-zida is 'master of the tree of life.'¹³ In time of drought the priest of the Lycean Zeus let down an oak-branch to the sur-

face of the water.¹ Codrus, when he devoted his life to his country, dressed as a woodman. Cook notes:

'If the last of the Athenian kings on so solemn an occasion appeared as an oak-cutter armed with an axe, we may be sure that this was no mere disguise but the ancient ritual costume of an oak-king.'²

The cult of the sacred tree embraces the highest rites in life and in death. The rite of tree-marriage in India in its surviving forms is mainly conventional.³ The idea of reincarnation may in some cases explain it, but the rites seem to point to other and more primitive ideas. The Agariā, a Dravidian tribe of Chotā Nāgpur, have a special regard for the *sāl*-tree, which is used at their marriages.⁴ The *bali*, or totem, system prohibited marriage between those who have the same totem. Among the Marathas the *devaks*, or marriage-guardians, though they no longer form a bar to the union of two worshippers of one *devak*, still have some share in the marriage-rite.

'The *devak* is usually some common tree such as the bel, fig, banyan, or the sami. In its commonest form it is the leaves of five trees, of which one, as the original *devak* of the section, is held specially sacred. It is worshipped chiefly at the time of marriage.'⁵

It has already been suggested that in primitive ages every valley, as Elton says, had its own king. Each king would be the champion and priest of the sacred tree, and this tree as indwelt by the divine spirit would be sacramentally united in all rites of initiation or other social *sacra* with the tribe or clan. The five leaves represent a pentapolis, or group of five states, one or other, as in ancient Rome,⁶ choosing the common priest-king of the five, preference therefore being given to the leaf which represented his sacred tree. Similar customs banning all marriage within a totem-clan have been observed among the Bantu tribes of S. Africa. The mushroom totem of the Awemba is an example of a vegetable totem.⁷

Again, it would appear that the root-idea in the animistic cult of the sacred tree is religion rather than totemism or ancestor-worship; these are perhaps only relics of the primitive age—results of anthropomorphic development and differentiation, degenerate conceptions of the earlier animistic principle of the unity of the divine spirit of life.

The mistletoe-bough in the Christmas feast and 'kissing under the mistletoe' are relics not only of the oak-cult of the Druids, but of its connexion with primitive marriage-rites. This cult rests on the authority of Pliny,⁸ and the special virtues ascribed to mistletoe are also referred to by him. Cook has some valuable notes on the mistletoe, which give support to Frazer's conjecture 'that the sun's fire was regarded as an emanation of the mistletoe.'⁹ Cook bases his argument on the cult of 'Ἰξίος Ἀπόλλων' at Ixiæ in Rhodes, a town named after the mistletoe. The cult is not definitely referred to in connexion with the oak, but 'it is probable, because the Rhodians regarded the oak as the sun-god's tree.' In the story of the punishment of Ixion there is, he suggests, another link between the mistletoe and the sun-cult. Ixion was the father of Peirithoüs, whose constant associate was Dryas.

'The relationship thus established between Ἰξίον the mistletoe and Δρύας the oak is scarcely fortuitous.'

A scholium on Euripides, *Phæn.* 1185, reads:

'Zeus in his anger bound Ixion to a winged wheel and sent it spinning through the air. . . . Others say that Zeus hurled him into Tartarus. Others again, that the wheel was made of fire.'

This flaming spin-wheel has been commonly understood as the sun-god. Cook concludes:

'It has not, however, been hitherto observed though indeed the fact is obvious, that Ἰξίωv is derived from ἰξός and that the mistletoe was on Greek soil thus intimately associated with the sun-god.¹

An old Staffordshire custom of keeping the mistletoe-bough throughout the year and then burning it in the fire under the Christmas pudding probably rests on some tradition of the perpetuation of the sacred fire. The mistletoe represented during the winter the 'sap of the oak,'² and this formal burning of it, like the feeding of the sacred fire of Vesta from the oak-grove of the Palatine slopes, expresses the principle of life. It has not been customary to use mistletoe in the decoration of churches at Christmas; but W. Stukeley³ reports a curious custom from York:

'On the Eve of Christmas Day they carry mistletoe to the high Altar of the Cathedral and proclaim a public and universal liberty, pardon, and freedom to all sorts of inferior and even wicked people at the gates of the city, towards the four quarters of Heaven.'⁴

There was in Plutarch's time a shrine of Fortuna Viscata on the Capitol at Rome. This may be the Fortuna Primigenia near the temple of Jupiter, where stood the oak of Jupiter Feretrius.

The *rota Fortuna* survived till lately at Douai, when about midsummer 'a large wheel called the *roue de fortune* was carried in procession before a wicker-work giant known as *le grand Gayant*, and other figures called *les enfants de Gayant*. These wicker giants were certainly the Druid divinities, whose colossal images of wicker-work are described by Caesar':⁵ 'Alii humani magnitudine simulacra habent; quorum contexta viminibus membra vivis hominibus complent; quibus succensis, circumventi flamma exanimantur homines.'⁶

The mistletoe-bough and the various customs connected with it are all survivals of the solar cult, and, with the wreaths, axes, spears, cranes, and doves, point to the true meaning of the worship of the sacred tree. The mistletoe-bough is made the type of the Golden Bough:

'Quale solet silvis brumali frigore viscum
Fronde virere novâ, quod non sua seminat arbos,
Et croceo fetu teretes circumdare truncos:
Talis erat species auri frondentis opaca
Lilce.'⁷

The yew was also regarded as a symbol of immortality.⁸ The name *eburos*, mid-Irish *ibhar* (*Taxus*),⁹ enters into place-names and clan-names—e.g., Eburacum (York), Eburodunum (Yverdon), Eburones. The last-named is an instance of a tribe or clan taking its name from a tree-deity.

There was a yew in Belach Mughna in the west of Leinster—a great sacred tree, and its top was as broad as the whole plain. Thrice a year did it bear fruit: it remained hidden from the time of the Deluge until the night on which Conn of the Hundred Battles was born, and then it was made manifest. Thirty cubits was the girth of that tree, and its height was three hundred cubits. However, Ninine the poet felled that tree.¹⁰

Cell-ee in the *Martyrology of Gorman* is the 'church of yews.' And there is an ancient hallowed site in Staffordshire, with only the memory left of its All Saints' dedication, the New Year festival of the Celts, which is now marked by the Hanchurch Yews. The churchyard yew is an ancient symbol of the tree of life.

In the story of Eden the command went forth: 'Of every tree of the garden thou mayest freely eat: But of the tree of the knowledge of good and evil, thou shalt not eat of it: for in the day that thou eatest thereof thou shalt surely die' (Gn 2^{16f}). No ban is put on the tree of life till the command is broken. Was the tree hidden like the yew of Mughna? Could it be found only by those initiated and instructed, as in the quest of the Golden Bough? It stood in the midst of the garden:

¹⁰ Whitley Stokes, *The Martyrology of Engus the Culdee* (II. Bradshaw Soc. Publications, xxix.), London, 1905, p. 259.

'Latet arbore opaca
Aureus et foliis et lento vimine ramus,
Junoni infernae dictus sacer: hunc tegit omnis
Lucus, et obscuris claudunt convallibus umbrae.'¹

Was it so shut in and shadowed that it could not be found? Is there anything parallel in the imagery to that of the Cretan labyrinth?

It has been suggested that in an earlier version of the Eden story there was but one tree, the tree of life, and it is to be noted that in Gn 3³ the tree with its forbidden fruit is described as being 'in the midst of the garden,' as is the tree of life in 2⁹. And in most of the myths of paradise there is the conception of the one tree.

The Norse Yggdrasil in its complexity is the central tree of the universe: 'The chief and most holy seat of the gods is by the ash Yggdrasil. There the gods meet in council every day. It is the greatest and best of all trees, its branches spread over all the world and reach above heaven.'²

The garden reached by the Chinese king in quest of the glories of paradise had 'a wondrous tree in its midst, and a fountain of immortality, from which four rivers, flowing to the four corners of the earth, took their rise.'³ The central tree with its fruit in the old willow pattern dish is a familiar illustration:

'The Chinese temple, there it stands
And there's the tree of many lands'—

in other words, the universe-tree of China.

Hercules, in the garden of the Hesperides, 'conquered the protecting dragon and secured the golden sun-fruits from the central tree.'⁴ The garden of Indra contained five wonderful trees, the chief of which was the *paridjata*, 'the flower of which preserved its freshness throughout the year, contained in itself every scent and flavour, and gave happiness to whoever demanded it. It was, moreover, a test of virtue, losing its splendour in the hands of the sinful, and preserving it for him who followed duty.'⁵

It was but a step in the development of myth to differentiate between the tree of life and the tree of knowledge; and it was a step in the revelation of truth. The tree of life has the promise of immortality and bliss.

The sacred books of the Parsis state that 'the original human pair, Maschia and Maschiana, sprang from a tree in Heden, a delightful spot where grew *homa* or *haoma*, the marvellous tree of life whose fruit imparted vigour and immortality. The woman at the instance of Ahriman, the spirit of evil, in the guise of a serpent, gave her husband fruit to eat and so led to their ruin.'⁶

The story of Eden ends in ruin, but it is ruin which has the promise of regeneration (Gn 3¹⁵). There is the way of the tree of life, and Christian mysticism found it in the way of the holy Cross. The drama of religion closes with the vision of the holy city, New Jerusalem, and the throne of God and of the Lamb:

'In the midst of the street of it, and on either side of the river, was there the tree of life, which bare twelve manner of fruits, and yielded her fruit every month: and the leaves of the tree were for the healing of the nations' (Rev 22²).

Ethics and religion have each their part in keeping 'the way of the tree of life' (Gn 3²⁴); they are the supporters of the wheeling sword, the whirling flaming circle of the solar disk, the most sacred symbol of the Sun of Righteousness.

8. The tree of knowledge.—The oracle is an integral part of tree-worship.

Joshua at Shechem 'took a great stone, and set it up there under an oak, that was by the sanctuary of the Lord. And Joshua said unto all the people, Behold, this stone shall be a witness unto us; for it hath heard all the words of the Lord which he spake unto us' (Jos 24^{26f}).

It was a witness to the oracle at Shechem. The 'plain of Meonenim' is the 'terebinth of the diviners' (Jg 9³⁷). In Africa the trees planted round the ancestral graves were tended by women whose oracles were listened to in times of crisis.⁷ Tree-divination was practised by the Ainus.⁸ The oracular virtue of the oak of Dodona was assigned to the depths of its root.⁹ The oracle was

¹ *Verg. An.* vi. 136-139.

chthonian. The witch of Endor raised spirits from the earth (1 S 28¹³).

'Altior ac penitus terrae defigitur arbor;
Aesculus in primis: quae quantum vertice ad auras
Aetherae, tantum radice in tartara tendit.'¹

At Delphi the sacred laurel of Apollo grew in the cleft of the rock.² The chthonian rock-altars on the Areopagus at Athens are carpeted in spring-time with asphodel. Did this suggest the phrase, κατ' ἀσφοδελὸν λεμῶνα, in Hom. *Od.* xi. 539, xxiv. 13? Both passages are assigned to the very latest or Athenian stratum of the *Odyssey*.

The rustling in the mulberry-trees (2 S 5²⁴) has its counterpart in the story of Æacus. He consulted an oak, a sapling from Dodona:

'Tu mihi da cives: et inania moenia reple.
Intremuit, ramisque sonum sine flamine motis
Alta dedit quercus.'³

The sacred cedar of the Chaldeans was not only the tree of life but 'the revealer of the oracles of earth and heaven.' The name of Ea, the god of wisdom, was supposed to be written on its core.⁴

The hazel appears in Irish romance as the tree of knowledge. The mystical fountain known as Connla's Well was overshadowed by nine mystical hazel-trees. The nuts were of the richest crimson colour and teemed with the knowledge of all that was choicest in literature and art. The nuts fell into the spring, where they were eaten by the salmon which frequented the spring. Therefore the salmon was the wisest of all things. In the story of Kullhwch, in the *Mabinogion*, the salmon of Llyn Llyw is stated to have been the first animal created, and its memory to surpass that of the eagle, the owl, the stag, and the blackbird. The source of its wisdom was the many-melodied hazel of knowledge.⁵ The culture-god of the Celtic world has been identified with Mercury, and with the Gaulish deity Ogmios, the god of eloquence and wisdom. His name in Welsh survived in the word *ofydd*, one skilled or versed in anything. In Ireland he appears as Ogma, one of the ancient Goidelic group of the Tuatha Dé Danann. He was in a special sense the diviner or discloser among the gods.⁶ The divining-rod is the surviving relic of the tree-oracle, and the hazel is the favourite tree from which it is cut. In France it was the custom to cut it on Wednesday, Mercury's day. This also points to the association of the hazel with the Gaulish Mercury. He was known also as the god 'qui vias et semitas commentus est,' and the custom of beating the bounds with a hazel-switch is another link with ancient rites.

Irish literature represents crimson nuts as forming the food of the gods.⁷ The crimson berries of the mountain-ash explain its sanctity. It has been suggested that it is the original counsel-tree of the Northern races.⁸ In Ireland the mountain-ash and the birch are still held sacred, and in Staffordshire in the 17th cent. Plot states that it was held dangerous to do wanton damage to the tree.⁹ It is still, under the name 'wicky,' a favourite tree in the country districts. Evelyn¹⁰ states that it was held in such veneration in Wales that it was found in every churchyard. It is still found in old burial-grounds in Yorkshire. In Derbyshire a little cross made of the witch-wiggin is held as a protection against witchcraft. The rites observed in cutting it belong to the earliest ages of tree-worship. It was to be cut on St. Helen's Day. It must be cut stealthily from a tree never seen before, and carried home by any way save that by which the wood-cutter had gone

on his secret and sacred quest.¹ As the care-tree it has been taken over by the Church in the rhyme:

'Care Sunday, care away,
Palm Sunday, and Easter Day.'

Care Sunday is Passion Sunday, the Sunday before Palm Sunday.²

The holly is the Irish *cuilenn*, the Welsh *celynen*, the O.E. *holegn*; it is not a variant of 'holy.' The persistence of its red berries in winter and its Christmas associations give it a high place among the trees of the north. It enters into place-names in Ireland, as in Druimm Cuilinn, now Druncullen, barony of English, King's County. More noticeable is its occurrence as a personal name, Macc Cuilinn, bishop of Lusk.³ The effigy of the Holly-boy in the Kentish Shrove-tide revels may be regarded as a substitute for the oak with its ancient religious association. At the close of the revels it was burned.⁴ The Christmas burning of the Yule-log is another link in the same chain, as the burning of the mistletoe-bough is the evidence of the continuity of the sacred fire.

The Christmas blossoming of the Glastonbury thorn and the Christmas-tree (of late introduction in England), with its lights and flowers and fruits, have been associated with the 'strange blossoming power of nature connected with St. Andrew's Day' (30th Nov.). These were transferred in the Middle Ages to the Christmas festival.⁵

'Christmas-Eve was given to the memory of Adam and Eve, and this led to the Paradise-plays which formed a prelude to the Nativity-plays. The Cross of Christ was held in ancient legend to have been made of "a tree which had sprung from a slip of the Tree of Knowledge." In the Paradise-play this tree was brought in laden with apples and decked with ribbons.⁶ The lights form an integral part of the earlier ideas of this tree-ritual.

In old Icelandic legend there is the story of a mountain-ash at Møðrutvell which on Christmas Eve was covered with lights that the strongest gale could not extinguish. These lights were its blossoms. In French legend, Perceval comes across a tree illuminated with a thousand candles; and in another story Durmalns le Galois twice saw a magnificent tree covered with lights from top to bottom.⁷

In Icelandic folk-lore lights are seen in the rowan-tree, and in Celtic folk-lore the scarlet berries of the rowan-tree are the source of wisdom. Is there not here a link between the light of wisdom and the bright fruit belonging to the tree of knowledge? The flamens wore the scarlet tuft in their caps.⁸

'Simonides tells us that it was not a white sail which Ægeus gave, but a scarlet one, dyed with the juice of the flower of a very flourishing holm-oak, and that this was to be the signal that all was well.'⁹

The story of Ægeus and Theseus has its parallel in the sign of the 'scarlet thread' at Jericho (Jos 2¹⁸).

The rod of Aaron was the rod of the priesthood, and the priest's lips were to keep knowledge (Mal 2⁷).

At the return from Captivity 'the Tirshatha said unto them, that they should not eat of the most holy things, till there stood up a priest with Urim and with Thummim' (Ezr 2⁶³). The breastplate of judgment contained these sacred lots (Ex 28³⁰). The sacred oracles are in the charge of the priest: 'for he is the messenger of the Lord of hosts' (Mal 2⁷).

The rod was the token of this authority; and the rod of Aaron was a rod of almond. The Hebrew word for 'almond' is *shākēdāh*, connected with the root 'to watch.' It is the tree of watchfulness, the tree of light. Jeremiah of the priests of Anathoth, in the opening of his prophecies, sees the vision of an almond-rod. It is the token of the watchfulness of God:

⁹ *Ib.* p. 370.

¹⁰ *Ib.* p. 371.

'Then said the Lord unto me, Thou hast well seen : for I will hasten my word to perform it' (Jer 12⁹). And in the open vision of death it would seem that the blossoming of the almond-tree symbolizes the light of the presence of God (Ec 12⁹), the light of wisdom and knowledge: 'Because the preacher was wise, he still taught the people knowledge' (12⁹).

The early cult of the sacred tree among the Jews left its mark in the Temple of Jerusalem. Robertson Smith notes that, as the two pillars Jaclin and Boaz, so also the golden candlestick had associations with this ancient cult.¹ The pillars were wreathed with pomegranates; the candlestick was a budding and blossoming almond. If the former witness to the tree of life, the latter witnesses to the tree of knowledge.

Light was the first of the gifts of life; and it is in the light alone that religion can fulfil the duties of life. A Babylonian seal figured by Mrs. Philpot shows the sacred tree with seven branches, three on the right and four on the left, with a fruiting branch drooping on either side. On the right is a figure sitting with outstretched hand, the head crowned with the horns of a bull; on the left is another figure sitting, without the bull-mask, but with a snake behind it.² It recalls in some points the story of Eden; but it is also a link in the development of the seven-branched candlestick of the Temple.

The sacred twig, the sacred fire, the priest-king who is guardian and champion of both, and who is also the representative of the majesty of the sun, each and all witness 'at sundry times and in divers manners' to the religious fellowship and communion which man enjoys with the divine spirit. Silent adoration is called for in the presence of the tree of life. The tree of the knowledge of good and evil is vocal in the light of divine wisdom:

'And I turned to see the voice that spake with me. And being turned, I saw seven golden candlesticks; and in the midst of the seven candlesticks one like unto the Son of man . . . and his voice as the sound of many waters' (Rev 11²⁻¹⁵). This voice is the voice of divine wisdom, vocal at Dodona and Cnossus and Delphi, vocal in the burning bush, and vocal to-day in 'the spirit of wisdom and understanding, the spirit of counsel and ghostly strength, the spirit of knowledge and true godliness . . . and the spirit of God's holy fear.'³ And this fruit of the Holy Spirit is the fruit of the sacred tree:

'And there shall come forth a rod out of the stem of Jesse, and a Branch shall grow out of his roots: And the spirit of the Lord shall rest upon him' (Is 11¹⁶).

It is true to-day, as in the earliest ages of animistic religion, that 'the fear of the Lord is the beginning of wisdom' (Ps 111¹⁰).

TREE OF KNOWLEDGE, TREE OF LIFE.—See TREES AND PLANTS.

TRIADS.—See TRIMŪRTI, TRINITY.

TRIMŪRTI.—Though the *Rigveda* does not contain the conception of a supreme spirit manifested in three forms (*trimūrti*), which is the Hindu doctrine of the Trinity, it contains elements which have contributed to form that belief. In the first place, Agni as the god of fire has three forms: he is the sun in the sky, lightning in the aerial waters, and fire on earth. On this idea is based much of the mysticism of the Vedic period, and it is reflected in the ritual by the threefold character of the sacrificial fire. Secondly, in prayers such as 'May Śūrya protect us from the sky, Vāta from the air,

¹ P. 467 f.

² P. 130.

³ *Book of Common Prayer*, Order of Confirmation; cf. Is 11^{2f}. LXX.

Agni from the earthly regions,¹ appears a tendency to reduce all the gods to manifestations of three chief deities, each representative of one of the three divisions, sky, air, and earth. Yāska² tells us that his predecessors in Vedic interpretation held that all the gods could be reduced to three, Agni, Vāyu or Indra, and Śūrya, though he himself does not adopt this view. A further step towards the amalgamation of the gods is seen in the *Maitrāyaṇī Saṃhitā*,³ which holds that Agni, Vāyu, and Śūrya are all sons of Prajāpati, the creator god.

The further development of the doctrine occurs only in the later *Upaniṣads* as the outcome of the adoption of the principle of the absolute (*brahman* or *ātman*). In the *Taittirīya Aranyaka*⁴ or *Mahānārāyaṇa Upaniṣad* the highest self (*paramātman*) is identified with Brahman (by which Brahman is probably meant), Śiva, Hari, and Indra; the identification with Hari is probably a later interpolation, as it spoils the metre, but it is doubtless an old change in the text. In the *Maitrāyaṇī Upaniṣad*⁵ Brahmā, Rudra, and Viṣṇu appear as forms (*tanavaḥ*) of the absolute, which itself is incorporeal, and again⁶ are declared to correspond respectively with the *rajas*, *tamas*, and *sattva* aspects of the absolute. The same triad is found in other texts such as the *Prāṇāgnihotra*, *Brahma*, *Nṛsiṅghotarāpāṇīya* and *Rāmottarāpāṇīya Upaniṣads*.

The comparative lateness and esoteric character of the doctrine are shown by the almost total absence of the conception from the epics, where it appears definitely only in the statement of the *Mahābhārata*:⁷

'In the form of Brahmā he creates; his human form [i.e. Viṣṇu] preserves; in his form as Rudra will he destroy; these are the three states of Prajāpati.'

This is the classical form of the doctrine which is repeated in the *Harivaṃśa*, in Kālidāsa's *Kumārasambhava*, and not rarely in the later literature. The personality of the trinity is varied slightly according to sectarian preferences: thus in the Śaiva view⁸ the absolute, which is Śiva, is manifested as Brahmā, Viṣṇu, and Bhava, the last a personal form of Śiva; the Nimbārka and other sects⁹ identify Kṛṣṇa with the absolute, distinguishing him from Viṣṇu as one of the trinity. There is some uncertainty whether the formation of the definite idea of a trinity was preceded by the conception of Viṣṇu and Śiva as merged in a unity, attested by the term Harihara, which appears first in the *Harivaṃśa*; this view, however, is rendered probable by the fact that the epic appears to have identified Viṣṇu and Śiva as equals before it combined Brahmā with them as their peer. A characteristically late idea recognizes a trinity of the Śaktis, or personifications of the power of the three gods: Vāch or Sarasvatī as that of Brahmā; Śrī, Lakṣmī, or Rādhā as that of Viṣṇu; and Umā, Durgā, or Kālī as that of Śiva. For this there is no Vedic parallel, though in the *āprī* hymns of the *Rigveda* a triad of sacrificial goddesses is found in Sarasvatī, Idā, and Bhāratī.

Serving as it does to reconcile rival monotheisms with one another and with the philosophic doctrine of the absolute, the theory of the Trimūrti presents no such close similarity to the Christian doctrine of the Trinity as to render derivation from Christian influences either necessary or probable, though chronologically the existence of such influence is

quite possible. It is, however, conceivable that the idea developed under the influence of Mahāyāna Buddhism, which possesses the notable triads of Buddha, Dhyaṇi-buddha, and Dhyaṇi-bodhisattva on the one hand, and of the Dharma-, Nirmāṇa-, and Sambhoga-kāyas of a Buddha on the other. The Buddhist art of Gandhāra, followed by that of Tibet, China, and Japan, is prone to depict groups of three deities, Buddhas, or bodhisattvas, and it is to this influence that we may assign the existence of such sculptures as that from the cave of Elephanta, Bombay, which presents the three gods in one statue, and affords the inspiration for the *ekā mūrtis trayo devāḥ* of the *Matsya Purāna*,¹ a passage often wrongly interpreted to mean 'One God and three persons.'

A. BERRIEDALE KEITH.

TRINITARIANISM.—See TRINITY, RELIGIOUS ORDERS (Christian).

TRINITY.—I. The term and concept.—(a) The term 'Trinity' (from Lat. *trinitas*) appears to have been first used by Tertullian,² while the corresponding Greek term 'Triad' (τριάς) appears to have been first used by Theophilus the Christian apologist,³ an older contemporary of Tertullian. In Tertullian, as in the subsequent usage, the term designates the Christian doctrine of God as Father, Son, and Spirit.

(b) Although the notion of a divine Triad or Trinity is characteristic of the Christian religion, it is by no means peculiar to it. In Indian religion, e.g., we meet with the trinitarian group of Brahmā, Śiva, and Viṣṇu; and in Egyptian religion with the trinitarian group of Osiris, Isis, and Horus, constituting a divine family, like the Father, Mother, and Son in mediæval Christian pictures. Nor is it only in historical religions that we find God viewed as a Trinity. One recalls in particular the Neo-Platonic view of the Supreme or Ultimate Reality, which was suggested by Plato in the *Timæus*; e.g., in the philosophy of Plotinus the primary or original Realities (ἀρχικαὶ ὑποστάσεις)⁴ are triadically represented as the Good or (in numerical symbol) the One, the Intelligence or the One-Many, and the World-Soul or the One and Many. The religious Trinity associated, if somewhat loosely, with Comte's philosophy might also be cited here: the cultus of humanity as the Great Being, of space as the Great Medium, and of the earth as the Great Fetish.

(c) What lends a special character to the Christian doctrine of the Trinity is its close association with the distinctive Christian view of divine incarnation. In other religions and religious philosophies we meet with the idea of divine incarnation, but it may be claimed that nowhere is the union of God and man so concrete and definite, and so universal in its import, as in the Christian religion. As Augustine said,⁵ if in the books of the Platonists it was to be found that 'in the beginning was

¹ J. N. Farquhar, *Religious Literature of India*, Oxford, 1920, p. 149.

² 'Custodiatur *oikonomia*s sacramentum, quae unitatem in trinitatem disponit' (*adv. Praxean*, 2).

³ τῆς τριάδος, τοῦ θεοῦ καὶ τοῦ λόγου αὐτοῦ καὶ τῆς σοφίας αὐτοῦ (ii. 15). But perhaps the earliest appearance of the term is in Clem. *Excerpt. ex Theod.* § 80; cf. A. Harnack, *Hist. of Dogma*, Eng. tr., 7 vols., London, 1894-99, ii. 209 n.

⁴ *Enn.* v. 1, cited by C. C. J. Webb, *God and Personality* (*Gifford Lectures*), London, 1918, p. 43.

⁵ *Conf.* vii. 9; cf. C. C. J. Webb, *Problems in the Relations of God and Man*, London, 1911, p. 236.

the Word,' it was not found there that 'the Word became flesh and dwelt among us.'² It is the very central truth of Christianity that God was historically manifest in Christ, and that He is still revealed in the world as the indwelling Spirit of the Church or community of Christ's founding. This Christian faith in the incarnation of the divine Word (*λόγος, sermo, ratio*) in the man Christ Jesus, with whom the believer is united through the fellowship of the Holy Spirit, constitutes the distinctive basis of the Christian doctrine of the Trinity.

2. The development of the doctrine.—The limits of this article preclude any attempt to trace in detail the development of the Trinitarian idea from its beginnings in the Bible to its final formulation in the orthodox creeds. In various articles of this Encyclopædia this ground is traversed, such as the comprehensive art. GOD; the artt. on particular developments of ancient Christian thought like the Alexandrian, Antiochene, and Cappadocian Theologies; the artt. on individual Christian theologians like Athanasius and Augustine; the artt. on heretical phases of Christological and Trinitarian belief like Adeptianism, Ariasism, Monophysitism, Nestorianism. It will be convenient, however, to take here a general conspectus of the development in question.

(a) The *Old Testament* could hardly be expected to furnish the doctrine of the Trinity, if belief in the Trinity is grounded (as stated above) upon belief in the incarnation of God in Christ and upon the experience of spiritual redemption and renewal through Christ. It is exegesis of a mischievous, if pious, sort that would discover the doctrine in the plural form, 'Elohim,' of the Deity's name, in the recorded appearance of three angels to Abraham, or even in the *ter sanctus* of the prophecies of Isaiah. It may be allowed, however, that the OT ideas of the Word of God and the Wisdom of God are adumbrations of the doctrine, as recognizing the truth of a various self-revealing activity in the one God.

(b) In the *New Testament* we do not find the doctrine of the Trinity in anything like its developed form, not even in the Pauline and Johannine theology, although ample witness is borne to the religious experience from which the doctrine springs. None the less Christ is acknowledged as the eternal Son of God and the supreme revelation of the Father, and the quickening Spirit of life is acknowledged to be derived 'from on high.'³ And so, when the early Christians would describe their conception of God, all the three elements—God, Christ, and the Spirit—enter into the description, and the one God is found to be revealed in a three-fold way. This is seen in the baptismal formula,⁴ 'In the name of the Father, and of the Son, and of the Holy Ghost,' which at least reflects the usage of the apostolic Church, and in which the members of the Trinity are already all three associated together. It is also to be seen in the familiar words of St. Paul,⁵ 'The grace of the Lord Jesus Christ, and the love of God, and the communion of the Holy Ghost.' This last has been called, and justly so, the great Trinitarian text of the NT, as being one of the few NT passages, and the earliest of them, in which the three elements of the Trinity are set alongside of each other in a single sentence. If the passage contains no formulated expression of the Trinity, it is yet of great significance as showing that, less than thirty years after the death of Christ, His name and the name of the Holy Spirit could be employed in conjunction with the name of God Himself. Truly, if the doctrine of the Trinity appeared

¹ Jn 11.

² Mt 28¹⁹.

³ Jn 14.

⁴ 2 Co 13¹⁴.

⁵ Lk 24⁴⁹.

somewhat late in theology, it must have lived very early in devotion.

(c) The story of the Trinity in *ecclesiastical history* is the story of the transition from the Trinity of experience, in which God is self-revealed as the Father or Creator and Legislator, the Son or Redeemer, and the Spirit or Sanctifier, to the Trinity of dogma, in which the threefold self-disclosure of God is but the reflexion, as it were, of a threefold distinction within the divine Nature itself. With the transition from the Trinity of experience to the Trinity of dogma the theological statement tends to lose touch with the gracious figure of the historical Christ. In the Nicæno-Constantinopolitan Creed, in which the Eastern development of the doctrine of the Trinity culminated, the dogma still retains its connexion with its positive ground and basis in the incarnate life of Christ; but in the Athanasian Creed, which represents the form which the dogma finally assumed in the West, it appears to have lost the connexion altogether, and to move entirely in the transcendent realm.

Five stages in the dogmatic development may be distinguished.¹ (1) The formal identification of the pre-existent Christ (of the Pauline and Johannine theology) with the Logos of Greek philosophy. In the NT the identification is in the practical rather than speculative interest, but in Justin Martyr and the apologists it may be regarded as the first step in the logical process whereby the historical figure of Jesus Christ was caught up into the purely speculative sphere. (2) The doctrine of the eternal generation of the Logos or Son (hitherto regarded primarily as the cosmological principle of revelation and not therefore co-eternal with God). This doctrine, due to Origen, which may be expressed in other words as the eternal Fatherhood of God, entered into the Athanasian theology. Formulated in the interests of the divinity of Christ, it conserved also—as against Sabellian views—the distinction between the Father and the Son. On the other hand, the subordinationism it implied and acknowledged, while countering dyotheistic and tritheistic tendencies, lent support to the Arian conception of the Son as a creature, especially after the Origenist theory of eternal creation (which enabled Origen himself to regard the Son as still primarily a cosmological principle) had been abandoned. (3) The doctrine of the consubstantiality of the Son with the Father. This was affirmed against Arianism at Nicæa, where the concept—if not as yet the actual term—*homoousios* (*ὁμοούσιος*) as applied to the eternal Son was amply vindicated. As Athanasius taught, in jealous regard for the divineness of the Christian incarnation and redemption, there was an absolute likeness between the Father and the Son, and also a co-inherence or mutual immanence (*περιχώρησις, circumincessio*) of their Persons.² (4) The doctrine of eternal distinctions within the divine Nature, according to the formula of 'three Hypostases in one Ousia or Substance' (*τρεῖς ὑποστάσεις, μὴ οὐσία*). To the Cappadocian theologians (Basil, Gregory of Nazianzus, Gregory of Nyssa) we owe the final settlement, for which this formula stands, of the dogmatic terminology. In distinguishing between *hypostasis* and *ousia*, the former denoting a real principle of distinction within the divine Nature and the latter the divine Substance or Nature (*φύσις*) itself,³ they sought to lift the orthodox doctrine out of the Sabellian modalism which recognized no distinction in reality between the

Father and the Son, so impairing the significance of the historical Christ, and at the same time to vindicate it against the opposite error of heathen polytheism (tritheism), of which it was so often accused. Moreover, the Cappadocians gave to the third member of the Trinity, the Holy Spirit, the definite place and character which He now possesses in the Eastern orthodoxy, as being also a Hypostasis in the Godhead, consubstantial with the Father, and proceeding from the Father through the Son. (5) The doctrine of the double procession from the Father and the Son (the *filioque* clause, added to the Nicæno-Constantinopolitan Creed on canonically indefensible grounds¹)—a doctrine which represents the difference between Western orthodoxy and Eastern (with its view of procession as from the Father alone, the unitary source of deity²); which was conceived, in the interests of the divine unity, as counteractive of the subordinationism contained in the Eastern formulas; and which under Augustine's influence found its way into the Athanasian Creed. Curiously enough, the Athanasian Creed (so called) thus differs theologically from the Nicæno-Constantinopolitan Creed in its original Eastern form on a point on which Athanasius's own sympathies would have lain with the Eastern symbol. The Greek (Athanasian) theology found the divine unity in the Father, the one fountain-head of deity, so leaving room for the conception of the Son and the Spirit as subordinate to the Father. The Roman (Augustinian) theology found the divine unity in the divine Nature or Substance, with the result that, as the distinctions between the three Hypostases or Persons became weakened under the doctrine of the co-inherence, so attractive to the non-metaphysical Westerns,³ there remained no proper foothold—so to speak—for the doctrine of subordination.

3. The statement of the doctrine.—(a) The ecclesiastical doctrine whose stages of development have been indicated may be briefly stated as follows, and the form of statement would commend itself as a whole alike to the Western or Roman Catholic and the Protestant Church. For, although the doctrine of the Trinity was the subject of much discussion, dogmatic and speculative, in the Middle Ages and at the Protestant Reformation, and has been since, it has been formulated all along on the lines of the Nicæno-Constantinopolitan and Athanasian Creeds. Both Roman Catholics and Protestants—generally speaking—yield formal adherence to these symbols, and the old orthodoxy remains still the new.

(b) There are then (as the statement may run) three Persons (Hypostases) or real distinctions in the unity of the divine Nature or Substance, which is Love. The Persons are co-equal, inasmuch as in each of them the divine Nature is one and undivided, and by each the collective divine attributes are shared. As a 'person' in Trinitarian usage is more than a mere aspect of being, being a real ground of experience and function, each divine Person, while less than a separate individuality, possesses His own hypostatic character or characteristic property (*ιδιότης*). The hypostatic characters of the Persons may be viewed from an internal and an external standpoint, *i.e.* with reference to the inner constitution of the Godhead or to the Godhead as related to the cosmos or world of manifestation. Viewed *ab intra*, the hypostatic character of the Father is ingeneration (*ἀγεννησία*), of the Son filiation, of the Spirit procession; wherefore, 'the Father is of none, neither begotten nor proceeding; the Son is

³ Strong, p. 170.

eternally begotten of the Father; the Holy Ghost eternally proceeding from the Father and the Son.¹ Viewed *ab extra* (for Love functions externally as well as internally, is centrifugal as well as centripetal²), the hypostatic character of the Father is made manifest in creation, whereby a world is provided for beings who should be capable of experiencing fellowship with the divine Love; the hypostatic character of the Son in redemption, whereby the alienating power of sin is overcome; and the hypostatic character of the Spirit in sanctification, whereby human nature is quickened and renewed and shaped to the divine likeness. Yet, while this is said, as there is no separation in the unity of the Godhead, so the one God is manifested in the threefold work of creation, redemption, and sanctification; moreover, each of the Persons as sharing the divine attributes is active in the threefold work, if with varying stress of function. Verily the doctrine of the Trinity *exit in mysterium*.

(c) It should, perhaps, be emphasized that the Trinitarian statement is never tritheistic, in the sense of affirming three separate self-conscious and self-determining individualities in the Godhead. When it is affirmed that there are three Persons in one God, the word 'person' is used archaically, and not in the modern sense of a centre or core of personality. It was a word employed by Tertullian³ as on the whole the best word by which to convey the idea of an inner principle of distinction or individuation (*ὑπόστασις*); and it was a good enough word when it bore a vaguer and more flexible meaning than it bears nowadays in Western Europe. To say that there are three separate personalities in the Godhead would be polytheism. To say that there are three eternal principles of distinction or modes of subsistence in the Godhead is not polytheism—although in the speculative construction of the Trinity it might lead, and has sometimes led, to a theoretical pluralism or polytheism.

4. The speculative construction of the doctrine.—(a) Although the Christian Church soon came to look upon the Trinity as an incomprehensible mystery of revelation, which reason might not probe, her theologians have not refrained whether in ancient or in modern times from speculation upon the doctrine. In mediæval times, indeed, the doctrine of the Trinity was 'the high school of logic and dialectic.'⁴ Then, as before and since, recourse was often made to the principle of analogy, in order to throw light upon the mysterious notion of tri-personality in the Godhead. It is a principle that has received classical treatment at the hands of Augustine, who employed in particular the analogies of the human self-consciousness and the relationship of love. It is not pretended, however, that by such analogies the doctrine of the Trinity may be rationalized. And, clearly, such analogies fail on one side or the other to satisfy the conception of 'three Persons in one Nature.' On the one hand, the psychological analogy of the self-consciousness does justice to the unity of the Nature, but not to the distinction of the Persons. This is as true, it has been remarked,⁵ of Dörner's construction founding upon Hegel's 'being in itself, being for itself, being in and for itself,' as of Augustine's 'memory, understanding, and will'⁶ (in each of which he found the whole rational nature expressed), or, as we might add, of his

'mind, self-knowledge, and self-love.'¹ On the other hand, the social analogy of love does justice, more or less, to the distinction of the Persons, but not to the unity of the Nature. In this case the three elements of the analogy are the loving subject, the loved object, and the mutual love which unites them. The subject and the object possess, to be sure, more than sufficient independence for the purpose in view, but it is difficult to see how the love which unites may be accepted as a distinct person, even in the vaguest sense of that term. The application of the psychological analogy may be regarded as an attempt to satisfy the *theoretical* interest attaching to the traditional dogma for which the Logos-conception stands, namely, the explanation of the relations between God and the world. On the assumption that the human individual is a microcosm, bearing traces of the divine Personality upon him, it would seek to make more intelligible the unity in diversity, or more precisely the unity in triplicity, affirmed in the orthodox view of the Godhead. Again, the construction of the Trinity which is founded upon the social analogy may be regarded as an attempt to satisfy the *practical* interest attaching to the traditional dogma, namely, the vindication of the truly divine character of the Person and Work of Jesus Christ. On the assumption that the love-created social unit is the real microcosm, it would make more intelligible the triplicity in unity which is also affirmed in the orthodox view of the Godhead. Perhaps the social analogy has been the more influential of the two. It certainly offers a picture of the inner constitution of the Godhead that corresponds to the Christian Gospel: 'The love of the Eternal Father is for ever satisfied in the Eternal Son; the Father and the Son are for ever bound together in the Holy Spirit, who is the bond of the Divine Love.'²

(b) In modern constructions of the doctrine of the Trinity there is a tendency to make much of the microcosm of human personality as carrying traces of macrocosmic Reality. God is to be interpreted, it is said, according to the teleological principle of the highest, and human personality is the highest thing we know. The result is that, as C. C. J. Webb³ has indicated, we hear a good deal nowadays, even in non-Unitarian Christianity, of 'the Personality of God,' whereas the historical doctrine is that of 'Personality in God.' This raises the question whether the future of Christianity lies in its associating itself with the modern philosophical movement of personalism or in the renewal of its old alliance with Platonism. Into such a question we may not enter, but we would cite a recent instance of a discussion of the Trinity in which human personality figures as the key to the mystery of the Godhead. It is S. A. McDowall's⁴ contention that there is more than analogy between human and divine personality, there is also identity in their nature. The Trinity within us is more than suggestive of the truth that in God personality is also triune. If we might borrow the language of Julian of Norwich,⁵ the 'made Trinity' actually points to 'the unmade blessed Trinity.' If the Godhead be a Personality, it must indeed be a unity, but the unity—like the unity of human personality—is composed of three persons, which, although not self-existent but completely interpenetrating, are differentiated from each other by the stress of their individual functioning.⁶ Personality, whether in God or in

man, could not really exist if it did not thus involve an internal manifold.¹ For the elaboration of these positions reference must be made to the book itself. The discussion is cited here only as illustrating a recent tendency in the application, in Trinitarian speculations, of the principle of analogy.

5. Economic and essential trinity.—(a) The transition from the Trinity of experience to the Trinity of dogma is describable in other terms as the transition from the economic or dispensational Trinity (*τρόπος ἀποκαλύψεως*) to the essential, immanent, or ontological Trinity (*τρόπος ὑπάρξεως*). At first the Christian faith was not Trinitarian in the strictly ontological reference. It was not so in the apostolic and sub-apostolic ages, as reflected in the NT and other early Christian writings. Nor was it so even in the age of the Christian apologists. And even Tertullian, who founded the nomenclature of the orthodox doctrine, knew as little of an ontological Trinity as did the apologists; his is still the economic or relative conception of the Johannine and Pauline theology. So Harnack holds,² and he says further³ that the whole history of Christological and Trinitarian dogma from Athanasius to Augustine is the history of the displacement of the Logos-conception by that of the Son, of the substitution of the immanent and absolute Trinity for the economic and relative. In any case the orthodox doctrine in its developed form is a Trinity of essence rather than of manifestation, as having to do in the first instance with the subjective rather than the objective Being of God. And, just because these two meanings of the Trinity—the theoretical, and the practical, as they might also be described—are being sharply distinguished in modern Christian thought, it might be well if the term 'Trinity' were employed to designate the Trinity of revelation (or the doctrine of the threefold self-manifestation of God), and the term 'Triunity' (cf. Germ. *Dreieinigkeit*) adopted as the designation of the essential Trinity (or the doctrine of the tri-personal nature of God).⁴

(b) It should be observed that there is no real cleavage or antithesis between the doctrines of the economic and the essential Trinity, and naturally so. The Triunity represents the effort to think out the Trinity, and so to afford it a reasonable basis. The first Christians had with St. Paul a saving experience of the grace of the Lord Jesus Christ, and of the love of God, and of the communion of the Holy Ghost;⁵ and the theologians of the ancient Church sought to set forth the Christian experience in logical terms of reason. In the effort they were led, inevitably, to effect an alliance between the gospel of their salvation and the speculative philosophy, and more especially the Platonism, in which they had been trained, while, in making room for the Christian gospel within the world—not altogether hospitable—of the Greek philosophy, they found themselves translating their empirical knowledge of God—the God and Father of the Lord Jesus Christ—into a doctrine of diversity or multiplicity, as distinguished from merely abstract unity, within the divine Nature itself. In other words, in thinking out the Trinity they arrived at the Triunity. None the less the greatest and most influential of the Christian Fathers, Origen, Athanasius, Basil and the Gregories, Augustine, all acknowledged that, for all the light thrown upon it in the Biblical revelation, the divine Nature remained for them a mystery transcending reason.⁶

⁵ Cf. 2 Co 13:4.

⁶ Cf. J. R. Illingworth, *The Doctrine of the Trinity*, London, 1907, ch. vi.

(c) It is claimed, however, especially by Catholic thinkers, that, logical mystery as the Trinity undoubtedly is, it not only conserves the spiritual values of the Gospel, but may be said to enshrine or encasket them. The Athanasian Creed, e.g., is declared to be in effect a sublime and magnificent hymn of the Christian faith, having a power all its own to stir and uplift the souls of believers with the greatness and mystery of the divine redemption in Jesus Christ. That being so, it may be allowed that there is justice in the contention that acceptance of the Triunity does not commit one to the adoption of obsolete modes of thought, but only to acceptance of the authoritative Christian tradition which the terms of the Greek philosophy served to symbolize, and with whose continued vitality they have become invested.¹

(d) But in consequence of a wide-spread failure, especially within the Protestant Church, to appreciate the symbolism in which the traditional Christian convictions are embodied, and to recognize in the doctrine of the Three in One any more than a sacred mysterious formula, modern Christian theology is thrown back more and more upon the historical revelation in Jesus Christ and the inward experience of Christian believers as the practical ground and basis of Trinitarian doctrine, being less concerned with what God is in Himself than with what He has shown Himself to be—less concerned with the Trinity of essence than with the Trinity of manifestation. It is part of the modern empirical movement in theology, chiefly associated with the names of Schleiermacher and Ritschl. When thus employed practically, as interpretative of Christian experience, rather than theoretically, as a doctrine of reality beyond and even apart from experience, the Trinity may be regarded as summarizing the different ways in which the knowledge of God may be held. (1) He may be thought of as the self-disclosed God and, as such, known to men as the ultimate and absolute Being, whose ways are past finding out. (2) He may be thought of as the self-disclosing God and, as such, known to men in nature and history and, above all, in the character and purposes of Jesus Christ. (3) He may be thought of as the self-imparting or self-communicating God and, as such, known to men as indwelling power. God revealed, God revealing, God abiding—in these three ways God makes Himself known, and they correspond to the elements of the Father, the Son, and the Holy Spirit in the Trinitarian formula. If then, theoretically, the Trinity is 'the affirmation of a full rich life in God as distinct from all abstract and barren conceptions of his Being,' it is, practically, 'the affirmation that the true nature of God must be learned from his historic revelation in Christ, and from the experience which Christ creates.'²

(e) Doubtless such a statement is liable to the charge of Sabellianism (modalistic Monarchianism), but it may readily be defended against such a charge. In Sabellianism the divine nature is an abstract undifferentiated unity known only in three successive modes or manifestations, none of which is complete or permanent; they are but names,³ and may not be translated into fundamental factors in the divine experience. Here the elements of the Trinity are acknowledged to be rooted eternally in unseen reality, so that God is always the Father, the Son, and the Spirit, although known through the threefold self-manifestation or not known at all.

(f) In the system of Christian theology the

³ Epiphanius, *Hær.* lxii. : ὡς εἶναι ἐν μία ὑποστάσει τρεῖς ὀνόμασι; cf. J. Tixeront, *Hist. des dogmes dans l'antiquité chrétienne*, 3 vols., Paris, 1909-12, i. 349, 483 f.

doctrine of the Trinity does not usually fit well into the general doctrine of God, and often bears the character of a doctrine apart. There is much to be said for Schleiermacher's view—in his case reflecting, it may be, a Sabellian attitude—that the Trinity falls to be discussed at the end of the dogmatic system. One could not properly speak, he urged, of the Father, the Son, and the Spirit until one had expounded the Christian faith regarding the Son and the Spirit. None the less, it is quite possible vitally to relate the Trinity, conceived scripturally as a Trinity of manifestation, to the general Christian conception of God.¹ (1) There is no difficulty with the doctrine of the Father, who in the new formula as in the old is God in all His fullness of being and life; from which fullness the Son and the Spirit subtract nothing. (2) The doctrine of the Son is not without difficulty in this connexion. The old formula rested on the assumption that the divinity of Christ (the Christian conviction of which was the experiential ground of the doctrine of the Son) was to be discovered in the metaphysical constitution of His person, and accordingly by the way of analysis, whereas the new formula founds upon the principle that the secrets of personality do not yield themselves to 'searching' but to observation, and that accordingly the divinity of Christ is to be traced and recognized, if anywhere, in the unfoldings of His character and life. Moreover, the old formula also implied that there existed a fundamental difference of nature between God and man, so that the incarnation of the divine Word was nothing if not a stupendous miracle. The new formula, under the ruling modern conception of divine immanence, would imply that the divine-human Christ may be reached along the lines of God's normal working in His world. God is to be conceived as always present and active in the world, manifesting Himself continuously in nature and history, yet manifesting Himself supremely and fully only in the Person and Work of Jesus Christ. In Jesus Christ we have at once true man arising out of humanity and true God coming forth from the Godhead. In other words, Jesus Christ is the perfect expression of the divine Nature in terms of human character and life. With such a new criterion of divinity, and such a new conception of the relationship between the divine and the human, an assured place may be found—it is claimed—for the doctrine of the Son in the modern doctrine of God. (3) The doctrine of the Spirit may also be seen to be fulfilled in the new doctrine of God towards which modern Christian thought appears to be advancing. For the Spirit is but the immanent God Himself, working more freely in the souls of men as righteousness and power because of the new channels of influence He has opened up for Himself through Jesus Christ. In short, God Himself (*ὁ θεός*) is the Father revealed; God Himself is in Christ revealing; God Himself is the Holy Spirit abiding. The form of the ancient dogmatic conception may be changed, but the substance of it remains. Still as of old we know God in His threefold relationship to men, and in each relationship we have very God Himself. Wherefore we may still unite in ascribing glory to the Father, and to the Son, and to the Holy Spirit, as it was in the beginning, is now, and ever shall be, world without end.

TRITHEISM.—1. Definition.—Tritheism (Gr. *τρεις*, 'three,' and *θεός*, 'God') is the belief in three Gods. As such, it is a form of polytheism, defined as the belief in many Gods or in more Gods than one.

2. Christianity and tritheism.—So far as the present writer is aware, no historical religion may properly be called tritheistic. Where divine triads or trinities are found, they are not distinguished from other divinities as true or real gods from idols. (1) On the other hand, the charge of being tritheistic has often been preferred against the Christian religion, as presented in the doctrine of the Trinity. (2) The Christian Church has, however, expressly dissociated itself from Trinitarian views tending to tritheism. (3) Moreover, liability to the charge of tritheism is regarded as sufficiently damaging also to speculative constructions of the Trinity. In what follows the writer would expound these three statements one by one.

3. The charge of tritheism.—(a) The accusation of being tritheistic, which has often been made against Christianity, is in a sense justified. For undoubtedly the doctrine of the Trinity has been, and is still, conceived among simple uneducated Christians in a naively tritheistic way. Sometimes also a naive tritheism is found even in theological statement, as when in so-called transactional theories the Atonement is represented as the result of a bargain between the first and second Persons of the Trinity.

(b) But the Christian religion, like other historical religions, must be judged by the affirmations of its best and most representative minds, and not by the crudities of the uninstructed or the aridities of theological pedantry. It is affirmed by the representative minds of Christianity that the accusation of tritheism is unjustified, being largely founded upon misunderstanding of the theological terms in which the Trinity is formulated. They would insist that there is a world of difference between the formula, 'There are three Gods,' or even the formula, 'There are three distinct or separate individuals in the class known as God,' and the formula in which the orthodox doctrine may be summarized, 'There are three Persons in one God.' In fact the Trinity is declared to be at bottom an assertion of the divine unity. If in the light of the Christian revelation we are led to affirm three eternal distinctions in the Godhead, we must still hold fast to the old faith of Israel's prophets and say, 'These three are one.' Admittedly, however, there are ambiguities and associations to mislead in the Trinitarian terminology. In particular, the ambiguity of the word 'person' is allowed to be a source of much misunderstanding. To set forth the true theological meaning of this word should be enough, it would be added, to vindicate the doctrine of the Trinity against a charge so obnoxious as that of tritheism. We are

¹ Cf. W. N. Clarke, *The Christian Doctrine of God*, Edinburgh, 1909.

reminded in this connexion of how the early Christian thinkers abhorred the suggestion even that in affirming the Trinity they were reinstating heathen polytheism.

It should be remembered¹ that there was no word 'person' in the vocabulary of the Greek-speaking theologians, who shaped the doctrine of the Trinity to the authoritative form it assumed in the Niceno-Constantinopolitan Creed. 'Person' (Lat. *persona*, 'an actor's mask'), as it appears in the Athanasian Creed, was intended to represent the Greek *ὑπόστασις*. Now 'hypostasis' ('sediment' or 'dregs,' lit. 'standing under or below') was used about the beginning of the Christian era to signify a real concrete existence or actuality in contradistinction to a mere appearance having nothing solid or permanent underlying it, such as a comet in comparison with a rainbow. Through Origen's influence it came to be employed in the theological terminology as the designation of a member of the Trinity, as in the Cappadocian formula, 'Three Hypostases in one Nature or Substance' (*φύσις, οὐσία*).² 'Hypostasis' then stood for a real independence—a real principle of individuation or distinction—*within* the Being of God, and ceased to be regarded, as in the Stoic use, as theologically equivalent to *οὐσία* or *φύσις*. It may be that the term 'hypostasis' as applied to the members of the divine Trinity suggested an independence or individuality of too complete a sort, as though the Father, Son, and Spirit were as separate in the class God as Peter, James, and John in the class named man;³ but this suggestion was corrected, at least for speculative minds, by the Logos-Christology deriving from St. John and St. Paul, in which the idea of immanent distinctions in the unity of the Godhead received recognition. On the other hand, the tritheistic suggestion was in a sense accentuated for the Latin-speaking theologians by the selection, due probably to Tertullian,⁴ of the word 'person' as the translation of *ὑπόστασις*. Though *persona*, as its original meaning might show, implied only a temporary and superficial kind of individuality (an implication more definitely conveyed by *πρόσωπον*, lit. 'face,' by which *persona* was often rendered in the later Greek theology), it implied also the dignity and worth of a rational nature. A 'person' in the early centuries of the Latin Church was an individual viewed in a legal aspect (the word often meant a litigant or a party to a contract as well as a player) as the subject of rights and duties, if not as yet in the philosophical sense of a self-conscious and self-determining Ego—a sense which has attached itself to the word in modern times. Yet even the ancient legal and relative associations of 'person' would impart ambiguity to its theological use, especially in popular thought, and the ambiguity would tend to increase in European usage as the word approximated more and more to the modern philosophical sense of personality. So it is not surprising that there has been a strong tendency to tritheism in Western theology, especially among the people; and that non-Christian thinkers, notably Jewish and Muhammadan, have so often viewed the doctrine of tri-personality in God as virtual or veiled tritheism.

4. Tritheism as a heresy of dogma.—(a) Although aberrations from the orthodox doctrine were in the East towards a modalistic Monarchianism (Sabellianism) rather than tritheism, it was in the East—among the Greek-speaking theologians—that a form of tritheism actually arose to meet with the condemnation of orthodoxy. The movement in question illustrates the reaction of Christological discussion and controversy upon the doctrine of the Trinity. Christology lay in the heart of the Trinitarian dogma, and the development of Christology naturally led to a revision of the dogmatic terms.

(b) As a definite phase in the history of Christian thought tritheism appeared c. A.D. 550 in Monophysite circles, being associated chiefly with the names of John Askunages and John Philopon. The latter, an Alexandrian philosopher and a distinguished Aristotelian, of whose work entitled *Διατριπής* important fragments have been preserved in the writings of John of Damascus,⁵ appears to have been the most influential of the school. As a Monophysite John Philopon was opposed to the Chaldeonian description of the Person of Christ as consisting of 'one person in two natures' (*ἐν πρόσωπον ὁ μιὰ ὑπόστασις ἐν δύο φύσεσιν*), and contended that Christ's was a single nature compounded of the divine and the human. That is

¹ See the recent discussion of Trinitarian terminology in C. O. J. Webb, *God and Personality (Gifford Lectures)*, London, 1915, esp. lect. ii.

⁵ De Her. 83.

to say, in Christology *φύσις* or *οὐσία* and *ὑπόστασις* were to be viewed as synonymous terms.

(c) When this Christological position is applied to the doctrine of the Trinity, the question is at once raised as to whether the orthodox formula of three Hypostases in one Substance can be maintained. If one *οὐσία*, is there not but one *ὑπόστασις*; if three *ὑποστάσεις*, are there not three *οὐσίαι*? The affirmative to the first question leads to a form of Unitarianism, the affirmative to the second to a form of tritheism.

(d) John Philopon started from the consideration of the three *ὑποστάσεις* and reached, accordingly, a tritheistic conclusion as to the divine *οὐσία* or *φύσις*: *ἔστω τρεῖς φύσεις λέγειν ἡμᾶς ἐπὶ τῆς ἁγίας τριάδος*.¹ So he and his followers were named by their opponents 'tritheists' (*τριθεῖται*), although we are told² that they would not actually have confessed themselves as believers in three Gods. If theirs was a theoretical, it was not also a practical, tritheism, like the Trinitarian notions of the transactional theorists mentioned above (which amply justified the protest of the earlier Unitarians). It appears, however, that John Philopon admitted the notion of a common Nature (*οὐσία κοινή*), if holding it in what might have been named later a nominalist sense; but Damian³ (578-605), the Monophysite patriarch of Constantinople, held so pronouncedly realistic a view of the one Substance, at the same time apparently regarding the three Persons as true reals or separate individualities, that, like Peter the Lombard in a later day, he was accused of teaching a Quaternity rather than a Trinity, and his followers were labelled 'tetradites' (*τετραδίται*). The tritheists were definitely opposed in the name of the orthodox dogma by John of Damascus, who in seeking to emphasize as against them the unity of the Godhead gave—as Augustine did—a modalistic flavour to his theological exposition.⁴

5. Tritheism as an error of speculation.—It has been remarked⁵ that in the tritheistic movement (so called) and the counter-movements it evoked we may find the roots of the mediæval controversy between nominalism and realism. The remark is illustrated by the case of Roscellin, the best-known representative of the older nominalism. According to Roscellin, universals were not reals, but merely subjective conceptions (*flatus vocis*).⁶ And, if this principle holds of the Nature or Substance of God, then the Persons of the Trinitarian formula must be regarded as distinct self-consciousnesses, and the unity of the Godhead as but a nominal and generic unity. Thus on philosophical principles Roscellin reached a theoretical tritheism, which, however, at Anselm's instance, was condemned at Soissons in 1092.⁷ And over and over again, from the beginnings of Christian theology down to the present, speculative constructions of the doctrine of the Trinity have had to encounter—sometimes in the irony of things—the damning charge of being tritheistic. In the ancient Church, as Callistus accused Hippolytus of dyotheism, so Dionysius—maintaining the Roman tradition of unspeculative adherence to the

⁶ Cf. Anselm, *de Fid. trin.* 21, Ep. ii. 35, 41.

⁷ Roscellin and the nominalists were dubbed by Anselm *dialectice hæretici* (*de Fid. trin.* 2); cf. F. Loofs, *Leitfaden zum Studium der Dogmengeschichte³*, Halle, 1893, § 60, 4.

unity of the Godhead—preferred the accusation of tritheism against Origen's teaching.¹ Yet Origen's doctrine of the eternal generation of the Logos or Son entered into the orthodox formulas, and a follower of Origen, Gregory Thaumaturgus, mightily championed the unity of the Godhead against the polytheists (tritheists).² Again, in the mediæval Church even Abelard was suspected of tritheism, and yet it was Abelard's aim and endeavour to mediate between the extremes of a tritheism like Roscellin's and pure modalism, and his sympathies lay with modalism rather than tritheism.³ Once again, if it is not invidious to select so modern an instance, W. Adams Brown comments as follows on W. N. Clarke's constructive presentation of the essential Trinity:

'It is hard to see how these "centres of conscious life and activity" can be distinguished from separate personalities.'⁴ And yet W. N. Clarke⁵ so emphasizes the Trinity of manifestation, as distinguished from the Trinity of essence, as to be far away indeed from tritheism. It all illustrates the fact that, while the doctrine of the Trinity, as set forth in the Nicæno-Constantinopolitan and Athanasian Creeds, will have no traffic with tritheism, it is difficult in the theological exposition of the dogma to steer a safe course between tritheism and a Sabellian modalism (in which the Father, Son, and Spirit are merely three modes or aspects of the one God)—which serves to give point to Augustine's famous remark that the alternative to the affirmation of the three Persons is silence: 'dictum est tres personae, non ut illud diceretur, sed ne taceretur.'⁶

W. FULTON.

TRUST.—In the wide sense of confidence in a supernatural Power on which man feels himself dependent, trust enters as an element into practically all religions from the lowest up to the highest. Savages rely on their fetich to bring them success in the chase, and other peoples on their national god to give them victory in war. But such trust possesses no ethical quality and need not further detain us. Only when the superior and supernatural Power is conceived in more or less ethical fashion can a trust emerge that has ethical and religious value. Religious trust, in the only sense worth considering, is confidence in and reliance upon the eternal Power on which we hang, as one that is working towards a worthy end and guiding the course of events in wisdom and goodness. It is the trust that comes to expression in Ps 36⁵⁷:

'Thy lovingkindness, O Lord, 'is in the heavens; thy faithfulness reacheth unto the skies. Thy righteousness is like the mountains of God. . . . And the children of men take refuge under the shadow of thy wings.'

Were the facts of life uniformly of a kind to render the moral purpose and control of God obvious and unmistakable, the exercise of trust would make no particular demand on our energies. Since, however, they are far from being so, the world not seldom seeming to ride roughshod over man and his values, trust always carries with it the idea of a triumph over difficulties. In the Epistle to the Hebrews it is presented in the light of an act of heroism: 'He endured, as seeing him who is invisible' (11²⁷).

Trust of this kind is not of course to be looked for in the religion of primitive races or in religions that are merely national. Nor does it emerge with any distinctness in the pantheistic religions of India. The Indian conception of the world-order as governed by the principles of *karma* and *samsāra*

(transmigration) is not at bottom ethical, and the corresponding piety consists not in submission to that order as something good, but in the desire to escape from it, and in the exercises through which the goal of absorption in Brahman is attained. Bhāgavatism, it is true, acknowledges a single God who is personal and gracious; and in its conception of *bhakti*, or devotional faith, as the way of deliverance from the wheel of birth and rebirth, resignation appears, if not as a constituent, at least as a fruit.¹ But *bhakti* is far less ethical trust than a mystical 'abiding' in the 'Adorable,' and the piety of Bhāgavatism as mirrored in the *Bhāgavad-Gīta*, intense though it is, is for the most part of the usual Indian type.

In the religion of the Greek dramatists, of Plato, and of the later Stoics, trust holds an assured though not a prominent place. Sophocles expresses the conviction that, however things may seem to us in our short-sightedness, if we could only see the purposes of the gods in their totality, we should know them to be good, and that 'nothing to which the gods lead man is base.' Of the just man Plato declares:

'Even when he is in poverty or sickness, or any other seeming misfortune, all things will in the end work together for good to him in life and in death: for the gods have a care for any one whose desire is to become just and to be like God, as far as man can attain the divine likeness, by the pursuit of virtue.'² Even more striking are the words of Epictetus: 'Do with me what thou wilt: my will is thy will: I appeal not against thy judgments.'³ In the *Epinomis*, a dialogue wrongly ascribed to Plato, it is said: 'Pray to the gods with trust.'⁴ And of Socrates Xenophon says that he must have believed in the gods, since he trusted them: πιστεύων δὲ θεοῖς πᾶς οὐκ εἶναι θεοῦ ἐνβουλήν.⁵

But, though in the higher Greek religion trust had a firm basis provided for it and secured a certain amount of recognition, its full significance was far from being realized. Nowhere do we find it put forward as a central element in piety or a spring of strength and goodness. It was in the Hebrew prophets and their spiritual successors that it first really came into its own. Everywhere in the Bible we are met by utterances of fervent and steadfast trust in God. And its religious importance is clearly recognized. Isaiah sees in it the only source of safety: 'If ye will not trust, ye shall not be established' (7⁹). Jeremiah speaks to the same effect: 'Cursed is the man who trusts in man and makes flesh his arm, and whose heart turns aside from Jahweh. . . . Blessed is the man who trusts in Jahweh and whose confidence Jahweh is' (17⁵⁻⁷). To trust in Jahweh and do good is presented in Ps 37 as the sum of religion. In the NT the idea of trust, deepened by a new feeling for God's care for the individual, occupies a position of still greater prominence. Outside the Synoptic Gospels, however, it is to a large extent merged in the idea of faith (*g. v.*). It is faith in the sense of belief that is established as the condition of salvation. This change of emphasis—as we shall see, it amounts to nothing more—is intelligible when we remember that the gospel was preached as, in the first place at least, a message to be received. None the less it created for the Church a serious problem and one that had to wait long for a satisfactory solution. The problem has to do with the mutual relations of faith and trust. By St. Paul,⁶ and also in the Epistle to the Hebrews, faith

⁶ *De Trin.* v. 9.

is conceived in a way that makes the two practically identical. But what if its object is thought of as a doctrine which must first be assented to before trust can enter? In that case faith, while including trust, will contain in addition a purely intellectual element, either intellectual submission, if the doctrine is authoritatively given, or intellectual insight, if it is the product of a rational process. Adopting the first alternative, the older Protestant theologians in their analysis of faith established *notitia* and *assensus* as the necessary preliminaries to *fiducia*. The vice of this solution is that it destroys the independence of faith—in other words, of religion—by binding it to an act external to it and without moral quality. The faith described by Paul as trust in God is presented as at bottom subjection to the Church or the Bible as the guarantor of religious truth. And its independence is equally subverted if, adopting the second alternative, we regard it as receiving its object from philosophical reflexion. The true solution of the problem lies in the recognition that in faith itself there is a cognitive element, and that its object is given not in the form of a doctrine, but in the form of an ideal value. Face to face with the great values that are supremely embodied in the life and cross of Jesus and that are summed up in the conception of a kingdom of the good, we affirm them on the ground of their worth as the manifestation of the eternal Power that works at the heart of things, the eternal Reality on which the universe no less than our human life is founded. Faith is nothing else than just this feeling for the ideal and, above all, the moral values and this affirmation of their cosmic significance. So interpreted, it is one and the same thing with trust in God, for what is trust in God but trust in the good as the central might on which we and the whole universe hang? If there is a difference, it is that in the idea of faith the emphasis falls on the cognitive aspect, and in the idea of trust on the volitional.

TSHI-SPEAKING TRIBES.—See NEGROES AND W. AFRICA.

TSIMSHIAN.—The Tsimshian belong to the northern group of coast Indians, but differ markedly from the Haida and Tlingit (*q.v.*) in language. Their social organization is also somewhat divergent, since instead of two phratries they have four—Eagle, Wolf, Kanhada, and Gyispawaduweda—each embracing many small local groups or clans. There are three chief Tsimshian divisions: the Tsimshian proper, living on the lower Skeena River and the coast to the south, the Niska of Nass River, and the Kitksan of the upper Skeena. The last does not border on the coast and is intermediate between the coast tribes proper and the true interior tribes of Athapascan lineage. Most of the information that we possess regarding Tsimshian religion is from the Niska, but there seems to have been little difference between their beliefs and those of the other divisions.

1. **Cosmological beliefs.**—The earth was believed to be flat and circular. It was supported by a man named Amala ('smoke hole'), who lay on his back and held upon his chest a spoon made of the horn of the mountain-goat. This was filled with grease, and in it stood a pole, on which the earth rested. When he became tired, he lifted the pole, and the earth shook. The pole, with the earth on

it, was turning round in the bowl of the spoon, the grease in which served to make it revolve easily. Sun, moon, and stars belonged to the sky and did not turn with the earth. This reference to the turning of the earth seems to point to White influence, but the association of grease with the being under the earth is paralleled by something related of the Haida Atlas, Sacred-one-standing-and-moving, and is probably genuinely aboriginal.

2. **Supernatural beings.**—The supernatural beings, so far as we are acquainted with them, were much the same as those among the Haida (*q.v.*). They had a supreme heaven-god called Laha ('on the air'), a perfect counterpart of the Haida Power-of-the-shining-heavens. From the information regarding him gathered by Boas, however, it seems that he approached much nearer to the monotheistic idea of a supreme being.

'Heaven is the great deity who has a number of mediators called Neqno'q. . . . Heaven rules the destinies of mankind; Heaven taught man to distinguish between good and bad, and gave the religious laws and institutions. Heaven is gratified by the mere existence of man. He is worshipped by offerings and prayer, the smoke rising from fires being especially agreeable to him. Murderers, adulterers, and those who behave foolishly, talking to no purpose, and making noise at night, are especially hateful to him. He loves those who take pity upon the poor, who do not try to become rich by selling at high prices what others want. His messengers, particularly sun and moon, must be treated with respect. Men make themselves agreeable to the deity by cleanliness. Therefore, they must bathe and wash their whole bodies before praying. For the same reason they take a vomitive when they wish to please the deity well. They fast and abstain from touching their wives if they desire their prayers to be successful. They offer everything that is considered valuable—eagle-down, red paint, red cedar bark, good elk-skin lines, etc. The offering is burnt.'¹

The ethics of this, especially in the matter of acquiring wealth, seems so different from the aboriginal code found elsewhere that it is probable that the native informant's statements were tinged with missionary teaching, and that Heaven, or Laha, was elevated to a position above that which he occupied in earlier days. There can be no doubt, however, as to the existence of a sky-god 'first among equals.'

The Tsimshian prayed less often to their heaven-god than to the minor deities, or 'mediators,' whom they generally asked for food and fair weather. Sometimes they prayed to the supernatural beings collectively. The most important 'mediators' are stated to have been the sun and moon, spirits appearing in the shape of lightning strokes, and animals. The Raven, also called Skämsem, was believed in and had the same functions and general character as among the Tlingit and Haida. They also believed in the sea grizzly bear, or Hagulák, which may have been originally a Haida conception, since his home was called Helahaidek ('near the Haida country'). In his house he had four kettles called Lukewarm, Warm, Hot, and Boiling. The killer-whales seem to have been his servants, since they were known as 'Hagulák's men.' There was also a one-legged man similar to the Master-hopper of the Haida.²

Besides praying to the deities, a person could force them to grant his desires by rigid fasting. He had to abstain from food and from seeing his wife for seven days, lying in bed motionless all that time. Then he might rise, wash himself, comb the right side of his head, and paint the right side of his face, after which he might look at his wife. A less rigid form of fasting extended over four days only. To make the ceremony very successful, the man's wife must join him, but, if the wife should be untrue to her husband, the effect of the fasting would be destroyed. Whatever twins wished was believed to be fulfilled, and they were appealed to especially to control the

¹ Boas, in *Rep. of Brit. Association for Advancement of Science*, 1889, p. 845 f.

² See art. HAIDA, § 19.

weather and bring eulachon and salmon. Numbers of tabus governed hunting and fishing, particularly the fishing of eulachon, which run into the Nass River in great numbers and are, or were, a principal source of wealth to the people. The first of these fish to be caught were roasted on a peculiarly-shaped frame made of elder-berry wood and with special ceremonies, the man who handled it praying meanwhile for an abundance of fish.

3. The dead.—The principal world of the dead was reached by following a trail and crossing a river. According to one story, a man who fainted and passed to the spirit-world was saved by a perforated stone hung round his neck as an amulet, which thwarted the endeavours of four shamans to remove his heart. Whether those who had died by violence or drowning went to regions distinct from the others is not recorded. At least at the mortuary feasts food was put into the fire for the dead.

4. Shamanism.—Nothing is known of Tsimshian shamans which would in any way distinguish them from those of the Tlingit and Haida, except that their bodies, like those of the common people, were cremated.

5. Witchcraft.—The wizard cast his spell by putting some article taken from the victim into a box containing portions of a human body. Strings were fastened inside this box, and, if the wizard wished his victim to die slowly, he fastened the object some distance above the body, but, if he desired him to perish at once, he cut the string, thereby precipitating the object upon the body. Afterwards he had to go round the house in which the person whom he had killed by witchcraft was lying, and later he had to walk round his grave and rub himself, pretending to cry all the time. Unless he observed these rules, he would himself perish. If it was believed that a person had been killed by witchcraft, the Tsimshian would take out his heart and lay a red-hot stone against it, wishing at the same time that the wizard might die. If the heart burst, it was expected that their wish would be fulfilled; if not, it was a sign that their suspicions were unfounded.

LITERATURE.—Nearly all the available Tsimshian material is contained in F. Boas, report v. 'On the North-Western Tribes of Canada,' in *Report of the British Association for the Advancement of Science*, 1889, p. 801 ff., report vi. *ib.* 1890, p. 562 ff., report x. *ib.* 1895, p. 523 ff., in *Bull.* 27 BE [1902], and in 31 RBEW [1909-1910]. JOHN R. SWANTON.

TUKARĀM.—In Tukarām there culminates an important section of the *bhakti* school¹ and his verses have all the authority of a 'Veda' for most of the twenty million Marāṭhī-speaking people of one of India's noblest races, among whom are to be found some of the greatest Indian reformers of the day. Both for his poetic genius and for his unique place in the people's heart he is happily described as 'the Robert Burns of India' who marks 'the era of the efflorescence of Mahārāshtra's people.'²

1. Sources.—(a) *Biographical*.—Two serious difficulties confront the modern biographer of Tukarām. (1) All the Marāṭhī *Lives* of Tukarām are drawn almost exclusively from a single authority, the poet-saint Mahipati (1715-90), whose accounts in the *Bhakti Vyāya* (chs. xlviii.-li) and the *Bhakti Līlāmṛita* (chs. xxv.-xl.) were written in 1762 and 1774 respectively, more than a century after Tukarām's end in 1650, 'long enough for legends to grow.'³ (2) We have 'no authentic and properly sifted account of his life,' but only 'a mass of legends and traditions that have gathered round Tukarām'⁴ and show a distinct 'tendency towards deification.'⁵ Yet we have 'at least some facts of historical accuracy to start with,'⁶ and Mahipati's 'detailed legends . . . seem to be in every way as deserving of being critically worked out as those of the early Christian martyrs to which they often bear a strong resemblance.'⁶

A few sources earlier than Mahipati have been indicated recently by V. L. Bhawe. Besides (1) Tukarām's autobiographical poems (see below) and (2) the *abhaṅgs* of Rāmēshwar Bhaṅṅ, the leading disciple of Tukarām,¹ there are (3) a brief life of Tukarām by his grandson, Gōpāl Buwa, (4) the autobiography of Bahinābāi, another disciple of Tukarām who dictated her own life-story, giving the names of some of Tukarām's contemporaries who figure prominently both in Mahipati and in Tukarām's own poems,² and (5) a source a century earlier than Mahipati, a work written by one named Krishnadās Bairāgi on Keśav Chaitanya Sampradāya, which gives the important 'guru-succession' of Tukarām and helps us to settle important dates in his life, this work being quoted by name and its facts given by one Niranjan.³ Some would add a sixth source earlier than Mahipati, in Narahari Mālu, author of *Bhaktikathāmṛita*, but he must be pronounced utterly untrustworthy, though he is followed by a few Marāṭhā authors.⁴

The investigation concerning biographical material has gone far enough to conclude with safety that, despite much unsifted tradition, 'miracle and wonder-working,' Mahipati's account has a solid substratum of historical accuracy. Moreover, he uses his sources with discrimination, rejecting what he discovers to be unreliable.⁵

(b) *Autobiographical*.—The true text of Tukarām's writings has not yet been critically ascertained, and between the several collections there is a wide difference as to the number of poems included, ranging from 4621 in the edition generally accepted⁶ to 8841 in one⁷ described by R. G. Bhandarkar as 'uncritically made.'⁸ Even the former is based on MSS admitted to have been 'corrected,' 'further corrected,' and 'arranged.'⁹ The problem remained in abeyance for fifty years until Bhawe in 1919-20 edited and published the first two instalments, numbering about 1300 poems, of what he claims is 'Tukarām's Original Gāthā,' written by one of Tukarām's fourteen disciples, one Santāji the Oilman whose MS⁹ bears a date in one place three years earlier than Tukarām's death. All that can be said at present is that scholars are patiently investigating the problem of a critical text of Tukarām's writings. His verses were probably all extempore and were taken down by at least one or two of his immediate disciples. It is almost certain that every collection contains poems which are not really his, and we are also quite unable to fix their chronological order—a serious disadvantage. They are practically our only source of information regarding his teaching.

2. Life.—Penetrating 'a wilderness of surmise and guess,' we are safe in deciding that Tukarām was born the same year as John Milton, in 1608, though later research may push the date farther back. From at least seven generations Tukarām inherited a devotion to the god Viṭhobā of Pandharpūr.¹⁰ It is first as a Śūdra grain-seller in his own native Dēhū, eighteen miles north-west of Poona, that Tukarām comes before us. His father Bōlhōbā, having married off his three sons with lavish outlay, sought to hand over his business to the eldest, whose predilection, however, for an unworldly life led to this responsibility falling on Tukarām at the early age of thirteen. The first four or five years appear to have been prosperous, but they were followed by a succession of disasters in business and home, so that young Tukarām's capital disappeared. Many stories are told illustrating his honesty, simple-mindedness, and spiritual devotion, Viṭhobā being represented as his unfailing helper on all occasions. All these stories probably have a solid basis of fact.

A great famine in 1629, during which his elder wife¹¹ died crying for bread, was the last in a succession of sorrows which led him to give up all business and worldly attachment. Sitting on the river bank with his younger brother Kānhōbā, he threw into the stream his half of the business papers and handed over the remainder to Kānhōbā, while he dedicated himself wholly to Viṭhobā.

The spirit of poetry came to him in a dream, commanding him to complete the unfinished task

of his great predecessor Nāmidēv, *bhakta* and poet. In another dream he received his all-important *gurū-mantra* — *Rām-Krishna-Hari*, the secret mystic formula which finally initiated him as a Hindu teacher. This was at the hands of one Bābājī Chaitanya of the line of Rāghav Chaitanya and Keśav Chaitanya—a possible indication that Tukārām had some connexion with the Chaitanya sect of the Vaiṣṇavites. A series of events setting forth his dealings with Brāhmins constitutes the most important part of his life-narrative.

One such story provides an interesting Hindu parallel to the Quaker doctrine of the sacramental significance of every meal. A Chinchwād Brāhmin, Chiptāmani Dev, had invited Tukārām to dine with him, and, the Sūdra's plate having been laid the usual distance from the Brāhmin's, Tukārām made the strange request that two more be laid, one for his own god and another for Gaupatī, worshipped by his host, his explanation in an autobiographical poem being: 'If you enjoy a meal in faith, God sits down to dine with you.' Another event, one of the most critical in his life, demonstrates Tukārām's reverence for Brāhmins, even at the height of his renown. Rāmēshwar Bhaṭṭ, a Brāhmin scholar jealous of the Sūdra's fame, had not only moved the public authorities against him but had personally enjoined silence upon him. 'But what of the poems already written?', asked their docile author. 'Throw them into the river,' was the cruel reply, and into the river the whole bundle went, covered with a stone. It was Tukārām's darkest hour, but, to the astonishment of all, several days later the sheets were seen floating on the river and were taken out unharmed. Rāmēshwar's deep repentance followed, the poet replying in gentle verse: 'If your mind is pure your enemies will be your friends.' And it was true enough in this case, for Rāmēshwar became his lifelong disciple.

Of the many incidents illustrating Tukārām's religious views one is of a Vedāntist Brāhmin who persisted in reading to this Vaiṣṇavite *bhakta* a pantheistic treatise to which Tukārām agreed to listen only on condition that he might be covered with a blanket. When the blanket was lifted after an hour's reading, Tukārām was found seated with his fingers in his ears, his defence being that he could not listen to the Advaita doctrine that God and His worshippers were the same.

The miraculous is found interwoven throughout Tukārām's life-story. His birth is viewed as an incarnation. He performs many miracles to help the poor. Viṭhobā miraculously intervenes at every point to vindicate and deliver his faithful devotee. In this legendary material is to be included, unquestionably, the account of Tukārām's 'ascension' on which Mahipatī has expended all his powers, giving rise to the popular Hindu belief¹ that Tukārām was carried away to Vaikuṅṭha (the Hindu heaven) in the ear of Viṣṇu. The probability is, as suggested by P. R. Bhandarkar, that 'he met his death by drowning,' in the holy river of his own village, in 1650, whether by what is called *jalasa-mādhi*, or prearranged drowning, as in the case of some other Indian *sādhus*, or whether 'the constant expectation of God's coming to fetch him away produced an illusion, and in obeying a fancied call from the opposite bank he ran into the river and was drowned, it is very difficult to say.'² The various traditions concerning Tukārām's influence after death must also be regarded as legendary.

3. **Autobiography.**—Though there is as yet no critical edition of Tukārām's *abhaṅgs*³ in existence, his autobiographical poems are generally accepted, and his self-revelations give the impression of being sincere and genuine. Of his kindness and unselfish service for others, on which Mahipatī dwells so often, he himself tells us nothing, his autobiographical verses being wholly concerned with the personal and spiritual side of things. 'It is his own religious life that occupies his soul.'⁴ The *abhaṅgs* classified as 'autobiography' in the English translations of the poems by J. N. Fraser and K. B. Marāṭhē⁵ number over 500, and there

¹ See L. R. Pāngārkar, *Śrī Tukārām Caritra*, Poona, 1920, pp. 495-512.

² *Two Masters: Jesus and Tukārām*, Bombay, 1903, p. 11.

³ An *abhaṅg* is an Indian metre, somewhat irregular, words rhyming at certain intervals.

⁴ J. N. Farquhar, *Religious Literature of India*, London, 1920, p. 300.

⁵ *The Poems of Tukārām*, 3 vols., Madras, 1909-15; the references by simple figures below are to this useful work.

are many hundreds more given up to confession, invocation, and aspiration. He tells us but little of his life in the world, though he often dwells on his guilt and misery. The poems of self-accusation, about 300, reveal a sense of sin whose depth is rare in Hindu literature, though his relation to God is personal and pantheistic by turns.

'Fallen of fallen, thrice fallen am I' (343). 'I am a great fallen sinner. . . My heart is witness to me that I am not redeemed' (126). This conviction of sin is often closely associated with extreme mental depression: 'False is "mine," false is "thine." False is Tukā, false is his faith. He speaks falsehood to the false' (2345). Sorrow, resulting from the death of parents, favourite wife, and eldest son, and from business failures, clearly led him to his self-dedication: 'It is well, O God, that I became a bankrupt, and was crushed by the famine; this is how I repented and turned to thee' (113). And his dedication was complete: 'Rank, race, colour, creed and caste—all are gone' (2790).

Paṭwardhan has made a 'tentative' effort to depict Tukārām's long inward struggle.¹ That this earnest pilgrim reached some worthy goal would appear from the poems, about 80 in number, under the heading 'Triumphant Happiness' in Fraser and Marāṭhē.

'I have found a sea of love, an inexhaustible flood. I have opened a treasure of spiritual knowledge; it diffuses the lustre of a million suns arisen in thy worshippers' souls' (573).

This, however, is by no means his habitual mood, which is rather one of despising his self-complacency. He has a passionate desire to help and serve those around, and, though he is far too often censorious, sometimes to the point of coarseness, yet he has something to say of constructive worth to his age and people. And it is chiefly as a preacher that he views himself. Though he lays no emphasis on Vedic lore, he has nevertheless a message invested with authority.

'These are not my words: I am a hired servant of Viṭhobā' (1420). Earnest and sincere preachers are badly needed, for there are impostors who eat and drink and who do even worse: 'Their desires are set on shawls and pots and money.' 'Matted hair and ashes are a scandal when the mind has no patience and forbearance' (1193). 'Such people sink themselves and destroy the ship of salvation,' but a true preacher 'rescues others by the sweet perfume of his words.'

4. **Experience of bhakti.**—To fathom Tukārām's deepest secret we need to explore his experience of *bhakti*, the 'clinging affection of the heart' for a personal God, though the god in Tukārām's case was a village-idol, surrounded by Puranic gross mythology and superstitious animism. The idol he worshipped was even one 'standing for both' Kṛṣṇa and Śiva,² but whether Tukārām recognized this plurality of gods at Pandharpūr we cannot say. In this unpromising soil Tukārām's *bhakti* grows, with pantheism and idolatry as twin-stems on the same tree. And, though his *bhakti* is too often a mere emotion, fugitive and fleeting, with more of longing than of satisfaction, it is yet free from those sensual extravagances that have degraded some forms of Indian *bhakti*. In Tukārām we probably see Indian *bhakti* at its best.

If it be asked in what Tukārām's *bhakti* experience consisted, the answer might be given in the words of the *Nārada-bhakti-sūtra*: 'surrendering all actions to God and feeling the greatest misery in forgetting God.'

'Tukā has his home in the Inconceivable' (1578). 'Whosoever I go, thou art my companion: thou takest me by the hand and guidest me. As I walk along, I lean on thee' (2149).³ 'No particular time is necessary,' says Tukārām, 'for the contemplation of God, it should be done always.'⁴ And again: 'God is ours, certainly ours, and is the soul of all souls. God is near, certainly near, outside and inside.'⁵

His deep sense of sin offered a serious obstacle to the quest of his soul.

⁵ Bhandarkar's tr., *Vaiṣṇavism*, p. 95.

'The Endless is beyond, and between him and me there are the lofty mountains of desire and anger. I am not able to ascend them, nor do I find any pass.'¹ 'I know my faults, but I cannot control my mind . . . I am a slave of the senses' (1369).

Did 'any pass' over the 'mountains' ever appear on his horizon? He would appear to have had glimpses of one.

'I know not how to cleanse me of sin, so I have seized thy feet. . . . If thou dost take a thing in hand, what is impossible?' (2035). 'Thou hast saved many a humble, many a guilty, many a sinful man. Tukā dwells at thy feet; preserve him, O God' (248). 'What prayer can I put up? . . . Up till now, I felt sure that some of my service had been accepted. Now nothing but the struggle is left me: I see no sign of assurance in him who stands hand on hip' = Viṭhobā (3010). 'Though I made myself ceremonially pure, some impurity would still cling to me' (2968).

Inward purity thus becomes the prime necessity.

'What I delight in is purity of heart' (2632). 'What you need is a clean heart and a spirit at peace' (2309). 'Blessed are the pious, for their heart is pure. . . . Their hearts are filled with devoted love' (894).

The urgent question therefore comes to be: How shall this purity be realized? Ceremonies are unavailing, as are also pilgrimages.² Tukārām has full confidence that God can fulfil His child's desire, and to the crucial question how the divine blessing is obtained the answer comes repeatedly: 'It is *bhāva*' (812).

'My single-minded *bhāva* has put an end to pilgrimage to and fro' (2773). 'God comes quickly and stands where he finds *bhāva*' (3671). 'Tis *bhāva* that moves us and is fitly called the means of salvation' (2597). 'Without *bhakti* and *bhāva* everything else is useless trouble.'³ 'Lay reasoning or learning aside in a bundle, for here *bhāva* is the one great criterion.'⁴

What is *bhāva*? His modern interpreters are not always clear. Bhandarkar says that it is 'faith, love, or the pure heart,'⁵ and also that it has different meanings in different contexts.⁶ Sometimes *bhāva* is that heart-religion which is guarantee of the vision of God without conscious effort, a parallel being found in the *Svetāśvatara Upaniṣad* reference to 'those who by the heart know the Supreme Spirit who dwells within.'⁷

Bhakti, therefore, as experienced by Tukārām, seems to have concerned itself chiefly with realizing a change of heart. 'The great precept of religion is to hear God in the heart' (812). And, with a change of heart, he longs for some assurance of the change:

'Whether I am indeed God's child, truly accepted by him, how am I to know? How shall I know of a surety that my heart is purer, my mind less tainted with anger? For if love be not in my heart how has my heart been changed?' 'Fortunate, indeed, are those persons in whose heart dwells forgiveness.'⁸

Three lines of solution appeared to Tukārām: concentrated personal meditation on God and His saints, persistent self-examination that shall root out self-esteem, and such utter self-abandonment to God that no voice shall be desired but His.⁹ Deep humility, simple faith in the divine protection, and complete abandonment of self to God comprise another triple secret of *bhakti*.¹⁰ Tukārām had travelled a long rough road in quest of peace. *Yoga* he had found unavailing, as well as *mantras*, austerities, and the five fires. On the summit of *bhakti* he found three graces whose fragrance reaches us in his pages: pity, pardon, peace.

'He who gives to God simple-hearted devotion . . . within his soul there dwell pity, pardon, peace.'¹¹ 'There is no Saviour of the needy save God alone: in Him are pity, pardon, peace.'¹² 'Where pity, pardon, peace abide there God dwells. Thither He runs and makes His home . . . and where these graces have free play He carries.'¹³

5. Teaching.—Tukārām is never systematic in his psychology, his theology, or his theodicy. He oscillates between a Dvaitist and an Advaitist view of God and the world, leaning now to a pantheistic scheme of things, now to a distinctly Providential, and he does not harmonize them. He says little or nothing of cosmogony, and, according to him, God realizes Himself in the devotion of His worshippers. Likewise, faith is essential to their realization of Him: 'It is our faith that makes thee a god' (1785), he says boldly to his Viṭhobā. On the other hand, God makes Himself accessible to man's feeble apprehension by means of divine condescension: 'He has embodied himself in forms to suit our pleasure' (1753). Man is a child of God. Indeed, the figure of childhood is pressed sometimes so far as to sacrifice reverence and dignity, the same applying to Tukārām's view of God as Mother, though in the latter he finds a solution of many perplexities. All this deals with man's 'natural' state, but separation has entered, sin being viewed variously. It is sometimes a mere breaking of caste rules, sometimes a breach of morality, and again, and very often, it is *mīpaṇa*, a word often on his lips and perhaps best rendered by 'self-centredness,' though this is inadequate. We have seen how deep was his sense of sin and what means of salvation were disclosed to him. Brāhmanical or mystic intuition and verbal theology were deprecated as much as austerities. Men should waste no time in argument, but throw themselves at God's feet. Specific hindrances to salvation are found in the above *mīpaṇa*, in indulgence of desire, fear of ridicule, learning, and disputation. What the religious life meant to him we have already seen. Mere renunciation leads to nothing, and indeed everything is worthless save a personal experience of religion. Tukārām's 'good man' must possess humility, peaceableness, kindness, truthfulness, contentment, and simplicity.

He is mostly despondent of his fellow-men: 'I am sick of mankind' (994), and for relief he turns to 'the saints,' about whom he has hundreds of verses, setting forth their calling, character, and service to mankind. At the other end of the scale of creation animals call forth his real sympathy. Whether he held to *ahimsā* is not quite clear. Reincarnation he accepts (972), but he is not sure whether to prefer mortal rebirth, for the power of God's name could break his *karma*. Conscious communion on earth was far preferable to being merged in the unconsciousness of Brahman.

Patwardhan has shown that Tukārām's 'doctrine of *bhakti*' comprised a conception of the Divine Motherhood which gave Tukārām a God of love and tenderness, a sense of human insufficiency which led to conflict between faith and 'the flesh,' devotion thus being frustrated by human frailties, and a defective view of life 'that was at best one-sided. His end was individual, the peace and solace and beatific rest of his own restless soul. . . . Tukārām was a pessimist in regard to this world. . . . The *bhakti* of the future ought to be broader based, fuller veined, and larger souled.'¹ A defect sometimes pointed out is that the claim of human need 'is a rare mood and very seldom expressed in his poems'² and that 'there are but few traces of the passion of winning others.'³ It is a 'defect,' however, very largely repaired by his self-forgetting service as set forth in the pages of Mahipati.

6. Relation to Hinduism.—Tukārām acquiesced in the greater part of the conventional Hinduism of his day while himself living on a loftier plane. Often therefore he speaks with two voices. Temple ceremonies he does not condemn, but his heart aspires to something higher. About Viṭhobā, however, there is no kind of ambiguity, for, as an incarnation of Kṛṣṇa or Viṣṇu, Viṭhobā was the bigger half of Tukārām's spiritual life,

though again faith was always the channel. Inwardly he experienced the living God, though outwardly it was an idol he worshipped.

'There is scarcely a theological or philosophical system to be found in his writings, but so far as philosophical thinking may be traced, he tends to be a monist.'¹ 'Tukārām was thus a devotee only of Viṭhobā of Pāṇḍharpūr and a monotheist in this sense. Though he worshipped the idol at the place, still he had always before his mind's eye the great Lord of the universe.'²

In some verses indeed he holds that the stone idol was a mere stone, neither embodying nor symbolizing the divine. The inconsistency of such a position he appears to have realized, but he does not solve it. Hence the millions in the Deccan who follow him in idolatrous practices and the thousands who share his theistic aspirations have both much to support them. Hence too a theistic society like the Prarthanā Samāj³ so recently as 20th June 1920 failed to pass a resolution that 'any member who performs a domestic or any other ceremony with idolatrous rites or worships any idols while performing such rites will *ipso facto* cease to be a member of the Bombay Prarthanā Samāj.'⁴

A similar ambiguity exists in his references to caste and holy places. Caste was accepted by Tukārām as an institution of the Hindu world, and he did not carry to its logical conclusion his conviction that God does not consider a man's caste, all His worshippers being equally dear to Him (2077). In personal inward religion Tukārām was democratic enough, but he was too much of the 'mild Hindu' to fight the battle of religious rights and privileges.

Tukārām was in no sense a 'reformer,' as the word is commonly understood: he was a sage with lofty principles in a degenerate time, a sage who for lack of courage, conviction, or inspiration allowed his protests to lapse after he had uttered them.

7. Influence.—Tukārām has quite a unique place in the inner life of his own people. Besides the Vārkaris, a pilgrim sect devoted to him, every member of which visits Pāṇḍharpūr not only at the two annual festivals but on other *ekādāsīs*, or 'monthly-elevenths,' named *vāris*, and whose preachings of equality and disregard of caste have been 'a valuable counterpoise to Brāhman domineering,'⁵ there are some fifteen million Deccan peasants of all castes and creeds who sing his verses in the fields by day and in companies around some flickering lamp at night. His poems form a substantial part of the hymn-book of the Prarthanā Samāj (*q.v.*) of Western India, now in its ninth edition and containing 500 of his *abhaṅgs*. His terms 'Viṭhobā, Pāṇḍuraṅg' etc., being unacceptable to *ĉkēśvarīs* (monotheists), the simple term 'God' has been substituted.⁶ That Tukārām has exercised a great nationalizing and democratizing influence among the people of the only Indian nation that has ever ruled over any considerable portion of India can hardly be doubted. His moralizing force cannot be said to have been so great, in view of idolatrous conditions in the Deccan to-day. But the Viṭhobā of Tukārām still inspires a phenomenal type of devotion in his devotees. From as far distant as Madras, women have been known to make at Viṭhobā's shrine the hair-offering called *vēnidān* (*vēnī* = 'braid,' *dān* = 'gift') by having their heads shaved as do Brāhman women at Gaya, and all Pāṇḍharpūr pilgrims have such an affection for their god that no *darshan* is complete without the pilgrim's head touching

Viṭhobā's feet. No fewer than 140,000 people take this *darshan* at a single festival, at the rate of 12,000 daily. Some of them accomplish the journey by prostrating their form at every step in honour of Viṭhobā, some thus rolling along for more than 40 miles;¹ one case is known of a man rolling like a log from Nāgpur, hundreds of miles away, at the rate of two miles a day, the journey taking two years.² Tukārām's moving verse has done not a little to inspire this tragic devotion in men and women alike.

All attempts to classify Tukārām have failed. He was neither an orthodox Hindu nor a Hindu Protestant. He lived according to the rules of a gigantic religious system with much of which he disagreed while enjoying an inward experience transcending the system, for spiritual intercourse with God and His 'saints' was the sum and substance of Tukārām's religion. He belongs therefore to none of the stereotyped forms, and, to be understood and appreciated at his proper worth, he must be approached without any kind of dogmatic prejudice, whether Hindu or Christian. Those who have no definite creed and who follow no organized system find in him a kindred spirit. He cannot be classed as a mystic, for he had no extraordinary visions, and he followed Hindu rules of living. We may regard him as a devoted theist living his own inward life amid idolatrous surroundings.

'You can find much in Tukārām's poetry that runs parallel with the teachings of Christ save its principles and spirit. These latter, eclectics easily read into his words, and when they cannot do so they put them there. Tukārām was one of the greatest saints of India, and as such he has influenced and is still influencing the devotional trend of his own people. In the case of us Christians he is one of the most powerful of sidelights. Only a few weeks ago he threw me into the very arms of my Lord.'³

At the close of an examination into 'The Alleged Indebtedness of Indian Theism to Christianity' the conclusion is reached:

'Certainly either Tukārām was actually in contact with Christian teaching, which is by no means improbable, or he was a remarkable instance of a *mens naturaliter Christiana*.'⁴

Of these two alternatives we incline to the second, as there has been no evidence adduced as yet pointing to Tukārām ever having been 'in contact with Christian teaching,' and, while he has much kinship with the NT writers, none of the fundamental doctrines of the Christian Church, with the possible exception of faith, can be traced in his pages.⁵ The kinship is indeed so close that a knowledge of his poems, at least in their English translation, should be regarded as an indispensable preparation for missionary work among his people. That nearly three centuries ago Tukārām should have proclaimed so clearly the inefficacy of all merely external rites and should have insisted so constantly on inward experience as the one essential of true religion offers to the Christian evangelist a most useful point of contact with the people of India.

LITERATURE.—This has been indicated in the footnotes. For a fuller treatment of the subject see J. N. Fraser and J. F. Edwards, *Life and Teaching of Tukārām*, Madras, in the press. J. F. EDWARDS.

TULASĪ-DĀSA.—I. Life.—Little is certainly known about the life of Tulasi-Dāsa (commonly pronounced 'Tulsi Dās'), the greatest poet of mediæval Northern India, beyond two or three dates and a few accidental particulars mentioned in his writings.

A life of the poet is said to have been written by his friend and companion, Vēpi-mādhava Dāsa. It is referred to by Śiva

Siñha, who wrote in the latter half of the 19th cent., but no copy of it is now known to exist. We have two personal documents relating to the poet—a deed of arbitration, and an entire book of the *Rāmācharita-mānasa*, both in his own handwriting.

There are numerous traditions concerning him, some of which may be accepted with considerable confidence. He is said to have been born at Rājāpur, in the present United Provinces of Bāndā, about A.D. 1532, and to have been a Sarwariā Brāhmaṇa of the Parāśara *gōtra*.¹ His father's name was Ātmārāma, and his mother's Hulāsī, his own name being Rāma Bōlā. In one of his verses² he tells us that he was abandoned by his parents immediately after his birth, and with great probability it is assumed from this that he was one of those unfortunate children known as *abhuktamūla*, born under the beginning of the currency of the asterism Mūla. Such a child is said to be destined to destroy its father, and the only remedy is to abandon it on its birth, or, at best, so to arrange that its parents shall not look upon its face during the first eight years of its existence. He was picked up by a wandering Sādhu, who, in token of the sacred leaf used in the ceremony of purification of the infant, re-named him Tulasi-Dāsa ('Servant of the *tulasi*-plant'), and by this name he was henceforth known. With this Sādhu, who was probably also his *guru*, or spiritual preceptor, Narahari-Dāsa, he wandered all over Northern India. From his *guru* he learnt the story of Rāma,³ but owing to his ignorance (? of Sanskrit)⁴ he could not at first grasp its importance. At length, after frequent hearings, he learnt it so far as his intelligence would allow, and then determined to write it in the vernacular for his own benefit and for that of others similarly situated. When he grew up, he lived as a householder, and married a girl named Ratnāvālī, the daughter of one Dinabandhu Pāṭhaka, by whom he had a son named Tāraka, who died at an early age. He was devoted to his wife and could not bear to be separated from her. She was a firm Vaiṣṇava, and on one occasion, when she had gone on a visit to her people, she reproached him for following her and for not showing equal affection to Rāma. Struck with remorse, Tulasi at once left her and took to an ascetic life. He is said to have seen her only once again in after years, and then not to have recognized her. With his head-quarters at first in Ayōdhyā and subsequently in Benares, he made long journeys over Northern India preaching the gospel of Rāma. At first he met with considerable opposition, but his holy life and his attractive personality conquered all obstacles, and, even in Benares, the head-quarters of Śiva-worship, he won universal respect. His fame as a poet spread far and wide and gained him many friends and followers, the most famous of whom were Rāja Māna-siñha (Mān Singh) of Ambār († 1614) and the celebrated 'Abdu 'r-Rahīm Ḥānḥāna (1556-1627). A wealthy landowner of Benares named Tōdar Mall (who is to be distinguished from Akbar's finance minister of the same name) was one of his closest friends, and a touching poem which Tulasi-Dāsa wrote on his death has survived among his most cherished verses. After Tōdar Mall's death his heirs quarrelled as to the disposal of the property, and referred the matter to Tulasi-Dāsa as arbitrator. The deed of arbitration in his handwriting is still in existence and is dated Sambāt 1669 (= A.D. 1612).

¹ No fewer than four places claim the honour of being his birthplace. The claim of Rājāpur is that best established. His caste has been a subject of dispute. According to some authorities, he was a Kanyakubja Brāhmaṇa.

² *Vinaya-patrickā*, 227, 2.

³ *Rām.* i. 30.

⁴ He was never a good Sanskrit scholar, and some of his few verses in that language contain grammatical blunders.

Bubonic plague appeared in India in 1616, and lasted for eight years. The poet seems to have been attacked by it, for one of his minor works, the *Hanumān Bāhuka*, describes his sufferings from some such disease. After temporary relief he had a relapse and died in Benares in A.D. 1623.¹

2. **Works.**—More than twenty formal works, besides numerous short poems, have been attributed to Tulasi-Dāsa, but some of these are certainly apocryphal, and others are of doubtful authenticity. The most generally accepted list mentions twelve, viz. six minor and six major. The minor works are the following: (1) *Rāma-lalā-Nahachhū*, (2) *Vairāgya-saṅdīpinī*, (3) *Baravai Rāmāyana*, (4) *Jānaki-maṅgala*, (5) *Pārvatī-maṅgala*, (6) *Rāmājñā*. The six major works are (7) *Kṛṣṇagītāvālī*, (8) *Vinaya-patrickā*, (9) *Gītāvālī*, (10) *Kavītāvālī*, (11) *Dōhāvālī*, and (12) *Rāmācharita-mānasa*.

Tulasi-Dāsa was a Smārta Vaiṣṇava; *i.e.*, while a worshipper of Rāmachandra, he also adhered to the tradition (*smṛti*) of ordinary Hinduism and followed the general religious customs of his caste. This involved, among other things, the worship of the god Śiva and the practice of eating his meals apart. In both respects he differed from the more thorough Vairāgi Vaiṣṇavas, who had abandoned tradition, and who worshipped only Viṣṇu in one or other of his incarnations and ate in company. During his stay in Ayōdhyā he associated with these Vairāgi Vaiṣṇavas and there composed the first three cantos of the *Rāmācharita-mānasa*. Subsequently, being unable to agree with them on points of discipline, he migrated to Benares and there completed the poem.

His devotion to Rāmachandra as an incarnation of the Supreme is illustrated by the above list of works. With two exceptions (nos. 5 and 7) they all deal directly or indirectly with that deity. No. 7 is a collection of hymns in praise of Kṛṣṇa, another incarnation of Viṣṇu. No. 5 is a short poem describing Śiva's marriage with Pārvatī, a subject also treated at some length as an episode in the *Rāmācharita-mānasa*. As already stated, Tulasi-Dāsa paid special reverence to Śiva as a great and kindly god, although by no means on a level with Rāmachandra. It was Śiva who, out of love for the world, communicated Rāma's history to Pārvatī and thereby made it known to mortals.

A brief notice of each of the works named above will suffice.

(1) *Rāma-lalā-Nahachhū*.—The genuineness of this is disputed. It is a short poem describing the 'nail-paring' ceremony at the investiture of Rāmachandra with the sacred caste-thread. This ceremony is a village rite still kept up on such occasions and at weddings in Oudh and Bihār, and the whole poem is in rural style and in rural metre.

(2) *Vairāgya-saṅdīpinī* ('Kindling of Quietism') describes the true nature of holiness. It advocates *vairāgya* (absence of passion), and the description of the perfect peace resulting from absolute self-surrender to the Deity is not without poetic beauty.²

(3) The *Baravai Rāmāyana* is a summary of the history of Rāmachandra in the Baravai metre. It is very short and, as we have it, probably incomplete. It is rejected by some authorities.

(4) *Jānaki-maṅgala* and (5) *Pārvatī-maṅgala*.—These are two short works celebrating the marriages of Sitā to Rāmachandra and of Pārvatī to Śiva respectively. The authenticity of both is doubtful. In no. 4 the order of events differs from that given by the poet in his more important works. The

¹ See G. A. Grierson, *Proceedings ASE*, 1898, p. 147 ff.

² The whole has been translated by G. A. Grierson in *IA* xxii. [1893] 198 ff.

Pārvatī-māṅgala is dated Sambat 1643 (= A.D. 1586).

(6) *Rāmājñā*.—This is a collection of verses to be used as omens previous to undertaking a journey or other important task. The contents are in the main a history of Rāmachandra in seven chapters, each of seven septads of verses, or 343 in all. The omen is found by selecting a verse by lot—a kind of *sortes Virgilianæ*. It is dated Sambat 1655 (= A.D. 1598).

(7) The *Kṛṣṇagītāvalī*, the first of the major works, has been already referred to. As its subject demanded, Tulasi-Dāsa wrote it, not in his customary Awadhī, but in the Braj Bhākhā dialect. It is one of the least read of the poet's works, but well repays perusal, as it contains many beautiful passages. He has entirely avoided debasing religion by that association with eroticism which spoils so much of the literature devoted to Kṛṣṇa.

(8) The *Vinaya-pātrikā* ('Petition') is one of the most important works of the poet, in which his most intimate feelings towards the Deity and that Deity's relations to the human soul are displayed with a freedom from reticence and poetic fervour that have rarely been equalled.

An interesting legend accounts for its origin. Tulasi, harassed and terrified by persecution, writes this petition to Rāmachandra—the loving, almighty, God—appealing for His protection. The whole forms a series of prayers, addressed, one by one, to the various minor gods as door-keepers and courtiers of the Supreme, and then, in an outburst of passionate entreaty and self-humiliation, to the Deity Himself. The final verse tells how, as in the case of an earthly monarch, the petition was granted under Rāma's own signature.

The *Vinaya-pātrikā* is one of the most admired works of the poet, but the difficulties of its language have discouraged many readers. The intense fervour of the writer often carries him into an extremity of passion, bursting forth in an elliptical style very different from the limpid beauty of his narrative poems. Again, the very form of the poem militates against its easy comprehension. It is a petition to a sovereign, expressed in a courtly vocabulary full of high-flown words and phrases. These belong to the nature of the case and are here most appropriate, but they do not tend to make the poem comprehensible to any one who is not a Sanskrit scholar. In spite of these surface defects, this admirable work deserves the closest study from any one who would become acquainted with the religious history of India. We have here a man whose influence for good over generations of Indians cannot be exaggerated, laying bare the inmost recesses of his heart, and openly proclaiming that at which other writers with the same experiences have only dared to hint. It is a book of confessions, but the confessions of a pure and faithful soul.

(9) In the *Gītāvalī* Tulasi-Dāsa appears in a new character, that of a *māgadha*, or panegyrist. It is a book of songs intended to increase in his readers their love for a tender, loving God. Again, as elsewhere, the love which he teaches is that of a child to his father. For the songs he has used the Braj Bhākhā dialect as the traditional vehicle of expression, and the dominant tone is not, as in the *Vinaya-pātrikā*, passion, but sweetness and charm. In this way he gives the whole history of Rāmachandra in a delightful style, quite different from that of his formal epic. There is no verse in the book which is not a complete little picture, and most attractive of all are those in the first book, in which he tells of the baby life of his hero and his brothers. It is a true gospel of the infant Rāma.

(10) Different again is the *Kavītāvalī*. Here the poet, in the character of a *vandin*, or bard, tells of the glory of Rāma, so as to encourage the faithful with a picture of the Deity's power. The

language is Awadhī mixed with Braj Bhākhā. No work of Tulasi-Dāsa shows his extraordinary mastery of vocabulary so well as this. His subject is heroic, and, without having needless recourse to Sanskrit, he writes in a heroic style. In the battle scenes the words themselves by their very sound echo the clash of arms and the cries of the combatants, and, in the description of the burning of Lankā, the crackling of the flames. The narrative closes with the sixth book. The seventh, which is nearly half of the whole, consists of a number of short poems in the *kavitta* metre written at different times and here collected by their author. They have no direct connexion with the preceding books, and, being full of personal allusions, form a valuable source of information as to the poet's times and experiences. It is here that we learn about his birth and parentage and about the persecutions to which he was subjected, and from one verse we gather that the date of the compilation was somewhere between A.D. 1612 and 1614. A supplement, in the same metre, is the *Hamamān Bāhuka*, already referred to, in which he tells how he was attacked by plague.

(11) *Dōhāvalī*.—The title means a collection of verses in the *dōhā* metre, and it is by no means certain what is meant by it. There is a work of this name (see below), but some authorities maintain that the list alludes to a poem called the *Rām Satsai* ('Seven hundred verses [also in this metre] in Praise of Rāma'). Many good scholars consider that this was written, not by the poet, but by another author of the same name. It is a rather tasteless production, but, if genuine, is not without importance, as the fifth chapter gives in great detail what purports to be the poet's doctrine regarding works as opposed to faith.¹ The difficulty in the way of accepting the work now called the *Dōhāvalī* as that referred to in the list is that it is largely composed of verses already occurring in the *Rāmācharita-mānasa*, the *Rāmājñā*, and the *Rām Satsai* itself. Out of a total of 572 verses no fewer than 258 have been so identified, and there are quite possibly more. If genuine, there must have been a nucleus of original verses to which subsequent admirers have added others, so as to compile a kind of anthology of the poet's best *dōhās*. This is the present writer's opinion, and, if it is correct, the final recension must have been sufficiently long after the composition of the *Rām Satsai* for the latter to have become recognized as the work of our poet.

(12) The *Rāmācharita-mānasa* ('Lake of the Gestes of Rāma') is commonly called the *Tulasi-kṛta Rāmāyana*. This epic, the poet's greatest achievement, and also, in point of time, probably his first, was begun in A.D. 1574, when its author was about 43 years of age, and upon it his fame chiefly rests. It has been described as the Bible of ninety millions of people, and is certainly more familiar to every Hindu of Northern India than our Bible is to the average English peasant. There is not a Hindu of Hindōstān proper, whether prince or cottar, who does not know its most famous verses and whose common talk is not coloured by it. Its similes have entered even into the language of Indian Muslims, some of whose most ordinary idioms, though they know it not, made their first appearance in this work.²

The life of Rāmachandra, considered as an incarnation of the Supreme, is here dealt with in a formal epic. The subject is the same as that of the celebrated Sanskrit *Rāmāyana* of Valmiki, but the epic of Tulasi-Dāsa is in no way a transla-

¹ Tr. G. A. Grierson in *IA* xxij. [1893] 229 ff.

² See G. A. Grierson, 'Tulasi Dāsa, Poet and Religious Reformer,' *JRAS*, 1903, p. 447. Much of what follows is condensed from this paper.

tion of that work. We have an independent story, built on the same foundation, but differing from it in the treatment of episodes and in important details.¹ The author himself states that he has taken his account from many different sources, and it has been shown that the principal of these, besides Vālmiki's work, were the *Adhyātmā Rāmāyana* (a section of the *Brahmāṇḍa Purāna*), the *Bhūṣuṇḍī Rāmāyana*, the *Vasiṣṭha Saṁhita*, and the *Prasanna-rāghava* attributed to Jayadēva.²

As illustrating the estimation in which this poem is held in India, the following very popular legend may be quoted. Rāmachandra denoted his approval of Vālmiki's epic by appending his signature to a copy of it. Thereupon the monkey-god Hanumān, with his nails, wrote another *Rāmāyana* upon a rock, and took it to Rāma. The latter approved of it also, but said that, as he had already signed Vālmiki's copy, he could not sign another; he had better show it to that poet. He did so, and, as Vālmiki saw that it would eclipse his own work, by a stratagem he induced Hanumān to fling it into the sea. Hanumān, in complying, prophesied that in a future age he would himself inspire a Brāhmaṇa named Tulasi, who would recite his (Hanumān's) poem in the tongue of the common people and destroy the fame of Vālmiki's epic.

There can be no doubt that its reputation is well deserved. The *Rāmācharita-mānasa* is one of the great epics. It has its prolixities and its episodes that jar upon European tastes, but, even so, no one can read it without being impressed by its high poetic merit. The various characters are vividly and consistently described, and live and move with all the dignity of a heroic age. The style is most admirably varied. There is the infinite pathos of the passage describing Rāma's farewell to his mother; the rugged, harsh language telling of the horrors of the battlefield; when occasion requires it, a sententious, aphoristic method of dealing with narrative, teeming with similes drawn, not from the traditions of the schools, but from nature herself; and, suffusing all, a life-giving atmosphere of the purest poetry. To us its weakest side is that which, to a Hindu, is its strongest—the character of its hero. To the poet, Rāmachandra is necessarily, as God manifest on earth, a perfect character. Even when the old story shows him performing unknighly deeds, Tulasi must call them virtues and plead that the end justifies the means. Or, again, the foulest treachery, such as that of Vibhiṣana towards his brothers, is extolled because the traitor is accepted and rewarded by the hero.³ But this is one of the obligations of the story and of the author's view of the divinity of Rāma. The human characters are to our ideas far more sympathetic. There are the impetuous and loving Lakṣmaṇa; Sītā, the ideal of an Indian wife and mother; Bharata, constant and tender, the model of the true *bhakta*; and Rāvaṇa—the Satan of the epic—destined to failure, and fighting with all his demon force against his fate.

One of the most striking features of the poem is the writer's capacity for seeing things. More than any other literature, Indian poetry has its stock similes—the lotus, the water-lily, the bee, the moon, and so on. Even the best Sanskrit poems often give the impression of being largely the work of the closet, not of the open air. Tulasi-Dāsa employed the same old similes—he would not have been Indian if he had avoided them—but thousands of others are his own. Little expressions—the turn of a sentence or an apt

¹ E.g., the account of the great battle outside Laṅkā is quite different.

² See L. P. Tessitori, *Il 'Rāmācaritamānasa e il Rāmāyana*, reprinted from *Giornale della Società Asiatica Italiana*, xxiv, [1911] (reviewed by G. A. Grierson, in *JRAS*, 1912, p. 794 ff.), and Sītā Rām, in *JRAS*, 1914, p. 419 ff.

³ The authors of the *Hindī Navaratna* (pp. 88, 289) point out that, with one exception, none of the numerous Hindī poets who told the tale of Rāma ever thought of condemning Vibhiṣana's conduct. The exception is Kēṣava-dāsa, a court poet who lived amid knighly surroundings. He also has the courage to condemn Rāma's treatment of Sītā.

epithet—show how he had seen and studied the world for himself.

It would be a great mistake to look upon him merely as an ascetic. He was a man that had lived. He had been a householder—a word of much meaning to an Indian—and had known the pleasures of a wedded life, the joy of clasping an infant son to his bosom, and the sorrow of losing that son ere he had attained his prime. He appealed not to scholars, but to his countrymen as a whole, the people whom he knew. He had mixed with them, begged from them, prayed with them, shared their pleasures and their yearnings, and, on the other hand, had contracted intimate friendships with the greatest men of the emperor's court. All this we find reflected in the pages of his writings.¹

His works have suffered the fate which has befallen those of other famous Indian authors. Imitators have written poems which they have passed off as his, and numerous *kṣēpakas*, or apocryphal additions, have been inserted in his epic. He has suffered too from the attentions of commentators without end, most of whom have wasted energy in discovering hidden meanings in the simplest passages, while they discreetly avoid the real difficulties. Finally, his epic has actually been translated into Sanskrit, and there are critics who have maintained that the translation is the original, and that the *Rāmācharita-mānasa* is nothing but a barefaced theft of another's poetry.²

3. Religious ideas.—The religious ideas of the poet are of great importance in the history of India. Seventh in descent of teacher and pupil from the great Rāmānanda (*q.v.*), he was a thorough Vaiṣṇava and follower of the *Bhakti-Mārga* (*q.v.*). He taught that there is but one Supreme Being, and that man is by nature sinful and unworthy of salvation. Nevertheless the Supreme, in His infinite mercy, became incarnate in the person of Rāmachandra to relieve the world from sin. Rāma has returned to heaven, where, besides being the ineffable Supreme, he is still Rāma, and where, in consequence, we have now a God who is not only infinitely merciful, but who knows by actual experience how great are man's infirmities and temptations, and who, though Himself incapable of sin, is ever ready to extend His help to the sinful being who calls upon Him. On all this follows, as a corollary, the doctrine of the universal brotherhood of man, and the duty which man owes to his neighbour. His definition of sin is that which is contrary to the will of Rāma, and it is only by acknowledging this, and by abandoning himself to utter loving faith in Rāma's power to save him from its thralldom, that a man can escape from the weary round of perpetual transmigration. The doctrine of the fatherhood of God and of the necessity of *bhakti*, or devotional faith, had long been known. In Northern India Rāmānanda had been its great exponent, and Tulasi-Dāsa put forward no novelty. His claim for consideration is that his teaching was successful. His own pure life and the magic of his poetry have done for the *Bhakti-Mārga* what the eloquence of hundreds of other teachers failed to do. The fact that he was a Smārta Vaiṣṇava must not be forgotten. He belonged to no sect, and founded no sect, but was just an ordinary Hindu, accepting all the Hindu mythological machinery. While worshipping Rāma as the Supreme, he paid adoration to Śiva and the other gods. His attitude to them was much the same as that of the official teaching of one branch of the Christian Church: to Rāma alone he offered *λατρεία*, to the others *δουλεία*, to Śiva *ὑπερδουλεία*.

A few words must be devoted to the poet's use of the word *māyā*. Occasionally he refers to it in terms that can only be interpreted as meaning the influence which hides Brāhma from the soul—the *māyā* of the Śiva-worshipping Vēdāntins, to whose doctrines he was strongly opposed. But all his

¹ Cf. *JRAS*, 1903, p. 452.

² See G. A. Grierson, in *JRAS*, 1913, p. 133 ff.

uses of the word in this sense are merely cases of similes and the like, and in no way form part of his real teaching. We may attribute this use of the word to his own association with the worship of Śiva. Elsewhere he employs the word in two different senses: in one it means merely 'magic,' and is the evil force used by demons in their combat with Rāma's army; in the other it represents a combination of the Gnostic demiurge and the Christian 'Tempter';¹ it is a personality, a female, subordinate to the Supreme, and, to a certain extent, His agent. In the latter capacity she sets the whole world dancing, yet she herself is set a-dancing, like an actress on the stage, by a movement of the Lord's eyebrows. She sullies every one, even the gods, with her temptations; and the Deity sometimes sends her forth specially to tempt some pious person who begins to show overweening pride.² As the world, the flesh, and the Devil in one, she leads mankind to sin, but, if a man has true *bhakti*, he is surely armoured against her, and she cannot approach him.³

Above all, Tulasi-Dāsa taught that the Supreme is a personality. While not denying the existence of the *Nirguṇaṁ Brāhma* of the *Upaniṣads*—a being totally devoid of all qualities, of whom the only thing that can be said is 'he is not this or that'—he maintained that the idea of such a being was beyond the comprehension of the human mind, and that the only God whom it was possible to adore was the personal (*saṁguṇa*) manifestation of the impersonal (*nirguṇa*).⁴

The practical result of the general adoption of Tulasi's religious attitude has been of the greatest importance to Northern India. In the poet's own time the masses of Hindōstān had two alternative religions open to them. One was the crude polytheism of the worship of village godlings, the other was the Kṛṣṇa-cult. The first still exists, but controlled and thrust into the background by Tulasi's faith. What the Kṛṣṇa-cult becomes among the uncultivated masses the religious fate of Bengal has shown. It inevitably tends to become a sex-worship, and its text-books teem with the most passionate, most licentious descriptions of the love adventures of Kṛṣṇa among the herdmaidens. All else is lost, and there gradually develop the unnameable horrors of a Śākta-cult. Upper India has been saved from this by Tulasi-Dāsa.

LITERATURE.—G. A. Grierson, 'Notes on Tul'si Das,' *IA* xxii. [1893] 89, 122, 197, 225, 253 (this is the only complete account in English of the poet's life and works; a few errors in it have been corrected in the preceding pages), 'Tulasi Dāsa, Poet and Religious Reformer,' *JRAS*, 1903, p. 447 ff.; Gaṇeśa-vihāri Mīśra, Śyāma-vihāri Mīśra, and Śukadēva-vihāri Mīśra, *Hindī-Navaratna*, Allahabad, 1910 (an account in Hindi of the nine great writers in that language); cf. the same authors' *Mīśrabandhu-vināda*, Khandwā, 1913, p. 304 ff. (a general history of Hindi literature in the same language).

Numerous edd. of all the poet's works have been published in India, but few of them possess critical value. Two excellent edd. of the *Rāmacharita-mānasa* have been published, viz. that issued in 1889 by the Khandwa-vilāsa Press in Bankipur and that issued in 1903 by the Kāśī Nāgari-prachārīni Sabhā of Benares. Both are critically edited and have elaborate introductions dealing with the poet's life and writings. For those not familiar with the language the writer can recommend a good ed., with a line-for-line Hindi commentary and much general information concerning the poet, by Rāmeśvara Bhaṭṭa, *Nirṇaya-sāgara* Press, Bombay, 1904. The same editor has issued from the Indian Press, Allahabad, 1913, a similar ed. of the *Vinaya-patṛikā*, which can be recommended to students. It is believed that it is intended to issue all the poet's works in this series.

A good, if somewhat literal, Eng. tr. of the *Rāmacharita-mānasa* has been made by F. S. Growse (1st ed., Allahabad, 1880-81). It has been several times reprinted in India.

TUNGUS.—I. Area, distribution, number, and history.—The name Tungus is usually derived from the word Tung-hung ('Eastern barbarians'), by which these people were known to the ancient Chinese. They call themselves Avankil (sing. Avanki) or Donki. The Tungusic tribes are the most widely distributed of all the native tribes of Siberia; they live in small groups all over Siberia as far west as the river Taz, as far east as the island of Sakhalin, as far north as the Arctic shore, and as far south as the middle of Manchuria. In spite of this distribution, the language and social anthropology of these tribes are the least known of all the Siberian peoples, the Samoyed, Turkic and Mongolic tribes, and Koryak and Chukchi, even the Gilyak and the Ainu, having had more space given to them in anthropological literature than the Tungus. As a reason for this may be cited the fact that the Tungus usually live in the interior of the continent, in places difficult of access and, with the exception of the Lamut, far away from the coast. The total number of Tungus belonging to the various tribes was 76,504 in 1897, while in 1911 there were only 75,204.

The Tungusic tribes are usually divided into Northern Tungusic and Southern Tungusic. Of these the Northern Tungusic group comprises: (1) Samogir, (2) Nigidal, (3) Olchi, (4) Oroki, (5) Manegu, (6) Tungus proper (including Lamut and Orochon). The Southern Tungusic group comprises: (1) Manchu, (2) Daur, (3) Solon, (4) Gold, (5) Orochi.

The Northern Tungus are at the stage of reindeer culture like the Magdalenian man in Europe, though at the same time they know the use of iron, which they brought from their more southern home. They belong to the Neo-Siberian group. The Southern Tungus are horse nomads, cattle-breeders, and fishermen, and in some places also agriculturists, and in the towns artisans. The Siberian Tungus emigrated from Manchuria partly in the seventh and partly in the thirteenth century after the Mongolic conquest, but their armies had probably invaded Siberia frequently even in the pre-Christian era. The first Tungus subdued by the Russian authorities in Mangazei in 1603 were the Tungus of the lower Tunguska. In 1615 a large Tungus force was defeated by the Russians on the Yenisei, and about 1623 all the Tungus of Central Siberia were forced to pay taxes. The Tungus of the Amur country, together with their territory, were made subject to Russia about fifty years ago.

Although the Northern Tungus live now under a very primitive culture, their pedigree goes as far back as that of the Turkic people, and they therefore present a case of degeneration under the influence of environment. Nowhere is this more clearly shown than in their folk-tales, which in comparison with the really primitive tales of the Samoyed are rather sophisticated. The old Chinese chroniclers used to comment on their two powerful neighbours as barbarians of inferior culture, *i.e.* their north-western neighbours in the pre-Christian era, the Turks of the present day, and their north-eastern, the Tungus. But, as both of them appear under a variety of tribal and dynastic names, it is difficult sometimes to know which of these peoples are of Tungus and which of Turkic race. They are more easily classified by their customs and characteristics, while the Mongols, whose name, used in a broad sense, is applied to both these races, seem to have no characteristic cultural features and are probably a mixture of the two races influenced by their steppe environment more than the Turks and Tungus, and brought to prominence through Jenghiz Khan's (himself a Mongol) conquest.

There are several peoples mentioned by the Chinese who can with some probability be considered to be of Tungus race. Such are (1) the Sushen, who lived north of the Liao-Tung peninsula and paid tribute in arrows and arrowheads to the emperors of the Shang dynasty (1766-1154 B.C.); (2) the Sienpi, who occupied an important strategic position in the Korea and north of China before the Great Wall was constructed (221-209 B.C.); these were the peoples who helped to cause the movement of the Hiung-nung westward, who in their turn pushed the Yue-chi (Turks) to Djungaria; in the 2nd cent. A.D. one branch of the Sienpi, the Jwen-Jwen (Zhu-Zhu) rose to power, but they are not heard of after the 6th cent., when the Tu-Kiu (Turks) emancipated themselves from the Jwen-Jwen yoke; (3) the Tu, who in the 3rd cent. A.D. lived in the forest between the Upper Temen and Yalu rivers; (4) the Moho (Uki), who in the 7th cent. A.D. inhabited the valley of Sungari and who were the founders of the state of Puhai; (5) the Khitans, who in 925 overthrew this dynasty and founded the Liao (Iron) dynasty; (6) the Niu-chi (Yu-chi), who in their turn overthrew the Liao dynasty in A.D. 1125 and lived in the Shan-Alin uplands; their dynasty was called Kiu (Golden); Jenghiz Khan subdued them in 1234, but in the 14th cent. the Niu-chi reasserted themselves and founded the Manchu dynasty, which in 1644 occupied the throne of China after the Ming dynasty and reigned till 1912.

There are certain characteristics and customs common to most of those peoples as well as the modern Tungus. One is the extensive use of the bow and arrows with iron or stone blades. The arrows are of definite type and adaptable for the use of poison. The arrows and skins are also used for the payment of taxes. Other characteristics are the use of richly-adorned aprons, by both sexes, the braiding of the hair into two plaits, also by both sexes, the breeding of pigs, and the exposing of the dead by placing them on high platforms. These habits are not associated with the Turks and were probably imposed on the Chinese by the Tungus. Thus Marco Polo calls the Chinese empire by the tribal Tungus name Khital (Cathai), and the Russians call it that even now.

2. Linguistics.—Since the time of Castrén the Tungusic tongues have been classed with the Ural-Altaic group, and, as they have not been sufficiently well known, even modern linguists like Tucker call them 'uncultivated,' while the fact is that, although the language of the Tungus (with the exception of the Manchu and Dauri) has not reached the stage of being written language, in grammatical forms, especially in verbal forms, we see a greater variety of simplifications than in many Aryan languages. The Manchu writing is in a modified form of Uiguric, the old Turkic character based again on the Soghdian.

The linguistic division, based on the results of the most recent researches, is into four groups: (1) the well-defined Manchu group, including Sibo, (2) the Gold group, including Olcha, Orochi, and Orok, (3) Tungus proper, including Lamut, Managir, Solon, and Daur, (4) Sanagir and Negda (on the lower Amur). The extent of this group is problematical, as it is possible that it can be united with group (3).¹

The Northern Tungus dialects are preserved in a purer form than the Southern, which have come under Mongolic and Chinese influence, yet these differences are not very important, and we can use linguistics as the surest means of tracing the existence of Tungusic tribes in any given region. In many places the Tungus use another language as well as their own.

As in language, so also in social anthropology and shamanistic religion, we can see a certain connexion between all the Tungusic tribes. But the preservation of their own language is not necessarily an indication of the preservation of their physical type.

3. Physical type.—As has been said, there has been contact between the Chinese, the Mongols, and the Tungus-Manchu since the 11th cent. B.C. and probably earlier, but it was based chiefly on conquest and on intermarriage among members of the royal families. Migrations *en masse* did not begin, as far as is known, till the 7th cent. and during the time of Jenghiz Khan. It is probable that the Koreans are a Chinese-Tungus mixture and that the Tungus have played a greater rôle than is known in the formation of the modern Japanese nation.

Deniker places the Tungus among the Northern Mongolians, whom he defines as people with oval or round faces and prominent cheek-bones, who inhabit Manchuria, Korea, Northern China, and Mongolia. He places the Kalmuk alongside of the Manchu and the Northern Tungus hunters. Maak, Schrenck, and Mainoff point out the difference in physical type between the Northern and the Southern Tungus. This is also supported by the present writer. Broadly speaking, the difference consists in this, that the Southern type approaches the so-called Mongol type (almost high

¹ This table is the result of a verbal communication from W. Kotwicz, the Tungusic scholar of Petrograd University.

stature, round and low-headed), while the Northern type approaches the type of the Eastern Palæo-Siberians (low stature, intermediate or long-headed, and average or high-headed). While the mixture of the Southern Tungus with other neighbouring tribes has been going on for so long that it is very difficult to make any record of it, and the Manchu type practically disappeared among the population of north-east China, the Northern Tungus, especially those isolated in the Arctic region, are comparatively unmixed, or in any case it is easy to trace their mixture. This is especially true in the case of the Tungus between the Lena and the Yenisei, who live in thoroughly Tungus or Tungus-Yakut land, while the Tungus between the Lena and the Okhotsk Sea live scattered among the Palæo-Siberians (Koryak, Chukchi, and Yukaghir). The latter were the secondary object of study of the Jesup Expedition of the U.S.A. some ten years ago, while the Tungus between the Yenisei and the Lena were studied by the Oxford-Philadelphian Expedition in 1914-15. The only racial admixture that has to be considered in the case of the Arctic Tungus between the Yenisei and the Lena is with the Yakut.

With the help of the genealogical method in dealing with the social anthropology of the North-Western Tungus (in North Central Siberia) it is possible to distinguish the following grades of Tungus metisation.

(A) The *Tungus*, whose genealogical table, as far back as could be recorded, does not show any foreign admixture; (B) the *Tungus-Yakut*, who call themselves Tungus, and are such linguistically and socially, but who have begun in the last two generations to intermarry with the Yakut; (C) the *Dolgan*, who were Tungus, but who for a long time have intermarried with the Yakut and have created socially, physically, and linguistically a new type; they consider themselves to be a separate nation, their language approaches more nearly to the Yakut, and in physique they look more like the Tungus; (D) the *Tungusized Yakut*, who live in the western part of the Yakutsk territory, and the eastern part of the Turukhansk country, all on the Tungus land; the other Yakut call them Tungus (Tongus); they are in a minority among the Tungus.

The Tungus-Yakut approach in their stature, and head and facial forms, to the Yakut (*q.v.*), who, on the whole, are of a more Mongolic type than the Northern Tungus, while the Dolgan, though they stand further from the pure Tungus than the Tungus-Yakut do, are yet in all these three aspects more like the Tungus than like the Yakut, or, we might say, they return to the physical type of the Tungus.

4. Technique.—Most of the Siberian Tungus are at the stage of reindeer-culture, though they differ from such *pur sang* reindeer-breeders as the Lapps or the Eskimo in that their technique is not so highly specialized and their carvings and drawings on reindeer-bone or mammoth-ivory are not so perfect; very few of them have any knowledge of making half-underground huts, most of them still having fur tents similar in structure to those in their original southern home. In spite of centuries spent in a land where there are no horses, or only the small Siberian ponies which are used for driving but not for riding, they still preserve their old habits of horse-riding, exchanging the horse for the reindeer. In mythology and religion also their southern origin is apparent from time to time. Thus on the grave of a deceased shaman must be placed driftwood figures of a goat, a horse, or a dromedary—animals which have not been known to them for many generations.

The Tungus who do not live in the tundra as reindeer-breeders, but inhabit the steppes and the forest, are mostly hunters, and occasionally horse- and cattle-breeders. Only in the Amur and Baikal region do we find stationary groups.

Among the Northern Tungus iron is much more used than among the Samoyed. Until quite

recently tatuing was common among the Tungus of the Yenisei, charcoal alone being used as colouring matter, and no bright colours.

One of the most characteristic features of the original Tungus costume is the beautifully decorated apron, which has in some places degenerated into a small covering for the sexual organs. Birch-bark is not so much in use as among the Ostyak, but the typical Tungus canoes are made of birch-bark sewn into shape. The Tungus ornaments are typical of a migratory people. They have no permanent style—we do not see on them either the conventionalized zoological-anatomical figures of the Samoyed or the rich ornamental designs of plant form so often met with among the neighbouring tribe of Yakut. Yet in their mode of life the Tungus exhibit more neatness, more cleanliness, and more reserve than any other tribe of Northern Asia, and probably this was the reason for the classic name that Castrén gave them, however few he saw. He called them 'the gentry of the Siberian aborigines.'

5. **Sociology.**—The original Tungus social division was into clans, named after the clan-ancestor or the river on whose banks they dwelt. At the present time the remnants of the clans are grouped together into local groups, with local river and other names. This arrangement was forced upon them by the Russian Government, but their internal organization and government, as far as it goes, rests with their council of elders and a prince, elected for three years and re-elected as many times as they wish. Langa, a Hukachar prince, and a great shaman of the Llimpiisk Tungus of the Yenisei tundra, has been prince for twenty-five years.

Married people are always known as the 'father of So-and-so,' 'the mother of So-and-so,' even if the Russian Christian name is used—e.g., Ivan's father.

(a) **Marriage.**—Marriage restrictions are very numerous. Not only are blood-relations and clan-relations debarred from marrying, but two brothers of one family may not marry two sisters of another family. The exchange of children in marriage is not allowed, except among the Pankagir Tungus. The terminology connected with relationship by marriage is regulated by the age-classes. Thus *kyniv* would be the name used by the husband for the father, elder brother, and other male relatives of his wife, and *anikyniv* for her elder female relatives, while for his wife's younger male relatives he would use the term *kutiv*, and for her younger female relatives *kukim*. There is a special relationship, called *kalliv*, between two men who have married sisters. The reindeer which plays a part in the marriage ceremony, i.e. on which the bride rides to the bridegroom's home, is called Havakin (from the god Havaki) among the Yenisei Tungus and Savakin among the Tungus of the Okhotsk region. This reindeer is never used for any work, and is never searched for if he gets lost. When he grows ill or old, he is killed, but not eaten. He might be called the reindeer of the bride's individual spirit. The most important feature of the match-making is the settlement of the *kalyin* (wife-price).

(b) **Birth.**—At childbirth the woman is considered unclean, and is obliged to go away from the tent for confinement. After three or four days she returns from her seclusion and is purified by jumping three times through the fire. Hickisch¹ says that the placenta is eaten. Among the Tungus of the Yenisei-Lena region the placenta is usually hung on a tree or a pole in a skin bag. On the whole, a Tungus woman gives birth to her

child very easily. If, however, there are any complications, the Tungus and also the Yakut woman is placed in a kneeling posture, with her hands tied to the tent poles, and subjected to a forcible massage with a log of wood by the woman who attends her. To help his wife, the Tungus husband cuts down a tree and drives a wooden wedge into it. If this has no effect, a shaman is summoned.

(c) **Burial.**—All the belongings of the dead man are placed near his body. The classical way of burying a man was to sew a reindeer skin round the body and put it in a coffin standing on four high poles or on a high platform,¹ while a woman was buried on the ground and covered over with trees. Among the sea and river tribes the dead were often buried in small canoes. Now the Russian mode of burial in the ground prevails, except where the ground is frozen. The *chum* (tent) where the death occurred is promptly removed to another place. On leaving the place where a dead person had been buried, his relatives used, in olden times, to let fly two or three arrows towards him.

(d) **Initiation of a shaman.**—A young shaman (*shaman*), who has shown signs of devotion, wisdom, and nervous sensibility, is prepared for his office by an old shaman, who teaches him the secrets of the shaman's assistant spirits. After a year or more of frequent intercourse with the young shaman, the old shaman gives him the shaman's coat and drum. The shaman's chief spirits are: *etigr*, in the form of a long serpent, who has power over epidemics, sickness, and all manner of diseases; *iiniany*, in human form, with eagle's wings, on which he carries the shaman from place to place, who also protects animals from diseases; *arkinga*, a prophet-spirit; and lesser spirits such as *khaniny*, *miryada*, *torunga*.

The shaman's coat (*hamahek*) must be made of wild reindeer hide. His cap (*haarken*) is an iron circlet with representations of wild reindeer antlers. His boots are called *hanan unta kupuri*, and his belt *angayaptun*. Hanging from the lower edge of his coat he has a fringe of reindeer- or fox-skin, called *chirukta*. A fringe at the back, longer than the others and with a bell at the end, is called *irginde*. Projecting from his shoulders are the 'iron elk antlers of the shaman' (*arkalan*). On the *gilde* (iron circles attached near the antlers at the back) hang pieces of iron (*buddilar*), which are the shaman's arrows against *haryi* (malicious spirits). In the middle of the back of the shaman's coat are hung representations of the sun and moon. These are considered the most important features of his costume, and the sun is often sewn on a piece of skin taken from the head of a bear. *Gagk*, the swan, is on the back, and *ukang*, the diver, on the front of the coat. *Gieli*, a fish (*taimen*) frequently met with, is also represented there, and so too are *kandi*, 'the shaman's *dakali*' (small birds). On his apron (*hanan haalne*) there are also representations of the sun and moon, and the shaman's staff (*hanan tyevim*) has a human face (of an ancestor) and bear's feet. Sometimes a human face is found on the sun which is hung on the skin from the bear's head. All these accessories suggest ancestor-man-bear-worship, as also do the traditions. All the objects used by the shaman have their special names; the shaman's cap, e.g., is designated by a different word from that used for an ordinary cap, and, if a common term is used, the word *hanan* is prefixed. The shaman's drum is oval in shape, and the drumstick, *giho*, is long and narrow, with jingles.

6. **Gods and spirits.**—Animism is highly developed in the Tungus religion. The spirits living everywhere in nature have to be propitiated. They are more or less independent of the highest god, Havaki. The mischievous spirits in folk-tales are called *chitlugdy* and *gamondo*. Both these creatures use a special 'bad language,' which occurs in the tales and is understood by the shamans. The malevolent spirits are called *haryi*. The chief *haryi* lives in the virgin forest (*taiga*) of the north. He has enormous eyes placed outside his face and a flat nose, and the black hair on his head and face is like the *taiga* after a storm. He can assume the form of an enormous bear, a wolf, or a bison. The Tungus of the Nerchinsk

¹ *Die Tungusen*, p. 84.

¹ The name given to this old form of coffin is *buni mongin*.

and Yakutsk districts call the *lurgi* spirits *buni*; to the *buni* of the water they give the name *garan*, and to the *buni* of the earth that of *dorokdi*. The stronger the influence of Christianity, the worse becomes the character of the *buni*. Then there are other spirits, the spirit-owners of flies, of various animals, and even of thieves, *shuro*.

The chief god, Havaki, is anthropomorphic, but is connected with the sun. Sometimes the sun with the face of a man in it is supposed to represent him. Among the Tungus of the present generation the conception of the highest god is very vague, though the conception of spirits living everywhere in nature has still a strong hold on them all, Christian and non-Christian.

7. **Sacrifices.**—Private sacrifices of food are offered without any special preparations, but the sacrifices to the spirits connected with fertility are more important and must therefore be performed in the presence of a shaman, who knows the method of procedure. Thus the spirit-owner of wild reindeer is propitiated by an offering of the head of a mountain-sheep. The chief abode of this spirit, according to the Yenisei Tungus, is on the rock Hulgadzyakit, between the Upper Kureika and Lake Chirinda. The spirit-owner of lake-fish inhabits a place near Mount Umtupkan, to the east of Lake Chirinda, and at the beginning of the fishing season ceremonies are held to propitiate him. To ensure success in trapping, the Tungus will use in the construction of the traps at least one piece of wood which has been used by a shaman during his shamanistic performances. But the *туру*, or stick, which is the 'tree on which the shaman climbs to the sky,' is never used for this purpose, being too sacred. It is too *hooma*—a word used to express an idea similar to that of Melanesian *mana*.

8. **Animal worship.**—The veneration of the bear is especially highly developed. When a bear is killed and brought home, a ceremony called *kuk* is held. The heart and liver of the bear are cut into pieces, cooked, and divided among those present (exclusively males). Each person, before eating his piece, bows before the bear and assures him that it was the Russians who killed him, and not the Avankil (Tungus). Another remnant of a ceremonial bear-dance is *ikandyedyzyem* ('we are singing'). The bones of the bear must be placed just as they are in a bag, and hung on a tree. If one bone is lost, the spirit of the bear will hold the hunter responsible for it.

The eagle is also treated with great veneration, and it is expressly forbidden to kill him. For both these animals the Tungus use that adjective which they also use in speaking of heroes, *i.e.* *hooma*.

To all other animals which are not especially venerated the Tungus always behave, as they say, 'carefully,' lest the animal should become extinct. When a slit is made in the ear of the reindeer for purposes of identification, the hair that is cut off must not be thrown away, but must be hung on a tree or put in some safe place. The head and feet of the wild reindeer must not be thrown away; a special platform is sometimes erected for their reception, while the teeth of the wild reindeer are kept as *tygak* (amulets). There is a fox custom which drives the procurers of fox-skins to despair. After the fox has been trapped, his muzzle is cut off and carefully preserved. The skin may then be used, but the meat must be placed safely on a platform.

TURKS.—I. **ETHNOLOGY.**—1. **Origin of the name.**—The terms 'Turk,' 'Turkish,' and 'Turkic' are used in two different senses: to designate either those peoples belonging to the Turkic linguistic family or those peoples from Asia who appear from time to time in military history under leaders of Turkic speech. With the advance of ethnological knowledge, the former use is being abandoned for the wider term 'Turanian,' and the latter practice is falling into disuse. The name 'Turan' is much wider than the term 'Turk' and in any case is not synonymous with it. It must be noted that, while we hear of the Turks under that name in S. Russia even in the 1st cent. A.D., they only established themselves in Turkestan ('Land of the Turks'), the country named after them, in the 4th cent. A.D. Before that the country was known as Iran or Iranistan ('Land of the Iranians'), and stretched farther west into the present Iran. Thus one must be careful not to confuse the archaeology of Turkestan relating to the Iranian period with that which can be ascribed to the Turks.

The earliest information about the Turks, to be found in the Chinese annals from 2356 B.C. onwards, alludes to them under the name of Hiung-nung, or slaves of the Hiung, while the name Tu-Kiu, or Turks, becomes prominent in the 6th cent. A.D. only when a prince of the Assena dynasty, Tiumen, rose to power. But we hear of the name Turk in connexion with the Turkish invaders of Europe in the pre-Christian era. Pomponius Mela in the 1st cent. A.D. calls them Turcae and says that they live near the Budini, and Pliny the Elder in the same century uses the name Tyraea of a people in the neighbourhood of the Don. Though the various Turkic invaders of Eastern and Western Europe were chiefly known by the names of their leaders (Kipchak, Nogai, Seljuk, Osmanli), the name Turk as a generic term for the whole race is that most frequently used up to the present day. The Turks themselves with the exception of some Anatolian Turks call themselves by a dynastic or clan name.

2. **Origin of the race.**—The Chinese annals refer to the Hiung-nung as their north-western barbarian neighbours, and make a distinction between them and their north-eastern neighbours, the Tung-hung, afterwards the Tungus. The third Central Asiatic race, the Mongols, do not seem to have so long a pedigree, and it is possible that they form a branch of the Tungus or the Turks, or are a combination of both left behind and isolated on the steppes. This may be so, if we assume that the Turks and Tungus are two independent races which entered into the composition of the sub-races of Japan, China, and Tibet. The analysis of the funda-

mental types of both these races shows striking differences, but in comparison with the North and South Asiatic type they may both be called Mongoloid. Even assuming that the Tungus and Turks, as well as the Mongols, are the closest descendants of the original *homo Asiaticus*, yet, when they first appear in history, the two races differ widely in language, physical type, and culture. If the remains of bronze culture in the Upper Yenisei valley with burial masks, some of which are prominently Aryan in character, can be definitely ascribed to the early Turks, who knows whether their Mongoloid type was not after all an acquired character due to their mixture with the Mongoloids?

So much for the anthropological evidence as to the origin of the Turks. Not less important from the point of view of the folklorist is the origin of the race as explained by tradition. Perhaps the most wide-spread is the legend (found also among the Mongols) of a she-wolf, or white she-wolf, who found and reared an abandoned boy, subsequently the founder of the Turkish race. This she-wolf, Ak-biuri, saved the little boy from the bad god Erlik and brought him to Altun-dagh ('Golden Mountains') to an Altun-kii ('Golden Cave'). Two days later the boy began to call her mother, and six days later he began to call her father. De Guignes suggests that this is merely a version of the Roman tradition brought back by the Huns after they returned from their invasion of Europe.¹ But as a matter of fact the story might have travelled in the opposite direction, or the origin might have been independent, for the Chinese describe the shields of the Turks as having representations of a wolf before the approximate date of the Roman story. Then almost as widely spread is the legend of their first ancestor being the eldest son of Japheth, son of Noah. It is hard to ascertain whether the legend relating to still another ancestor, the son of the virgin-widow, Alanqua, has also a Biblical background.

3. Cradle of the race.—There are several hypotheses as to the geographical position of the original home of the Turks. H. H. Howorth seeks it in the southern parts of the Altai (Altun-dagh). Richthofen considers the region of the Amur, Lena, and Selenga their problematic original home. Parker suggests not the Altai Golden Mountains but some other mountains of the same name in the present Chinese province of Kin-Shan.

Recent archaeological discoveries in the Altai-Sayan region as well as study of the aborigines of the forest regions of these mountains support Howorth's theory.² While it is still difficult to know with certainty to whom to attribute the bronze remains of the Minusinsk, called by the Russians by the vague name of 'Chud' remains (*Chujoi*, 'stranger'), there is no reason not to suppose that the country was inhabited always by the Turks, who were influenced in their bronze culture by some Iranian people from Central Asia, though also by the Chinese. The investigation of the bronze culture in the region of Kuban (N. Caucasus) will probably throw light on this question, if the Kuban culture is found to be more similar to the Minusinsk than to the other bronze

stations in E. Russia—*e.g.*, the Ural (Perm). However, the fact that the customs and implements of the pre-bronze era (neolithic and late paleolithic) persist through the bronze period (probably 8th-3rd cent. B.C.) and the iron age and to some extent even till to-day points to the conclusion that the bulk of the population there remained the same, *i.e.* Turkish. The implements referred to are those used in the preparation of food and for agriculture.

The popular explanation that the bronze culture of Minusinsk is the work of a peaceful agricultural people of a higher type than the Turks, afterwards destroyed by the invasion of iron culture nomad people, who were, as no one now doubts, Turks, is not based on historical facts. We do not hear of the destruction of an empire at the stage of bronze culture in the Chinese annals—a fact worth noting—though mention of less significant movements at the beginning of the iron age from Central Asia towards the north-west is fairly frequent. If we assume that the pre-bronze and bronze age inhabitants of the Altai were of Turkic stock and in danger of invasion from the south-east or west, there is no reason why they themselves should not develop warlike industries which the so-called iron age remains represent. The bronze industry survives for some time during the next period, but the arrowheads, spears, daggers, and stirrups are produced in greater quantities than non-military bronze objects. The example of the Great War has shown us how easy it is to divert industrial power from one channel to another.

Most of the graves of the iron age in the Altai-Sayan district are communal, called by the Turks *chaa-tas* (the Russians call them *kurgans*), and are probably war graves. The inscriptions to be found on some of the burial stones all date from the iron age.¹ Those on the Southern Yenisei are earlier (about the 6th and 7th cent. A.D.) than those south of Lake Baikal along the Orkhon. The language of these inscriptions is one of the old Turkish dialects, the Uigur, belonging to a people politically very prominent to whom are attributed the remnants of Karakorum as their capital. Thus the earliest cultural remains of the Turkish race are nearer to Western than Eastern Asia, and the Turks at this early stage of their history, even if we take only the iron age, were living on a higher level of civilization compared with their near neighbours than they do now. It would seem that their subsequent mixture with invaders coming from the East has lowered their standard of culture, though in their subsequent history they several times developed local civilizations, notably under the Timurids in Turkestan and under the Ottomans in Byzantium.

But of course the attribution of cultural remains of the bronze and iron ages to the Turks does not carry them very far back, considering the antiquity of Chinese history. The first mention of the Turks here appears in 2356 B.C., while the bronze remnants of Minusinsk may be dated about 700-300 B.C. This was the time when unknown bronze flourished in the Volga-Kama-Ural district and in Scandinavia around the Baltic, when Greek settlers round the Black Sea and in Scythia were producing wonderful local art, when in Persia Darius and Xerxes were encouraging the development of local civilization which was in turn overturned by Alexander, who set up Hellenistic politics in its place. But Minusinsk was in neither of these circles, and its resemblance to Scythian culture is counterbalanced by its similarity to the Chinese. Then the second culture, that of the iron age, coincides with the rule of the Arabs over the Sasanid Persians and with the empire of the Khazars on the Lower Volga.

The attribution of both bronze and iron periods on the Yenisei to the Turkish race does not necessarily decide the question of the place whence

¹ P. M. Melioranski, 'Decipherment of the old Turkic inscription on a Stone found in the Aitaim-Oi in the Village of Kenkolsk in the Aulieata District,' *Mém. E. Sect. I. R. Arch. S.*, 1899, xi. 1-4, pp. 271-273; O. Donner, 'Sur l'origine de l'alphabet turc du Nord de l'Asie,' *Journ. Soc. fin.-ougr.* xiv. [1896] 1; V. Thomsen, 'Inscriptions de l'Orkhon déchiffrées,' i. 1894, *Mém. Soc. fin.-ougr.*, 1894, v. 54, 1896, i. 224.

they sprang. All we know now of the inhabitants of the Iish (Russ. Chern) or Black Forest of the Altai points to this, however, that their present character and customs are results of their environment and are similar to the customs and character of the earliest inhabitants of those regions. The original Turks were not steppe nomads living by warfare and constantly changing their camping places, but cattle-breeders and agriculturists devoted to their fields and forests and knowing the system of slave labour, while so advanced politically as to form confederations. Perhaps the most important proof of the origin of the Turks in the Altai region is the resemblance of the art found in the old picture writings in the region to the art of the most primitive and typical Turks of the present day, whether in the form of cattle brands or rock drawings. Further, the burial customs of these people seem to have been unchanged by time and are now practised as in the place of their origin. There must have been in all ages Turkic tribes living on the outskirts of the empires whose mode of life was more nomadic and who consequently mixed to a greater extent with other nomads. Those tribes were, however, not the true Turks as described in the Orkhon inscriptions, but Kazaks, who correspond to the Russian Cossacks, or frontier half-military guards.

The hypothesis of the Altaian origin of the Turks is in opposition to the theory launched some 50 years ago by Castrén and since uncritically accepted by some Finnish and Russian ethnologists (Otto Donner, Klementz), that the Samoyed originated in the Altai and Sayan Mountains and migrated from there to the north. If, further, the Samoyed are identified with the Finns, as they are by some people, the Finns, who in modern times developed the high culture of the Scandinavians, become the ancestors of the bronze age people of Minusinsk.

The linguistic authority of Castrén seemed sufficient to make people accept his theory without investigation, but his whole hypothesis was based on the supposition of the historian Fischer in the 18th cent. that the inhospitable region of the Arctic could not be the home of the Samoyed on account of its frigid character and poverty. The only support was of a linguistic character, that at the time of Castrén some Tatar clans in S. Siberia (the Kamashints) could speak Samoyed. Moreover, this theory holds that many other Tatars, of Uriankhai and Minusinsk, like the Koibal, Soyon, Beltir, and Karagass, are Turkicized Samoyed, one branch of which was pushed by the advance of the Turks towards the north. Such is Castrén's theory.

That the Samoyed might have originated further south than they are now is possible, but they must have always been fairly far north. All their present culture, which can be called 'reindeer' culture, shows that they are under the influence of a period of Arctic environment too long to trace their origin. The few linguistic observations of the Samoyed tongue in S. Siberia only prove that some of the clans of the Samoyed migrated from the north further south. Neither in physical type nor in customs do either of these doubtful Samoyed resemble the real Samoyed. While an uninterrupted chain of ethnological and, above all, archeological evidence, as well as Chinese and Arab historical mentions, ties the Turks to the Black Forest of the Altai mountains, from which they spread at an early date over the Sayan and Orkhon, no archeological remains can be ascribed to the Samoyed, and no ethnological evidence supports the theory of Castrén.

The relationship between the Samoyed and Finnic races is still an open question, but in any case historical and archaeological evidence of early Finnish culture does not go further east than the Ural (Perm). By dismissing, therefore, the Samoyed-Altai theory, one dismisses also the claim of the Finns to an Altai-Sayan cradle. Possibly further archaeological discoveries may reveal still earlier Turkic inscriptions than those of the Yenisei, but they can only be found more to the south, since the inscriptions to the east of the Yenisei, i.e. the Orkhon, are one or more hundred years later. The relation between the Minusinsk bronze antiquities and the archeological remains of the steppes of the Black Sea attributed to the Scythians has been recently studied carefully, and a close resemblance was found.¹ Minusinsk was taken in this respect as a centre from which this culture spread towards the Black Sea.

¹ E. H. Minns, *Scythians and Greeks*, Cambridge, 1913, p. 261.

This is important as throwing light on the puzzle of the origin of the Scythians, though no one can doubt now the kinship, if not identity, of the Eastern Scythians and the Turks. If the cradle of the Turks is to be sought in the forest of the Altai with its environment which encourages a sedentary and agricultural mode of life—and the steppes and valleys between the Altai and Baikal are full of evidences of the sedentary culture of this people—it is still true that in comparison with the old Chinese, the Turks, especially their eastern branches, must be considered barbarians. Besides, there never has been a uniform culture spread over the various Turkic nations, nor did they ever live in a mass undivided by foreign races. This is why it is difficult to be certain whether some of the clans mentioned first by the Chinese and then by the Arab writers can be considered Turks. It is much easier to make this distinction among the contemporary Turks, even though they appear also under various names of Tatar, Tuba, or Osmanli.

A few words must be said about the name 'Tatar.' R. G. Latham¹ points out that the less we use the term Tatar or Tartar, the sounder will be our ethnology. He also calls attention to the mistake of coupling the Manchu and their dynasty with the Tatars. One of the earliest mentions of the word 'Tatars' is found in the old Turkish inscriptions of the Orkhon ascribed to Bilge-Khan.² About this time (8th cent.) the 'Otuz-Tatar' ('Thirty Tatar') lived to the east and south-east of Baikal and were dependent on the Turkish confederacy. Chinese history does not mention them till the 9th century. According to N. A. Aristoff,³ the Otuz-Tatars were originally Turks, while the Mongolian scholar Bichurin is inclined to call them Mongols. In the same inscription on the Orkhon is a mention of the 'Tokuz-Tatars' ('Nine Tatars').

The term 'Tatar' is closely connected with the term 'Tatan.'⁴ The people living in the present Khalka from the 9th cent. were called Tatan. They were divided into many *aimán*, or unions of clans. The strongest of these were the Mongol, Taigut, Kere, and Tatar.⁵ These were divided into clans, but all of them used the tribal name of Tatan. The Mongols successfully fought the Niuchi (Tungus) in the middle of the 12th cent., and towards the end of this century the Mongol ruler, Temujin, was elected head of all the Tatars and a great part of China under the name of Jenghiz Khan. The house of the Mongol-Tatan reigned from 1206 to 1638. The Mongol *aimán* of the Tatan confederacy subdued the Tatar *aimán* before they started on their European conquest, but it is doubtful whether all the Tatan accepted the name of this one *aimán*. On the contrary, the name Mongol came into greater prominence than that of Tatan or Tatar through Jenghiz Khan. It is probable, however, that some of the Jenghiz Khan hordes were known to their neighbours as Tatan. When Carpini came as an envoy from the pope to the Khan Kuyuk, he may have made a mistake between Tatan and Tatar, so in the 13th cent. all the geographers named the land between the Caspian and the Chinese Seas Great Tartary. It is perhaps because the Chinese historians often called Tatan 'Tata' (a mistake now corrected by them) that many Asiatic scholars, such as H. J.

⁵ *Ib.* i. 129, 221-227.

von Klaproth,¹ confuse the two names Tatan and Tatar.

The first people to call all Mongols Tatars were probably the Russians, and they gave this name also to the tribes who had settled along the Volga, and who seem not even to have been Tatan but various Turks brought within the Mongol-Tatar army, who after the death of Jenghiz Khan were pleased to regain their independence. At the present day Tatars, whether on the Volga, in the Crimea, the Caucasus, or Siberia, represent a fairly pure strain of Turks. Among the problematic Turks may be placed the Scythians, Parthians (though their descendants, the Turkomans, are among the most representative Turks now), Yuchi (whose descendants, the Rajputs, are certainly a non-Turkic people), and Ye-tha, or Ephthalites, called also White Huns (these seem to have been different in type and habits from the Huns who migrated westward). All these peoples are variously ascribed to the Tungus or Turks; some others, as the original Bulgars and Avars, are sometimes counted as Turks, sometimes as Finns; and the Nogai, Kipchak, and Usbeg are regarded as either Mongols or Turks. The Dungans are placed between the Chinese and Turks, and the Horsak (Sokra and Horpsa) are the Buddhist Turks of Tibet. Finally, the Usuni (Wusun) are attributed by some to the Turks and by some to 'Aryans' of Central Asia. Some other peoples are without doubt Turks, as the Hiung-nu, Khakas, Kirgis, Uigur, Tukiü (Assena), Seljuk, Khazar, etc.

II. DIVISION OF THE MODERN TURKS.—The distribution of the Turks is so wide and their geographical environment so varied that it is difficult to speak of the Turkish type from an ethnological standpoint. Politically, too, what is called Turkish is often only Muhammadan and quite different in nationality. We find that in the pre-war Turkish empire of Asia Minor, N. Africa, and S.E. Europe there were far fewer Turks in an ethnological sense than there were in the pre-war Russian empire.

i. THE SIBERIAN TURKS.—1. Yakut.—See art. YAKUT.

2. Siberian 'Tatars.'—According to religion, the Siberian Tatars can be divided into two groups: Muhammadans and shamanists. The Muhammadans are: (1) the Tobolsk Tatars, in the Tobolsk government, (2) the Barabine (Baraba) Tatars, in the Kainsk district, (3) the Chulim Tatars, in Mariinsk district, (4) the Tomsk-Kuznietsk Tatars, in the Kuznietsk and Barnaulsk districts. The shamanists are: (5) the 'Chern,' or Black Forest Tatars, in the Biisk district, (6) Telcut and Telengit, in Biisk and Kuznietsk districts, (7) Kumandints, in Kuznietsk and Biisk districts, (8) Shorts and Lebedints, in Kuznietsk district, (9) Kyzyl and Kamashints, in Achinsk district, (10) Koibal, Sagai, and Kachints, in Minusinsk district, (11) Karagass, in the forest of Nijne-Udinsk district. The total number of Siberian Tatars in 1911 was about 250,000.

The Tatars of the Tomsk government speak their native Turkic language, and only 30 per cent of them know Russian as well. In the Yeniseisk government only 12 per cent know Russian. The Telcut of the Kuznietsk district are perhaps the most Russified, while the Telengit along the Bia and the Katun are all baptized, and partly Russified, partly Mongolized. The following natives seem to be mixed with the Yenisei-Ostiak and Samoyed, or, as some think, are Tatarized Samoyed: the Kumandints, Shorts, Lebedints, Kyzyl, Kamashints, Koibal, Kachints,

¹ *Mémoires relatifs à l'Asie sur les Tatares*, 3 vols., London, 1820-28.

and Karagass. The most genuine Turks are those 'Tatars' who inhabit the region of the Altai forests—the 'Chern' Tatars.

ii. CENTRAL ASIATIC TURKS.—The Central Asiatic Turks, all of whom are Muhammadans, can be divided according to their mode of life into (a) steppe nomads, and (b) village- or town-dwellers. The steppe nomads are: (1) the Kirgis or Kazak, (2) the Kara-Kirgis, (3) the Kara-Kalpak, (4) part of the Turkomans, (5) part of the Usbegs. The village- and town-dwellers are: (6) Sarts, (7) Taranchi, (8) most of the Usbegs (with the Kipchak), (9) most of the Turkomans.

1. Kirgis-Kazak and Kara-Kirgis.—The Kirgis-Kazak live in the northern and eastern part of the Aral-Caspian basin, and in the Orenburg steppes, so they are lowlanders. The Kara-Kirgis live on the slopes of Pamir, Altai, and Tian-Shan. They are mountaineers. There are, however, other Kirgis, to whom this name may be applied historically and ethnologically, who lived from the 6th cent. A.D. in the Yenisei valley and migrated to Semirechie, forced forward by the advances of the Russians in the 18th century. They are often identified with the 'Khakas' (Castrén, Klementz, Kasmin, Radloff), and the inscriptions found in the valley of S. Yenisei are attributed to them. The Kirgis-Kazak call themselves Kazak, *kaz* meaning 'goose,' *zag* meaning 'crow,' i.e. the steppe birds, the free birds of the steppe. The Russians call them Kirgis-Kazak to distinguish them from their own Cossacks (Kazak). The Kirgis-Kazak derive themselves from the Usbeg, and they derive the Kara-Kirgis from dogs. But the Kara-Kirgis call themselves brothers of the Kirgis-Kazak, and in fact are probably one of their branches. Out of 4.7 millions of these Kazak only about 400,000 are Kara-Kirgis.

The Kirgis-Kazak were divided into three groups, called *orda*—the southern, or great *orda*, 'Ulu-dschus,' the little *orda*, 'Kishi-dschus,' to the west, towards European Russia, and the middle *orda*, 'Orta-dschus,' in the typical steppe country. But, when they began to mix with one another and to increase in numbers, they divided into clans, and each clan had its own *tamga*, or clan symbol, with which the horses and dromedaries were marked. The heads of the clans were called Sultans, while the nobility was called Tiuri or Ak-suek, 'White Bones.' They trace their ancestry from Jenghiz Khan, notwithstanding that the latter was a Mongol. All the other people were called Kara-Suek, 'Black Bones.' Lately, however, marriage prohibitions between these castes have been withdrawn, and the social division is based on material considerations.

The felt hut of the Kirgis is called *yrta*, and a group of *yrta* is called *aul*. Herds of sheep, horses, and dromedaries are their chief form of property. In sharp contrast to their lightly-built houses are their graves, especially among the Turkestan and Semirechie Kirgis. They look like small towers and are made of bricks and clay. The subjugation of the Kirgis by the Russians began in 1734 and took more than 90 years—even during the Great War some groups of Kirgis considered themselves independent.

2. Kara-Kalpak.—The Kara-Kalpak, or 'Black Caps,' are akin to the Kirgis-Kazak, and live in Turkestan, especially in the Syr-Daria district, where they form half of the population. They number about 134,000 (1911). They seem to be taller than the other Kirgis, and lead half-sedentary lives, part of them being agriculturists. Some 20,000 of them live in Khiva.

3. Sarts.—The Sarts (1,847,000 in 1911) were originally a mixture of the original Iranian inhabitants, the Tajik, with their Turanian conquerors,

the Usbeg. They busy themselves with commerce, but occasionally take to agriculture and cotton-plant growing, in which they are not as successful as the Tajiks, though they know the use of the *arika*, irrigation canals. All the Sarts speak Turkish, and are Muhammadans (Sunnite); they have many followers of the Şūfi order. In physical type they approach nearer to the Iranians.

4. **Taranchi.**—The Taranchi are very like the Sarts. They also live in winter in villages, *kishlak*, and their summer houses are called *sakla*. They migrated to Russian Turkestan from Kulja at the same time as the Dungan after Kulja passed to China. They number about 83,000 (1911) and live in the Semirechie country, in the Ili basin, and partly in the Transcaspian country. They are agriculturists, especially busying themselves with vegetable gardens, but prefer commerce. They are Muhammadans, but their women do not cover their faces as the Sart women do.

Besides the Taranchi there are various Turkish tribes on the Eastern slopes of the Tian-Shan, in Kashgar, Yarkand, and Khotan, who are the supposed descendants of the Uigur. Their language is sometimes called Turki, and is possibly one of the oldest types of Turkish. They form the most easterly branch of the Central Asiatic Turks, and probably remained behind when the first westward movements began. They ruled in Kashgaria from the 10th to the 12th century. Though in time they became Muhammadans, early Nestorian teaching has left its traces; they still use the Syriac alphabet and possess a book of the 11th cent. in this writing, called *Kudatku Billik*. They are a 'free self-governing people.' Some of them have been to Mecca (800 miles to the Siberian Railway, then through Odessa to Jedda). They consider Stamboul their religious and political capital. The Turks and generally the Muhammadans in Asia are more prosperous than the Buddhists, though the Buddhists are protected by the Chinese Government.

The Kirei of N.W. Mongolia are supposed to have come from the source of the Amur. In the 11th and 12th centuries the Kirei were an important power, and were probably of Nestorian creed. Whether the mythical Prester John (a Christian priest who reigned in some Christian Asiatic kingdom) was their king it is difficult to say. They are not heard of for a long period after the time of Jenghiz Khan. They now differ from the Buddhist Mongols in being Muhammadans. They live on the banks of the Upper or Black Irtish and the greater part of the Western Altai pastures and the Jungaria plains as far as Lake Zaisan. They train hawks, falcons, and golden eagles for hunting such game as gazelles, foxes, and even wolves. Like the Kazak, they claim Jenghiz Khan (a Mongol) as their ancestor.

5. **Usbeg.**—The Usbeg (about 600,000 in 1911; including Kipchak, about 660,000) form the majority of the inhabitants of the Samarkand district and parts of Ferghana and Syr-Daria districts. In Bokhara and Khiva they are the ruling people, like the Osmanli in Turkey. Their name is probably derived from Usbeg Khan of the Golden Horde (1312–40); in the 16th cent. they founded in Turkestan the Khanates of Khiva and Bokhara. They are a mixture of three elements: Turks, Iranians, and Mongols. The Turkish element is probably predominant, though in the case of the Usbeg of Khiva it is the Iranian type that predominates. Since the Usbeg exchanged their nomad life for a sedentary one, their customary law, *adat*, has lost ground, and is being replaced by written law, *shari-at*. Father-right is very strong, but the position of women is on the whole better than among the Sarts and Tajiks. Though

the Usbeg now imitate the Sarts in making huts covered with clay, and live in small villages encircled by walls like fortresses, here and there the old felt *yurta* is still found.

6. **Turkomans of Transcaspia.**—The Turkomans live to the number of about 600,000 in the Transcaspian territory and also partly in Persia, Khiva, and Bokhara. Until the Russian occupation of Merv they were nomad horse-breeders. Although some of them were subject to Persia, their boast has been that 'not one Persian could cross their frontier without a string round his neck.' In 1881 the Russians destroyed their power by capturing their principal fortress, Geok-Tepe, and their slave trade has been suppressed. They now live in clay or raw brick houses, and, in some places, in Russian wooden houses. They are Muhammadans, but follow the unwritten customary law. The clan division is still strong, and all migrations are made in clan groups. Endogamy is enforced. As the male population is abundant, the *kaly*m for the wife is very high, and in some places the unmarried men form 27 per cent of the population. On the whole they seem to be a democratic people.

The chief clans of the Turkomans are: (a) the Chaudurs (Chaudur), in the north-west part of Ust-Urt and the Karaboghar Gulf; near (b) the Yomuts or Yamuds, extending from Khiva across the Ust-Urt and along the shore of the Caspian to Persia; (c) the Goklans or Goklens, settled in the Persian province of Astarabad; they are said to be the most civilized and friendly of all the Turkomans; (d) the Tekkes (Taka), who were the most important tribe when the Russians conquered Transcaspia; they are first heard of in the peninsula of Mangishlak, but were driven out by the Kalmuks in 1718 and subsequently occupied the Akhal and Merv oases; the Russians inflicted a crushing defeat on them at Geok-Tepe in 1881; (e) the Sakars inhabit the left bank of the Oxus near Charjui; (f) the Sarik (Saruk) are found in the neighbourhood of Panjdeh and Yulatan; (g) the Salor (Salore), an old and important tribe, suffered much in the course of fights with the Tekkes, and in 1857 migrated to Zarabad in Persian territory near the Harirud; (h) the Ersazis (Ersars) are now found chiefly near Khoja Salih; they were once a very important tribe on the upper Oxus.

The Central Asiatic territories, which belong to Russia, have a total population of from five to six millions, of which at least from four to five millions are Turks. Eastern or Chinese Turkestan has a population of about two millions, excluding Kulja and Jungaria. Jungaria has about 600,000 and Kulja 150,000, the overwhelming majority in all these three provinces being Turks. Besides the Turks of the north we find some Mongols, and in the east and south Tibetans.

iii. **THE VOLGA 'TATARS.'**—The Volga Tatars are those Turks who have been settled on the Lower Volga since the Hunnic invasions, and, since their hold has been strengthened by frequent invasions, they are partly mixed with the Mongols, the Finns, and, since the 13th cent., the Russians. After the break up of Jenghiz Khan's empire they belonged to the great *orda* of Kipchak (Kipchak being mainly a political and not a racial term). After the fall of the Kipchak the Khanates of Kazan and Astrakhan continued to exist. The Khanate of Kazan was conquered by Russia in 1552, the Khanate of Astrakhan in 1557.

1. **Kazan Tatars.**—The Kazan Tatars number more than a million, and their centre is in the government of Kazan, though they extend on both banks of the Volga as far as the government of Saratov.

2. **Astrakhan Tatars.**—The Astrakhan Tatars, to the number of some 50,000, live at the mouth of the Volga. Some of the Volga Tatars, such as the Cheremiss, Chuvash, and other middle Volga tribes, and the Bashkir, are supposed to be of Finno-Ugrian origin, but they are now Turks in speech and Muhammadans in creed and social life. Muhammadanism was introduced among the Volga Turks in the 10th century.

3. **The Bashkir.**—The government of Orenburg

is a great district for the Mordvins and the Bashkir. The latter are also found in Ufa, Perm, Samara, and Vyatka governments. Latham¹ says that the Bashkir are as entirely Turks in language and features as are the Kirgis. They are shepherds, herdsmen, but above all bee-masters. After the battle of 1552, when the power of the Tatars of the Volga was broken, the Bashkir submitted themselves to Russia, against whom they have not ceased to rebel. Their number is about 392,000.

4. **Teptyar.**—A typical mixture of races, something like that of the Chulim Tatars of Siberia, where it is difficult to define which racial element predominates, are the Teptyar. When the Khanate of Kazan fell, a mixed population of Turks, Cheremiss, Votiak, Chuvash, and Mordvins fled to the east of Ural; out of these has arisen a population which the other Turkish tribes call Teptyar; they are partly shamanist, partly Muhammadan.

iv. **THE PONTUS OR CRIMEAN AND NOGAI TATARS.**—The Khanate of the Crimea, originally Nogai (a political division of Tatars similar to the Kipchak who came there in the 13th cent.), was by the middle of the 16th cent. more or less Osmanli politically. In 1778 they became independent, but in 1784 became subject to Russia. They are known as excellent agriculturists and growers of grapes and tobacco.

The hill tribes of the Crimea who migrated there before the Nogai in the 11th or 12th cent. from Asia Minor, and are probably a branch of the Seljuk, are shepherds. The culture of the Crimean Tatars is more like that of Kazan and Astrakhan Tatars than like that of the Osmanli. Their total number is about 300,000. The same Nogai Tatars are to be found in Lithuania and Rumania to the number of 5000. They are now mostly Christian, and mixed with the local population.

Another branch of the Nogai occupied the country between the Tobol and the Yaik rivers at the beginning of the 17th century. They were transplanted by Peter the Great to the banks of the Kuma and Kuban, but a small group remained behind at the mouth of the Volga and are called Kundur Tatars.

The Nogai are very Mongol in physiognomy. Some people attribute to them the tumuli of the Orenburg government.

v. **WESTERN TURKS.**—i. **Turks of the Caucasus.**—The Turks of the Caucasus—properly speaking, the Azarbaijan Tatars—are the inhabitants of the province of which Tabriz is the capital. They number about two millions. They seem to be Turks speaking a Yagatai dialect, who invaded Persia during the Seljuk period (11th cent.). They are also called *Iliyets*, i.e. tribes or clans. Each clan has its own *ikhani*, appointed by the Shah.

Some of these clans are: (a) the Kajara, near Astrabad; the present dynasty of Persian Shahs comes from this tribe; (b) the Ayshars of Azarbaijan province (a group of these immigrated to Anatolia and live now in Anti-Tawins); (c) the Shekakis; (d) the Karakoyunlu; (e) the Karagazli; (f) the Bahalu; (g) the Inamli; (h) the Kashkai, who probably arrived at Herat before the Persians.

Azarbaijan Tatars are mixed with the Persians; other Turks of the Caucasus, living in the mountains along the upper parts of the rivers Cheghem, Baksan, and Kuban, are mixed with the natives of the Caucasus and are physically of local type.

2. **Turks of Anatolia.**—(a) *Osmanli and Seljuk.*—The term Osmanli or Ottoman, used in a strict sense, means 'descendant of Osman,' a chief who gathered round him a nation at the end of the 13th and beginning of the 14th century. Recent researches have proved² that the Osmanli Turks (who until the revival of nationalism in Eastern Europe never called themselves Turks, but always

¹ *Ethnology*, i. 373.

² H. A. Gibbons, *The Foundation of the Ottoman Empire*, London, 1916.

Osmanli) are a tribe of Turks who lived in Persia for a considerable time before they moved to Asia Minor. It was probably as refugees before the advance of the army of Jenghiz Khan that they appeared in the 13th cent. and with the permission of the Seljuks of Konia settled on the Asiatic remnants of the Byzantine empire. As the Osmanli have no written history before the capture of Constantinople, all that we know about their early history is founded on tradition. Their clan is supposed to be descended from Khorasan, but we know more about Ertogul, who was the father of Osman. Osman owned only the small territory of Sugur, and it is not certain (Gibbons) that he and his people were Muhammadans, like the Seljuks, until he married into a Muhammadan family. It was the political unrest in E. Europe that helped the descendants of Osman to conquer all the Balkan Peninsula and Byzantium. The invasion of Asia Minor by Timur at the beginning of the 15th cent. stopped but for a very short time the successes of the Osmanli in Europe. If we consider that the Osmanli were originally only a small clan, and that the Seljuk and other Turks looked down upon them and did not join with them, we must conclude that the bulk of the Osmanli nation was recruited from some race other than the Turkish. Recently the name Osmanli became the term applied to all the subjects of the pre-war Turkish empire.

Many of the Turks of the old Byzantium who belonged to the Osmanli empire were not Osmanli in the strict sense. Thus the supposed remnants of the Seljuks of the 11th cent. are called Konlots. It is interesting to note that Byzantine authors mention a Turkish colony which settled in Macedonia on the river Vardar in the 9th century.

(b) *Turkomans.*—The Turkomans of Anatolia are spread all over Anatolia, but are specially numerous in the central part and in E. Taurus. They are more Mongolian in type than the Osmanli or Seljuk. They are nomads, but not to the same extent as the Yuruks. Their summer residences (*yaila*) are close to their winter houses (*kishla*). Some of them are Shi'ahs, others Sunnites. They seem to have been first heard of in Anatolia in the 12th cent. and are mentioned by the historians Nicetas and Anna Comnena as 'Turcomans.'¹ They were opposing both Seljuk and Ottoman rule and probably migrated from C. Asia under their own political régime.

(c) *Yuruks.*—The Yuruks live chiefly in the mountains, but also in the plains from Smyrna to the E. Taurus. They are typical nomads.

Old ethnologists sometimes mistook the religious communities of the Muhammadan sects for distinct Turkish nations—e.g., the Kizil-Bash (*q.v.*), or Red Heads, living in the Angora region of Asia Minor, Persia, Afghanistan, and the Caucasus.

III. **RELIGION.**—We shall deal only with the religion of the Turks before they accepted Muhammadanism; it has persisted up till now among some Turks of Central Asia and Siberia. There is evidence (the Buddhist writings in Uigur character) that some of the Central Asiatic Turks were followers of Buddha about the 8th century. Still more has been heard about Christian Nestorian influences. In fact, there is a permanent sign of these in the form of Uigur written characters modelled probably on the Soghdian. The Arabs captured Samarkand in 706, but Muhammadanism in Central Asia was introduced later, and to some extent it is still spreading. The original religion of the Turks is a shamanism of

¹ W. M. Ramsay, *The Intermixture of Races in Asia Minor*, London, 1917.

the Southern type, *i.e.* with a well-marked dualism. Their shamanistic ceremonies and mythology are more highly developed than those among any other shamanistic people. It is this religion that can be called genuinely Turkish.

1. **Gods and spirits.**—The highest good god is Yulgen, while the symbol of evil is Erlik, who lives in the darkness. Another higher being is Kudai, who is a sort of medium between men and the highest beings. The spirit owner of the hearth is called Bel, and was so called by the Turks who were responsible for the old Yenisei inscriptions; several names of the gods appear in them. Then there are seventeen high rulers ruling over various parts of the Turkish lands. The Altai ruler is called Altai-Khan, and lives in the source of the river Katun. Yulgen himself is so good-natured that, when he wants to punish men for failing to give him sacrifice, he asks Erlik to do it. Yulgen is very often identified with the idea of the sky, Tengri, or with light, Yaryk. The sky is generally the home of all good spirits. Ara-neme or Tengri Yulgen lives in the seventh sky. He has a mother, three sons, and twelve daughters. His eldest son is the god of thunder and rain, and his third son, Timur-Khan, is the god of war. One of his peculiarities is that an arrow passed through his throat and since then he stutters. Kun, the sun, is of female sex, while the moon, Ai-ada, is a husband of the sun. All the mountains, forests, lakes, and rivers have their spirit owners, *elü*, whose functions are not quite clear. They seem rather benevolent if propitiated. The same cannot be said about the spirit assistants of Erlik, called *kara-neme*, who, even if propitiated, may be found harmful. They are known also under the names of *kuremes*, *asa*, *rozyr*. Images of gods and spirits are made of various materials and are called *tyns* or *kurmes*.

The chief office of the shaman is to use his sacred drum (*tiungjur*) and keep off by its sound the malevolent spirits. The shamans themselves are in some tribes of two types, some to ward off the bad powers (black shamans) and some to propitiate the good powers (white shamans, who are very often not professional but merely heads of the families).

The goddess of birth is held in great regard; her name among the Altai Turks is Umai, among the Siberian Tatars and the Yakut, Ayisit.
