TO
SIR JOHN MAURICE CLARK, BARONET
PUBLISHER
AND
FRIEND

v

PREFACE

IN issuing this, the twelfth, volume of THE ENCYCLOPÆDIA OF RELIGION AND ETHICS, I wish to thank those who have assisted me in the work.

And first let me name the Publishers, Messrs. T. & T. CLARK, and their Staff, above all Sir JOHN M. CLARK, Bart., to whom I have taken the liberty of dedicating it. The Printers also, Messrs. MORRISON & GIBB LTD., deserve the thanks of all concerned, and mine most of all; and especially must their able and accurate Readers be remembered.

What shall I say of my accomplished and loyal Staff? Besides Dr. Selbie and Dr. Gray, whose names are on the title-page, I must mention Mr. J. F. Grant and Mr. T. Riach. Not less deserving than these are the two sisters Miss M. C. Macdonald (now Mrs. Laburn) and Miss D. R. Macdonald (now Mrs. Dow), to whom most of all is due the minute accuracy of the ENCYCLOPÆDIA. With them let me name my Secretary, Miss H. Robertson, who was with me at the planning of the Work and has guided its course to the end. I must also mention our indispensable Librarian, Miss E. M. Mitchell, and Miss B. Wisely, the Typist, whose work has often won the admiration of the authors of articles.

Many scholars have aided with their contributions and with their counsel. I cannot name them. But I must say one thing. The ENCYCLOPÆDIA would not have been what it is if I had not had in every department of study covered by it at least one man upon whom I could rely for advice.

The names of the translators have never appeared. The translations from the French have for the most part been made by my assistants. The German translations are almost all due to the Rev. ALEXANDER GRIEVE, M.A., D.Phil. Mr. ALBERT BONUS, M.A., has translated nearly all the Italian work. Either Professor W. R. MORFILL or Dr. E. H. MINNS has been responsible for the Russian translations. A few articles written in Danish were translated by the Rev. JOHN BEVERIDGE, B.D.

The editing of a work like THE ENCYCLOPÆDIA OF RELIGION AND ETHICS is undoubtedly difficult, but it has brought me into touch with so many men of ability and generosity, and has enabled me to make so many friendships, that the pleasure of it has far outweighed its pain.

An Index Volume is in course of preparation.

THE EDITOR.

INDEX

[The following text is extremely faint and illegible due to the quality of the scan. It appears to be an index or a list of entries.]

AUTHORS OF ARTICLES IN THIS VOLUME

- ABELSON (JOSHUA), M.A., D.Lit. (London).

OF

RELIGION AND ETHICS

S

SUFFERING.—I. *INTRODUCTION: THE FACT AND THE PROBLEM.*—Suffering, as a feature of life in this earth, is too obvious and too familiar to need description. Sentimentality and denunciation are alike superfluous. Suffering is all but universal. From the point where, in the evolutionary process, a brain is developed, upward through all ranks of being, suffering is an unvarying element in experience. It appears in endless variety. Some of it belongs to animals in their natural conditions as an accompaniment of their life-story or as a consequence of their predaceous habits. It is, however, in human life that suffering most abounds. A great deal of human suffering is what we term roughly 'physical pain,' though, in point of fact, the suffering of a self-conscious being must be radically distinct from that of a living creature in whose sentient life the thought of personality has not yet dawned. Physical pain is found in many degrees of intensity, from that which is easily bearable, at least by persons in normal health, to that which is appalling to look upon, and must constitute an unimaginable anguish. If we pass from physical suffering to that which is mental and moral, we are overwhelmed by the mass and the magnitude of the agonies that are the lot of mankind. From the sorrows of childhood, deeper than the observer can calculate, to the stony griefs of age, untold and unguaged, there is a range of suffering beyond all enumeration and conception, baffling the imagination, affronting the intelligence.

The worst feature of human suffering is the chaotic nature of its distribution. If strong men alone were sufferers, we would comfort ourselves by noting the gladness of little children; but children suffer, often with an intensity which seems too awful for the tender frame to endure and yet survive. If the guilty alone suffered, we might have some kind of theodicy to fit the facts; but the innocent suffer; they are the greatest sufferers. If we had to consider only our own pains, we might find a reason for them, or at least we could retreat to the fastness of our unconquerable soul. When, however, it is the pain of others that confronts us, we feel that our explanations are an impertinence. The clue to their sufferings is not to be found in any supposed rationale of our own.

VOL. XII.—1

The deepest element in the problem of pain is that so much suffering is meaningless, as far as our most careful thought can discern. After we have noted causes the removal of which would certainly reduce the quantity of pain in the world, after we have seen the ends which it may be supposed to serve, there remains a surplussage of pain unaccounted for by our largest theory. It is this surplussage that forms the heart of the mystery of suffering. If there is any meaningless pain in the world, it cannot, surely, be the best of all possible worlds. How can a world crossed by such a bar sinister be the expression of wisdom, power, or goodness?

'The dilemma of Epicurus is still with us: if God wishes to prevent evil but cannot, then he is impotent; if he could but will not, he is malevolent; if he has both the power and the will, whence then is evil?'

The challenge to theism is direct. There is probably little theoretic atheism among ordinary men and women. But it is certain that in multitudes of cases faith has suffered shipwreck on the rock of meaningless pain. To this form of unbelief women are peculiarly prone. Suffering appeals to their sympathy. Their acquaintance with it is wide and intimate. They feel, more deeply than men, the waste and cruelty of it; and they are accordingly brought to doubt the existence of a God who is at once almighty and all-merciful. In their case, too, scepticism means more than it does to the majority of men. It is not merely the abandonment of a theory. It is the ruin of a life, through the loss of the hope which alone makes life endurable. In all ages the pressure of this problem of pain has been felt. It may even be said to be the driving force in all philosophy and in every great religion.

How shall man be reconciled to life? What view of the world must be taken if man is to live worthily in it? What estimate of life must be held if it is to be at least endurable? How are the facts of suffering to be adjusted to the sense of value and the inspiration of hope, which are the mainsprings of fruitful labour?

II. *THE LEADING ATTEMPTS AT SOLUTION.*—**I. Pessimism.**—Frankly and definitely, suffering is so wide-spread and so intense that the verdict

¹ W. R. Sorley and others, *The Elements of Pain and Conflict in Human Life*, p. 48.

of open-eyed and unprejudiced observers must be that the world is an intolerable place to live in, and that life is an unendurable burden.

The classical example of this solution of the problem of pain is the doctrine of Buddha, which, in the heart of the 19th cent., was reproduced by Schopenhauer. Pessimism must always be substantially the same. It is interesting for its verdict, not for its discussions. Buddha's 'Four Noble Truths'—pain, the origin of pain, the destruction of pain, and the eightfold holy way—are the conclusion of the whole matter. The first contains the result of direct observation. Suffering prevails. Life is worthless and miserable. The third traces this universal wretchedness to its source in 'thirst,' the desire which attaches the soul to worldly objects and leads to 'becoming'—an infinite series of new existences, with a monotonous repetition of birth, pain, and despair. The third points out the means of deliverance from life and from suffering, viz. cessation of desire. Let desire cease; then the thread of life will be snapped; then the fountain of suffering will cease to flow. The fourth is Buddha's plan of salvation, containing a careful account of the steps by which the extinction of desire is to be accomplished. Among these morality has its place; and Buddhist ethic has a mild lustre of its own. The crown of the procedure, however, is contemplation. Schopenhauer's 'path' includes art, but otherwise is scarcely an improvement upon Buddha's. The issue for both is the same—the cessation of desire, the abandonment of the will to live.

To discuss the philosophy of pessimism (*q.v.*) would be wasted labour. The Buddhist psychology, with its rigidly atomistic sensationalism, has gone to the scrap-heap. Schopenhauer's dependence on Kant does not give his system commanding authority. The real strength of pessimism, or the final demonstration of its weakness, must be sought elsewhere. Pessimism pursues the empirical method. The first question to be asked is as to the validity of this method and as to the certainty of the first 'Noble Truth' reached by means of it. Can the worthlessness of life be established by any enumeration of details? The question is not as to the possibility of balancing the pessimist's instances by others of a more cheering nature. Optimism cannot be established by such means. The real question is as to the method itself. The pessimist inference from the facts of pain is not really drawn by mere generalization. It rests on a preconceived theory of values, by which all the facts of life are tested. Pessimism is simply disappointed hedonism. If the highest good is pleasure, life is certainly not worth living, for pleasure in any guise is not to be had, on any terms whatever, in human experience, to such a degree as to counterbalance the damning facts of pain. If the Creator was bound to secure for His creatures a surplussage of pleasure, He certainly has failed to do so. His power has not been equal to His good intentions. If He exists, we must conceive of Him as shorn of His omnipotence, or even 'gone mad.' Hedonism, however, is of all ethical theories the most precarious. If appeal be made to experts in living, the answer will be returned that happiness is not the chief good for man and cannot be conceived as the chief end of creation. That place of eminence belongs to moral goodness.

Our question as to the world, accordingly, must be: Is it so framed and ordered that moral goodness is being wrought out therein, not merely in spite of, but actually by means of, the suffering that is to be found in all human life? It is to be observed, however, that the answer might be enough to refute pessimism, and yet leave a crux for theism. We might be quite convinced that virtue is the highest good for man, and we might vindicate the position that virtue grows to its maturity through the discipline of pain; still, if there remains a margin of suffering that bears no relation at all to character and cannot be related to the chief end of creation, the theistic conclusion remains open to doubt. It may even become necessary to maintain that optimism cannot be established by argument at all, and that theism is warranted by some other process than that of

logical demonstration. In that case the challenge of suffering may be met; but not otherwise. After we have refuted a theoretic pessimism, we have to recognize the fact of pain. Before one irrelevant pang our best theorizings sink abashed. We have nothing to say. Our speech would be a worse irrelevance.

2. Stoicism.—Another answer to the challenge of suffering is to the effect that, while pain is real and may be very acute, it is one of those indifferent things which a wise and strong man may neglect, not allowing it to disturb him in any way. The Stoic philosophy is the elaboration of this answer, by means of a full apparatus of metaphysic, psychology, and ethic. Stoicism, however, is more than a philosophical theory. It is an attitude to life. It reappears in noted personalities, when the insistent evils and disorders of the world drive men to the inner region of their own souls, to find there a refuge nowhere else discoverable. The circumstances under which classical Stoicism arose are familiar. It was an age of individualism. No relief or satisfaction could be found in any form of life open to man in the world of that day. Men could not go into the world and find the counterpart of their own moral nature. They could not lose themselves in the activities of city or nation and in the very process of such devotion achieve their own highest welfare. And this for two reasons: no city or nation was left standing in its independence; and the soul of man had grown so great in its needs and capacities that it could no longer be satisfied within the limits of civic or national activities, however intense and vivid these might be. Man had discovered himself. He knew now that nothing less than the universe would meet his need and afford a satisfying life. Here, then, is the Stoic gospel, which is at once a philosophy and a message of salvation. The ultimate reality is reason. We may speak of Nature or of God. In any case there is one principle at work in the world and in man. Stoicism is, in this aspect, optimism. It believes in a principle which underlies all phenomena and is moving through all events to complete victory. This principle is the life of all that is, both within man and beyond him. It is a principle of reason and of harmony. It is inherently good; and its supremacy is the highest welfare of the world and of man. The ethical ideal for man, accordingly, is consistency with nature or with reason; or, speaking religiously, it is harmony with the will of God. The ancient Stoic doctrine of providence has the fervour of intense religious conviction. It is strange at first sight that such a glowing optimism should have any room for a theoretic acknowledgment of the facts of pain and evil. It is to be noted, however, that the ultimate reason has been reached in Stoicism too easily. It is, after all, a negation of the vast and confusing facts of a miserable and perplexing experience. It is the bare affirmation of an abstract principle which ought to be the truth of all things and, in point of fact, is reproduced in scarcely any of them. Reason is everything; and yet reason is nowhere. Stoic optimism is a faith; but the Stoic estimate of facts is dark and pessimistic. What, then, is man to do, poised as he is between reason, which is his true nature, and a world in which man and things are so irrational? What attitude is he to take towards such brute facts as hunger and cold, oppression and cruelty, bereavement and grief? The Stoic answer is serene and hard. The wise man will choose reason. He will be absolutely sure that this choice brings him a good of which no power in man or in things can rob him. He is in indefeasible possession of the absolute best. His harmony with reason sets him in a charmed circle, into

which nothing irrational and evil can ever enter. Pain racks his body; but his body is not his reason. Death robs him of wife or child; but they are not himself. Evil afflicts his friends; but that cannot invade the citadel of his own peace. We read the aphorisms and counsels of an Epictetus with a shudder. So calm, so logical, so inhuman! It ought to be noted, however, that this attitude of complete detachment towards pain and evil is an advance upon a view such as that of Aristotle, which regards them as obstacles in the way of a perfect life. To the Stoic they are not obstacles. The perfect life has simply nothing to do with them. The wise man will not court them; but he will not allow them to disturb his serenity. He will make their occurrence in his experience the occasion of manifesting his consistency with reason. He will even benefit by their presence, inasmuch as his conquest of them will invigorate his strength and enable him to gain a yet greater superiority over them. But, in themselves, they have no relation to his inner life, which is complete without them and does nothing to them. At this point our admiration for the Stoic attitude reaches its highest.

Here also our criticism begins. The reason, which is the Stoic's God, and highest good, is not positively related to the manifold experiences of life. It is not in and through them that reason is revealed in its own inner wealth, and that man attains the fullness of his being. Very specially, pain and evil serve no end of reason, and the supreme principle of the universe has no relation to them. Man, in union with that principle, has no duty with regard to them, save to repel them and to refuse to them the tribute of an emotion. It is not on these lines that the worth of life can be vindicated or an idealist construction of the universe be established. The Stoic conclusion is mere negation, abstraction, and emptiness. It is good only for defiance; but defiance is not victory over pain; and far less is it transmutation of evil into the means of a greater good.

Yet is it good, even for defiance? Stoicism has too easily assumed that man can choose the reason of the universe and identify himself with it. A painful doubt develops. What if a man's self be the main obstacle to his being identified with God? In abandoning all things finite and particular, will he not need also to surrender himself? Thus the axe is laid to the root of Stoic pride; and the Stoic gospel turns out to be a counsel of despair. In the might of my self I am to defy the world. But who am I? The very essence of finitude, the very acme of contrast with the reason which is the harmony of the universe. My utmost willing, then, is weakness. Upon my resistance falls the doom of ineptitude and impotence. Victory is turned to defeat. Self-confidence is no longer possible; for self is the secret of failure. When Stoicism has reached this point, it is ready for a philosophy, or a religion, which shall start where it ended and make the condition of man's achievement of the highest good, not his self-assertion, but his self-surrender. The challenge of suffering might now be met in a different way—not by resistance, but by acceptance. Pain might become, not an obstacle in the path of the perfect life, not even a thing indifferent to man's inner good, but the opportunity and the instrument of his death to self, and therefore, also, of his complete self-realization. Stoicism began with optimism and ended in pessimism. It might be possible to reverse the process and to lean our optimism upon a deeper view of evil than an empirical pessimism had ever reached. Such a stage beyond Stoicism is found in one direction in Neo-Platonism, and by another path in Christianity.

3. **Meliorism.**—A nobler answer to the challenge

of suffering than that offered by Stoicism was very prevalent during the recent war. The world, it is admitted, is full of virulent evils and untold sufferings. These things are not to be explained. They are to be fought. They are not to be accepted as an irresistible fate or as the appointment of an almighty and sovereign Disposer of events. They are evil, and only evil, continually. Judged by the human conscience, they exist only to be resisted, defeated, banished from the experience of the race. They are a challenge to love, sympathy, honour, to be met by sacrifice, by service, and above all by unending war. All intelligences are summoned to take part in this war for peace, this struggle for the abolition of suffering. Among the hosts engaged in this life-and-death conflict some individuals, both human and superhuman, occupy the position of leadership, as well in strategy as in the actual fighting. Commander-in-chief of this army is God. He is not what absolutism, or orthodox theism, has conceived Him to be. He is not the inscrutable ground of all being, the omnipotent will, the omniscient mind by whose unalterable decree all things in creation are predetermined. He is a finite being, though of course His resources both in wisdom and in power are far more than human. He is in this fight, which is no shadowy and spectral combat, but is for Him as for man tragically real, a genuine life or death struggle. We can indeed scarcely imagine His being defeated ultimately; but He has not won yet. Nay, He cannot win unless He secure the co-operation of man. In this tremendous conflict human beings cannot be neutral. If they are not for Him, they are against Him, slackers, traitors, or open enemies. He sends out a great call for volunteers; and all who have a spark of generosity or heroism will rally to His side. They will fight with the splendid courage which comes from sympathy with the oppressed and tortured everywhere, and with the desperate energy of those who see the issue plainly. They are fighting for their all, for the very life of humanity, and humanity's radiant and high-souled Leader. Every rookery pulled down, every disease routed, every social wrong redressed, is a battle won in the long campaign, a stage to the final, all-comprehensive victory. Suffering is being eliminated. Progress is being made. The end, if not in sight, is reasonably secure.

But the practical value of meliorism must rest ultimately on the validity of its presuppositions. If these are invalid, their results cannot be permanent. Now the presuppositions of meliorism are mainly three: (1) the universe is conceived as growing in time, its future, strictly speaking, unpredictable; (2) God Himself is avowedly a finite being, in time, sometimes described even as 'young,' with a future before Him in which He has still to make good; (3) the issue of the conflict is, in the nature of the case, uncertain, though every successive victory and the inexhaustible resources of intelligences, human and superhuman, give ground for hope. It is not too much to say that each one of these presuppositions is disputable. Not one of them has won universal consent. Together they constitute a huge hypothesis. If regarded as more than this, they become sheer dogmatism; and dogmas are but 'iron rations' at best, and are soon exhausted.

The error both of Stoicism and of meliorism lies in trying to turn what is partial into an absolute. Because a man is summoned to oppose the evil that is in the world with all his might, it is supposed that he can 'carry on' till the victory is his. Suppose, however, that this rough dualism between the good man and the wicked world does not represent the real situation. Suppose that the real source of evil is not without, but within, and that

the conflict that is being waged in the world is the image and the outcome of a more devouring strife that rages in man's own soul. Then the result will be, as happened in the history of Stoicism, that self must give up its self-sufficiency and must seek the true and the good, not by self-assertion, but by self-surrender, and see in its attainment of virtue and knowledge the disclosure and the communication of One who includes the universe in His consciousness and His control. Then the fighter may 'carry on' without anxiety and without self-confidence, because the victory has been won already, not by himself, but by the Power which is working in him, whose servant and vehicle he is. The end of such a war is not uncertain, though it can be reached only through a sacrificial ministry.

It ought to be added that meliorism makes no pretension of having solved the problem of pain. It knows no more than any other theory why pain should ever be; and it cannot be blamed for refusing to face the question. A graver defect, however, is its inability to provide hope or comfort for those sufferers who are not taking part in the successive victories, or are not directly benefited by them. In this war, as in all wars, it is the non-combatants who suffer most. But really the metaphor breaks down altogether. Where time is the whole of reality, there can be no 'repatriation' of those who have been overwhelmed by the powers of evil. Some meliorists believe in immortality. But their faith is not a certain conclusion from their presuppositions; nor does meliorism require such a faith for its completeness. It is concerned only with the progress of humanity. Its soldiers get their fill of fighting, and this is all the pay they ask for. Those who have never had a chance to fight, who have been crushed by forces too great for them, have no compensatory advantages offered them. At this point meliorism lapses below Stoicism. It has no resource against pessimism. A world with such hopeless, meaningless pain in it had better never have been. The meliorist 'God' escapes the condemnation and contempt even of the most ordinary intelligence, only because, to do him justice, he is not creator of the world, and is not responsible for its blemishes. We stand, as does 'God' also, in the midst of a circumambient fate, unintelligible, inaccessible, whose blind decree can be neither modified nor served, which is liable at any moment to intervene disastrously in our affairs and turn our most brilliant victory into mockery and despair.

4. **Optimism.**—The most perfect optimism would be a thoroughgoing pantheism. If finitude is really an illusion which disappears from the point of view of the Absolute, evil cannot be held to exist. Ascend to the point of view of the Absolute, and forthwith evil is seen to be mere seeming. The idea that it exists is the mistake of those who attribute to things finite a reality which does not belong to them.

This sounds convincing. But two remarks immediately occur. (1) Who shall ascend to the height of the Absolute? How shall the finite leap to the Infinite? Practically, pantheism has nothing to say to the sufferer. His pain is utterly irremediable. Pain necessarily belongs to the finite. He is bound to the finite. As long as he exists he must suffer. When suffering ceases, he will have ceased to be. Pantheistic optimism is thus pessimistic in its estimate of life. (2) If evil is an illusion, because it is finite, so must good be also, for it too is finite. Good and evil are, in fact, meaningless. For the Absolute they do not exist. Optimism and pessimism, accordingly, are philosophies of the unreal, and are in the strictest sense alike nonsense. Of course this treatment of the problem of pain is due to the error which turns the unity of thought against the manifold of experience and regards the universal as the only real, while the particular is condemned as the illusory.

The philosophy of Leibniz has been dealt with in this *Encyclopædia*¹ and needs no further exposition here. Leibniz stands at the opposite pole from pantheism; yet it is pantheism to which his own ruling principle of thought constantly leads him. The principle of sufficient reason, as he interprets it, is the same as that of identity and contradiction. A complete analysis would be a perfect explanation. The principle of identity is the highest principle of truth. All appearance of difference is mere illusion,

¹ See art. LEIBNIZ and PESSIMISM AND OPTIMISM.

due to the disability of a finite consciousness. From this point of view the problem of evil may be solved; but the solution is really pantheistic.

The criticism of Hume, and the yet more destructive work of Kant, have made the dominance of an abstract Absolute impossible for modern thought. The finite has come to its rights. The principle of freedom is too strongly entrenched in the convictions of men ever to be relegated to the sphere of the negative and the illusory. This means that modern optimism can no longer take the position of pantheism, and so affirm the sole reality of good as to destroy the possibility of evil. Its proof must now consist in arguing that evil is inseparable from the highest good in this sense, that the highest good is attainable only through the conquest of evil. This argument consists fundamentally in a special reading of the facts of human life. It may be presented as a deduction from an idealist philosophy, or it may appear as an induction from data empirically reached. Fundamentally it is a judgment of value, as intuition of the significance of life, and is not reached by either the *a priori* or the *a posteriori* method.

There is no evil except for a rational being, who is capable of willing a good which he identifies with the absolute good, but which is in reality in antagonism to it. But, inasmuch as the possibility of willing this lower good is inseparable from the existence of free subjects, who only come to the clear consciousness of the higher through experience of the lower, it is just the high destiny of man and the infinite perfection of God which make it inconceivable how there should be a universe, containing beings who realize what is the meaning of their own life and of the whole, unless those beings pass through the long and painful process by which the absolutely good is revealed as that which can overcome the deepest depths of evil.¹

Watson, from whom these words are quoted, develops them into a view of human life and history which shows that, the higher the conception of the good, the deeper will be the insight into evil. The man who knows himself a sinner knows that no sin is alien to him. He is the supreme sinner of the universe, the chief of sinners; and in the act in which he confesses and dies to his sin the violated order is rectified; and the guilt which he so profoundly acknowledges is lifted to the shoulders of Another, and he is free for ever. Watson does not in this passage explicitly apply this profound conception of an optimism, vindicated through a deeper pessimism than Buddha or Schopenhauer ever knew, to the pangs of nature and the physical woes of men. Plainly, however, the one problem lies within the other. The deepest evil man can suffer is the division within his own spirit. Let his breach with the Absolute be healed, and his breach with nature cannot fail to be healed likewise. The truth of nature is spirit. If the unity of spirit rise triumphant above the dualism that a false assertion of freedom has wrought, there can be left nowhere in the universe any element of difference, and therefore of evil, which is not in process of being transcended in the realization of the ultimate good.

Many writers who do not adhere to Watson's type of idealism base their ethical view of the universe on the facts which he emphasizes. The world was certainly not framed to produce the pleasure of all sentient creatures or the happiness of human beings. The highest good is moral good, and moral good can be attained by man only through a process of discipline. A world which made goodness easy would make true goodness impossible. By work, by suffering, and by temptation, human character is perfected. The theistic and optimistic inference is more securely drawn from a world with imperfections, in conflict with which character is ripened, than it would be from one in which neither physical nor moral evil was present. It is possible to believe that the Creator of such a

¹ John Watson, *The Philosophical Basis of Religion*, p. 459.

world is good and wise and almighty, whereas such a faith would be valueless if the world were a machine for turning out mechanical perfection. This does not mean, of course, that for every pain we suffer we can allege a moral purpose. Physical suffering comes to us through our place in a cosmic order whose laws operate with absolute impartiality.

Would we prefer that it were otherwise? Yet in such a world, and in such a world alone, can the highest good be realized. As matter of observed fact, the good is making progress towards a victory, which may be delayed, but which stands in no reasonable doubt. One difficulty lies in the path of such modest optimism, viz. the fate of the individual. Most upholders of this view take refuge in the idea of personal immortality. It is granted that the general optimistic estimate requires that there shall be a balance of good for the individual as well as for the race, seeing that the individual is an end in himself, and not a mere link in a chain. But in the vast majority of individuals this balance is not struck within time and space. It is necessary, therefore, to postulate another life, in which the wrongs and sufferings of this world shall be rectified and their memory lost in the realization of perfect good.

An argument such as this, which turns upon the supremacy of moral worth, and the function of pain in realizing it in the history of individuals and of the race, is intellectually unanswerable. The conclusion of the whole matter is:

'God's in His heaven—
All's right with the world!'

It is to be noted, however, that, when we have solved the problem of pain from the point of view of the spectator, suffering still remains a mystery for the sufferers. No amount of argument can meet their need. What they require is an experience. Their pain cannot be transmuted into joy by telling them that, in the final result, there will be for them a preponderance of good. They will continue to suffer, and before their anguish argument sinks back ashamed. They need to be introduced to the experience of a suffering within which theirs is comprehended and of a good through which theirs is guaranteed.

Optimism must submit to the test of fact. The fact in this case is pain; and pain is insoluble by a process of reasoning. Over against every phase of the argument stands the intractable pain, or, rather, there stands the piteous army of the sufferers. Optimism appears satisfactory only when we stand back from the facts. Stand in the midst of them, and our philosophy is smitten into silence. A world, with pain in it—and such pain!—cannot be the best of all possible worlds.

Of course, Omar Khayyam's aspiration is ridiculous. We cannot 'grasp this sorry scheme of things entire,' cannot 'shatter it to bits' and 'remould it nearer to the heart's desire.' None the less, we turn from the best that the optimist can say to the contemplation of a universe which contains such 'things' in it and are conscious of a lamentable gap. The key does not fit the lock. Suffering remains a mystery and a challenge to theism.

5. The Christian doctrine of providence.—It cannot be doubted that Jesus had the whole fact of pain present to His mind. He lived in the midst of suffering. Yet it did not present itself to Him as a problem. Certainly He made no explicit reference to the questions with which Job wrestled. His compassions flowed forth unhindered by any theory of the causes of pain. He never viewed suffering as other than a great evil. He devoted a large part of His ministry to its alleviation. But He never stood before it confounded or paralyzed. If He was conscious of its challenge to theism, He never replied by argument. He lived in unbroken communion with God, and faced all the problems of life from that position of perfect acquaintance. He knew God. He knew that God's love gathers into its compass all the suffering of man and of the whole sentient creation. The good will of a God whom He knew as the Father cannot be impugned. The victory of His love cannot be doubted. In this faith Jesus lived and died. He revealed to men its divine object, and gave theism the verification of experience. Christianity is the reproduction of this proof. It is a life 'hid with Christ in God.' Its secret is an experience.

This experience is not a mystic rapture, to be attained in rare moments by those who have leisure to cultivate the conditions leading to such remote and perilous heights. It may be reached by children. It can be reached only by those who consent to become as little children. It is peculiarly accessible to sufferers. It is reached in the act by which man surrenders his separateness of will and commits himself trustfully to the divine love as it meets him in the chiefest of all sufferers. Such an experience cannot be translated directly into a theory of pain. It contains more than any theory can express. All noble idealism seeks to interpret its fullness; and, apart from it, no philosophical solution can be more than an attractive speculation.

The Christian doctrine of providence (*q.v.*) articulates the leading ideas which are implicit in this experience, and by means of them seeks to exhibit the relation of God to the history of the world. It does so, however, under the distinct understanding that the experience of communion with God, while it is central and all-comprehensive, cannot be drawn upon to provide ready-made answers to the questions which intellect may raise regarding the course of nature and of human life. The divine love is the highest reason. The Logos is love incarnate in the life of the Son of God. But this does not mean that a book could be written, solving, on the whole and in every detail, the mystery of pain. No reasoning process can reach the sanctuary where God at once comforts and remakes the soul that pain has shattered. The Christian is an optimist, but not a theorist. He knows God. He has seen Him in Christ. God is love. That is the secret. There is no truth outside of love, no power that can withstand love. It dominates the universe. It is almighty. When it is reproduced in man, it is the greatest thing in the world. The doctrine of providence simply says, in different connexions, that the divine love is sure of itself, knows its own design, is baffled by no obstacles, overcomes all enemies, is moving to an end, guaranteed in Christ, which is none other than God's perfect communication of Himself in and to a universe which responds with the 'Amen' of absolute faith and unhindered devotion. Christian optimism blends the confident assertion of love's supremacy with an unashamed agnosticism. Its key unlocks the mystery of suffering. Yet the Christian does not employ this key to meet the question of why and wherefore, either as to the presence of pain in the world at large or as to any individual affliction. He bears witness to the fact of love. The acceptance of that fact introduces the sufferer to an experience in which all questionings are transcended in a great possession. Christianity accordingly stands apart from theoretic optimism. It does not, of course, impugn the function of pain, by which philosophers and poets have sought to establish their hopeful conclusions. It can use such instances of beneficial pain as illustrations of its own central truth. It doubts, however, their adequacy to establish, by intellectual demonstration, results so magnificent. It is in full sympathy with their spirit. But it rests its optimism on a different basis; and it presents its results not so much to those who contemplate suffering from without, in order to satisfy their questions, as to those who know it from within, that they may know it better and enter through it into fellowship with God.

(a) *The ground of Christian optimism.*—The Christian doctrine of providence stands at one point in profound and significant agreement with such an idealism as is presented in the writings of Caird and Watson. It believes that the problem of pain is part of the wider and deeper problem of moral evil. It does not stay to discuss the fact of

physical evil before it has dealt with the graver problem of sin. It presses on to the tremendous fact of breach with God, confident that, if that has been met and healed, no other discord can remain finally unresolved. Nature finds its truth in man. Physical suffering has its analogue in the division which exists between the human soul and God. Reconciliation with God will be the final solution of a mystery of pain which reverberates throughout the universe. In spite of this parallelism, however, Christianity and idealism stand apart. Christianity is an idealism, no doubt. But idealism is not Christianity. The vital question for both is the reconciliation of man and God. How is it achieved? Idealism answers, In an idea. Christianity ventures its all on an historic fact. Idealism pursues the soul to its deepest consciousness of guilt and declares that there already is the reconciliation. The consciousness of guilt is possible only to a soul fundamentally at one with God. In awaking to a sense of his guilt, man knows himself reconciled at once to God and the universe. The spiritual unity is gained; the unification of all experience is thereby guaranteed. Christianity deepens the diagnosis and exhibits a different remedy. In sin man has the universe against him. It reacts to his sin in perpetual judgment, registering in his character and his career, in loss and defeat and pain, the condemnation which man's attack upon the universal order has brought upon him. This automatic reaction does not stand apart from the will of God. It reflects one aspect of the divine mind regarding sin and carries out one part of the divine dealing with it. But sin is not the ultimate reality of the moral world; and judgment is not the whole mind and will of God. The ultimate in God and in the universe is love. The reconciliation is accomplished not in an idea, but in the action of God. The love of God goes into action coincidentally with the sin of man. It is true that God's experience of time must differ from ours in a manner necessarily inconceivable by us; so that it is not improper to speak of an eternal act of love and an eternal atonement. But the standpoint of Christianity is, definitely historical. Sin is in time. Sin-bearing is in time also. Love can reconcile the world to God only if it pass to the world's side and in the world realize experimentally the whole meaning of sin. It must enter into the tragedy of human life in an experience more tragic than any penitent sinner ever passed through. 'Christ died for our sins' (1 Co 15³). It is the first, the only, Christian gospel. In the action and passion of a life crowned by the Cross Christ is not another than God. He is God, in a temporal experience, manifesting an eternal fact. Love has gone to the utmost limit of sin and suffering and has returned bearing the fruits of that unimaginable agony in a world reconciled, mankind redeemed, sin and evil judged, exposed, broken. The fact of sin—that is pessimism. The fact of Christ—that is optimism. Christianity confronts the world of sin and suffering with the deeper suffering of divine sin-bearing love. All else that it has to say is an inference from that basal fact. Its doctrine of providence consists in developing the significance of that fact for the varied discipline of life.

¹ The Christian faith in providence is an immediate inference from the Christian experience of redemption, and it is an inference as vast and unqualified as the redeeming love on which it rests.¹

To be reconciled to God is to be reconciled to life. To be at one with God is to be at home in the universe. The reactions of the order with which we now live in harmony set like a tide towards our perfecting. 'All things work together

¹ J. Denney, *Christian Doctrine of Reconciliation*, p. 330f.; see also pp. 1, 3, 177-179.

for good to them that love God.' Love has taken the place of fate. Possessing it and being possessed by it, we possess all things. We cross every chasm, even the ultimate gulf of death, and find ourselves still in a region where love is king.

The NT is a lyric; but it is not a freak of poetic fancy. It is the song of a victory won, the record of an experience, not the less reliable that it is amazing, an inference which is strictly logical, from the greater to the less, though it surpass all calculation. 'He that spared not his own Son, but delivered him up for us all, how shall he not with him also freely give us all things?' (Ro 8³²).

(b) *The Christian attitude towards suffering.*—(1) Pain means obstruction of life. It is essentially evil. It is not the intention of God that any of His sentient creatures should suffer. It is not possible to say to every sufferer, 'God sent you this; He has laid this affliction upon you.' This judgment upon suffering as evil will be assailed from many points of view, scientific, ethical, and religious. Suffering, it will be said, is inevitable, as an element in the evolution of the world. It was experienced by innumerable sentient creatures millenniums before man appeared on the earth, before the first sin was committed. Suffering, it will be urged, is a splendid moral discipline. It is, therefore, a good, of which no man can complain that he has had too much. It is sufficient to reply that the Author and Object of Christian faith, the Revealer and the Organ of the infinite love, did not think so. He steadfastly set Himself to reduce the sum of pain. So far as we know, He never met a case of pain which He did not relieve, if the conditions were present for His doing so. In such action He Himself suffered exceedingly. He made no moan. He recognized such suffering to be necessary to the fulfilment of His redeeming vocation (Mt 8¹⁷). But His doing so cannot be construed as an approval of pain. Rather was it a judgment upon pain as an evil to be removed at any cost of pain. This judgment, moreover, was not an implicit hedonism. It would be ridiculous to make such a suggestion regarding the teaching of Jesus. He never taught that it was a primary concern of God's love to keep His creatures immune from suffering. He absolutely denied that the crown of life was pleasure. But this cannot be construed to mean that He regarded suffering as a good, or asceticism as the ideal of life, or sorrow as the soul of religion. It does imply, however, that He regarded the condition of the world as abnormal. He occupies the point of view of the religious mind of Israel in looking upon the world as standing in intimate and vital relation with human life. There is a strict relevance between these two. If there be evil in man, there will be pain in nature. Nature stands so near to spirit that it thrills responsive to the breach that sin has wrought between the human spirit and the divine. Paul is enlarging the same idea inherited from the OT, and reinterpreted through the death and resurrection of the Redeemer, when He speaks of the 'sighing of creation,' of its subjection to *παράκλησις* and its share in the hope of redemption (Ro 8¹⁸⁻²²). There is suffering in nature; and there is suffering in man as part of nature. And all suffering, in nature or in little children, is the exposition and illustration of that which, in self-conscious and self-determining man, is sin. Dogmatism regarding the origin of sin and suffering is forbidden. To appeal to predestination for a theory is to bring the Eternal within the limits of time. We have nothing to do with origins. We have to do only with meanings and values. And this is the meaning which Christianity puts on pain. It means intensely; and it means evil. The first thing to be done with it is

not to discuss it or apologize for it, but to relieve it, if possible, and at least administer the healing of sympathy. This, then, is the first position of Christianity with respect to pain: it is not God's will for His creatures that they should suffer; it is His will that pain shall be abolished from His universe for evermore.

(2) Pain is not an unanswerable challenge to theism. It is not inconsistent with the supremacy of love. Love has won an eternal victory in an event which occurred in time. Love has snatched victory from defeat. It has transmuted the foulest crime of man into the instrument of the divine redemption. It has done this greatest thing. How shall it not accomplish all lesser things in the same order? He who redeems from sin will not be baffled by suffering. It is to be noted carefully that Christian thought, in claiming that God is not hindered by the obstacle of pain, is not passing from ethical to non-ethical considerations, giving up love to take up power. What Christian experience finds in the Cross of Christ is not an incident, an act over and done with, like the punishment of a criminal. It is the historic revelation of that which is in essence timeless, and endures through all time, and triumphs in all history, viz. the atoning love of God. The Cross is the supreme revelation of the divine immanence. God is present in all pain. He suffers in all suffering. He is the chief sufferer in the world.

Theology has never done justice to the surest affirmation of faith: 'In all their affliction he was afflicted.' The incarnation of God in Christ is the deepest truth of the divine relation to the world. Nicene orthodoxy is not orthodox enough. Misled by the Greek conception of the Absolute, it ascribes divinity to One who, nevertheless, has an experience of which God is incapable. But the God whom faith finds in Christ is the only God there is. He suffers in all that sin has wrought, and His suffering is the redemption of the world. Christianity meets the challenge of pain, not by anxious computations of the amount of good which may be extracted from the agonies that fill the records of time, but by the unveiling of the suffering of God. The Cross is the only Christian apologetic. Only through the suffering of God is it tolerable to suppose that a world with pain in it is His world, reconciled to Him, and carrying within its tragic history the energy of omnipotent redeeming love. We time-determined consciousnesses cannot pretend to understand God; but we know Him with an estimate that is sure and pierces the inevitable mists of time. God is love. This we know. For the rest we can afford to wait.

(3) Christianity sets out in the name and by the power of a victory already won, on its age-long vocation—the conquest of sin and suffering. To accept at God's hands the deliverance He has wrought by pain is to be committed to a perpetual war with pain. The campaign is world-wide. The battles are innumerable. The fundamental strategy is to utilize for every instance of pain the energy of love, which is the very nature of God and is available and adequate for the redemption of man. In this matter it may be that Church theology and Church policy have lagged behind the actual experience of Christians and have failed to push home the victory.

Three lines of action are prescribed by the consciousness of redemption. (i.) The employment of pain. It is here that optimism is most at home. Browning has rung out the answering challenge to pain. It is absolutely true that in a sinful world the perfecting of souls is won through suffering. We are to react on the pains we endure, and so make them subservient to the development of moral stature. We are bound to be swift and earnest in this subjection of pain to our uses; for the opportunity of so employing it passes with the passing moment. We are to lay to heart the thought which finds eloquent expression in Ugo Bassi's 'Sermon in the Hospital':

'While we suffer, let us set our souls
To suffer perfectly: since this alone,
The suffering, which is this world's special grace,
May here be perfected and left behind.'¹

All this is to be accepted, rejoiced in, and practised. The only reservation to be made is that such considerations do not establish optimism as a theory. The data are not broad enough. The victory over pain must first be won before specific sufferings can be attacked in detail and made to yield booty to the conqueror. This is the paradox of the higher life of man. Apart from this sure base in triumphant love, the flood of irrelevant pain in nature and history would rout the most confident optimism.

(ii.) The mastery of conditions. This is the sphere of organized ministry. All such service, whether operated by idealists or materialists, Christians or non-Christians, proceeds on the supposition that the conditions of human life are abnormal, and that, before full vigorous life can be enjoyed, these conditions must be improved. Another presupposition, however, has to be made if such ministerial aid to sufferers is to be completely successful, and is to be rendered, not merely with skill and fidelity, but with the energy of perfect confidence. We must be certified that in rendering such help we have the universe on our side, that resident within it are forces capable of carrying sentient creatures to such complete and harmonious exercise of function as shall be a perfect victory over pain. No alteration of conditions will be of any avail in social service or in medical work, unless there be this fountain of energy, discharging itself for ever through these channels. Apart from this, we shall not escape the verdict of pessimism on our most abundant efforts. Many will appeal to 'Nature'; but Christianity knows nothing of personified abstractions. It goes deep into experience, and finds the living God, triumphant over pain, and pouring the energy of His Spirit through channels of human ministry. Such an experience of God binds upon those who share it an inescapable obligation of combating pain of every kind, wherever it shows its desolating presence. They are the fellow-workers, without question or criticism, of all of any creed, or none, who will do this work and become conscious or unconscious instruments of love, suffering and victorious.

(iii.) The direct exhibition of the ultimate cure of pain, viz. the love of God in Christ. This is not an extravagance of unreasoning emotionalism. It is sober fact, verified in innumerable instances; God's love does heal pain. If the love of God were regnant in all human life, how much of the world's pain would remain? This is not an abstract speculation; it is a question whose answer cannot be arithmetically complete, and yet is absolutely sure, and admits of boundless practical application. We must make thorough work of the category of solidarity. Soul and body, man and man, race and race, humanity and nature: the universe is organic to the core. It lives from the centre. By the lines of solidarity pain has penetrated to the last filament of the vast web of life. By the same lines of solidarity the healing of pain will go spreading through the entire creation which now waits with eager longing for the revelation of the sons of God. Man's part in this comprehensive conquest of pain corresponds to his place and function in the world. In him the meaning and value of the world are consciously apprehended and uttered. By him too they have been grievously mistaken, and the forces which should have filled the world with the peace and joy of functions normally operating and perfectly fulfilled have been hindered, and the world of man and nature has been put to illimitable torture. It is not morbid when a man sees in the pain of innocent children, of wronged womanhood, and even of the creatures beneath our rank, the sign and seal of his own sin, the issues of a mighty evil in which he is confederate. It is the simple truth.

Therefore man has special work to do in the healing of pain. He has to receive the healing which love can bestow in his own experience, allowing it unhindered exercise as he is reconciled to God and to life. He has to become the conscious organ of that healing to all who suffer. He is never to inflict pain except in so far as pain, in the conditions under which we live (themselves abnormal), is the instrument of moral or physical benefit. He is to be ceaselessly the channel of the love of God to man. Simply by being in the communion of God, one living in the divine love becomes source and centre of healing to the souls and bodies of all around. The evidence is matter of daily experience. Yet the power of healing is not a bare physical force. It requires conscious appropriation and direction. Love that heals is not magic. It is effective as a vocation, accepted and fulfilled. The specific task of love belongs to the manifold opportunities of life, and these are innumerable. They include all ministries of help. In particular, two great obligations rest on all in whom love is doing its reconciling and healing work. One is witness, the other is prayer. The Church, called into being by love's deed, has been

¹ H. E. Hamilton King, *The Disciples*, London, 1887, p. 191.

slow in its recognition of these evident duties—slower, and less confident, in respect of the second than of the first. Yet it is in prayer that the function and high privilege of humanity do chiefly consist. By prayer man enters the sanctuary of the divine immanence. In prayer the indwelling love finds another home and citadel, a new centre from which to work. Prayer is the liberation of the spiritual energies that are saving the world. Prayer provides God with the conditions without which an Omnipotence that is moral, and not physical, dare not and cannot work. The question will be asked, Does this mean that any given pain can be relieved by prayer? The answer must be that dogmatism and prediction are forbidden by the organic structure of the universe. No man sins by himself or suffers by himself, and no man is redeemed for himself alone. It is impossible to cut a man out of the texture of his existence and operate on him as though he were an unrelated atom moving in empty space. We have no calculus by which to work out the measurements of the individual's sin and sufferings or to forecast the immediacy and completeness of his deliverance. At the same time, our answer must not 'limit God.' He certainly does not fling about His powers, healing at haphazard. But with equal confidence we may affirm that His healing power is available beyond any measure in which men have permitted it to operate. The *ordo salutis* here is fixed and cannot be altered: first the reconciliation, then the healing; first the faith that commits itself absolutely to God in Christ, then the faith that refuses no gift of God.

The experience recorded in the NT is normative. First, believers owned Jesus Lord, then they received the Spirit. The love to which they committed themselves lived on in them, and wrought mightily. No complete catalogue of such operations could be given. But among the lists that are given we read of healings (1 Co 12^{9, 28}). The gifts of the Spirit are not magical, and there is nothing stereotyped in the activities produced by them. It would be ridiculous to infer from the presence of a certain gift in the NT communities that it must be perpetual in the Church of all ages. The gifts were created for use. If the use ceased, the gift was withdrawn. But is it fair to regard healing as a sporadic and passing manifestation of the Spirit's presence? Healing of the world's pain is certainly part of the world's redemption. Is it proper to make a distinction here and say that we will believe in the forgiveness of sins, but draw the line at the relief of pain? It may be that sects which we justly condemn for their absurd metaphysics and their ridiculous jargon, and for faults graver still, have such influence as belongs to them because they have been bold enough to rely on a healing power which belongs to the love that was, in Christ, the reconciliation of the world. It may be that the Church has to learn in this matter from those whom, quite justifiably, it has excluded from its fellowship. In any case, the conquest of pain is the work of omnipotent atoning love; and in prayer man co-operates with God in healing the hurt of humanity and of the world.

(4) Christian faith is more than conqueror of pain and can do much more for the sufferer than relieve him of his distress. Christianity teaches the transmutation of pain. Those who love God find that all things, pain included, work together for their good. As they go deeper into the experience of suffering, they make a still more wonderful discovery. In their pain they are not alone. They meet in that sequestered place Another, and He too is a sufferer. These two pains, theirs and His, draw together into the unity of one experience—He in them, and they in Him; their pain His,

His pain theirs. This is not to escape from pain. It is to take out of pain the element which makes it an evil. When the self is surrendered to the love of God in Christ, the sting of pain, which is sin, is taken out of it. It becomes straightway part of a life-fellowship with redeeming love. It undergoes a complete transmutation. It has been taken up into the pain that is the price of the world's redemption. There is no question of diminishing the value of love's redeeming deed on the Cross of Christ. But the method of triumphant love remains. The ages reproduce the method of Calvary. The sufferings of Christ rise like a tide in the souls of His people (Ph 3¹⁰, Col 1²⁴). Their sufferings take on the quality of His. They are ministerial, vicarious, sacrificial. They are not on that account less hard to bear. Were shame and spitting, thorns and nails, less painful because Jesus bore them as part of His obedience? Suffering borne with Him is suffering still. It is, however, bearable, and far more than bearable. It is utterly changed. It is not a fate, but a vocation, the highest service that a soul can render to God or man. Its evil is blotted out. It is a moment in the being of the highest good. This does not mean that in every suffering a believing man will be conscious that it is good. The pain may inhibit the sense of joy, even as it did with Jesus on the Cross. But none the less is it received and retained by the servant of God as the crown of his ministry, even as Jesus refused to come down from His Cross.

Perhaps James Hinton overstrains the thought when he suggests that our feeling of pain in sacrifice is due to the lack of a perfect love in us. Sacrifice is pain; but in deepest anguish we know it preferable to the best that the world can give.

'Remembering these things . . . what should we consider the presence of pain in the world to mean? . . . Does it not mean that a world in which so much of pain is present, is adapted—was altogether made—to be the scene of an overpowering, an absorbing love? . . . The reason we are made, or seem as if we were made for pain, is that we are made for love. . . .

What is the happiness God has meant us for, the happiness to which human nature is fitted, to which it should aspire? Should it be that from which the painful is banished, or that in which pain is latent? Should pain be merely absent, or swallowed up in love and turned to joy? . . .

The pain that is latent in man's bliss is latent, too, in God's; in His most as He is highest: and that great life and death to which the eyes of men are ever turned, or wandering ever are recalled, reveals it to us. . . .

All pains may be summed up in sacrifice; and sacrifice is—of course it is—the instrument of joy.¹

This is a nobler optimism than that which rests its case on the fruitage of benefit out of pain. Browning, who is the poet of the one, has not missed the other:

'I think this is the authentic sign and seal
Of Godship, that it ever waxes glad,
And more glad, until gladness blossoms, bursts
Into a rage to suffer for mankind,
And recommence at sorrow: drops like seed
After the blossom, ultimate of all.'²

The mystery of pain, then, is hid with Christ in God and becomes the open secret of the universe. All pain is a symbol of the suffering of God, and fulfils the function of sacrifice. These innumerable untold and incalculable pains of nature and of humanity are drawn into the compass of the atoning suffering of God. The sign of the Cross is upon a world of sin. The ministerial, vicarious, sacrificial quality of suffering begins very early in the history of the world. Its presence is ever more closely marked as the scale of being rises. It can be traced in each stage of the 'ascent of man.' It can be followed along the whole course of that river of blood and tears which flows through human history. It is useless to make computations, and ask, Was even redemption worth such a price? It would

¹ *The Mystery of Pain*², pp. 37, 38, 39, 40, 52.

² *Dalauktion's Adventure*.

not be, if the price paid were merely human pain. But within the human pain is hid the anguish of crucified love. It is part of 'the reproach of Christ.' Because the infinite love shares this pain, it is transmuted. It becomes part of the price which God pays. Nothing could apologize for God, not any benefit wrung from tortured bodies and slaughtered souls, if He merely looked on from a throne of omnipotence. But a God who suffers is immune from our criticism and does not need our defence. The suffering of love has redeemed the world and has not lost its redeeming power.

Confessedly, this is a faith, not a theory. It is not the less, but the more, sure on that account. It is not a precarious inference from insecure premisses. Its premisses are the love and suffering of God, revealed in the ministry and the Cross of Christ, and apprehended in the act which commits the soul to their redeeming power. Faith is not an act finished in a spasm of emotion. It is the assumption of an attitude towards God and towards life, warranted and established by God's redeeming action.

Faith, says a great Christian teacher, 'is the whole being and attitude of the soul as determined by the sin-bearing love of God in Christ. That love, and that love alone, evokes it, and on that love and that alone, it rests.'¹

Therefore, Christian optimism is not a document which can be signed, sealed, and delivered to a suffering world to solve the whole problem of suffering. It is the outcome of an experience. Experience cannot be finished, gathered up, and put aside. It lives and grows from a centre. Those who will know the force of its demonstration must occupy the central standpoint. As that is reached in the act of self-commitment to the appeal of divine suffering love, it can be retained only in the continued action of communion with God. Faith in divine providence is not easy. Did any serious thinker ever imagine a state of mind in which faith would rest on an argument? Faith is a post held in the midst of a furious attack which never ceases. It can be held only in prayer. Prayer is at once communion and co-operation with God. In both aspects it carries with it confirmation of faith. Without it faith withers and dies. As we live by receiving the divine love and by acting in the power of it, even to the last limit of devotion, the world where men suffer reveals itself as still within the compass of a sovereign purpose which through pain is passing to its victory. And prayer is the concentrated power of that life, the life of receiving and of giving. Prayer, therefore, conveys the final proof of divine providence. In prayer the darkness of suffering comes into the light of divine victorious love.

(5) Lastly, the Christian view of pain is available for comfort. Comfort for such suffering as the world is full of cannot consist in words.

'The philosopher's generalisations falter, and only the professional pietist, babbling about all being for the best, keeps on talking. His observations are highly admirable. But even faith is almost ashamed of them. It is better to say nothing. There is simply nothing to be said.'²

The only offer of comfort that will not insult the sufferer comes from the love of a God who can and does suffer. This is the knowledge we have of Him. Where suffering is He is, in the fullness of a power won by His own pain. Outside of Him there is no comfort. A world without suffering love at the heart of it would be an atheistic world. The last word regarding it would be unrelieved pessimism.

Comfort is the work of God within the soul. It is direct, immediate, as the divine Spirit enfolds the human in the unity of a mutual indwelling. Its action is beneath the eye of the observer; and it fulfils its mission when there is no eye to

¹ Denney, *Christian Doctrine of Reconciliation*, p. 295.

² Carnegie Simpson, *Facts of Life*, p. 72.

see, no heart to pity. It is the privilege of creatures whose consciousness is other than human. It upholds those who are not conscious of its operations. Beneath their pain there is a divine experience of which theirs is part. Christianity is withheld from pessimism, only because it holds thus profoundly the truth of the divine immanence. Only so is it withheld from blasphemy, as it beholds the agonies of the world. Even so, it is dumb with amazement. All the more earnestly does it lay upon those who have received the Divine consolations the duty of ministering to those who suffer. Their fulfilment of this duty consists in making themselves the vehicles of redeeming love. They have nothing of their own to give. The comfort they can give is simply the comfort they have received, and that is the love of God. Whatever they say and do will be effective as it bears witness to, and is the medium of, this—the only medicine for human hurt. In many cases silence will be the most perfect human vehicle of the divine comfort.

The Christian view of pain does not warrant the conclusion that in the case of the individual all suffering will cease. The organism is disordered, and the elimination of pain cannot take place at haphazard. The doctrine of divine providence, however, rests on the eternal victory of love, of which the time-development of the world contains the progressive achievement. It, therefore, becomes a prediction of that which will emerge out of time—the complete reconciliation of the world.

Without this, comfort in suffering would be incomplete. God has no comfort to give if He is uncertain of victory. Love is triumphant over sin and suffering; therefore both sin and suffering will cease to be. The final message of Christianity to a suffering world is one of an immortal hope: 'There shall be no more death, neither sorrow, nor crying, neither shall there be any more pain; for the former things are passed away.'

LITERATURE.—See references in artt. PESSIMISM AND OPTIMISM AND GOOD AND EVIL; and art. 'Pessimism' in *EBR*¹. Almost all volumes dealing with the philosophy of religion, or with Christian apologetic or dogmatic, have discussions of the topic. A selection of English works is here appended. J. SUFFERING MESSIAH. — See **JESUS CHRIST**, vii. 514, **MESSIAH**, viii. 574^a.

ŞŪFĪS. — 1. Derivation and meaning. — The derivation of the name 'Şūfis' (Muḥammadan mystics) was long a subject of dispute. Most Şūfis favour the theory that it is derived from *şafā* ('purity') and that the Şūfi is one of the elect who have become purified from all worldly defilements. Others would connect it with *şaff* ('rank'), as though the Şūfi were spiritually in the first rank in virtue of his communion with God; or with *şuffa* ('bench'), referring the origin of Şūfism¹ to the Ahl al-şuffa ('people of the bench'), a title given to certain poor Muslims in the early days of Islām who had no house or lodging and therefore used to take shelter on the covered bench outside the mosque built by the Prophet at Medina. As Qushairi and other Şūfis admit, none of these explanations is etymologically defensible. There is, however, among the derivations proposed by the Şūfis themselves one which does not violate the principles of etymology. The author of the oldest extant Arabic treatise on Şūfism, Abū Naşr al-Sarrāj, declares that in his opinion (which, naturally, is not based on philological grounds) the word 'Şūfi' is derived from *şūf* ('wool'), 'for the woollen raiment is the habit of the prophets and the badge of the saints and elect, as appears in many traditions and narratives.'² Notwithstanding the facetious remark of Scaliger, 'quod quidam Sofi a floceo lanae dictum nolunt, hoc leuius est ipso floceo lanae,' it was perceived by some European Orientalists in the 18th cent. that this derivation was what Reiske pronounced it to be—'sola nera et grammaticae ipsique rei congrua.' Meanwhile its claims to acceptance were challenged by Joseph von Hammer, who in his *Gesch. der schönen Redekünste Persiens*,³ asserted that the Şūfis are related to the ancient gymnosophists of India and that 'the Arabic words Şūfi (mystic) and *sāfi* (pure) belong to the same root, like the Greek *σοφός* and *σαφής*.' This unlucky sentence might cast doubt on von Hammer's competence as a philologist, but his suggested equation of 'Şūfi' with *σοφός* was, at first sight, plausible enough. Although rejected by Tholuck,⁴ it has been championed in comparatively recent times by Adalbert Merx.⁵ In 1894 the question was finally settled by Th. Nöldeke, at that time Professor of Arabic in the University of Strassburg. He pointed out⁶ that the word *σοφός* is unknown in Aramaic and therefore could scarcely be expected to occur in Arabic. On the other hand, both Aramaic and Arabic have the words *σοφστής* and *φίλοσοφος*, and in the latter language the *σ* is represented by *śin* (س), as is almost invariably the case in Greek words which have been Arabicized, not by *şād* (ص). If 'Şūfi' were of Greek extraction, its initial *şād* would be at least abnormal. Further, we have no positive ground for regarding the derivation from *σοφός* as probable in itself, whereas the derivation from *şūf* is confirmed by

the authority of Oriental tradition. Nöldeke then cites a number of passages showing that, in the first two centuries of Islām, garments of coarse wool were worn by the common people and especially by those who followed an ascetic way of life. The words *labisa 'l-şūf*, 'he clad himself in wool,' occur frequently in the early literature and signify that the person to whom they are applied has renounced the world and become an ascetic; at a later period, when asceticism passed into mysticism, *labisa 'l-şūf* generally means 'he became a Şūfi.' In Persian too the ascetic is often called *pashmīna-pāsh*, i.e. 'wearing a woollen garment.' The old Muslim ascetics who clothed themselves in wool borrowed this practice from Christian hermits or monks. When Hammād b. Salama († A.D. 784) came to Başra, he said to Farqad al-Sanjī, who appeared before him in a woollen garment, 'Put off this (emblem of) Christianity.'¹ Such garments are described as *ziyy al-ruhban*, 'the dress of the Christian ascetics.'² A *ḥadīth* put in the mouth of the Prophet states that Jesus Himself used to wear them.

We are told by Jāmi³ that the name 'Şūfi' was first borne by Abū Ḥāshim of Kūfa, a contemporary of Sufyān al-Thaurī († A.D. 778). According to Qushairi,⁴ it came into vogue before A.H. 200 (=A.D. 815). Al-Sarrāj mentions the view that it was invented by the people of Baghdād.⁵ Although the circumstances of its origin are obscure, it seems to have gained currency during the period of transition from asceticism to mysticism, about the end of the 2nd cent. of the Hijrah, and may possibly mark some stage in that process. No weight can be attached to the apocryphal traditions which seek to prove that the appellation existed in the Prophet's time or even throw it back into the pre-Islāmic age. The Şūfis of the 3rd and 4th centuries, who claimed to be the true spiritual descendants of Muḥammad, considered themselves fully justified in fabricating evidence in support of their assertion. So far as the present writer is aware, the first Arabic writer to use the word 'Şūfi' is Jāhīz of Basra († A.D. 869), who refers to 'the Şūfis amongst the pietists' (*al-Şūfiya minn 'l-nussāk*) and enumerates the names of several who were famous for their eloquence.⁶

In the present article the terms 'Şūfi' and 'Şūfism' are to be understood in their ordinary sense, viz. as equivalent to 'Muḥammadan mystic' and 'Muḥammadan mysticism.' Ancient Şūfism, however, had strong ascetic tendencies, while the mystical element might be insignificant; and there have always been Şūfis of an ascetic and devotional type whom we should hesitate to describe as mystics in the proper meaning of the word. In Persian and Turkish poetry 'Şūfi' sometimes bears the sense of 'hypocritical pietist' or 'dissolute free-thinker' and may be used as a term of reproach by poets who are themselves Şūfis of a different sort.⁷

2. Origin and early development.—The beginnings of mysticism in Islām take us back to the great ascetic movement which arose, largely under Christian influence, during the 7th cent. A.D.⁸ This is reflected in the biographical works containing notices of eminent Şūfis, which include the names of many of those early ascetics. The movement, though extreme in certain directions, was mainly orthodox. It is characterized by

⁸ See art. ASCETICISM (Muslim).

¹ 'Şūfism' is the more correct form. 'Şūfism' implies derivation from 'Şūfi,' whereas the corresponding Arabic words *taşawwuf* and *şūfi* are collateral formations from *şūf*, which is the common root of both.

intense religious exaltation, an overwhelming consciousness of human frailty, boundless fear of God, and utter submission to His will. There was no organized monastic life, though some ascetics wandered to and fro accompanied by a few friends or held prayer-meetings in which they studied the Qur'an and discussed their spiritual experiences. Basra seems to have been the centre of an anti-ritualistic party who laid stress on the higher aspects of asceticism, regarding it as essentially an inward feeling, whereas the Syrians were more concerned with its external forms;¹ Hasan al-Basri (q.v.) said that it consisted in humility and was not a matter of dress and food. Examination of what is involved in the first article of the Muslim creed—the command to associate nothing with Allāh—gradually led to the view that true asceticism is incompatible with any selfish desire, even with the desire to undergo the utmost privations and austerities for the sake of winning paradise, and that it must culminate in disinterested love of God.² Thus the old asceticism, rooted in fanatical exaggeration of religious observances, gave way to a doctrine which in the end threatened to make all observances unnecessary. But this consequence did not show itself immediately. The Sūfis of the 2nd cent. were usually orthodox and law-abiding. They cultivated poverty, self-abasement, resignation. If they loved God, they feared Him more, and on the whole their mysticism lacked positive qualities as well as distinctive theories. They stand midway between asceticism (*zuhd*) and theosophy, or gnosis (*ma'rifat*). The word that best describes their attitude is 'quietism' (*riqā'a*).

Special mention may be made of Ibrāhīm b. Adham, a prince of Balkh, whose legend is modelled on the story of Buddha;³ Shaqīq, also of Balkh, who developed the doctrine of 'trust in God' (*tawakkul*);⁴ Rābī'a al-'Adawīya, a saintly woman who was born at Basra and died at Jerusalem;⁵ and Ma'rūf al-Karkhī, a native of Baghdad.⁶ The two last-named foreshadow the ecstatic and enthusiastic mysticism which is characteristic of the succeeding age, although it may be doubted whether all the sayings and verses attributed to Rābī'a on the subject of divine love are genuine. Ma'rūf is the author of the first recorded definition of Sūfism, 'to grasp the verities and to renounce that which is in the hands of God's creatures.'⁷

During the 3rd cent. Sūfism enters decisively on a new course. The ascetic and quietistic spirit, though still strong, is overpowered by speculative and pantheistic tendencies which had hitherto remained in the background but now assert themselves with increasing boldness. Notwithstanding the dominant and vital part which these tendencies play in the future development of Sūfism, it is a mistake to identify their triumph with the origin of Sūfism. Nor is it less a mistake to describe them as an entirely foreign element which flowed into Sūfism from outside and rapidly transformed it, so that all at once it became different in kind. The germs of Sūfi pantheism are to be found in the Qur'an:

E.g., xxviii. 88: 'Every thing is perishing (*hālik*) except the face (reality) of Allāh'; iv. 26 f.: 'Every one on the earth is passing away (*fāni*), but the glorious and honoured face of thy Lord abideth for ever'; and ii. 109: 'Wheresoever ye turn, there is the face of Allāh.'

Certainly the Muslim mystics might have arrived independently at the conclusion that Allāh is the only real being.

* It is conceivable that this notion may have come into Islam from outside; on the other hand, speculation on the doctrine

of the divine unity appears sufficient to account for its development and indeed for its origin. Had there been more gods than one, says the Koran, the heavens and the earth must have come to grief; but if any attempt be made to define the word "god" metaphysically, speculation quickly leads to something like the truly existing or the necessarily existing; even with Homer the difference between God and man is that the former is eternal, the latter transient. The relation between God and matter immediately suggests questions: is matter independent of God, or not? The former supposition leads to polytheism, the latter only is consistent with real monotheism. If, then, God is not outside matter, He must in a way be identical with matter; and the most thoughtful of the Sūfis, accepting this conclusion, based on it a series of inferences as unlike the original doctrines of Islam as any that could have been evolved.¹

Theoretically, there is no reason why the Sūfis should not have reached their pantheistic goal in some such fashion as this, and probably they often did, although in most cases it was a truth grasped intuitively from mystical experience rather than the result of philosophical reflexion. But, in seeking to explain how they advanced from quietism to pantheism, we cannot proceed on the assumption that they were wholly impervious to non-Islamic ideas. The influence of Christianity, Neo-Platonism, and Buddhism is an undeniable fact. It was in the air and inevitably made itself felt. Of its extent and importance we have ample evidence, although the materials at our disposal seldom enable us to trace it out in detail. In short the new Sūfism of the 3rd cent., like Sūfism in every period of its history, is the product of diverse forces working together—speculative developments of the Muhammadan monotheistic idea, Christian asceticism and mysticism, Gnosticism, Greek and Indian philosophies. Until recently the problem has been attacked on the wrong lines. Many former investigators held the view that this great movement, which drew its life and strength from all classes and races in the Muslim empire, could be adequately explained by pointing to one definite source (*e.g.*, the Vedānta or Neo-Platonism) or by formulating theories which are at best half-truths (*e.g.*, that Sūfism was a reaction of the Aryan mind against a Semitic religion forcibly imposed on it). It is now, the present writer thinks, recognized that, instead of searching in vain after a single cause, we should endeavour to study the various influences by which the Sūfi doctrine was moulded, to place them in due order and connexion, and to distinguish as far as possible what was contributed by each. These influences constitute the environment in which the doctrine developed, and among them are to be reckoned all political, social, and intellectual conditions which favoured the growth of mysticism, such as the devastating civil wars of the Umayyad period, the sceptical and rationalistic currents that ran strongly in the early 'Abbasid age, and particularly the bitter sectarianism and barren dogmatism of the *'ulamā*.

The main features in the evolution of Sūfism in the 3rd cent. may be set forth as follows.

The older Sūfis had sought to bring every word, act, and thought of their lives into harmony with the divine will—an ideal which expressed their conception of Allāh as a transcendent personality, 'the Lord of created beings,' and which they attained by means of asceticism. This theory and practice naturally produced (1) the doctrine of divine love, which is the highest positive form of quietism, and (2) ecstasy, which is frequently a result, either involuntary or intentional, of ascetic exercises. Although the early Sūfis were more or less orthodox, their relation to Islām being not unlike that of the mediæval Spanish mystics to the Roman Catholic Church, a religion of love and ecstasy was bound to come into conflict with Islām sooner or later. Rābī'a declared that she had no

fear of hell or hope of paradise, and that she could not love the Prophet because her love of God absorbed her so entirely that neither love nor hate of any other thing remained in her heart. The barrier between Allāh and His creatures was gradually broken down. The definition of divine unity (*tauḥīd*) became pantheistic; the unique personality of Allāh, far above and beyond human reach, was transformed into the one real Being (*al-Ḥaqq*) revealed in all created things, the mystic's true self, which he finds by losing his individual consciousness in ecstatic self-abandonment. This doctrine, however it may be disguised, is the essence of Ṣūfism, and the historical circumstances of its origin justify the statement that it was at least partially derived from sources outside of Islām. Merx, indeed, seems to go too far when he calls it 'Greek' and connects it specifically with the writings attributed to Dionysius the Areopagite,¹ though it may well have been influenced both by them and by the so-called *Theology of Aristotle*, a Neo-Platonic treatise of which an Arabic version appeared before the end of the 3rd century. But at this epoch little can have been borrowed directly from books. What makes the influence of Hellenism certain is the fact that in Western Asia and Egypt the Ṣūfi theosophy arose on a soil long saturated with Hellenistic culture, while some of its leading exponents were non-Arab Muslims belonging to the subject nationalities.²

One example will suffice. The mystical knowledge of God peculiar to the Ṣūfis is denoted by the term *ma'rifa* = γνῶσις, i.e. immediate knowledge resulting from apocalyptic vision. It is defined in this sense by several Ṣūfis of the 3rd cent., but we owe the first important speculations on its nature to Dhu 'l-Nūn of Egypt († A.D. 859), of whom his Persian biographer says: 'He is the head of this sect [the Ṣūfis]: they all descend from and are related to him.'³ That, no doubt, is an exaggeration; yet it shows the significance of that, as soon as Islamic mysticism began to develop, it drew inspiration from the doctrine concerning 'a gnosis or higher knowledge which can be taught with safety'—as Dhu 'l-Nūn also says—'only to the "perfect" or "fully initiated."⁴ While Dhu 'l-Nūn conceived the Ṣūfi's supreme experience as a super-intellectual God-given knowledge, peculiar to those who 'see God with their hearts' and ultimately involving complete unconsciousness ('the more a man knows God, the more is he lost in Him'), he never makes use of the term *fanā*, which is associated with the name of his contemporary, Abū Yazīd, or Bāyazīd, of Bistām. *Fanā* is best rendered by 'passing-away'; it may be applied to the disappearance of evil qualities or, in its pantheistic sense, to the passing-away of the whole individual self in union with God. Possibly the term was derived by Muslim mystics from a verse in the Qur'ān⁵ quoted above, but in Eastern Persia, where it first came into prominence, it must have been deeply coloured by Perso-Indian ideas.⁶ The definition of *fanā* as a moral state, and of the means by which the extinction of all passions and desires is brought about, agrees so exactly with the definition of *nirvāṇa* that Buddhistic influence cannot be denied. As regards the pantheistic aspect of *fanā*, the Vedānta and similar forms of Indian thought readily suggest themselves. Here again the lives and sayings of representative Ṣūfis, in conjunction with other historical evidence, provide the only trustworthy clue. Bāyazīd was a native of Khurāsān. His grandfather was a Zoroastrian and his master in Ṣūfism a Kurd. He learned the mystical doctrine of passing-away (*fanā*) in the divine unity from Abū 'Alī of Sind. He knew the Indian practice of 'watching the breaths' (*pāś-a-nāfās*) and described it as the gnostic's worship of God.⁷ The character of his pantheism is probably reflected in the utterances which his legend records, even if their authenticity may be questioned—for example,

'I went from God to God, until they cried from me in me, "O Thou I!"'

'Verily, I am God, there is no God except me, so worship me. Glory to me! How great is my majesty!

'Nothing is better for man than to be without aught, having no asceticism, no theory, no practice. When he is without all, he is with all.'

'Creatures are subject to states, but the gnostic has no state, because his vestiges are obliterated and his individuality (*ḥuwyā*) passes away in the individuality of Another and his traces are effaced by Another's traces.'

At this time earnest Ṣūfis did not habitually and openly indulge in the language of 'deification.' The doctrine underlying it was esoteric, reserved for adepts in theosophy, who usually were more discreet than Bāyazīd and Hallāj. They saw the necessity of keeping their mystical theories in close touch with the religion which they professed. Consequently the Qur'ān and the Sunna were proclaimed to be the standard to which not only speculation but also spiritual feelings and states must conform.

Let us now consider the methods whereby a reconciliation was effected and take a general survey of the relations existing between Ṣūfism and Islām.

3. The Law, the Path, and the Truth.—The Qur'ān contains a few passages from which it can fairly be argued that Muḥammad had in him something of the mystic, but that book as a whole is no better fitted than the Pentateuch to form the basis of a system of mysticism. Nevertheless, the Ṣūfis, adopting the Shi'ite principle of allegorical interpretation (*ta'wīl*), were able to prove to their own satisfaction that every verse and word of the sacred text hides treasures of meaning which God reveals to the elect¹—meanings which flash upon the inward eye in moments of rapt meditation. So much being granted, one can imagine that it was easy to show Qur'anic authority for any mystical doctrine whatsoever and to maintain that Ṣūfism was really the esoteric teaching of the Prophet communicated by him to his son-in-law, 'Alī b. Abī Ṭālib. From the same principle it follows that the Ṣūfi interpretation of Islām admits an endless variety of divergent and even contradictory beliefs and practices, all of which *ex hypothesi* are equally valid in kind, though not in degree, since the meanings of the Qur'ān are infinite and reveal themselves to each mystic in proportion to the spiritual capacity with which he is endowed. Hence the Ṣūfis are not a sect, and there is no uniform body of doctrine constituting what is called 'Ṣūfism.' The many-sidedness of the term is exemplified by the innumerable attempts made to define it.² Similarly, the attitude of the Ṣūfis towards Muḥammadan religious law depends on a subjective criterion. Some punctiliously fulfilled their ritual obligations, while at the same time they recognized that forms of worship have only a relative value in comparison with 'the works of the heart,' or are altogether worthless except as symbols of spiritual realities. To make the pilgrimage, e.g., is to journey away from sin; to put on the pilgrim's garb (*iḥrām*) is to cast off with one's every-day clothes all sensual thoughts and feelings. This is a well-known doctrine of the Ismā'īlis, from whom the Ṣūfis seem to have borrowed it.³ Others are antinomian, whether they be free-thinking and free-living dervishes, genuine mystics like the Malāmatis described by Hujwiri,⁴ whose fear of men's praise caused them deliberately to act in such a way as to incur reprobation, or gnostics supremely indifferent to the shadow-shows of religion and

morality in a phantom world. Many Sūfis, however, insist that, normally at any rate, perfect realization of the Truth (*ḥaqīqat*)—i.e. the consummation of the mystical life—is not only compatible with observance of the Law (*sharīʿat*) but includes it as a facet or aspect of the whole. This view will be better explained if we give a brief account of its ethical and psychological basis.

The Sūfis regarded themselves as a peculiarly favoured class, possessing an esoteric knowledge of the Qurʾān and the apostolic traditions, and using technical expressions which no ordinary Muslim could understand. This fostered a feeling of brotherhood, and it was not long before traces of organization began to appear. Eminent mystics gathered round them groups of disciples (small at first) for private instruction and in course of time became recognized teachers, heads of mystical schools, and abbots presiding over convents where Sūfis were trained. It was generally held that for those entering on the religious life a teacher was indispensable. A self-trained mystic, who had not passed through the discipline prescribed by a spiritual director (*shaiḫh*, *pīr*, *murshid*), was looked upon with suspicion. The authority of the *shaiḫhs* was absolute. It lay with them to decide whether the novice, after his probationary period, should be granted leave to take the vow of obedience to his master which was exacted from all candidates for initiation. Hujwiri mentions a three years' probation.

The first year is devoted to service of the people (i.e. the Sūfis), the second year to service of God, and the third year to watching over his own heart. He can serve the people, only when he places himself in the rank of servants and all others in the rank of masters, i.e., he must regard all, without exception, as being better than himself and must deem it his duty to serve all alike. And he can serve God, only when he cuts off all his selfish interests relating either to the present or to the future life, and worships God for God's sake alone. . . . And he can watch over his heart, only when his thoughts are collected and every care is dismissed, so that in communion with God he guards his heart from the assaults of heedlessness.¹

On taking the vow of initiation, the novice was invested by his *shaiḫh* with the *khirqa* or *mur-aggā'a*, a garment made of pieces of cloth stitched together, which in later times superseded the woollen dress worn by the original Sūfis. This ceremony marked his admission to the Sūfī brotherhood. Occasionally a Sūfī might be invested with two *khirqas* by different *shaiḫhs*, as happened to Abū Saʿīd ibn Abī 'l-Khair. The veneration which the *shaiḫhs* inspired in their disciples is well known. Dhu 'l-Nūn went so far as to say that the true disciple should be more obedient to his master than to God Himself.² The rule, method, and religious practice inculcated by the *shaiḫh* and followed by the disciple constitute the Path (*ṭarīqa*). Accordingly, the Path has no fixed and uniform character; its details are determined by the individuality of the teacher. The *ṭarīqas* of the dervish orders exemplify this divergence. Broadly speaking, the Path corresponds to the *via purgativa* of mediæval Christian mysticism. Hunger, solitude, and silence are the chief weapons employed in the war against 'the flesh' (*nafs*). The ascetic and ethical discipline is divided into a progressive series of 'stations' (*maqāmāt*), which the learner must traverse, making himself perfect in every one of them before advancing to the next. They vary in number and order, but the first place is usually occupied by 'repentance' or 'conversion' (*ṭawba*), i.e. turning away from sin towards God. The moral ideal of the Sūfis is unselfishness, whether it take the form of renouncing worldly possessions and desires, sincerity in word and deed without regard for the good opinions of others,

patience, humility, charity, or trust in God and single-hearted devotion to His will.¹ These are the fruits of the Path, but its true end is attained by means of exercises in spiritual meditation and recollection which predispose and prepare the disciple for ecstatic experiences. It may be that he will never reach that end; ecstasy is an incalculable gift of divine grace and cannot be extorted. But the Sūfis had a method of their own for producing the state of mind in which 'revelation' of the unseen was most likely to occur. They called it *dhikr* ('recollection'), set the highest value upon it, and deemed it the corner-stone of practical religion.² The simplest form of *dhikr* is the continual repetition of the name Allah or of some short litany, accompanied with intense concentration on the thought of God.³ Concentration might be assisted by other means, such as flagellation and holding the breath, until the sense of personality gradually disappeared in a state of trance.

The first stage of *dhikr* is to forget self, and the last stage is the effacement of the thinker in the act of thought, without consciousness of thought, and such absorption in the object of thought as precludes return to the subject thereof.⁴ Concerted performances of *dhikr*, with music and dancing, were introduced at an early date, and their demoralizing effect on neophytes is noted by Hujwiri.⁵ Such prayer-services, as is well known, play an important part in the ritual of the dervish orders.⁶

A general view of Sūfī psychology, so far as it bears on the ecstatic life, may be obtained from Qushairī⁷ or from the more systematic treatment of the subject by Ghazālī in the second half of his *Iḥyā*.⁸

There are four terms which, taken together, comprise the sensual, spiritual, and intellectual nature of man: (1) *nafs*, the appetitive soul; (2) *rūh*, the spirit; (3) *qalb*, the heart; (4) *ʿaql*, the intelligence. The *nafs*, being the seat of the passions, is wholly evil; its mortification by means of asceticism is the Sūfī's holy war (*jihād*). The *qalb* and the *rūh* (to which Qushairī adds the *sirr*, the inmost ground of the *qalb*) are the proper organs of the mystical life and are not clearly distinguished from one another. *Qalb*, as used by Sūfis, does not signify the heart of flesh, but 'a transcendental subtlety' or non-material essence whereby the realities of all things are perceived and reflected as in a mirror. Hence the phrase *oculus cordis* has equivalents in Arabic, Persian, and Turkish. But the power of the heart to perceive and reflect spiritual realities depends on its purity. It is veiled in greater or less degree by sensuous impressions—sin, egoism, book-learning, traditional faith, etc.; and, in proportion as these veils are removed, its vision of reality becomes more perfect. God alone can purify it, but the need for co-operation with the act of divine grace is asserted by those Sūfis who follow the Path and attach particular importance to the methods of recollection (*dhikr*) and meditation (*muwāḥabat*), by which the heart is purged of everything except the thought of God. The 'stations' (*maqāmāt*) of the Path, which belong to the mystic's practical religion, are subordinate to the 'states' (*ahwāl*), which belong to his inner life. The term 'state' (*ḥāl*) denotes a mood of feeling, a spiritual disposition or experience, which God causes to pass over the heart; it is not subject to human control, but comes and goes as God wills; usually it is transient, but it may abide permanently. The classification of *ahwāl* in pairs of opposites—e.g., hope and fear, expansion and contraction, presence and absence—answers to psychological facts familiar to students of mysticism. Passively yielding to the divine influences which swing him to and fro in an ascending scale, the Sūfī is 'the son of his time,' dominated by the 'state' in which he finds himself at the moment, oblivious of the past and without thought of the future. The highest 'states' are ecstatic, and the term *ḥāl* is often synonymous with ecstasy, though it had not this special sense originally.

Here we come back to the point at issue between Sūfism and Islām. Through ecstasy the Sūfī reaches the plane of the Truth (*ḥaqīqat*), where he is one with God. The person thus enraptured

(*majdhūb*) is a saint (*walī*); no further testimony is required, since the doctrine that a saint who violates the Law is thereby shown to be an impostor applies only when the ecstatic fit has subsided. And in any case, it was argued, a divinely inspired man must not be judged by appearances; his knowledge of unseen things may justify him in doing what religion and morality condemn: the story of Moses and Khadir¹ illustrates this. Ecstasy not being confined to one sex, the Ṣūfī legend includes a long roll of women, to whom a separate section is sometimes allotted in standard hagiographical works. In accordance with the theopathic character of Muslim saints, their miracles (*karāmāt* = *χαρισματα*) are described, not as wrought by them, but as granted or manifested to them; and, while the higher Ṣūfism declares that 'reliance on miracles hinders the elect from penetrating to the inmost shrine of the Truth,' and that 'the greatest miracle is the substitution of a good quality for a bad one,' the popular *walī* cannot, even if he wishes, avoid the reputation of being gifted with powers which Muslims call 'extraordinary' and Europeans 'supernatural.' The saints form an invisible hierarchy by which the order of the world is maintained. At their head stands the *quṭb* ('axis'), over him inferior grades of sanctity—*nūqabā*, *autād*, *abrār*, *abdāl* or *budalā*, etc.—the numbers of each class increasing in proportion to its distance from the *quṭb*.² Probably this idea was taken over by the Ṣūfis from the Shi'ites and Ismā'īlis.³

The Ṣūfī theory of ecstasy recognizes two aspects of the experience of oneness with God. These aspects are symbolized by such negative terms as *fanā* ('passing-away' from individuality), *faql* ('self-loss'), *sukr* ('intoxication'), with their positive counterparts *baqā* ('abiding in God'), *awjūd* ('finding God'), and *ṣahw* ('sobriety'). In the controversy which arose as to the relative values of the ecstatic state and the subsequent return to consciousness⁴ it is easy to discern the same motives as ranged Ṣūfis on opposite sides in regard to the question, Were they antinomian or not? From the standpoint of pure Ṣūfism there is nothing beyond the supreme negation of self, when 'the mortal disappears' and religion no longer exists; but logic compels those Ṣūfis who are more than nominal Muslims to set the life in God against and above the death to self, and to find the highest mystical experience in the state of conscious clairvoyance which succeeds the moment of ecstasy.

'The full circle of deification must comprehend both the inward and outward aspects of Deity—the One and the Many, the Truth and the Law. It is not enough to escape from all that is creaturely without entering into the eternal life of God the Creator as manifested in His works. To abide in God (*baqā*), after having passed away from selfhood (*fanā*), is the mark of the Perfect Man, who not only journeys to God, i.e. passes from plurality to unity, but *in* and *with* God, i.e. continuing in the unitive state, he returns with God to the phenomenal world from which he set out, and manifests unity in plurality. In this descent . . . he brings down and displays the Truth to mankind while fulfilling the duties of the religious law.'⁵

Such a compromise could not restore the balance effectually. The Ṣūfis might do homage to the Law, but they ranked it below the Truth and even below the Path. And, if the Truth is above the Law, yet not in contradiction with it, the view was plausible that, when a man has attained to the Truth, all his acts and words are holy and in harmony with the spirit of the Law, however they may seem to clash with its letter. Still, a

via media had to be secured, even at the price of illogical concessions on both sides.

A Persian Ṣūfī, writing in the 5th cent., laments that his contemporaries 'give the name of "law" to their lusts, call their own senseless fancies "divine knowledge," the motions of the heart and affections of the animal soul "divine love," heresy "poverty," scepticism "purity," disbelief in positive religion "a passing away from self," neglect of the Law of the Prophet "the mystic path."¹

In A.D. 1045 Qushairī published his famous 'Epistle on Ṣūfism' (*Risāla fī 'ilm al-taṣawwuf*), recalling to his fellow-mystics how in past times great Ṣūfis spoke and behaved as good Muslims and set an example of piety which their unworthy successors had almost forgotten. That these protests were not made in vain was due above all to Ghazālī.² He fused the traditional and mystical elements into one mass. His work was lasting because it took shape not so much from the force of his mind as under the pressure of a searching spiritual experience: he had worked out and solved the problem in himself before he gave the result in his books. Fifty years after the appearance of Qushairī's *Risāla* Ghazālī resigned the professorship of theology and canon law which he held in the Nizāmiya college at Baghdād and went into retirement as a Ṣūfī. He has told us in pages as fascinating as Newman's *Apologia* how his studies and meditations at last made his conversion inevitable, through what struggles he shed off philosophy, scholasticism, and legalism, and gained the certainty that the central truth of religion lies in the inner life of the soul.³ By frankly accepting the main Ṣūfī position Ghazālī gave a new meaning to Islām and an assured place within its fold to many earnestly religious men and women whom the formalists would have driven out if they could. Henceforth Islām is in large measure a mystical faith. But Ghazālī always remained a Muslim in two essential points: (1) his reverence for the religious law, (2) his view of the nature of God. He shut the door against pantheism by insisting on the dogma that the Divine Being is personal, unique, distinct from all other beings. In so far as the human soul has these attributes, it is capable of knowing God; but it can never be identified with God. Our knowledge of God depends on His will to make Himself known through revelation to prophets and saints whom He created. This left Allāh spiritualized and brought near to men's hearts, but still Allāh, not the All in One. It may be said that Ghazālī belongs to Islām rather than to Islāmic mysticism, and that, inasmuch as he is not a pantheist, he is not a typical Ṣūfī. This seems true. On the other hand, while Ṣūfis who are pantheists often use language implying belief in a personal God, such belief is by no means inconsistent with the full theory of *fanā*, or at least may be sincerely combined with it.

4. God, man, and the universe.—Upon the foundation of experimental mysticism the Ṣūfis built a theology and a philosophy of which the forms are as various in content and expression as the materials are diverse in origin. It is a notable fact that the oldest scheme of this kind—which has recently been made accessible through the publication of the *Kitāb al-Ṭawāsīn* of Hallāj—was derived from the Christian doctrine of two natures in God.

According to Hallāj (*q.v.*), the essence of God's essence is love. Before the creation God loved Himself in absolute unity and through love revealed Himself to Himself alone. Then, desiring to behold that love-in-aloneness, that love without otherness

⁴ See Literature.

and duality, as an external object, He brought forth from non-existence an image of Himself, endowed with all His attributes and names. This divine image is Adam, in and by whom God is made manifest. Hallāj, however, maintains a certain distinction between the divine and human natures. Even in their mystical union some personality survives: divinity (*dhāt*) is infused in—not confused with—humanity (*nāsūt*), as wine in water; hence the 'deified' man cries, 'Ana 'l-Haqq, 'I am God.'¹ The markedly Christian flavour of the Hallājian doctrine, together with its author's use of the heretical term *ḥuḥūl* ('infusion' or 'incarnation'), condemned it in Muslim eyes, and later Sūfis take care to give it a monistic interpretation; Ibn al-'Arabī, e.g., reduces the *lāhūt* and *nāsūt* to correlative and interchangeable aspects of the one reality. Yet the magnitude of the debt which Sūfism owes to Hallāj can hardly be overestimated. His doctrine, though formally rejected, introduced and established in Islām the revolutionary idea that there is a principle of difference in the Absolute itself.

An important school of Sūfis, whose watchword is 'the unity of being' (*wahdat al-wujūd* or *ittiḥād*), hold that reality is one, that all apparent multiplicity is a mode of unity, and that the phenomenal is the outward manifestation of the real. Their views may be illustrated by giving some account of a work entitled *The Man perfect in Knowledge of the Last and First Things* by 'Abd al-Karīm al-Jīlī, a mystic of the 15th century A.D.²

The essence of God is unknowable *per se*; we must seek knowledge of it through its names and attributes. It is a substance with two accidents, eternity and everlastingness; with two qualities, creativeness and creatureliness; with two descriptions, uncreatedness and origination in time; with two names, Lord and slave (*i.e.* God and man); with two aspects, the outward or visible, which is the present world, and the inward or invisible, which is the world to come. Pure being, as such, has neither name nor attribute; only when it gradually descends from its absoluteness and enters the realm of manifestation do names and attributes appear imprinted on it. The sum of these attributes is the phenomenal universe, which is phenomenal in the sense that it shows reality under the form of externality. Although the distinction of essence and attribute must be admitted if we are to think of the universe at all, the two are ultimately one, like water and ice. The so-called phenomenal world—the world of attributes—is no illusion; it really exists as the self-revelation or other self of the Absolute. It expresses God's idea of Himself; for, as Ibn al-'Arabī says,

'We ourselves are the attributes by which we describe God: our existence is merely an objectification of His existence. God is necessary to us in order that we may exist, while we are necessary to Him, in order that He may be manifested to Himself.'

The simple essence, apart from all qualities and relations, Jīlī calls 'the darkness' (*al-'amā*). It develops consciousness by passing through three stages which modify its purity and simplicity. The first stage is oneness (*ahādīyat*), the second is 'He-ness' (*ḥuḥūyat*), the third is 'I-ness' (*anīyat*). By this process of descent absolute being becomes the subject and object of all thought and reveals itself as divinity with distinctive attributes embracing the whole series of existence. While every appearance displays some attribute of reality, man is the microcosm in which all these attributes are united, and in him alone does the Absolute become conscious of itself in all its diverse aspects. This can only mean that the Absolute, having completely realized itself in human nature, returns into itself through the medium of human nature, or, in mystical language, that God and man become one in the perfect man—the divinely rapt prophet or saint—whose religious function as a mediator between man and God corresponds with his metaphysical

function as the unifying principle by which the opposed terms of reality and appearance are harmonized. Therefore the upward movement of the Absolute, from the sphere of manifestation back to the unmanifested essence, takes place in and through the unitive experience of the soul; and so we have exchanged metaphysics for mysticism. Jīlī recognizes three phases of this experience running parallel, as it were, to the three stages—oneness, He-ness, and I-ness—traversed by the Absolute in its descent to consciousness, viz. the illumination of the names, the illumination of the attributes, and the illumination of the essence. The perfect man is the final cause of creation, the preserver of the universe, the *quṭb* ('axis') on which all the spheres of existence revolve. He is a copy made in the image of God—a type of the essence with its two correlated attributes, divinity and humanity. Hence his real nature is threefold, as Jīlī expressly declares in the following verses:

'If you say that it (the essence) is One, you are right; or if you say that it is Two, it is in fact Two;
Or if you say, "No, it is Three," you are right, for that is the real nature of man.'

Coming from a Muslim, who identifies the absolutely perfect man with the prophet Muḥammad, this Trinitarian doctrine is very remarkable; but we must remember that the Sūfis generally regard Muḥammad as the Logos, the Light of God which existed before the creation of the world, and for the sake of which all things were made.³ The Logos is manifested in every age by the prophets and saints, who alone are actually perfect, though all men are potentially so.

Other Sūfis enumerate 'five different planes of existence' (*ḥazarāt-i khamsa*), which loses in true being as it descends,⁴ and many adopt the Neo-Platonic scheme of emanation.⁴

The theory that all existence, thought, and action are really divine leads to consequences from which the Sūfis do not shrink. In the first place, the universe must be essentially good. Even infidelity and sin are effects of the divine activity and belong to the divine perfection. Satan himself glorifies God, inasmuch as his disobedience is subordinate to the eternal will. Yet some attributes, *i.e.* some aspects in which God shows Himself, such as majesty and wrath, are relatively less perfect than others, such as beauty and mercy. What men call evil is privation, not-being. In relation to the One, who has no opposite, it is nothing; it appears only in the phenomenal world, where things are manifested *per contrarium*. Similarly, all religious beliefs must be essentially true. God, as Ibn al-'Arabī says, is not limited by any one creed.

To summarize Jīlī once more: the different forms of worship result from the variety of names and attributes by which God reveals Himself in creation. Every name and attribute produces its own characteristic effect; e.g., God is the true Guide (*al-Hādī*); but He is also the Misdancer (*al-Muḥīl*), for the Qur'ān says: 'Allāh shall lead the wicked into error.' If any one of His names had remained ineffectual and unrealized, His self-manifestation would not have been complete. Therefore He sent His prophets, in order that those who followed them might worship Him as the One who guides mankind to salvation, and that those who disobeyed them might worship Him as the One who leads mankind to perdition. He is the truth or essence of every belief. Idolaters worship the being who permeates each atom of the material world; dualists adore the Creator and creature in one; magicians (fire-worshippers) the unity in which all names and attributes pass away, just as fire destroys all natural properties and transmutes them to its own nature; those who deny the existence of a Creator really worship Him in respect of His He-ness, in which He is potentially but not actually creative. It follows that all men are saved at the last. But Jīlī, as a Muslim, is obliged to make distinctions.

The more completely and universally the idea of God is presented in any form of worship, the more perfect that form must be. Religions revealed through a prophet contain the fullest measure of truth, and among these the most excellent is Islam. Non-Muslims, although their felicity is ultimately assured, suffer restriction: in the case of those who acknowledge no prophet, because they invented forms of worship for themselves; and, in the case of Jews and Christians, because they altered the one revelation brought by all the prophets from Adam to Muhammad. Jñ finds in Christianity the nearest approach to his own monistic interpretation of Islam. Christians (he says) recognize the two complementary sides of true belief concerning God, viz. that from one point of view He is above all likeness, while from the other point of view He reveals Himself in the forms of His creatures. Their mistake lies in the limitation to which they have subjected the principle that God becomes manifest in this way. God said in the Qur'ān, 'I breathed my spirit into Adam'; and here the name Adam signifies every human individual. The worship of those who behold God in man is the highest of all. Something of this vision Christians possess, and their doctrine about Jesus is a bridge that will lead them at last to the knowledge that mankind are like mirrors set face to face, each of which contains what is in all; and so they will behold God in themselves and declare Him to be absolutely One.

5. *Sūfi poetry.*—Among the practices devised by the Sūfis for the purpose of stimulating religious emotion there is none more potent than that which they name 'audition' (*samāʿ*), i.e. listening to music and song.¹ Countless stories are told of Sūfis who were thrown into ecstasy on hearing a few lines of verse chanted inadvertently by a singing-girl or with intention by one of themselves. Such verses were usually erotic, but not mystical; the allegorical sense was not given by the poet but was supplied by the hearer. In Sūfi poetry, of course, it is otherwise; here the poet's meaning is mystical, however sensuous may be the form in which it lurks. And often the two kinds are so like each other superficially that, unless we have some clue to the intention of the writer, we cannot easily decide whether we are reading an ode of human love or a hymn addressed to the Deity.² If it be asked why the Sūfis make such large use of erotic and bacchanalian symbolism, the answer is that they could find no analogy more suggestive and better adapted to shadow forth the states of enthusiasm and ecstasy which their poets describe.

Wine, torch, and beauty are epiphanies of Vainy,
For it is that which is revealed under all forms soever.
Wine and torch are the transport and light of the knower;
Behold The Beauty, for it is hidden from none.

Wine, torch, and beauty, all are present;
Neglect not to embrace that Beauty.
Quaff the wine of dying to self, and for a season
Peradventure you will be freed from the dominion of self.
Drink wine, for its cup is the face of the Friend;
The flagon is His eye drunken and down with wine.³

This poetry is the chief glory of Persian literature. It may be studied in the quatrains attributed to Abū Saʿīd b. Abīl-Khair,⁴ in the poems of Farīd'uddīn 'Aṭṭār,⁵ Jalāl al-dīn Rūmī (*q.v.*), and Jāmī,⁶ or in the *Gulshānī Rāz* of Maḥmād Shabīstārī. Whinfield's edition of the last-named work⁷ is provided with explanatory notes and may be recommended as the best introduction to the subject. In Arabic this *genre* of poetry takes a more conventional form, which is not so attractive to Western readers, but the odes of Ibn al-Fārīdī⁸ are exceedingly fine, while those

of Ibn al-'Arabi,¹ in spite of their recondite style, contain some passages of great beauty. Of the Turkish Sūfi poets the most interesting is Nesīmī,² a fervent admirer of Hallāj and a member of the sect known as Ḥurūfīs, who derive their title from the mystic significations which they attach to the letters of the alphabet and to combinations of these.³

The Sūfi poet is not directly concerned with metaphysics.

He 'lets his heart be wholly filled by the sublime conceptions of all-embracing Unity and all-conquering Love which form the real basis whereon all the rest is built. . . . He sees how the Truth is the one source of all existence, diffused throughout the universe through emanation after emanation; how the Primal Intelligence, itself rayed out from the One, rays out in turn the Primal Soul; how the Divine Names cast their light upon the darkness of not-being, each atom of which mirror-like reflects one. He sees how the Awful Attributes of the Truth are reflected in the existence of hell and the devils, and how the Beautiful Attributes are reflected in that of Paradise and the angels. He further sees how Man reflects all the Attributes, Awful and Beautiful alike, and is thus the Microcosm, summing up the universe in himself. He thus sees how it is the Truth alone that is acting through all things, and moreover how this action is a never-ceasing, never-pausing process, every existent atom being each instant clothed with a fresh phenomenal efflux radiated from the Source of Existence, and being again stripped of it, so that the whole contingent universe is momentarily being annihilated and re-created, though the successive acts of destruction and renewal follow one another in such swift succession that they are wholly imperceptible, and all appears as one uninterrupted line, even as an unbroken circle of fire is seen if a single spark shall be whirled quickly round. But the poet may not rest content with the mere perception of these high mysteries; indeed that very Love which has revealed them to him impels him to seek reunion with the Truth.'⁴

God, as the poets conceive Him, is the eternal Beauty which by the necessity of its nature desires to be loved, manifests itself for the sake of love, and is the real object of all love. Even earthly love is a type of spiritual, a bridge leading to reality.⁵ The soul, being divine in its essence, longs for union with that from which it is separated by the illusion of individuality, and this longing aspiration, which urges it to pass away from selfhood and to rise on the wings of ecstasy, is the only means whereby it can return to its original home. Love transmutes into pure gold the base phenomenal alloy of which every creature partakes. While reason is dualistic, love unifies by transcending thought.

He comes, a moon whose like the sky ne'er saw, awake or dreaming,
Crowned with eternal flame no flood can lay.
Lo, from the flagon of thy love, O Lord, my soul is swimming,
And ruined all my body's house of clay!

When first the Giver of the grape my lonely heart befriended,
Wine fired my bosom and my veins filled up,
But when his image all mine eye possessed, a voice descended:
"Well done, O sovereign Wine and peerless Cup!"

Love's mighty arm from roof to base each dark abode is hewing
Where chinks reluctant catch a golden ray.
My heart, when Love's sea of a sudden burst into its viewing,
Leaped headlong in, with "Find me now who may!"⁶

The following passages further illustrate the manner in which this principle is applied by Sūfi poets.

Love is the final cause of creation:

'In solitude, where Being signless dwelt,
And all the universe still dormant lay
Concealed in selflessness, One Being was,
Exempt from "I" or "Thou"-ness, and apart
From all duality; Beauty Supreme,
Unmanifest except unto itself
By its own light, yet fraught with power to charm
The souls of all . . .

But Beauty cannot brook
Concealment and the veil, nor patient rest
Unseen and unadmired: 'twill burst all bonds
And from its prison-casement to the world
Reveal itself . . .

Wherever Beauty dwells,
Such is its nature and its heritage
From Everlasting Beauty, which emerged
From realms of purity to shine upon
The worlds, and all the souls which dwell therein.

Each speck of matter did He constitute
A mirror, causing each one to reflect
The beauty of His visage. From the rose
Flashed forth His beauty, and the nightingale,
Beholding it, loved madly. From that fire
The candle drew the lustre which beguiles
The moth to immolation . . .
Beware! say not, "He is All-Beautiful,
And we His lovers." Thou art but the glass,
And He the face confronting it, which casts
Its image on the mirror. He alone
Is manifest, and Thou in truth art hid.
Pure love, like beauty, coming but from Him
Reveals itself in thee. If steadfastly
Thou canst regard, thou wilt at length perceive
He is the mirror also; He alike
The Treasure and the Casquet. "I" and "Thou"
Have here no place, and are but phantasies
Vain and unreal.¹

Love is the essence of all religions :

'Soul of mine, thou dawning Light : be not far, O be not far !
Love of mine, thou Vision Bright : be not far, O be not far !'

See how well my Turban stretch, yet the Parsee Girdle binds
me ;

Cord and Wallet I bear light : be not far, O be not far !
True Parsee and true Brahman, a Christian, yet a Mussulman,
Thee I trust supreme by Right : be not far, O be not far !
In all Mosques, Pagodas, Churches, I do find one Shrine alone ;
Thy Face is there my sole delight : be not far, O be not far !'²

The same principle enables the Šūfī poet to solve
the problems of evil and predestination.

'The more a man loves, the deeper he penetrates the divine
purposes. Love is "the astrolabe of heavenly mysteries," the
eye-salve which clears the spiritual eye and makes it clair-
voyant.'³

Through love we can discern that evil, so far as it has
any real existence—and in relation to God it has none—is a good in disguise or, at the worst, a
necessary condition for the manifestation of good.⁴
As regards predestination, perfect love implies
identity of will and thus abolishes the conflict
between freedom and necessity.

'The word "compulsion" makes me impatient for love's sake ;
'Tis he who loves not that is fettered by compulsion.
This is close communion with God, not compulsion,
The shining of the sun, and not a dark cloud.'⁵

The lyric poetry of Šūfīsm reaches its highest
mark in pantheistic hymns describing the states
of *fanā* (negation of individuality) and *baqā*
(affirmation of universal consciousness).

'Lo, for I to myself am unknown, now in God's name what
must I do ?

I adore not the Cross nor the Crescent, I am not a Giaour nor
a Jew.

East nor West, land nor sea is my home, I have kin nor with
angel nor gnomes.

I am wrought not of fire nor of foam, I am shaped not of dust
nor of dew.

I was born not in China afar, not in Saqsin and not in Bulghār ;
Not in India, where five rivers are, nor 'Iraiq nor Khorāsin I
grew.

Not in this world nor that world I dwell, not in Paradise, neither
in Hell ;

Not from Eden and Rizwān I fell, not from Adam my lineage
I drew.

In a place beyond uttermost Place, in a tract without shadow
of trace,

Soul and body transcending I live in the soul of my Loved One
anew !'⁶

Though many of these poems are exquisite in
form and elaborate in style, it is difficult to regard
them as products of conscious literary art, and the
present writer is inclined to accept the statement
that the odes of Jalāl al-Dīn Rūmī, Ibn al-Fārid,

Ibn al-'Arabi and other Šūfī poets were often
composed under the influence of ecstasy and are in
fact analogous to what is known as 'automatic
writing.'¹ Their rhythm and melody, combined
with the symbolic form in which they are clothed,
give them a strange power of communicating to
the reader the same feeling of rapture by which
their composer was inspired: and the effect is
greatly enhanced when they are chanted with an
accompaniment of music, as is customary among
Šūfīs engaged in *dīkr*. While students of this
poetry cannot ignore the conventional rules of
interpretation which assign a fixed allegorical
meaning to a large number of words that are
commonly used in a different sense, such a method
may easily be pushed too far. Ibn al-'Arabi's
commentary on the *Tarjūmān al-Ashwāq* shows
that even the author of a mystical ode is sometimes
unable to explain its meaning. The ecstatic
element appears only at intervals and seldom with
its first intensity in narrative romances, which depict
the soul's love of God and its ultimate union with
Him as the story of two human lovers—e.g., Yūsuf
and Zulāikḥā, Lailā and Majnūn, Salāmān and
Absāl—and didactic poems, of which the *Masnawī*
is the most celebrated.

LITERATURE.—This art is supplementary to, and should be
read in connexion with, the art. ASCETICISM (Muslim). In the
present writer's opinion, it would be premature to aim at giving
a historical conspectus of the subject, since adequate materials
are not yet available. Further information concerning the
doctrines of individual Šūfīs will be found in the art. 'ASD

SUGGESTION.—Suggestion is the production of a reaction by an ideational process, but without deliberation on the part of the subject thereof. The term applies also to any attempt by the subject or by another person to produce such a reaction. 'A' suggestion is any idea that determines, or is used for the purpose of determining, the outcome of such a non-deliberative process.

The qualification 'by an ideational process' is intended to differentiate suggestion from primary instinct-acts. Such acts, though they may be secondarily initiated by an idea or mental image (as when a letter makes me angry with the writer of it), require as their primary stimulus nothing but an appropriate sense-presentation. Suggestion, on the other hand, is primarily ideational. The most typical suggestions are those that are conveyed by language. Gesture, in the broad sense of significant bodily motions, postures, and inarticulate vocalization, comes next. Natural phenomena act suggestively only when they have antecedently acquired a meaning, as when one avoids poison ivy, or quickens one's pace upon hearing distant thunder.

The term 'reaction,' as here used, refers to both psychical and bodily responses. It includes beliefs, hallucinatory perceptions, attitudes (with their affective and emotional aspects), stimulation of involuntary muscles and of certain glands, particular contractions of voluntary muscles and muscle-systems, even extended chains of such contractions, and finally, in all these fields, inhibitions and functional paralyses as well as stimulations.

A reaction is 'deliberate' when it is made after attention has been given to alternatives, and with the alternatives in view. Associated with the idea that defines any alternative is a tendency towards something beyond itself as merely this idea now present. Because of these associated tendencies ideas may be said to compete with one another and therefore to involve inhibitions as well as positive stimulations. In deliberation there is mutual inhibition of two or more competing ideas, wherefore popular thought correctly conceives that pause or postponement is a mark of deliberate conduct and of deliberate believing. Suggestion, on the other hand, implies the absence, or relative lack, of such competition, inhibition, and pause. All that is necessary is that attention should be withheld from some of the ideas appropriate to the given situation, and focused or 'narrowed down' to some one idea or coherent chain of ideas. Thereupon the associated tendency that has just been referred to is automatically instated.

How such associated tendencies should be conceived has been a matter of debate. W. McDougall, emphasizing the subconscious character of the connexions here involved, and also the close relation of suggestion in general to 'psychic phenomena,' is of the opinion that any adequate analysis of suggestion must rest at last upon a theory of the subconscious.¹ William James used the phrase 'ideo-motor action' to designate what he regarded as a mental law, namely:

'Every representation of a movement awakens in some degree the actual movement which is its object; and awakens it in a maximum degree whenever it is not kept from so doing by an antagonistic representation present simultaneously to the mind.'²

On the other hand, E. L. Thorndike opposes to the 'ideo-motor' theory, and by implication to McDougall also, the following far simpler theory: an idea may produce a movement in either of two ways—by imaging an object that awakens an instinctive response, or, under the ordinary law of habit, by reinstating something that has pre-

viously been associated in the subject's experience with the suggestive idea. The reason why the idea of bending my first finger produces actual bending, according to Thorndike, is that the two—the idea of the bending and the actual bending—have been experienced together heretofore. The very first flexions of the finger, it may be added, occurred reflexly, without any antecedent idea thereof. Just so, if the sight of a glass of water upon my dinner-table induces me to drink water that I do not want, habit is clearly the explanation.¹

This theory enables us to bring all the psychical and physical manifestations of suggestion under the same two heads, habit and instinct.

Both are found in Antony's handling of the Roman rabble. The opinion of the artisans concerning Caesar's death was quickly reversed, not by the weighing of pros and cons, but by bringing attention back again and again to essentially the same point, i.e. by narrowing attention so that the old attitude of admiration for Caesar the conqueror was reinstated. In addition, Antony arouses various instincts, as when he works upon curiosity until the crowd demands to hear the will that he pretends to withhold.

It is evident that suggestion is not an exceptional, rare, or abnormal phenomenon, but an omnipresent fact of all mind whenever its reactions are upon the ideational level. In hypnosis competing ideas may be inhibited to an extraordinary degree, but there is no fixed line of division between the incipient stages of hypnosis gradually brought on and fully normal mental action. Similarly the ordinary effects of cheerful or of gloomy expectation are merely heightened in the extreme and truly remarkable facts of suggestive therapeutics.²

The process of suggestion has, as such, no particular relation to the truth or the falsity of what is suggested. One may arrive by suggestion at true beliefs or false, and at ethically correct or incorrect attitudes and conduct. Suggestion is an ordinary device of oratory and of preaching, as it is also of advertising and of salesmanship. Recent works on 'business psychology' present what may fairly be called a technic that is parallel to that of physicians who employ psycho-therapy. Thus far the ethical aspects of influencing buyers by suggestion have not been examined as carefully as the technic.

If any one should doubt whether the deliberate influencing of men to act without deliberation is ever justifiable, the following three considerations would have a bearing. (1) There are numerous cases in which the ends of deliberation are defeated by the process of deliberation itself, as when too meticulous weighing of possible consequences or an overwrought insistence upon complete certainty prevents the action that a situation calls for. One way to get such a person over his 'dead centre' is precisely to narrow his attention to one of the alternatives until action ensues. (2) When an instinctive capacity for noble emotions and attitudes has become dull from disuse, one simply lacks considerations that are needed for deliberation. A psychological pre-condition of all deliberation is appreciation of the pertinent alternatives. What is to be done for a man, then, whose habits preclude any feeling of the force of a pertinent alternative? The obviously rational procedure is by processes of suggestion to narrow his attention upon some object that may awaken an instinctive response of the desirable sort, and then to lead him to include this fresh experience among the data of his deliberate thinking. (3) Whether we will or not, a large factor in education, particularly in the development of standards and ideals in the young, is suggestion emanating from adults, especi-

¹ See Thorndike, 'Ideo-Motor Action,' *Psych. Rev.* xx. [1913] 91-106.

² See art. DISEASE AND MEDICINE, HYPNOTISM, PSYCHOTHERAPEUTICS.

¹ See art. HYPNOTISM.

² *Principles of Psychology*, ii. 526.

ally parents and teachers. A purely rationalistic education is a psychological impossibility. Hence it is a custom of educators to take at least some measures for determining the sorts of suggestion to which pupils shall be exposed. M. W. Keatinge argues for careful, deliberate planning of this part of teaching.¹

On the other hand, suggestion is, on the whole, a process of repetition or of maintaining some *status quo ante* rather than a process of criticism and revision. Under the influence of suggestion alone one merely drifts with social currents, or follows a leader, or imitates one's own past, or at best applies a recognized standard or sets free a disused instinctive capacity. To judge a standard, on the other hand, one must attend to alternatives. It would be a mistake, nevertheless, to suppose that truly ethical action requires nothing but deliberation. Ethical situations are made real to us, especially situations that call for reform, by some kindling of elemental processes that include strong satisfactions or their opposites. Thus it comes to pass that great sermons commonly interweave strong suggestions with analysis and even argument.

To exhibit the whole significance of suggestion in religion would require an historical catalogue of practically all forms of deeply felt experience. Primitive fears connected with tabu and with spiritism were propagated from individual to individual and from generation to generation by suggestion. The same is true of the rejoicing that accompanied some of the ceremonies. Priesthoods acquired and retained their power by narrowing the attention of worshippers by means of sense stimuli of various sorts focused upon some point that required no deliberation. The mystics of all ages have practised auto-suggestion under the name of contemplation or interior prayer. Modern revivals have produced a sense of sin, conversion (reversal of attitudes and of likes and dislikes), and 'assurance' or the 'witness of the Spirit' chiefly by suggestion. Indeed, managers of revival campaigns at the present day are accustomed to organize preaching, singing, personal work, and advertising of various kinds upon a strictly suggestive basis. Not the least item is the careful preparation of the public mind, sometimes for weeks in advance of the first public meeting. Finally, such experiences as 'the jerks,' 'the power,' 'speaking in tongues,' and 'interpretation of tongues' present as a whole cases of suggestion. They are usually initiated by a spontaneous automatism which is then imitated (by oneself and by others) without deliberation, but often with support from passages of Scripture. The idea of a baptism 'with fire' has similarly fulfilled itself here and there.²

The phenomena of suggestion reach their climax in human masses, whether crowds (which involve spatial propinquity) or a public whose opinions and attitudes are formed by common reading matter or even by statements passing from mouth to mouth. It is a fact of common observation that in a crowd one may act 'like a different person,' accepting as truth what one could not ordinarily believe, and conducting oneself contrary to one's ordinary standards. The mechanism whereby crowd suggestion acquires this remarkable power is as follows. (1) Certain instinctive capacities are strongly stirred by the massing of appropriate stimuli. Man has a gregarious instinct, is peculiarly interested in the movements of his fellows, and is sensitive to their approvals and disapprovals. Here is the basis for a quickening or excitement of

the mind through the mere presence of others, as also for watching and following others, and for subordinating, even forgetting, one's own ideas in the presence of a sentiment generally held by the mass. (2) A crowd usually assembles under the influence of some common thought. Even when this is not the case, conversation tends to produce a common thought. Moreover, under the stimulus of the excitement already referred to, some individual—either one with relatively few inhibitions or one with strong convictions, or even a designing demagogue—is likely to speak aloud. This often precipitates the thinking of the entire mass. It is now as if each one were suggesting to every other one the idea that has come to expression. Thus sentiment rolls up like a snowball. (3) This narrowing of attention, as already indicated, involves an equally strong inhibition upon ideas that would ordinarily appear as competitors. Therefore strong, impulsive action occurs spontaneously and appears to the subject to be natural and justifiable. A crowd is incapable of fine discriminations and of skill; its acts tend towards the simplicity and crudity of instinct; and therefore, in this case, a human association easily acts less socially (as far as ends and consequences are concerned) than its members would do if they faced the same moral issue severally.

All that has just been said applies also to masses that are unified by means of the public press. Our present means of communication are so swift and so all-pervasive that men feel the presence of one another almost the world over at almost the same instant. Communities that are a thousand miles apart get the same news, often word for word, at about the same hour; the effect of the news in one community now becomes an item of news in the other; action as well as idea thus spreads. This is the process whereby a whole nation rises to succour sufferers from earthquake or from fire, or to repel an invader. Thus, too, political opinions as well as fashions of dress and of speech spread with great rapidity.

A study of suggestion as a means of governing men in the State as well as in the Church will show that one of the basal differences between types of organization lies in the degree to which suggestion, as compared with deliberation, is officially used. At the tribal level of organization common action is secured to a great extent by suggestion of the crowd type, as in dances and other ceremonies, and in the personal leadership of the chief. In the monarchical State, as in sacerdotal religion, men are ruled partly by direct command (which is, under some conditions, a potent mode of suggestion), and partly by pageantry and other sensuous or sentimental appeal that ever reawakens a traditional attitude of loyalty. The underlying psychical principle of democracy, on the other hand, is deliberate group action. A deliberative group is one in which unity is sought, not by withdrawing attention from alternatives, but by mutual incitement to pause and weigh alternatives before acting. This type is most fully developed in bodies that have formal rules of order. Here, as a preliminary to each common act, the entire group pauses, the chairman saying, 'Are there any remarks?' Then, as if challenging each individual to full, deliberate self-expression, he asks, 'Are you ready for the question?' This procedure has been devised so as to prevent action under suggestion. Whereas the crowd becomes a unit by the suppression of individual inhibitions, the deliberative group achieves its unity precisely by inviting the expression of competing ideas, and by spreading them out for inspection and unforced selection. The ballot, in popular government, is an organ for essentially

¹ *Suggestion in Education*, 2.

the same type of deliberation on the scale of the local community or of the nation.¹

GEORGE A. COE.

SUHRAWARDĪ.—Suhraward, a small town in the Jibāl province of Persia, has given its name to two celebrated mystics whose lives, characters, and opinions present a remarkable contrast, though both were born in the same decade. Of Shihāb al-dīn 'Umar b. 'Abdallah al-Suhrawardī (A.D. 1144-1234) it is enough to say that he was a Šāfi of the conventional type, that he lectured and preached in Baghdād under court patronage, and that his writings include a well-known treatise on Šūfism—the '*Awārif al-ma'ārif*'—and a polemical work directed against the study of Greek philosophy, which he dedicated to the khalifah al-Nāsir.² His contemporary, Shihāb al-dīn Yahyā b. Amīrak al-Suhrawardī (A.D. 1153-91), after studying jurisprudence and theology at Marāgha, devoted himself to mystical philosophy, led the wandering life of a dervish, and finally settled in Aleppo. While some of his earlier books were written under the influence of Aristotle, he was at heart a Platonist, as is shown by the title and contents of his chief work, the *Hikmatu 'l-ishrāq* ('Philosophy of Illumination')—whence the school of mystics who follow him are called *Ishrāqīs* (*al-ishrāqīyūn*). Being an enthusiast as well as a bold and original thinker, he made no attempt to disguise the anti-Islāmic tendency of his doctrines. It cannot be denied that from the orthodox standpoint they were detestable; and, though at first he found an admirer in al-Malik al-Zāhir, the son of Saladin, he was condemned and executed by order of that prince in 1191. The name of 'martyr' (*shahīd*) was refused to him; he is generally known as Suhrawardī al-maqtūl ('Suhrawardī the slain') or al-Shaikh al-maqtūl.

In his theory of illumination he combines Neo-Platonic and Persian ideas. The source of all things is the Absolute Light (*al-nūr al-qāhīr*). That which is visible requires no definition, and nothing is more visible than light, whose very nature consists in manifestation.

The Primal Light, therefore, has no reason of its existence beyond itself. All that is other than this original principle is dependent, contingent, possible. The "not-light" (darkness) is not something distinct proceeding from an independent source. It is an error of the representatives of the Magian religion to suppose that Light and Darkness are two distinct realities created by two distinct creative agencies. . . . The relation between them is not that of contrariety, but of existence and non-existence. The affirmation of Light necessarily posits its own negation—Darkness, which it must illuminate in order to be itself. This Primordial Light is the source of all motion. But its motion is not change of place; it is due to the *love* of illumination which constitutes its very essence. . . . The number of illuminations which proceed from it is infinite. Illuminations of intenser brightness become in their turn the sources of other illuminations; and the scale of brightness gradually descends to illuminations too faint to beget other illuminations. All these illuminations are mediums,

or in the language of theology angels through whom the infinite varieties of being receive life and sustenance from the Primal Light.¹

We may distinguish two illuminations, *i.e.* modes of being, of the Primal Light: (1) pure, abstract, formless; (2) accidental, derivative, possessing form. The pure light is self-conscious substance (spirit and soul), knowing itself through itself, for 'whatever knows itself must be pure light.' The accidental light is related to the pure light as effect to cause and only exists as an attribute in association with the illuminated object (body), which is not matter in Aristotle's use of the term, but merely the negation necessarily implied in the nature of light.

The experimental fact of the transformation of the primary elements² into one another points to this fundamental Absolute matter which, with its various degrees of grossness, constitutes the various spheres of material being.³

It is of two kinds: (a) dark substance, (b) dark forms, *i.e.* qualities; and the combination of these two makes up a material body. Since darkness is nothing but the absence of light, and light is identical with reality, the substance and forms of the universe consist of illuminations diffused from the Primal Light in infinite gradations of intensity. It follows that everything partakes of reality in proportion to the radiance which it receives and towards which it ever moves 'with a lover's passion, in order to drink more and more of the original fountain of Light.' This perpetual flow and ebb of desire produces the revolutions of the heavenly spheres, the processes of nature, and all human activities. The abstract light (First Intelligence) is less perfect than the Primal Light (God), in contemplating which it becomes conscious of its imperfection, whence there arises in it a darkness that is the ground of plurality in the sensible world. While the entire universe is eternal as emanating from the eternal Light, but contingent if regarded as the object of irradiation, some illuminations are simple, others compound and therefore inferior. The intelligences, the celestial spheres, the souls of the heavens, time, motion, and the archetypes of the elements belong to a higher world, which may be called eternal in contrast with all below it, though in the relation existing between them not posteriority but parallelism is implied. Suhrawardī, like Plato, conceives a world of Ideas—he declares that it was revealed to him mystically—in which every kind of sublunary thing exists as a substance in itself.⁴ The wise men of Persia (Zoroastrians), he says, gave names to many of these pure lights (Ideas); *e.g.*, they named the Idea of water Khurdād (May), that of trees Murdād (July), and that of fire Ardibilisht (April).

As each species is endowed with its distinctive qualities and preserved by its guardian Idea—the 'lord of the species' (*rabbu 'l-naw'*)—so the Idea of the human body is 'the holy spirit' or universal Reason, while bodies individually are types of rational souls. The soul does not exist before the body. Being pure light, it imparts illumination to the body through the medium of the animal soul. It operates with the five external and the five internal senses, which correspond to powers residing in the ideal archetype. Thus vision, knowledge, memory, imagination, etc., are essentially not passive functions but illuminative acts of the soul. Obeying the principle that what is lower in the scale of being loves what is higher, the soul longs to be united with the formless

world of light, and it advances towards this end according as it seeks to become perfect in philosophy and the practice of virtue. By so doing it develops a mystical perception (*dhaug*) which clears all doubts away. *Dhaug*, as Suhrawardī tells us, forms the basis of the speculations set forth in the *Hikmatu 'l-ishrāq*. In one passage he seems to hint that he himself is the *qutb*, the mysterious head of the Sūfī hierarchy,¹ for he asserts that the philosophy of illumination was taught by Empedocles, Pythagoras, Plato, and the Zoroastrian sages, and that the world is never without some one who possesses the doctrine and can expound it with authority; that person, he adds, is God's vicegerent (*khalīfat Allah*) on the earth.² Attainment of *fanā*³ unites the soul with God, but does not mean that one substance is absorbed in another. No two souls can be completely alike.

¹The individual souls, after death, are not unified into one soul, but continue different from each other in proportion to the illumination they received during their companionship with physical organisms. . . . Some souls probably come back to this world in order to make up their deficiencies. The doctrine of transmigration cannot be proved or disproved from a purely logical standpoint, though it is a probable hypothesis to account for the future destiny of the soul. All souls are thus constantly journeying towards their common source, which calls back the whole universe when this journey

is over, and starts another cycle of being to reproduce in almost all respects the history of the preceding cycles.¹

Suhrawardī agrees with Ghazālī in holding that the world could not be better than it is. Evil is a negation depending on the motion and darkness which, as we have seen, are involved in the nature of light; it is associated with the effects and does not proceed *per se* from the First Cause; if it existed *per se*, it would not be evil. In his clear and sympathetic exposition of the Ishrāqī philosophy Shaikh Muḥammad Iqbāl calls attention to Suhrawardī's intellectual independence and to the skill with which he moulded his Neo-Platonic materials into a thoroughly Persian system of thought, uniting speculation and emotion in perfect harmony. Mystic and (in a sense) pantheist as he was, he regards the external world as real and never loses touch with it.

²No Persian thinker is more alive to the necessity of explaining all the aspects of objective existence in reference to his fundamental principles.²

SUICIDE (Introductory).—Before attempting any discussion of suicide from the standpoint of ethics or religion, we should note that in many cases—probably the majority, among civilized peoples—either no moral judgment can be passed upon the act or at least great allowance must be made for the mental condition of the agent. Lunacy not infrequently involves such complete loss of the instinct of self-preservation that the patient, even where analgesia is not present, will mutilate or kill himself, apparently without any idea of what he is doing. So in *dementia præcox* 'self-respect, modesty and the instinct of self-preservation are quite absent'; and the result is various absurd, criminal, or indecent acts, including suicide for a trivial reason or none at all.⁴ Again, *dementia paralytica*, or chronic periencephalitis, although like many forms of mental diseases it generally produces intense and unreasoning attachment to life,⁵ often involves accessions of wild, self-directed fury, such as that in which Guy de Maupassant tried to kill himself.⁶ But the most typical examples are those of melancholia. We quote part of Tanzi's admirably lucid account:

'In some cases of melancholia scenes of the most horrible and sanguinary nature, which are represented to the patient's mind as simple possibilities, and repeated as favourite images on account of their hideousness, become transformed into a *motor obsession*. The obsession, meeting with but slight resistance in an exhausted and abulic brain (*i.e.* one almost if not quite deprived of will-power), becomes so imperative as to drive the patient inexorably to the commission of acts corresponding to it, such as . . . suicide in its most horrible forms.'⁷

The state in which these acts occur—the *raptus melancholicus*—is quasi-unconscious. But suicide often takes place in less advanced cases than this, when the patient is not wholly irresponsible, but

is actuated by motives the importance of which his disease greatly exaggerates. A preliminary symptom of the *raptus* is precordial anxiety—a sort of horrible intensification of that uneasy 'sinking feeling in the pit of the stomach' which often attacks a healthy man when frightened or anxious.³ Now, as a normal subject may be tempted, by the depression arising out of a real misfortune, to take his own life, so a melancholic suffering from this intense and abnormal feeling of anxious misery is not infrequently driven in a quasi-normal way to commit suicide. Objectively he has no sufficient motive, but subjectively his hopeless depression, the morbid nature of which he is unable to realize, presents itself as a good reason for wishing to be dead and fulfilling his wish.⁴ Still more typical are those suicides of melancholics which are inspired by altruistic motives, the patient believing that his death will in some way greatly benefit his friends—*c.g.*, that he is miserably poor and must relieve his family of the burden of supporting him,⁵ or that his life is demanded in expiation of a fancied crime, or the like. Such unfortunates are well aware of what they are doing; their delusion consists simply in believing that they have an adequate motive. Often their action has a kind of perverted nobility, arising from a devotion to an ideal which in itself is lofty enough, although the ideal is imaginary and the form which the devotion takes morbid. It has been suggested that in these cases the disease has exaggerated and distorted the instinct of self-sacrifice,⁶ which is a normal constituent of the

² *Ib.*, p. 149.

³ This is merely a rough description of the nature of the two sensations. Physiologically they are quite distinct, one being precordial, the other epigastric.

⁴ Tanzi, p. 514; Mercier, *Sanity and Insanity*², p. 350.

⁵ Mercier, p. 351; this suicide was in reality very well off.

⁶ It might also be described as a distortion of the social sense, or herd-instinct, which some would regard as primary (like self-preservation, etc.). See W. Trotter, *Instincts of the Herd*², London, 1919, especially p. 18 ff.

² Carra de Vaux, p. 68 f.

³ See art. SŪFĪS.

⁴ Tanzi (*A Text-book of Mental Diseases*, p. 640) gives a case (p. 641) of a patient who believed that he was invulnerable and killed himself in trying to prove it. An apparently unmotivated suicide is described on p. 662.

⁵ Tanzi, p. 231.

⁶ *Ib.*, p. 519.

⁷ *Ib.*, p. 513.

sexual emotions, especially in women. Hence such suicides are particularly common among adolescents. As there is admittedly a close connexion between sexual and religious emotions, especially in their more exaggerated and morbid forms, we may put some at least of the religious suicides (see below) in this category.¹

In most cases of this kind the patient's insanity is easily recognizable; and even in those instances where a melancholiac supposed to be cured relapses and ends his life in a suicidal fit—or possibly feigns recovery in order to carry out, when left unguarded, his purpose of self-destruction—we need have no hesitation in pronouncing him at least partly irresponsible.² It is less easy to pass judgment on the numerous class of neurasthenics. A characteristic feature of the mental state of these sufferers is that impulses, often of the most absurd or criminal nature, haunt and obsess the imagination; and, while the patient knows perfectly well that these impulses are not rational—thus differing from the melancholiac—he is not always strong-minded enough to control them.

The most vivid description known to us of this condition occurs, not in a technical work at all, but in two of the stories of one who seems himself to have been a neurasthenic and clearly regarded such impulses as part of the normal human mentality—Edgar Allan Poe.³ This author represents two men, one as betraying a fatal secret, the other as killing a pet animal, for no other reason than that the acts are insanely devoid of motive; and the writings of alienists⁴ give many actual cases of the same kind. Clearly, then, when a neurasthenic's obsession is suicidal, if he yields to it, he cannot either be regarded as an ordinary lunatic who does not know what he is doing or imagines that he has good reasons for his act, or he judged like a normal man who decides, on more or less rational grounds, that he wishes to end his life.

It is still harder to pass satisfactory moral judgments on the rather numerous persons, apparently sane but perhaps really neurasthenic, whose suicides have a motive, but an inadequate one—a small injury, real or supposed, to honour, or even so trivial a cause as a wager.

Suicides of this kind sometimes amount to a sort of epidemic. When one member of a family has ended his life, the recurrence of the anniversary of his death, the sight of the weapon that he used, or some such casual association has been known to drive a relative to follow his example, until as many as seven of one household have died by their own hands.⁵ Larger epidemics, extending through an entire city, or even wider,⁶ have not been unknown in ancient or modern times, and are frequently associated with religious mania. These are probably hysterical, as hysteria is easily communicated and often produces, especially among women, 'theatrical attempts at suicide.'⁷

To all these classes of more or less non-moral acts of self-destruction should be added the very large number of instances of persons who are sane for the greater part of their lives, but, as a result of violent nervous shock, disease, grief, excesses of one sort or another, etc., become temporarily unbalanced to a slight degree. These causes are so many that it is questionable whether any one whose life is of normal length is absolutely sane during every waking moment of it.⁸ We need not doubt that the charitable verdict of the average coroner's jury, 'suicide while of unsound mind,' is in a large percentage of cases quite in accordance with medical facts.

But our primary interest is in the act of one who, being perfectly sane, takes his own life. The question whether such a deed is justifiable, and, if so, when and under what circumstances, has been answered in the most various ways by peoples of

¹ See Mercier, pp. 354-357.

⁸ Mercier, p. 131.

different degrees of culture, from the lowest savages to members of the highest civilizations, ancient and modern. Some account of these answers has been given elsewhere.¹ We propose now to consider the attitude taken by religions, savage and civilized, and by the leading schools of moral philosophy.

I. Religion.—Various faiths have taken every conceivable view of suicide, from recommending it to resolutely and uncompromisingly opposing it. As the grounds for the former view are less obvious to us, it is well to begin by briefly discussing them. First in the list stand those fanatic beliefs, including degraded forms of Christianity, whose votaries have been impelled to kill themselves, often in most painful ways, to attain a blissful immortality or to avoid something which they regarded as polluting.

Russia furnishes us with some remarkable examples. Thus at Tiraspol, in 1897, twenty-eight persons buried themselves alive to escape the census, which apparently they regarded as sinful. But a more wide-spread epidemic occurred in 1666, in which year many Russian zealots looked for the appearance of Antichrist. To escape him and enter heaven, suicide was strongly urged by certain wrong-headed and often wholly criminal persons, clerical and lay. 'Whole communities hailed with enthusiasm the gospel of death, and hastened to put its precepts into practice. . . . At first the favourite mode of death was by starvation. . . . (But) death by famine was attended by some obvious disadvantages. It was slow: it opened the door to repentance: it occasionally admitted of rescue. Accordingly death by fire was preferred as surer and more expeditious. . . . The mania in its most extreme form died away towards the end of the seventeenth century, but during the eighteenth and nineteenth centuries cases of collective suicide from religious motives occurred from time to time.'²

Many of these people, and other such religious suicides, were undoubtedly in a condition of hysteria, if not actual paranoia. We have a parallel to such self-destruction in the most horrible of the rites of Kybele—that which took place on the *dies sanguinis*, at least in its earlier form.³ On this occasion the devotees of the goddess, wrought up to a pitch of frenzy by an exciting and elaborate ritual, not only wounded themselves, but performed the act of self-emasculation, thereafter joining the ranks of the *Galli*. Turning now to medical evidence, we find⁴ such mutilation named along with suicide and manslaughter as typical of some forms of lunacy. We have thus two closely related acts, both involving loss of the instinct of self-preservation, arising, not from ordinary mania, but from a temporary insanity artificially produced and due to a perverted or degraded religious instinct.

But religious suicides are not always maniacs. We need only allude in passing to the innumerable cases, familiar from Frazer, of divine kings and other incarnate deities who kill themselves or are killed, either after a fixed period has elapsed or when their bodily vigour begins to fail. Indeed, these can hardly be called suicides in the strict sense, since the killing is, in intent, merely the first act of a process of reincarnation. That the god should be destroyed is never thought of; it is simply desired to provide him with a new and more desirable fleshly covering. Nor can one justly class as maniacs those persons who hold that by killing themselves they can attain future happiness—an idea not uncommon in some forms of Buddhism—or will return to life in this world stronger or wiser than before.⁵ However erroneous their belief may be from the point of view of any sound theological or metaphysical system, it is not a delusion in the medical sense, but often the perfectly logical result of their tenets. In the

³ Vividly described by Frazer, *GB*, pt. iv., *Adonis, Attis, Osiris*, London, 1914, i. 223 ff.; cf. Wissowa, *Rel. und Kultus der Römer*, Munich, 1912, p. 321 ff.

⁴ Tanzi, p. 513.

⁵ Examples of both in *GB*, pt. iii., *The Dying God*, p. 42 ff.

lower strata of human history we have numerous examples of savages who regard suicide as perfectly justifiable (*a*) because the deceased will in the next world have a body in the same state as his present one.¹ This naturally leads to the conclusion that voluntary death is much preferable to mutilation or long and wasting illness, since it will avoid a maimed or helpless life after death. Such suicides are practically examples of euthanasia (*q.v.*). Or (*b*) suicide may, at least in some cases, be reputed as honourable and therefore as procuring a more than usually pleasant lot in the next world, not merely avoiding an unpleasant one. Obviously such ideas are not wide-spread or unqualified, or they would result in the extinction of the peoples holding them. They mostly take this form: a dependent—wife, vassal, or slave—is so closely bound to his or her superior that death cannot sever the tie; therefore, just as in any earthly journey the vassal will faithfully attend his lord, so, when his lord dies, the most honourable course is to follow and continue to serve him. Such fidelity will, it may be expected, result in due honour among the dead.

So at the death of a king of Benin 'his favourites and servants used to compete with each other for the privilege of being buried alive with his body in order that they might attend and minister to him in the other world,' and 'the first to die was deemed the happiest,'² no doubt as being the most prompt and willing. Similarly among the early Germans 'infame in omnem uitam ac probrosum superstitem principis uo ex acie recessisse';³ and in a higher civilization Persian nobles were capable of similar devotion to their king.⁴

But this is hardly a religious idea; more definitely connected with religious belief is the Hindu *sati* (*q.v.*).

Religious opposition to suicide is to be found in all, or nearly all, strata of civilization. Probably the chief, if not the only, reason for this among primitive races is simply the dread of the ghost. The self-destroyer must have been greatly wronged or troubled in some way, or he would not have acted as he did; therefore his ghost will be an unusually troublesome and revengeful spirit, like that of all *βαιοθάνατοι*—to borrow the convenient Greek term. Hence, either he must be appeased by the death of his enemy, if known, or by offerings of some kind, or else he must be rendered harmless.

A natural way to accomplish this is to mutilate or destroy the corpse—in fact, to treat it much as mediæval Europe did a supposed vampire. Well-known survivals of this are the Athenian practice of severing its right hand,⁵ and the custom, not long discontinued in England, of driving a stake through the body. Such treatment, originally a mere precautionary measure, would easily enough generate the belief that the act of the deceased was something extraordinarily wicked, *i.e.* strongly displeasing to whatever deity the community worshipped. It should be noted, however, that among some peoples in a not very advanced stage of culture suicide is objected to on religious grounds, but no such drastic methods of treating the corpse are in vogue. The Kayans of North Borneo hold that those who die by their own hands live miserably in the next world; but the bodies are not burned or mutilated, nor is any fear of them shown,⁶ unless their unceremonious burial on the spot where they are found may be taken to be a precautionary measure indicating fear.⁷

This vague idea of suicide as a crime has been taken over by several higher religions and explained by them in the light of their ethical and eschatological beliefs. Thus for any uncorrupted and logical form of Buddhism it is clearly forbidden, since it violates the first of the five funda-

mental precepts, 'Kill not any living thing.'¹ A religion—it can scarcely be called a philosophy—which presents certain striking parallels to that of Gautama gave an elaborate justification of its prohibition of suicide. To the Orphic-Pythagorean the present life was a penance which took the form of imprisonment; therefore to kill one's self was to attempt, quite vainly, to shirk a deserved penalty.² This view, with various modifications, was taken up by Plato, and reappears in the theological teachings of later philosophy.³

The native Roman religion perhaps condemned suicide originally and in theory at least. Servius⁴ tells us that the *libri pontificales* bade the body of one who had hanged himself to be cast forth unburied; and the later *Seruius Danielis* adds on the authority of Cassius Heminia that the idea of the disgracefulness of suicide dates from the time of Tarquinius Superbus. More noteworthy is a quotation from Varro,⁵ confirming the statement that *suspensiosi* were denied the regular funeral rites. We have no hint, however, that the various suicides of legend and history were otherwise than honourably treated. Possibly the objection was not to suicide in general, but to hanging, regarded as *informis*. At any rate, the rhetorical discussions of the subject⁶ quote no native religious scruple.

The opposition of Christianity has from an early date been of the most determined kind. It is true that nothing in the NT directly justifies such an attitude, but certain Patristic writings make it obvious that by their time the discussion had taken the form of an inquiry whether self-destruction was ever allowable. Thus St. Augustine⁷ deliberates at considerable length whether such a crime (*scelus*), as he repeatedly calls it, may be condoned in the case of a woman whose honour is in danger, or in any case; and he arrives at a negative conclusion. His reasons are chiefly: (*a*) that suicide is an act which precludes the possibility of repentance,⁸ and (*b*) that it is a form of homicide, and therefore a violation of the sixth commandment,⁹ not justified by any of the exceptions, general or special to that commandment, which have been divinely established,¹⁰ and aggravated by the fact that the person thus killed has done nothing worthy of death.¹¹ Hence suicide to avoid violation is at best the commission of a greater sin to escape a lesser.¹² But even St. Augustine himself was obliged to admit the possibility of exceptions, since in his day several persons who had taken their own lives were recognized officially as martyrs—an indication, even if other proofs were lacking, that the opposition to suicide was of gradual growth. He suggests¹³ that in such cases as in that of Samson a special divine ordinance superseded the general law, which nevertheless remains in full force for all ordinary persons. This remains in substance the position of orthodox Catholicism. It is not insignificant that in the most splendid of all mediæval works on eschatological subjects, although the possibility of repentance at the very moment of a violent death is admitted, the examples are chosen from persons killed in battle or by assassins.¹⁴ Nor has orthodox Protestantism been any less emphatic; indeed, its rejection of the doctrine of purgatory makes it still more uncompromising in condemnation of suicide and less hope-

ful with regard to the future destiny of suicides. Judaism in its later forms strongly denounces self-destruction,¹ but the OT says nothing which could reasonably be held to justify this, unless we adopt the Augustinian view of the meaning of the sixth commandment. Probably the Hebrews, until late post-Exilic times, must be counted among those races to whom suicide is simply one of the various possible forms of death and calls for no special comment.²

2. **Ethics.**—All the different views of suicide taught by various religions re-appear, with additions and re-statements, in various ethical systems. The religious side of Plato's views has already been mentioned. Both he and Aristotle³ objected to self-destruction as cowardly and an offence against the State, which thus loses a citizen. Plato also declares it unnatural, since a man is his own closest friend. But both are willing to allow it in some cases—incurable pain, or disgrace so great as to make life no longer worth living. The flood of individualism which resulted from the overthrow of the old political life by the Macedonian conquest swept away the second of the above arguments; and consequently we find much discussion of suicide in the later schools, notably Stoicism, and a decided tendency to condone or even commend it. Its most whole-hearted upholders are those who deny immortality, or at least personal immortality; for they readily embrace the idea—as old as Homer and frequently appearing in poetry—that death is the cure for all ills.⁴ A thoroughgoing exponent of this view and insist upon the miseries of life was Hegesias the Cyrenaic, who, according to Cicero, was 'forbidden by King Ptolemy to lecture on that topic, owing to the number of suicides which took place among his hearers.'⁵ Less extreme doctrines were prevalent among the Stoics, who before the time of Posidonios generally denied personal immortality and without exception refused to admit that death was an evil or life a good. Both being 'indifferent,' since neither is a virtue or a vice, it follows that sometimes one and sometimes the other is 'preferable' (*προηγμένον*); hence it is 'reasonable' for even the perfectly wise man to kill himself if it will benefit his friends or his country, or will free him from great pain or incurable disease.⁶ Suicide for trifling reasons, however, was condemned.

Epiktetos, perhaps the most lovable member of this school, puts the matter thus in an imaginary dialogue with his pupils: 'Epiktetos, we can no longer endure to be bound to this wretched body! . . . Let us go whence we came; let us at length get free of these chains that weight us down.' . . .

'Wait for God, sirs; when He gives the signal and sets you free from this your service, you shall depart to Him; for the present, endure to live in the place where He has stationed you. . . . Wait, do not depart unreasonably.'⁷

Another passage indicates what he means by a 'reasonable' departure: 'The room is smoky. If only moderately, I will stay; if there is too much smoke, I will go. Remember this, keep fast hold on it—the door is open. . . . "You must live in Gyara."⁸ Very well. But Gyara is open to me a very smoky room. So I will depart to a habitation in which no one can prevent me dwelling; a habitation which is open to everyone.'

The Epicureans did not indeed recommend suicide in general; but that death, although an evil, is not one which can touch or harm us is one of their fundamental principles. 'When we are, death is not present; when death is present, then we are not,' says the founder of the sect.¹⁰

The suicide of the ordinary unphilosophical man, Lucretius stigmatizes as self-contradictory, since it is caused by fear of the very death which it courts.¹ The Cynics professed to be absolutely indifferent to life and death as to everything else and are accused of killing themselves by extraordinary methods for little or no reason,² while some Skeptics were equally insensible.³ In Rome, where originally suicide appears to have been rare,⁴ the famous deaths of Cato, Thrasea, and others were for the most part inspired by Greek teaching, generally Stoic. Mediæval ethics added nothing new.

Perhaps the greatest contribution of modern times to the rational treatment of the matter is the consideration noticed in the opening paragraphs of this article, that many suicides are non-moral and entirely the affair of the specialist in mental diseases. Apart from this, and considering only cases where the agent is fully rational, the characteristic feature of the ethical discussions of the subject is their elimination of the theological elements in the arguments, Hume's famous essay 'Of Suicide'⁵ being the last important work to pay them much attention. Perhaps the school most nearly favourable to suicide is Utilitarianism; for, starting from its definition of a good act as one which increases the sum total of human happiness (identified with pleasure),⁶ one can easily imagine cases where the death of a man by his own hand would cause little or no pain to any one and would be more or less completely a source of pleasure to many. The more metaphysical schools discountenance it, either as an insult to humanity in general as embodied and exemplified in oneself (Kant) or as a final assertion of the will to live (Schopenhauer). There is also a tendency, arising from a contemplation of such medical facts as those already mentioned, to remove it altogether from the field of ethics—a view which we believe to be an exaggeration of a truth. The general trend of non-theological thought on the part of the ordinary educated man is towards a compromise between the extreme laxitude towards suicide represented by Stoicism and the extreme rigidity of the Kantians. That self-destruction is now and then justified by circumstances is admitted by most; and it is quite as widely admitted that those circumstances must be of an extreme and unusual kind to make the act anything else than cowardly and otherwise immoral.

LITERATURE.—Besides the works given under EUTHANASIA, the following may be cited: E. Tanzi, *A Text-book of Mental Diseases*, Eng. tr., London, 1909; C. Mercier, *Sanity and Insanity*², do. 1905 (short popular account); J. G. Frazer, *GB*, do. 1911-14; J. S. Mill, *Utilitarianism*, do. 1863 (many subsequent edd.). H. J. ROSE.

SUICIDE (Buddhist).—I. Introduction.—We are concerned only with 'religious suicide' and the Buddhist views thereon, not with the various kinds of suicide mentioned in Buddhist literature, interesting as they may be.⁷ The position of the old Indian ascetics in regard to suicide may be summarized as follows. While the majority of sects were addicted to rapid methods of suicide—throwing oneself down from a mountain, etc.—the Jains (and probably also the disciples of Gosāla) considered those methods vulgar and evil.⁸ Men

⁴ See art. SUICIDE (Greek and Roman) and note the clumsiness of the Latin, as compared with the Greek, expressions for suicide. The word 'suicide' itself, although of Latin derivation, is impossible as a Latin compound.

⁵ First published in his *Essays and Treatises*, London, 1777.

⁶ 'Actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness. By happiness is intended pleasure, and the absence of pain; by unhappiness, pain, and the privation of pleasure' is the famous dictum of J. S. Mill, *Utilitarianism*, ch. II.

⁷ See, e.g., *Mañjhīna*, ii. 109; a husband, threatened with separation from his wife, kills her and commits suicide, in order that they may be husband and wife in their next birth.

⁸ See *Kathākośa*, tr. C. H. Tawney, London, 1895, p. 8.

who thus kill themselves are reborn as demons.¹ While practising starvation, the Jain must avoid any desire for death (*maraṇāsāmsā*):² 'Renouncing all food and drink, I patiently wait for my end.'

2. Buddhism condemns asceticism.—Any austerity which is likely to weaken body or mind is forbidden. The Jains and many others saw in asceticism and physical pain (*dukkha*, *tapas*) a force that makes for purification from sin: suicide by starvation is the ascetic act *par excellence*.³ While vocal sins are destroyed through silence (*mauna*) and mental sins through 'respiratory-restraint,' bodily sins are destroyed through starvation (*abhojana*)⁴ and lust is crushed through mortification. Buddhism had better methods of crushing lust and destroying sin—the realization of the impermanence of pleasure and of the non-substantiality of the Ego, the experience in trance (*dhyāna*) of a happiness which has nothing to do with pleasure and destroys in a man any infatuation for pleasure. It was thus enabled to disqualify ascetic methods.

3. Buddhism condemns suicide.—There is a celebrated text:

'A monk who preaches suicide, who tells man: "Do away with this wretched life, full of suffering and sin; death is better," in fact preaches murder, is a murderer, is no longer a monk.'⁵

A man must live his allotted span of life. He cannot avoid, by suicide, the sufferings which are the result of his former evil deeds; nor can he win sooner, by a voluntary death, the reward of his good deeds. Everything comes to him who waits. To that effect Buddha employs to Pāyāsi the simile of the woman who cuts open her body in order to see whether her child is a boy or a girl.⁶

It seems also that suicide from religious motives is not effective. Buddhists object to 'thirst for non-existence' (*vibhavatrṣṇā*), as they object to 'thirst for existence' (*bhavatrṣṇā*). A saint must abide in indifference, without caring for life, without caring for death. He will not commit suicide in order to reach *nirvāṇa* sooner. Is not suicide a desperate act of disgust and desire, disgust of existence, desire of rest?

4. Buddhism admits suicide.—We have therefore good reason to believe (1) that suicide is not an ascetic act leading to spiritual progress and to *nirvāṇa*, and (2) that no saint or *arhat*—a spiritually perfect being—will kill himself. But we are confronted with a number of stories which prove beyond dispute that we are mistaken in these two important conclusions. On the one hand, suicide may be in certain cases the actual cause or the occasion of the attainment of *arhatship*, although in other cases it may be premature and sinful. On the other hand, *arhats* commit suicide.

In illustration of the first point, we may quote the stories of the attempted suicide of (1) Sihā, (2) Sappadāsa, and (3) Vakkali; for the second the suicide of (4) Vakkali and (5) Godhika.

¹ The *giripadana* or *bhṛgyupāta* is *pāgayañjanachetthiya* (H. Jacobi, *Ausgewählte Erzählungen in Mahāvāṣṭī*, Leipzig, 1886, p. 2; A. Weber, *Fragment der Bhagavati*, Berlin, 1865-66, p. 206).

² On Jain suicide see J. J. Meyer, *Hindu Tales*, Eng. tr., London, 1909; Uvasagadasāo, ed. and tr. A. F. R. Hoernle, Calcutta, 1888-90, §§ 57, 89; *Āchārāṅgasūtra*, i. 7, 5-8, tr. H. Jacobi, *SBE* xxii. [1884] 74-75; E. W. Hopkins, *The Religions of India*, London, 1896, p. 291; G. Bühler, *Ueber die indische Sekte der Jainas*, Vienna, 1887, p. 12. As concerns Gośāla, see Uvasagadasāo, app. ii. p. 23 (suicide is permitted to ascetics who have reached the highest degree of perfection).

³ Violent death, voluntary or not, destroys sin (see J. J. Meyer, *Hindu Tales*).

⁴ See, e.g., *Majjhima*, i. 92; *SBE* i. [1910], s.v. 'Suicide,' the references to vols. xxii. and xlv.

⁵ *Pārājika*, iii.; see *SBE* xliii. [1881] 4.

⁶ *Digha-Nikāya*, ii. 331; *Dialogues of the Buddha*, ii. 350 (*SBB* iii. [London, 1910]).

(1) Sihā was distressed at not obtaining spiritual progress after seven years of endeavour. She said: 'What have I to do with this wretched life (*pāpajīvita*)? I will die through hanging.' But, just as the rope was tied round her neck, she was turning her thought towards enlightenment (*vipassanā*), as was her former habit. She attained *arhatship*, and at this very moment the rope loosened from her throat and fell.¹

(2) The story of Sappadāsa is to the same effect. This monk was overpowered by passion (*kilesa*) and never obtained concentration. This distressed him so much that he was about to commit suicide with a razor or a sword, when he suddenly realized the inward vision.²

(3) Vakkali was fond of looking at the Buddha, and the excessive importance which he attached to the physical body—a putrid body (*pūtikāya*)—of the Master was an obstacle to his spiritual advance. In order to create in him a 'holy fear' (*saṃvega*), the Buddha commanded him to go. Desperate at being no longer able to see the Master, Vakkali decided to commit suicide by throwing himself down from a mountain, saying: 'What have I to do with this life, if I can no longer see Him?' At this moment the Master appeared and prevented him from thus 'destroying the conditions of his reaching the Path (*maggaphala*).'³

(4) Vakkali was suffering from a painful illness. Bhagavat came to comfort him and said: 'Your death will be a holy one, an auspicious one (*apāpika*).' When the Master had gone, Vakkali uttered for the last time the Buddhist profession of faith (universal transitoriness) and took the sword.⁴

(5) Godhika was unable because of disease to remain in a certain state of meditation. He thought: 'If I were to take a sword.' Māra approached the Buddha and told him: 'Your disciple wants to die; he has resolved to die. Prevent him. How could one of your disciples die while he is not yet an *arhat*?' But, as it is explained in the *Abhidharmakośavyākhyā*, Godhika reached *arhatship* just after he had begun cutting his throat.⁵ It is said: 'Those who take the sword are without regard for life; they achieve insight (*vipassanā*) and reach *nirvāṇa*.' 'Thus act the strong ones (*dhīra*); they desire not life; having removed thirst and the root of thirst (that is, ignorance), Godhika is at rest.'⁶

5. The *nirvāṇa* of the great saints.—Vakkali was an *arhat*, but, as he did not possess the power of 'loosening the *saṃskāras* of life,' he had, in order to die, to take the sword. On the other hand, Śākyamuni and, in later sources, a number of saints—e.g., Mahāpajāpatī Gotamī in the *Apadāna*—possess such a power. The Sanskrit *Abhidharma*⁷ teaches that it belongs to the saints who have reached the *nirupadhīśaṇnirvāṇa* ('*nirvāṇa* without rests').

In the case of Śākyamuni we have to deal with a voluntary death; in the case of Mahāpajāpatī, who has to obtain permission of Śākyamuni before she resolves to die, we have to deal with a voluntary death of a slightly different character. The Pratyekabuddhas, like Śākyamuni, decide for themselves when the 'time' has arrived; their method is to rise a few cubits above the ground and burn themselves.

We can easily understand that a Buddha, when he has set in motion the wheel, when he has elected two chief disciples—briefly, 'when he has done what he had to do'—is duly authorized to enter into the final rest. The case of an *arhat* is not different; the *arhat* also has achieved what he had to achieve—i.e. he has removed the slightest kind of desire. If he is not, like a Buddha, capable of abandoning life in a quiet way, there is no reason why he should not have recourse to more drastic methods.

6. Mahāyāna praises and deprecates suicide as self-surrender and worship.—The saint of the new Buddhism must, before reaching *nirvāṇa*, spend millions of lives in charity, worship, and meditation. 'Abandoning one's existence' (*ātmanas tyāgah*, *ātmaabhāvatyāgā*) is to be looked upon as the best self-sacrifice, for to give one's body is better than to give alms; and also as the best

⁶ The *Mitundapāṇḍita* deals with suicide (see *SBE* xxxv. [1890] 273 ff.), but does not mention Godhika and Vakkali. See J. P. Minayeff, *Recherches sur le bouddhisme*, tr. R. H. Assier de Poupignac, Paris, 1894, p. 223; *Saṃyutta*, i. 120, iii. 123; Dhammapada's Commentary, v. 57 (ā. 431); *Kāthāvatthu's* Commentary, ad i. 2.

⁷ *Abhidharmakośa*, ch. vi.

worship, for to burn one's body as an offering is certainly more meritorious than to kindle lamps at a shrine. We may refer (1) to the story of the future Śākyamuni giving his body to feed a starving tigress,¹ and (2) to the legend of Bhaiṣajyarāja, who, dissatisfied with his previous worship although painful and extravagant, filled his body with all sorts of oil and set it on fire.²

The *bodhisattvas* of the past have practised in that way many heroic deeds (*duḥkara*), some of which are told in the canon of ancient Buddhism (*Chariyapitaka*, *Jātaka*); the new scriptures are inexhaustible on this topic.

In accordance with the principles of the new Buddhism and the *Légende dorée* of the eternal Buddhism, self-surrender culminating in voluntary death has been held in honour in various Buddhist countries. It happens (or it used to happen) that Chinese monks beg for fuel, build a funeral pyre, sit cross-legged on it, cover their head with linen soaked in oil, and set themselves on fire. With some branches of the Chinese Mahāyāna, the 'burning of the skull' is an essential part of ordination as a 'future Buddha'—a symbol of the holocaust for which human courage is nowadays inadequate.³

The pilgrim I-tsing says that Indian Buddhists abstain from suicide and, in general, from self-torture.⁴ Whether this statement be accurate or not—A. Barth did not believe it to be quite accurate—the theologians of the Great Vehicle strongly deprecate such practices. One of the chief aims of Śāntidesa in his *Śikṣāsāmuḥchaya*,⁵ 'A Compendium of the Rules of the Disciple of the Great Vehicle,' is to elucidate this point: In what measure is a disciple—a beginner—to imitate the heroic deeds of the *bodhisattvas* of old? The disciple is ready, willing, and resolved even to commit sin and to burn in hell for the sake of another, not to mention sacrificing his limbs and body; but he must avoid any mistake in the realization of his resolve. The question is whether in such and such a case sacrifice or self-denial is really useful to our fellow-creatures; whether there is not some other means of procuring universal welfare. To sum up, the sacrifice of one's body is not in accordance with a wise estimate of the spiritual needs of a beginner.

SUICIDE (Chinese).—Suicide is at least not uncommon in China. Literature and history supply illustrations. In a Chinese novelette the heroine commits suicide on the grave of her betrothed lover to avoid the marriage arranged for her with his rival, and that rival thereupon takes his own life in order to pursue in the other world at once his quest for his bride and vengeance on her lover. Among some eight hundred biographical

² *Saddharmapundarīka*, xxii., tr. H. Kern, *SBE* xxi. [1884].

³ See J. J. M. de Groot, *Le Code du Mahāyāna en Chine*, Amsterdam, 1893, pp. 50, 217, 227. It is recorded that in the Japanese sect of Sukhāvati religious suicide was not unknown. In 1422 a large company of persons, after hearing a stirring sermon by a zealot to the effect that paradise may be gained solely by calling on the name of Amītabha, committed suicide by walking into the sea while repeating the 'Namu Amida Butsu.'

⁴ *A Record of the Buddhist Religion*, tr. J. Takakusu, Oxford, 1896, p. 197 f. (ch. xxxviii. f.); A. Barth, *Journ. des Savants*, 1898, p. 541.

⁵ *Bibl. Buddhica*, i. [Petrograd, 1902].

notices in W. F. Mayers's *Chinese Readers' Manual*,¹ 27 instances of suicide are recorded—generals after defeat, a tyrant to escape his impending doom, a dethroned ruler, statesmen whose advice, like Ahithophel's, has been rejected, or who desired to enforce their counsel by this last proof of their earnestness, a captive to avoid exile, hopeless prisoners, ministers who, having incurred imperial displeasure, were allowed to die thus rather than by the hands of the executioner, a rebel whose plot was discovered, women to avoid a marriage deemed by them to be shameful, an upright servant rather than commit a murder enjoined on him, a minister of justice under whose subordinates capital punishment was unduly frequent, those moved by loyalty to a deceased master, by grief for the death of father or son, or by shame for a son's treachery.

In addition to suicides on such occasions as these, some of which will be noted as peculiarly Chinese, cases also occur in which misery (*e.g.*, hopeless leprosy) drives to suicide. More frequent are cases in which suicide is committed in an access of passion, sometimes with the view of involving one's adversary in legal proceedings in this world, or less frequently with the hope of harassing him by visitations of the vengeful ghost.

Hanging, leaping down a well, and opium poisoning have been perhaps the most common methods of suicide; the last may diminish in frequency under the present opium restrictions.

In the absence of accurate statistics it is impossible to estimate the ratio of deaths by suicide to the total population. The general impression, probably well founded, is that suicide is much more frequent than in Great Britain. This greater frequency, if it is assumed as fact, may be accounted for by the low value put on individual life, a tendency to ungovernable rage, and the fact that social and religious feelings do not rigorously inhibit suicide, but rather in certain circumstances (*e.g.*, where marriage is being urged on a widow or a bride whose betrothed bridegroom has died) approve it.

P. J. MACLAGAN.

SUICIDE (Greek and Roman).—I. *GREEK*.—Under the name 'suicide' we here include all forms in which the individual kills himself intentionally, whether he acts of his own free will or under compulsion, and whether the end of his action be selfish or altruistic.

1. **Legendary suicides.**—The earliest definite mention of suicide in Greek literature is the case of Epikaste (Iokaste), the mother of Oidipus of Thebes, in the *Nekyia*.²

Odysseus tells how in Hades 'I saw the mother of Oidipodes, fair Epikaste, who wrought an awful deed in ignorance of mind, marrying her own son. And he had slain his father and he married her. And presently the gods made it known to men. Then he in lovely Thebe endured sorrow and ruled over the Kadmeans by the grievous counsels of the gods. But she went to the house of Hades, fastening a high noose from the lofty hall, holden by her woe. And to him she left sorrows in the aftertime full many, even all that the Erynyes of a mother bring to pass.'

The precise motive for suicide is not very clearly indicated here, or rather Homer does not distinguish clearly between the horror of Epikaste at the revolting nature of the situation in which she unwittingly finds herself and her shame in the face of her deed becoming known. But the essential points are that (1) suicide presents itself to Homer as the natural and fitting act when life has lost all that makes life worth living, and (2) no blame attaches to suicide in itself.

¹ New ed., London, 1910.

² *Iliad*, Od. xi. 271 ff.

But the most famous and indeed the typical heroic suicide is that of Aias. Homer does not mention his suicide explicitly, but it is clearly alluded to in *Od.* xi. 548 ff., where Odysseus expresses his regret at having obtained the arms of Achilles:

ὡς δὴ μὴ δέφαλον νικᾶν τοιῶδες ἐπ' ἀέθλω·
τοῖν γὰρ κεφαλὴν ἕνεκ' αὐτῶν (the arms of Achilles) γαῖα
κατέσχευ,
Διανθ', ὅς κτλ.

His suicide was recounted in the *Aithiopsis* of Arktinos in connexion with the award of the arms of Achilles to Odysseus.¹ It is to be noted that so far there is no mention of madness or of an attack by Aias upon the herds. These incidents were, however, recounted in the *Little Iliad* of Lesches.² Also, whereas in *Od.* xi. 555 it is emphasized that the death of Aias was mourned by the Greeks equally with that of Achilles, the *Little Iliad*³ told of the withholding of burial honours. But even so there is nothing to indicate that the suicide in itself was considered blameworthy. It is an act quite in accordance with the haughtiness and self-sufficiency which characterize Aias in Homer, and of which the famous 'silence of Aias' in *Od.* xi. 553 ff., so admired by the author of the treatise *On the Sublime*,⁴ is a fitting expression. The suicide of Aias is the typical act of a great soul which cannot brook dishonour.

A motive of a less heroic kind which prompts to suicide is excess of sorrow for the dead. The feeling is one familiar to Homer. 'If I lose thee, it were better for me to go beneath the earth,' says Andromache to Hektor,⁵ in the same spirit in which David cries, 'Would God I had died for thee, O Absalom, my son, my son!'⁶ There is not in Homer any express mention of suicide for this reason, but Antikleia is referred to in terms which are hardly consonant with any other explanation than that she died by her own hand.

Ermaios says to the disguised Odysseus: 'Laertes still lives, but evermore he prays to Zeus that life may perish from his limbs within his halls; for he mourns exceedingly for his son that is gone and for his wedded wife, whose death beyond all else hath grieved him and brought him to untimely age. She in grief for her glorious son perished by a miserable death (λευγαλέω θανάτῳ): so may none perish who dwells here friendly to me and doing friendly deeds.'⁷

The natural inference from these words is strongly confirmed by the reference to her in *Od.* xi. 84 ff. and 197 ff. The later story said frankly that she hanged herself.⁸

The list of such suicides is a long one.

Aigeus, father of Theseus, had arranged with his son when he left for Crete, carrying the annual tribute of the Athenians to the Minotaur, that, if Theseus were successful in slaying the monster, a white sail should be hoisted upon the returning vessel. Theseus forgot to take down the black sail which the ship was flying, and Aigeus, thinking that his son had perished, threw himself from the rock on which he was keeping watch into the sea (Ægean) which thenceforth bore his name.⁹ Erigone, daughter of Ikarion, hanged herself when she found the dead body of her father.¹⁰ Skedasos committed suicide when his daughters had hanged themselves.¹¹ When Evadne throws herself on the funeral pyre of her husband, her father Iphis threatens to commit suicide by starvation.¹²

A special case of suicide to avoid shame is that to escape sexual dishonour.

Legend told how the Leukadian rock received its name from Leukatas, who, to escape the unwelcome attentions of Apollo, plunged into the sea off the island of Leukas.¹³ Pausanias tells us¹⁴ how the daughters of Skedasos of Leuktra hanged themselves to escape the violence offered them by certain Lacedæmonians.

Suicide, in the sense of self-devotion for one's country, has always occupied a prominent place in patriotic saga. Kodros, the last king of Athens, is a famous example.

The Lacedæmonians, under pressure of famine, resolved to invade Attica. But first they consulted the Delphic oracle as to their prospects of taking Athens and, receiving an answer that they would be successful if they did not kill the Athenian king, marched on the city. Cleomantis, a Delphian, secretly communicated to the Athenians the purport of the oracle. Kodros thereupon dressed himself as a beggar and stole out of the besieged city and proceeded to gather firewood. When two enemy scouts approached him, he slew one of them with his hatchet, whereupon the other, taking him for a beggar, drew his sword and slew him, thus rendering the capture of Athens impossible.¹

There is the similar story of Makaria, daughter of Herakles and Deianeira.² That such a death was deemed a glorious one is sufficiently attested.³

2. Heroic suicide.—The motives which in the Homeric poems seem mainly to be regarded as prompting to suicide are of a heroic nature—the sense of dishonour suffered or impending, the devotion of a high purpose, or the intolerable sorrow of a personal bereavement. The sense of the common ills of humanity is by no means ignored—*τλήτων γὰρ Μοῖραι θυμὸν θέσαν ἀνθρώποισιν.*⁴ But there is no pessimism. Whatever the evils that darken human life, at least it is a good thing to enjoy the sun, and the darkest shadow that falls athwart Homeric life is the sense not of its burden but of its brevity. Life at any level is to be preferred to the sunless realms of Hades.⁵

But with the rise of reflexion, as witnessed in the poetry of the age succeeding the Homeric, we have a view of life which is frankly pessimistic. Hesiod conceives the present to be an age of iron, thrown into darker relief by the picture of a happier golden age gone by.⁶

That life is an evil has become a commonplace. *πάντων μὲν μὴ φῦνα ἐπιχθονίοισιν ἄριστον*⁷ is a doctrine which becomes a hackneyed phrase of later poetry—*τὸ μὲν δὴ πανταχοῦ θρυλούμενον, κράτιστον εἶναι φημι μὴ φῦνα βροτῶν.*⁸ The logical consequence of this view of life is that man is justified in ending what he cannot mend. Whether, in fact, this pessimistic view of life actually induced an increased practice of suicide is more difficult to establish. But in any case motives of a less heroic kind seem now to be recognized as worthy causes of suicide. Thus poverty is expressly recognized by Theognis⁹ as a sufficient cause.

3. The historians.—In the historians of the 5th cent. suicide is not a particularly prominent feature, and belongs in general to one or other of the types already noticed.

Herodotus relates the legend of Nitokris, who, in order to escape punishment for her misdeeds, committed suicide by leaping into a room full of ashes.¹⁰ Arion is compelled by the ferryman either to commit suicide, with the prospect of being buried ashore, or to jump into the sea.¹¹ The daughter of Mykerinos, being violated by her father, hanged herself from grief.¹² Shame was the motive for the suicide of Spargapises, leader of the Massagetai, who in a state of intoxication were surprised and killed or captured by the Persians.¹³ And we have the parallel stories of Othryades, who, ashamed to return to Sparta when his company was killed, slew himself at Thyraei,¹⁴ and of Pantites, who, having survived the disaster at Thermopylai, 'on his return to Sparta, being held in dishonour, hanged himself.'¹⁵

In Thucydides we read how in 427 B.C. the Corcyrean democrats 'went to the temple of Hera and, persuading some fifty of the suppliants (belonging to the oligarchic party) to stand their trial, condemned them all to death. The majority refused to come out, and, when they saw what was going on, destroyed one another in the enclosure of the temple where they were, except a few who hanged themselves on trees or put an end to their lives in any other way they could.'¹ Again in 425 B.C. the oligarchs of Corcyra were entrapped into a large building from which they were led forth in groups of twenty for execution. When those in the building got to know what was happening, they refused to come out. Then the Corcyrean populace broke a hole in the roof through which they showered tiles and arrows at those within. 'The prisoners tried to shelter themselves as best they could. Most of them put an end to their own lives. Some thrust into their throats arrows which were shot at them; others strangled themselves with cords taken from beds which they found in the place, or with strips torn from their own clothes. This went on during the greater part of the night, until in one way or another, by their own hands or by missiles from the roof, they all perished.'² Thucydides knows, too, the story that Themistokles poisoned himself: *λέγουσι δὲ τινες καὶ ἐκούσιον φάρμακον ἀποθανεῖν αὐτόν*.³

In Xenophon, *Hell.* vi. ii. 36, we have the familiar motive of shame. Krinippos, when the Syracusan fleet under his command was captured by Iphikrates (373 B.C.), *ὑπὸ λύπης θανάτω ἀδαιρέτω ἀποθνήσκει*. So *Hell.* vii. iv. 9, when the invading Arkadians were attacked in camp by the Eleans, whom they defeated, the Elean hipparch, who was held responsible for the attack, committed suicide (364 B.C.).

But the suicide which is more prominent in Xenophon is of the romantic type, described as *ἐπιποθάνειν, ἐπισφάζει ἑαυτόν*, where love faithful unto death refuses to be comforted otherwise than by sharing the fate of the beloved. 'Cyrus himself died, and eight of his best followers fell over him (*ἔκειντο ἐπ' αὐτῷ*). And Artapates, the most faithful of his staff, when he saw that Cyrus had fallen, is said to have leapt from his horse and thrown himself upon him. And some say that the king ordered him to be slain over Cyrus (*ἐπισφάζει αὐτόν Κύρου*); but others say that he drew his sword and killed himself over him (*ἑαυτόν ἐπισφάζεσθαι*).'⁴ We have the same motive in the story of Pantheia, so beautifully told by Xenophon.⁵

The emotional value of this motive has made it very prominent in literature, as, indeed, it has everywhere and at all times been actually a very common cause of suicide.

It is familiar to the OT.⁶ Already in Homer Antilochos holds the hands of Achilles, lest in his grief for Patroklos he should cut his throat;⁷ and, even if suicide is not meant, Andromache's anguish for Hektor almost makes her die.⁸ Most familiar perhaps of all is the case of Laodamia, the wife of Protesilaos, to whom she had been married just before his departure for Troy. There Protesilaos was the first to leap ashore and, after slaying many Trojans, was killed by Hektor. After his death his wife grieved for him so much that Hermes for pity brought back Protesilaos from the dead. At first Laodamia, thinking he had actually returned from Troy, rejoiced, but when he returned to Hades *ἑαυτὴν ἐφόνευσεν*.⁹ As this legend is enshrined for us in the verses of Wordsworth, so Tennyson has told the story of another who was faithful unto death: Oinone, the beloved of Paris, whose story is unknown to the epic cycle and to the tragedians. When Paris died, she either hanged herself¹⁰ or threw herself into his funeral pyre.¹¹

Another late legend is that of Hero and Leander, the subject of the poem by Musaios entitled *τὰ καθ' Ἡρώ καὶ Λεάνδρον*. Leander of Abydos swam the Hellespont nightly to visit his beloved Hero, the priestess of Aphrodite at Sestos across the straits, being lighted by a lamp which Hero set upon her tower by the seashore. He attempted the passage one stormy night, when the lamp was extinguished by the storm. Next morning his dead body was washed ashore, and Hero threw herself from her tower to join him in death.¹ Pausanias² remarks of three heroines, Marpessa, Kleopatra, and Polydora, that they all committed suicide in this way: *προποθανοῦσι πάντα τοῖς ἀνδράσιν ἑαυτὰς ἐπικατέσφαζαν*.

The motives of such suicides are not always identical and no doubt were sometimes complex. Sometimes it was the last sacrifice of devotion, a tradition become a religion, like the Indian *sati* or our own proud tradition that the captain goes down with his ship.

Xenophon tells how in 388 B.C. Anaxibios the Spartan, falling into an ambush, said to those by him: "'Gentlemen, my duty is to die here. As for you, seek safety before we engage the enemy.'" Then he took his shield from his armour bearer and fell fighting at his post. But his favourites (*τὰ παιδικά*) abode with him, and twelve of the Lacedaemonian harmosts who had come from the cities died with him fighting.³ Haimon in the *Antigone* of Sophocles had all along determined to die with Antigone,⁴ but the actual suicide is complicated by his futile attempt to slay his father and becomes outwardly an act of disappointed rage.⁵

Where the suicide considers himself responsible for another's death, his own death may appear to be due as an act of atonement.

Thus Kallirrhoe, having by her unkindness brought about the suicide of her lover Koresos, repented and out of pity for him and shame for her conduct killed herself,⁶ precisely as Adrastos, when he accidentally killed the son of Cræsus, 'stood before the dead and submitted himself to Cræsus, holding out his hands and entreating him to slay him over the dead (*ἐπικατασφάζει τῷ νεκρῷ*) since for him life was no longer tolerable (*οὐδὲ οἱ εἶναι βιώσιμον*).'⁷

But, without any such complications, we have the devotion of those who, lovely and pleasant in their lives, in death would not be divided. When Kastor is slain by Idas, his brother Polydeukes cries: 'Our Father, Son of Kronos, what release shall there be from sorrow? Give me also to die with him, O Lord. Honour is departed for him who is bereft of friends.'⁸ And the more one knows of the religious thought of the Greeks, the less is one inclined to disparage the influence of the motive to which Plato alludes—the hope of a blessed reunion hereafter: 'Ere now for human love, for dead wife, for dead son many a man has gone willingly to the house of Hades, drawn by the hope that in the world beyond they might see and be with those they loved.'⁹

4. **Compulsory suicide.**—A special interest attaches to Xenophon, *Hell.* ii. iii. 56. In describing the execution by compulsory suicide of Theramenes in 403 B.C., he says: 'When, being compelled to die, he drank the hemlock (*τὸ κώνειον ἐπιε*), it was said that he threw what was left of it as in the game of *cottabos*, crying, "This for the fair Kritias!"' This is the first occurrence of the word *κόνειον* in the historians and the only one in Xenophon. When the practice of execution by compulsory poisoning was introduced in Athens we do not know, nor when hemlock first became the recognized medium. The use of hemlock for this purpose, we may with probability suppose, first became regular in the latter part of the 5th cent. B.C. Even in the orators, however, references to it are surprisingly rare. It is not mentioned in Antiphon. Andocides mentions it only once.¹⁰ Lysias refers to it twice.¹¹ It is not found in Demosthenes, Lycurgus, Dinarchus. The advantages of hemlock-drinking over other more

cumbrous methods of suicide are referred to in the *Frogs*¹ of Aristophanes (405 B.C.).

It was by drinking hemlock that Socrates died in 399 B.C.² It was the method used by the Athenian women whom the shameful conduct of the characters of Euripides drove to suicide, according to Aristophanes.³ It is difficult to resist the conclusion that in the stress and excitement and anxiety of the closing years of the Peloponnesian war suicide had assumed a prominence hitherto unknown, and it would appear that this phenomenon was not unconnected with the interest in the preparation of speedy and painless modes of putting an end to life. Incidentally it may be noted that Attic hemlock was reputed to be specially effective.⁴ Theophrastus tells us of the discovery by Thrasyas of Mantinea of a *ῥάδια καὶ ἀπονοῖα ἀπόδυσσις* in which the juices of hemlock (κάνειον) and poppy (μήκων) and other such herbs were made up in a dose of small bulk, weighing about a drachma, the effects of which were incurable and which, moreover, would keep and retain its potency for an indefinite period.⁵ No doubt, also, the fact of having at their disposal a convenient and not too painful means of terminating life induced, as in our own time, many rash persons to attempt their lives. It is interesting to note that Menander wrote a play with the title *Κωνειάζομενα*. Hence there was developed the interest in antidotes of which we have evidence.⁶ Theophrastus has much to say of antidotes.⁷ In particular it is interesting, in view of the attitude of the people of Ceos to suicide, to notice that to them is attributed an improved method of preparing hemlock.⁸

The story of the death of Theramenes points in the same direction. When in our own country death by the axe of the headsman was a common fate, it became a point of honour with his victims that they should take leave of life like gentlemen. Montrose, we are told, went to the scaffold clad in rich attire 'more becoming a bridegroom than a criminal going to the gallows.' Such conduct is the true analogue to the dying libation of Theramenes. Socrates had the same idea :

'What about making a libation with this cup?', he says to the jailer, 'May I or not?', and, that not being feasible, he yet drank the cup of death 'easily and cheerfully' as one who toasts a friend.⁹

And, as meaner victims of the axe imitated the conduct of Montrose and others, and the grand manner degenerated into the bravado of the desperate and callous, so we have a degenerate echo of the heroic in the story told by Ælian and Athenæus of the devotees of debauchery who, having drained the cup of pleasure to the lees, ended by throwing away the cup, and concluded life's banquet with a toast.¹⁰

5. Legal aspect.—So long as suicide does not become so frequent as to threaten seriously the well-being of the community, the State has no motive to intervene by legislation against it. At no time does Athenian law define suicide as a penal offence. The only outbreak of which we hear in Attica suggesting an epidemic of suicide is that which legend connected with the origin of the Aiora, or swing-festival.

¹ 116 ff.

² Plato, *Phædo*, 57 A : τὸ φάρμακον ἔπινεν; cf. 57 B, 116 D, 117 A. Though Plato does not name the poison, it is clear from the symptoms described that it was hemlock. Ælian, *Var. Hist.* i. 16, calls it merely τὸ φάρμακον; Diodor. xiv. 37 : πῶς κώνειον ἐτελεύτησεν; Diog. Laert. ii. 42.

⁶ Plato, *Lysis*, 219 E : 'I mean, for example, if a father knew that his son had drunk hemlock and thought that wine would save him, he would value the wine.' Cf. Nicander, *Alexipharmaca*, 186.

⁷ ix. xvi. 6.

⁸ *Ib.*, 9.

⁹ Plato, *Phædo*, 117.

¹⁰ Ælian, *Var. Hist.* iv. 23; Athen. xii. 537 C.

Legend told how, when Dionysos first came to Attica with the new gift of wine, he was hospitably entertained by Ikaros, to whom he revealed his intoxicating boon. Ikaros gave of the wine to some shepherds, who in their vinous frenzy killed their would-be benefactor. His daughter, Erigone, guided to the spot by his faithful dog Maira, hanged herself on a tree. Then there broke out among the Athenian women an epidemic of hanging, which abated only when the Athenians discovered the cause and instituted the Aiora festival in honour of Erigone.¹

Plutarch tells of a similar outbreak at Miletos which, obscure in origin, was generally attributed to atmospheric conditions :

'A strange and terrible affliction once came upon the maidens of Miletos, from some obscure cause—mostly it was conjectured that some poisonous and ecstatic temperament of the atmosphere produced in them a mental upset and frenzy. For there fell suddenly upon all of them a desire of death and a mad impulse towards hanging. Many hanged themselves before they could be prevented. The words and the tears of their parents, the persuasions of their friends, had no effect. In spite of all the ingenuity and cleverness of those who watched them, they succeeded in making away with themselves. The plague seemed to be of an unearthly character and beyond human remedy, until on the motion of a wise man a resolution was proposed that women who hanged themselves should be carried out to burial through the market-place. The ratification of this resolution not only checked the evil but altogether put an end to the passion for death. A great evidence of the high character and virtue of the women was this shrinking from dishonour and the fact that they who were fearless in face of the two most awful things in the world—death and pain—could not support the appearance of disgrace nor bear the thought of shame after death.'²

Theramenes, in whose time hemlock as a means of suicide appears to have come into vogue, was a native of Ceos, and we have seen above that Theophrastus³ ascribes to the Ceans certain improvements in the method of preparing that poison. There is evidence that at some period suicide by drinking hemlock was a recognized practice—if not a legal regulation—in Ceos for persons who had passed the age of 60. Strabo⁴ (63 B.C.—A.D. 23), speaking of Iulis, the chief town in Ceos, birthplace of Simonides and his nephew Bacchylides, says :

παρὰ τοῦτους δὲ δοκεῖ τεθῆναι ποτὲ νόμος, οὗ μέμνηται καὶ Μένανδρος [342-291 B.C.] "καλὸν τὸ Κέως νόμιμόν εἶναι, Φανία δὲ μὴ δυνάμενος εἶν καλῶς, οὐδ' ἔτι κακῶς." Προσέτατε γὰρ, ὡς εἴκεν, ὁ νόμος τοὺς ὑπὲρ ἐξήκοντα ἔτη γεγονότας κωνειάζεσθαι, τοῦ διαρκεῖν τοῖς ἄλλοις τὴν προφήν, καὶ πολλορκομμένους δὲ ποτὲ ὑπ' Ἀθηναίων, ψηφισσάσθαι φασὶ τοὺς πρεσβύτας τοὺς ἐξ αὐτῶν ἀποθάνειν, ὀρισθέντος πλήθους ἐπ' αὐτοῖς δὲ παύσασθαι πολλορκομίας.

Stephanus of Byzantium⁵ writes to the same effect.⁶ So too Ælian.⁷ Valerius Maximus, who wrote under Tiberius, attests a similar practice for Massilia and tells of the Ceian practice as he had actually witnessed it.⁸

In Thebes, too, the treatment of suicides attracted some remark.⁹ In Athens such differential treatment as we hear of is of a religious rather than of a legal nature. The suicide as a victim of violence belongs to the class of those whose spirits 'walk.'¹⁰ According to a statement in Suidas,¹¹ suicides and other victims of violent and untimely death were buried in a special place. We find a similar ordinance given by Plato.¹² To the same order of ideas belongs the Athenian custom of burying the hand which wrought the

deed apart from the suicide's body.¹ Josephus, in mentioning the custom, adds the unsatisfactory reason that the hand was regarded as alien to the body.² It is more natural to connect the practice with the idea of the soul of the suicide 'walking'—'perhaps to prevent his ghost from attacking the living.'³

6. **Philosophy.**—As regards the attitude of the philosophic schools, the teaching of the Pythagoreans condemned suicide. According to Orphic or Pythagorean doctrine, the soul is undergoing in the body a penitential discipline for ante-natal sin.⁴ Hence suicide is an unwarranted rebellion against the will of God on the part of the individual, whom it behoves to wait until it please God to set him free.

Plato, if we may infer his position from the *Phaedo* and the *Laws*, condemns suicide on grounds which we would characterize as religious. Religious, too, are the grounds on which Aristotle appears to regard suicide as reprehensible.⁵ Aristotle treats suicide as an offence not against the individual, but against the State, and that of a religious kind, as involving the city in pollution and requiring therefore penalties of a religious nature. No doubt Aristotle had in view such ceremonial observances as the severance of the right hand and the like, to which we have referred above.

Stoic teaching was decidedly favourable to suicide. Life and death being for the wise man indifferent (*ἀδιάφορα*), morally neither good nor evil, the question of suicide resolves itself for him into a decision whether life or death is in a given case preferable. Life in accordance with nature being the Stoic ideal,⁶ when the conditions essential to that ideal are no longer fulfilled, suicide becomes a reasonable deliverance (*ἐξάλογος ἐξάγωγῆ*).

Thus suicide may be demanded by a man's duty to his country or his friends or by a condition of severe pain or of physical disablement or incurable disease.⁷ The paradox of the Stoic position is that the question of 'to be or not to be' is decided not with regard to virtue or vice, but with regard to the *ἀδιάφορα*, the 'indifferent' things. It is a question of *τὰ καθήκοντα* and *τὰ παρὰ τὸ καθήκον*.⁸ Hence it may be proper (*καθήκον*) for the happy to commit suicide, for the unhappy to remain in life.⁹ Goodness or badness *per se* has no bearing on the question.¹⁰ There is, indeed, little that differs from the Platonic position in the statement of their doctrine in Diogenes Laertius.¹¹ But the danger of the Stoic doctrine lay in the facility with which comparatively trivial discomforts might be held to justify suicide.

Zeno (c. 300 B.C.), the founder of the Stoic school, is said, according to one account, to have taken his own life because he had stumbled and wrenched his finger.¹² Cleanthes, his successor, having developed a gum-boil, refrained from food by the advice of his doctors for two days. The treatment was successful, and the doctors relaxed the regime and allowed him *πάντα τὰ συνήθη*, all the usual foods. But Cleanthes, having gone so far in the path of death, persisted to the end.¹³ For the Stoic the length or brevity of life was a matter of indifference.¹⁴

The Cynics, too, favoured suicide. Antisthenes

seems to have used the term, afterwards so familiar in the Stoics, *ἐξάγωγῆ*, to denote suicide.¹ Diogenes is said to have recommended suicide to Antisthenes.

According to Diog. Laert. vi. 18, when Antisthenes was lying upon his deathbed, Diogenes visited him, carrying a dagger; and, when Antisthenes said, 'Who will deliver me from this trouble?', Diogenes, showing him the dagger, said, 'This.' There is a similar story in Diog. Laert. iv. 3, that on one occasion Speusippus, driving in his carriage to the Academy, met Diogenes and wished him good-day (*χαίρε εἰπεῖν*), to which he replied that he would not wish him the same *ὅστις ὑπομένεις ζῆν τοιοῦτος ἄν.*

On the other hand, the Academic, Peripatetic, and Epicurean schools were all opposed to suicide, at any rate in theory.

With regard to the Academics it may suffice to quote the story of Carneades, who, when he heard that the Stoic Antipater had committed suicide by drinking poison, exclaimed, 'Then give me too to drink!' And, when his friends said, 'What?' 'Athol brose' (*οὐδέμελε*), he said.²

The Peripatetics hold that the excellences of the soul are superior to the excellences of the body and other external excellences, yet they aim at the other excellences, first, as desirable for their own sakes, and next, as being useful *πρὸς τε τὸν πολιτικὸν καὶ τὸν κοινωνικὸν βίον καὶ δε καὶ πρὸς τὸν θεωρητικὸν. παραμετρεῖσθαι γὰρ τὸν βίον ταῖς πολιτικαῖς καὶ ταῖς κοινωνικαῖς πράξεσι καὶ ταῖς θεωρητικαῖς.*³ Their attitude to suicide is thus in sharp contrast to that of the Stoics.

As regards the Epicureans, believing as they did in the extinction of the soul at dissolution, it might well seem that life at any level was at least worth something, and it were folly to cast that away for the nothingness of the grave. It would seem that they occupied themselves particularly in pointing out the folly of committing suicide through fear of the terrors of death.

'Death, that most dreaded of ills, is nothing to us. For while we are, death is not; and when death has come, we are not. Death, then, is nothing to the living nor yet to the dead, since it does not affect the former, and the latter no longer exist. The crowd, to be sure, at one time shrink from death as the worst of evils, at another choose it as a refuge from the miseries of life. But the wise man neither declines life nor shrinks from death, since life is not distasteful to him, nor does he think it an evil not to live.'⁴

The Cyrenaics seem in general to have been opposed to suicide. Theodoros, counting the world his country and disbelieving in friendship, held that even self-sacrifice for one's country was unjustifiable.⁵ Hegesias, on the other hand, preached suicide so frankly as to earn the title of *ὁ Πεισιθάνατος*,⁶ and with such success as to provoke the interference of Ptolemy.⁷

7. **Religion.**—From the religious point of view suicide was regarded always as a crime, a violation of the social order. We have seen that Orphic teaching condemned suicide. But it is impossible to regard this condemnation as limited to so confined a circle. The more one reflects on the evidence, the more one is forced to the conclusion that much which we ascribe to the Orphics is really part of the general tradition—part of the popular belief. The sort of doctrine which Plato ascribes at one moment to the mystics he at another ascribes to popular belief. In any case the belief in immortality is described in the *Apology* as among *τὰ λεγόμενα*, among the popular beliefs. And popular belief certainly differentiated between the fortune after death of the suicide and of those who died a natural death (*θανάτῳ εἰμαρμένῳ, morte sunt*). Already in Homer it is difficult to account for the position of Antikleia, the mother of Odysseus, on any other supposition than that

she is a suicide and thus not admitted immediately to the realm of Hades.¹ We have seen above that, according to one tradition, the dead Aias was deprived of certain rites of burial. The same feeling is at the bottom of the practice of severing the right hand of the suicide and burying it apart from the rest of the body. So in our own country suicides used to be buried at the marches in a no man's land: or, if in the churchyard, the body must be passed over the wall and not enter by the gate.

As popular religion regarded with horror all shedding of blood, all interference with the natural bounds of life, so it regarded with a peculiar horror the shedding of kindred blood (*αἷμα ἐμφύλιον*). Ixion, who first introduced this crime—*ἐμφύλιον αἷμα πρόωριστος οἶκ ἄτερ τέχνας ἐπέμιξε θνατοῖς*—won for himself a choice woe.² The supreme case of 'kindred blood'—which is the term used by Sophocles to denote the patricide of Oedipus³—is suicide. The Greek language hardly distinguishes between self-murder and murder of kin. The suicide belongs to the class of the victims of violent and untimely death—*ἄωροι βαιοθάνατοι* (or, in late usage, *βιοθάνατοι*)—the murdered, the dead on birth or in nonage,⁴ the unborn victim of abortion,⁵ regarding the fate of whom the popular mind was peculiarly sensitive. It seems probable that these religious grounds, and not any speculative theories, were the really active motives at all periods of ancient Greece in condemning the practice of suicide.

II. ROMAN.—I. Heroic suicide.—What we may call the heroic type of suicide—committed either to escape intolerable shame or for great causes which seem to demand the sacrifice of the individual life—was thoroughly consonant with the character of Republican Rome. Such suicides were a prominent feature in the early history of Rome, and the tradition of them undoubtedly exercised a powerful influence upon later conduct.⁶

The typical example of self-sacrifice for the fatherland is that of the Decii. According to modern authorities, the story is true only of the younger Decius. But, in any case, both are enshrined in Livy's matchless prose. The elder, P. Decius Mus, devoted himself in 337 B.C. in a battle with the Latins near Mount Vesuvius, when he was in command of the left wing. A precisely similar story is told of the younger Decius, who at the battle of Sentinum in 295 B.C. devoted himself to death, charging into the densest ranks of the Gauls, where he fell.⁷

Suicide to escape intolerable dishonour is illustrated by the story of Lucretia, the victim of the *mala libido*⁸ of Sextus Tarquinius. Her story is too familiar to be told here.⁹

2. Penalties of suicide.—We have seen that suicide by hanging was regarded by the Greeks as a shameful type of death. When Oedipus discovers the nature of his sin, he can find no stronger words to describe his deeds than to say that they are *κρείσσον' ἀγχόνης*, i.e. such as even suicide by hanging could not expiate. The Roman feeling seems to have been precisely similar. If we quote the case of Amata, wife of King Latinus, it is mainly on account of the interesting matter preserved by Servius in his commentary on the passage. Vergil tells us that

¹ Regina ut tectis venientem prospicit hostem,
Incessi muros, ignes ad tecta volare :

¹ *Od.* xi. 85 f.

² Pind. *Pyth.* ii. 30 ff.

³ *Od. Tyr.* 1406.

⁴ Plato, *Rep.* 615 C: τῶν δὲ εὐθὺς γενομένων καὶ ὀλίγον χρόνον βιοῦντων.

⁵ See S. Reinach, *Ἄωροι βαιοθάνατοι*, in *ARW* ix. [1906] 312-322, and S. Wide, in *ARW* xii. [1909].

⁶ See Cic. *Pro Sextio*, 48, *pro Scario*, iii. 1 ff.

⁷ Livy, viii. 9 f., x. 28.

⁸ *Ib.* i. 67.

⁹ *Ib.* 57 f.; Ovid, *Fasti*, ii. 741 ff.

Nusquam acies contra Rutulas, nulla agmina Turni :
Infelix pugnae juvenem in certamine credit
Extinctum ; et, subito mentem turbata dolore,
Se causam clamat, crimenque, caputque malorum :
Multaque per moestum demens effata furorem,
Purpureos moritura manu discindit amictus,
Et nodum informis leti trabe necit ab alta.¹

Servius on this passage tells us that certain posthumous penalties attached to this form of suicide :

¹ Sane sciendum quia cautum fuerat in pontificalibus libris ut qui laqueo vitam finisset, insepultus abiceretur. . . Cassius autem Hemina [the oldest Roman annalist] ait : " Tarquinius Superbum cum cloacas populum facere coegisset et ob hanc iniuriam multi se suspensio necarent, iussisse corpora eorum cruci affigi : tunc primum turpe habitum, iussisse sibi consciscere." Et Varro ait : " Suspensiois quibus iusta fieri ius non sit, suspensiois oscillis² veluti per imitationem mortis parentari."

It is clear in any case that the grounds on which this particular kind of suicide was condemned were religious or mystical rather than ethical.

3. Suicide under the Empire.—That suicide was extremely prevalent under the Empire, at any rate among the higher ranks of society, cannot be doubted. Nor are the causes which contributed to this state of affairs difficult to conjecture. The most important were probably chiefly two : on the one hand the decay of religious belief and on the other hand the great popularity of a school of philosophy which was favourable to suicide. With regard to the first, however, it is to be remarked that it does not appear that even in Republican times suicide, for sufficient cause, was considered to be inconsistent with piety. The Stoic teaching suited in general the typical Roman character, and, in particular, the Stoic teaching in regard to suicide found ready acceptance among the educated classes under the Empire. In this matter the Stoic position appealed even to men who in other respects were at variance with the Stoics. In one sense the Stoic doctrine was merely a logical development from the position taken up by Plato. Even Plato had admitted suicide when some compelling *ἀνάγκη*—some ineluctable constraint of circumstances—forced a man to end what he could not mend. The nature of this *ἀνάγκη*, or, as the Romans called it, *necessitas*³ or *necessitudo*, was so indefinite as to be capable of a very various interpretation. It only remained for later Stoics like Panaitios (c. 140 B.C.) and Posidonios (c. 130-46 B.C.) to interpret it in the sense not of an external compulsion, but of an inner overmastering impulse. By this interpretation the whole philosophic anti-suicide position was undermined. It was no longer felt to be a disgraceful thing to commit suicide : the only thing worth considering was how to commit suicide with such bravery or bravado, such fortitude or such parade of fortitude, as would most appeal to the imagination. The morality of suicide was no longer in dispute : given such a situation as either from the individual point of view or from the point of view of his relation to the State appeared intolerable, then suicide was the obvious and expected course of action.

The pages of the writers of the Empire teem with suicides, and a glance at some of these will help to illustrate what was the current view of voluntary death.

Pliny the younger,⁴ writing of Titus Aristo, an eminent lawyer whom he describes as inferior to none of the philosophers 'castitate, pietate, iustitia, fortitudine,' tells how, being afflicted by 'longa et pertinax valetudo,' he contemplated taking his own life : 'You would be surprised, were you present, at the patience with which he bears this illness, holding out against pain, resisting the temptation to quench his thirst, enduring the unbelievable heat of fever while motionless and warmly covered. He lately summoned me and a few other special

¹ *Æn.* xii. 595 ff.

² The meaning of these *oscilla* we have seen above in connexion with the Athenian festival of the Aiora ; cf. Verg. *Georg.* ii. 287 ff.

³ Tac. *Ann.* vi. 23.

⁴ *Ep.* i. 22.

friends and requested us to consult his physicians about the issue of his illness, with the intention of voluntarily departing from life, if his illness were incurable, while on the other hand, if it were merely to be difficult and tedious, he would bear up and bide his time; for so much, he thought, was due to the entreaties of his wife, the tears of his daughter, even to us his friends, that he should not by voluntary death abandon our hopes, if only they were not vain. Such conduct I consider eminently high and praiseworthy. For to rush to death under the influence of an impulse and an instinctive feeling is no more than what many have done: but deliberately to weigh the motives for and against and then, as reason advises, to accept or reject the policy of life or death, that is the conduct of a great soul.¹

In A.D. 101 the poet Silius Italicus committed suicide by abstention from food. Pliny says: 'It has just been announced that Silius Italicus has ended his life by starvation (*inedia*) in his Neapolitan villa. Bad health was the cause. He had developed an incurable tumour and, weary of it, he betook himself to death with irrevocable firmness. Up to his last day he had been happy and fortunate, with the exception of the death of the younger of his two children.'²

In *Ep.* iii. 16 Pliny celebrates the heroic conduct of Arria, who, when her husband Cæcina Pætus was condemned for his share in the conspiracy of Scribonianus against Claudius in A.D. 42, encourages her husband to commit suicide, first stabbing herself and then handing the dagger to her husband with the words 'Pæte, non dolet.'³ This famous suicide is the subject of an epigram of Martial.²

A somewhat similar story is told in Pliny.³ A special interest attaches to the type of suicide mentioned by Pliny in *Ep.* iii. 9.

Cæcilius Classicus, proconsul of Bœtica A.D. 98-99, was accused of extortion and anticipated judgment by death—presumably suicide: 'Ille accusationem vel fortuita vel voluntaria morte præverit; nam fuit mors eius infamis, ambigua tamen: ut enim credibile videbatur, voluisse exire de vita, cum defendi non posset; ita mirum pudorem damnationis morte fugisse, quem non pudisset damnanda committere.'

References are frequent under the Empire to the forestalling of judgment by suicide. In a well-known passage⁴ Tacitus explains the motives, referring to the year A.D. 34, as being dread of the executioner and the desire to secure certain posthumous advantages which the suicide had over the condemned in respect of the disposal of his person and his property. Normally, it appears, the goods of a condemned person were confiscated, and he forfeited the rites of burial. The suicide, on the other hand, did not forfeit the rites of burial, and his testamentary dispositions remained valid. These advantages constitute what Tacitus calls the 'pretium festinandi.'⁵ In practice, however, there seems to have been considerable variation in the treatment of the goods of such a suicide. In the time of the Republic apparently his goods were confiscated as a matter of course.⁶ It is clear from the evidence of Tacitus himself that even under the Empire suicide before sentence did not always save the suicide's goods from confiscation.⁷

The perplexities of the question and the various distinctions made may be seen in Justinian, *Dig.* xlviii. 21: 'DE BONIS EORUM QUI ANTE SENTENTIAM VEL MORTEM SIBI CONSCIVERUNT VEL ACCUSATOREM CORRUPERUNT,' where § 3 forms an important document with regard to suicide:

'Persons accused of or caught in crime who, through fear of the charge hanging over them commit suicide, have no heirs. Papinianus,⁸ however, writes that, when guilty persons who have not been accused commit suicide, their goods are not forfeited to the *fiscus*. For it is not the fact of guilt that is liable, but the fear of the guilty conscience is held in the case of an accused person as tantamount to a confession of guilt. Therefore, for the confiscation of the goods of suicides, it is required that they must either have been accused or caught in the criminal act. According, however, to the rescript of the emperor Pius, the goods of a person who, lying under an accusation, commits suicide are confiscated only if the crime of which he was accused was such that, if condemned, he would have suffered either death or deportation. He likewise held

that a person who was accused of a petty theft, even if he committed suicide by hanging, was not in such case that his goods should be taken away from his heirs, any more than they would have been taken from himself, had he been convicted of theft. Therefore the goods of a suicide are to be forfeited only if the charge in which he was implicated were of such a nature that conviction would have entailed the loss of his property. If, on the other hand, a person committed suicide from weariness of life or impatience of pain or the like, he was entitled, according to Antoninus, to have a successor. According to a rescript of the emperor Hadrian, if a father, accused of killing his son, committed suicide, it must be held that his suicide was due rather to grief for the loss of his son, and therefore his goods were not to be confiscated. This distinction is on the same level as the inquiry whether a person who commits suicide without being guilty is liable to any penalty on the ground that he has passed sentence on himself. For in any case suicide is punishable save when it is due to weariness of life or intolerance of some grief. And rightly so: for, if a man did not spare himself, much less will he spare another. It is forbidden by imperial mandates to confiscate the goods of persons who have died in prison or on bail, while the issue of their case is still uncertain. We have to consider, in the case of a person who has died by his own hand without reasonable cause while under accusation, whether, if his heirs are prepared to take up his case and maintain the innocence of the deceased, they are to be heard and his goods not to be confiscated until the charge is proved; or whether in any case they are to be confiscated. But a rescript of the emperor Pius to Modestus Taurinus laid down that, if the heirs are prepared to undertake the defence, the goods are not to be confiscated, until the charge is proved.¹

Other examples of this type of suicide in Tacitus are P. Vitellius,¹ M. Æmilii Scaurus,² Plancina.³ L. Piso died before his trial by a *mors opportuna* which was probably suicide.⁴

A notable feature of the Empire is the use of compulsory suicide as a means of execution. Intimation is conveyed, more or less explicitly, to the party concerned that his death is desired. The advantages of this form of compulsory death over actual execution were apparently partly aesthetic, but probably the main advantage was that it seemed to make the guilty person his own judge and executioner and thus relieved the emperor of the *invidia* which necessarily attached to an actual execution. This method left to a man his 'choice of death'—what was known as 'liberum mortis arbitrium,'⁵ or merely 'mortis arbitrium.'⁶

Other examples of compulsory suicide recorded in the *Annals* of Tacitus are Silanus,⁷ Poppæa Sabina,⁸ Silvanus,⁹ Narcissus,¹⁰ Iulius Montanus,¹¹ Thrasea Pætus, Soranus Barea and his daughter,¹² Valerius Asiaticus,¹³ Arruntius,¹⁴ Anteius.¹⁵

Three examples may be selected as being the suicides of notable men with regard to whose last moments we possess detailed records—the poet Lucan, the emperor Nero, and Seneca.

The suicide of Lucan in A.D. 65 is thus described by Tacitus:¹⁶

'Exim M. Annaei Lucani caedem imperat [sc. Nero]. Is, profuente sanguine, ubi frigescere pedes mansuque, et paulatim ab extremis cedere spiritum, fervido adhuc et compote mentis pectore, intellegit; recordatus carmen a se compositum, quo vulneratum militem, per eiusmodi mortis imaginem obisse tradiderat, versus ipsos retulit [*Pharsal.* iii. 635-646?], eaque illi suprema vox fuit.'¹⁷

The suicide of Nero has often been described. The account given by Suetonius¹⁸ is too long to quote. The story of Seneca's death is told in Tacitus, *Ann.* xv. 60-63.

It appears that in those times every suicide was more or less a *poseur*, who was expected to make his suicide remarkable by some notable word or act. Hence Tacitus remarks: 'Senecio . . . et

³ *Ep.* vi. 24.

⁶ Cf. Livy, iii. 58.

Quinctianus et Scaevinus . . . mox reliqui coniuratorum perire, nullo facto dicitove memorando.¹

A notable feature of those suicides is the frequency with which the wife shares the suicide of the husband or even by example prompts him to death—e.g., Sextia,² Pomilia,³ Seneca's wife, as just mentioned, and Arria, wife of Petus.

Suetonius, as the historian of the emperors, naturally has numerous suicides, some of which present interesting features.

In his life of Augustus⁴ we have a curious case (in 42 B.C.): 'patrem et filium pro vita rogantes sortiri vel dimicare [i. e. trial by combat] iussisse [sc. Augustus] ut alterutri concederetur; ac spectasse utrumque morientem, cum patre, qui se obtulerat occiso, filius quoque voluntaria occubuisse necē.'

'Quin et Arabani, Parthorum regis, laceratus est literis, parricidia et caedes et ignaviam et luxuriam obicientis, monentisque, ut voluntaria morte maximo iustissimoque civium odio quam primum satisfaceret.'⁵

'Allos [other senators], cum clam interemisset, citare nihilo minus ut vivos perseveravit, paucos post dies voluntaria morte preesente mentitus.'⁶

The attitude of at least the educated world of the time may be described as an advanced Stoicism, and the permissibility of suicide under certain circumstances was accepted at Rome not merely by professed Stoics but also by adherents of other philosophical schools. We cannot do more here than summarize and illustrate the chief aspects of the question of suicide as it presented itself to the chief exponents of later Stoicism.

In the first place, whereas to Plato suicide had seemed to be permissible only, if at all, under compulsion (*ἀνάγκη*) of an external nature, this compulsion is now so interpreted that suicide becomes in fact not so much the involuntary act of the unwilling victim of circumstances as the voluntary assertion by the individual of his freedom. The liberty of the 'wise' man consists precisely in this that he is entitled to 'withdraw himself' (*ἐξάγειν ἑαυτῶν*) when he finds his liberty hampered by his environment. Already Cicero had interpreted for the Romans this phase of later Stoicism:

'Et constat Stoicos, praesertim inter Romanos, in eo quod vitae se subducere liceat morte voluntaria (*ἐξάγωγὴν* dicere solebant) vel libertatem sapientis cerni putasse.'⁷

This is the prevalent doctrine under the Empire.⁸

Hence the man who finds it no longer possible to obey God, or, in other words, to live as his nature requires, is to perceive precisely in this fact an intimation from God that it is time to depart from life.⁹

Again, Plato had felt the difficulty that, while on the one hand it was better for man to depart and be with God, it was yet held to be unlawful to hasten that departure by one's own voluntary act. Now the conviction of the nothingness of this present life as compared with the after life for which it is a preparation has become an additional motive for suicide, no longer hampered by any other restraint than that the individual must convince himself that God gives the signal for him to depart.¹⁰

In the end, then, to be or not to be becomes purely a question for the individual. Suicide is not to be the rash act of a momentary impulse, a temporary confusion of values. It is to be determined upon or rejected after due deliberation. Nothing indeed is more striking in the accounts of suicides under the Empire than precisely this formal weighing of the considerations for and against.

VOL. XII.—3

The individual point of view was much insisted upon in the later Stoicism. The same set of circumstances might in a given case demand suicide, in another not. A situation of intolerable shame, for instance, might be for an ordinary man a sufficient ground for suicide. Yet it might be the duty of another man, whose life was essential to the State, to reject the temptation. A man's death must be in consonance with his life.

Peregrinus, according to Lucian, *ἔφη βούλεσθαι χρυσῷ βίω χρυσὴν κοράνην ἐπιθέιναι* χρῆμα γὰρ τὸν Ἡρακλείως βεβιωκότα, Ἡρακλείως ἀποθανεῖν.¹

This doctrine of 'propriety' is expounded in a well-known passage of Cicero's *de Officiis*, which is of course based upon Panætius.²

III. CONCLUSION.—Our review, then, of the history of suicide among Greeks and Romans shows that at all times the only valid motives against the practice of suicide have been, in the main, not ethical but religious. And consequently the penalties attached to suicide are not so much civil as religious. They affect a man's condition not here but in the hereafter. The withholding of the rites of burial, the severance of the right hand, and so forth, all belong to the religious circle of ideas. When religious values ceased to have any meaning and were not replaced by other values, then, as in the case of the Cynics, there was no antagonism to suicide. When, on the other hand, the life hereafter was so emphasized that in comparison with that after life the life here seemed of little account, there was an obvious impulse to suicide. But that impulse was resisted and decried—by Plato on the ground of a higher law, a great mystery which demands that we remain in our prison-house till God shall please to set us free; by the Neo-Platonists because suicide is *ipso facto* detrimental to the soul. The whole question is admirably put in Macrobius, *Comm. in Somn. Scip.* i. 13:

'Haec Platonicae sectae semina altius Plotinus exsequitur. Oportet, inquit, animam post hominem liberam corporeis passionibus inveniri. Quam qui de corpore vilenter extrudit, liberam esse non patitur. Qui enim sibi sua sponte necem comparat, aut pertaesus necessitatis aut metu cuiusquam ad hoc descendit aut odio; quae omnia inter passiones habentur; ergo etsi ante fuit his sordibus pura, hoc ipso tamen, quod exit extorta, sordescit. Deinde mortem debere ait animae a corpore solutionem esse, non vinculum, exitu autem coacto animam circa corpus magis magisque vinciri. Et revera ideo sic extortae animae diu circa corpus eiusve sepulchrum vel locum, in quo iniecta manus est, pervagantur: cum contra illae animae, quae se in hac vita a vinculis corpora philosophiae morte dissolvunt, adhuc extante corpore caelo et sideribus inserantur.'

SUICIDE (Hindu).—I. Vedic.—In view of the devotion to life and its pleasures which marks the *Rigveda*, and which is reflected in the disapproval therein implied of the practice of *sati*, it is not surprising that no trace of the custom of religious suicide can be found in that text. Nor in the later *Saṁhitās* and the *Brāhmaṇas* is there any clear recognition of such a usage, unless we accept the suggestion of Hillebrandt³ that the consecration ceremony (*dikṣā*),⁴ which is an essential preliminary to the most important rites, is in reality a faded form of the older practice of suicide by fire. While it is true that the generation of heat in the man who undergoes the rite is an important feature of it, the purpose of this practice, as of the fasting which constitutes even a more essential

element of the ceremony, may much more naturally be deemed to be to produce the psychological condition best suited for the performance of the sacrifice. There are, however, in the *Brāhmaṇas* two doctrines which undoubtedly pave the way for the approval of suicide from religious motives. In the first place, there is developed the conception that the proper sacrifice is that of a man's self, and that other forms of offering are substitutes;¹ in the second place, in the latest of the great *Brāhmaṇas*, the *Śatapatha*,² the closing act of both the *puruṣamedha* and the *sarvamedha*, the human and the universal sacrifices, is the giving away by the performer of the whole of his possessions, including in the latter case even the land, and his wandering into the forest, doubtless as a preliminary to an early death. The teaching of the *Upaniṣads*, which emptied empirical life of all true reality, held out union with the infinite as the result of knowledge, and glorified the cessation of existence, must have tended to the same result, but the logical conclusion of their thought is not expressed in any of the older *Upaniṣads*, and it is only in such late works as the *Jābāla*³ and *Kaṇṭhaśruti*⁴ *Upaniṣads* that it is expressly laid down that the *sannyāsin*, who has acquired full insight, may enter upon the great journey, or choose death by voluntary starvation, by drowning, by fire, or by a hero's fate. Earlier evidence (and better proof of usage) is afforded by notices in the *Dharmasūtras*: in *Vasiṣṭha*⁵ it is expressly stated that the world of *Brahman* is obtained by entering the fire; and in *Āpastamba*,⁶ in an interesting discussion which ends with a defence of secular life and aims, it is admitted that in one view the ideal was for an ascetic first to live on fruits, roots, grass, and leaves only, then on those things alone which become spontaneously detached, then on water, then on air, and finally on ether alone. With the testimony of *Vasiṣṭha* accords the record of the death on a pyre erected by his own wish of Kalanos, an Indian follower and friend of Alexander, who fell ill at Pasargadae and decided on death, despite the opposition of the king, rather than alter his mode of life.⁷

2. **Buddhism and Jainism.**—It is characteristic of the general sanity of Buddhism in its earliest form that the Buddha appears to have disapproved of suicide, as he disapproved of all excesses of ascetic fervour. But it would be surprising if the influence both of Brāhmanism and of Jainism had not had its effect in making suicide reputable in certain communities. Not only is the duty of self-sacrifice deemed to excuse the action of the *bodhisattva* in committing suicide with the definite aim of being reborn as the fish whose flesh alone can save the people from disease, but self-destruction appears to be approved if undertaken with the desire of securing rebirth in such a condition as will permit entry into the Buddhist order.⁸

While this attitude is exceptional in Buddhism, Jainism frankly recognizes and commends religious suicide. It is dealt with at length in the *Āyāra*,⁹ the first *Āṅga*, and its preliminaries are described in detail in the *Aurapachchakkhāṇa* and the *Saṁtthāra*, the second and fourth of the *Painnas* in one

reckoning. But suicide is not permitted promiscuously; it is allowed to those ascetics who have acquired the highest degree of perfection, and it in essence consists of giving up begging, and lying down in a duly chosen place to await death by hunger and thirst. Frequent mention is made of death being thus brought about by a month's abstinence (*kālamāse*); this fate is recorded of the Tirthakaras Pārśva and Ariṣṭanemi,¹ of the monk Khandaga,² of the layman Āmbada,³ and of all those celebrated in the *Uvāsagadasāo*. At this supreme moment of his career the ascetic must not long after rebirth in this world or as a god; he must not wish to live on or desire sensual pleasures, but equally he must not seek for death to come more swiftly. The final condition thus reached by the sage (*saṁāhipatte*) is one of complete mental and physical collapse. Practically identical with it appears to be the *paññabhūmi*, the last of the eight stages of man's existence as taught by Gosāla Maṅkhaliputta.⁴ The popularity of the practice is attested throughout the whole history of Jainism: in 1172 thus died the great scholar and statesman Hemachandra, followed in a short time by his patron Kumārāpāla;⁵ in 1912 a monk at Ahmadābād, though in perfect health, starved himself to death by a fast of 41 days; and in the following year a nun at Rājkot, having previously weakened herself by austerities, died after two or three days' fast. Suicide, however, is still not permitted to others than ascetics, and non-religious suicide is regarded with especial horror by the Jains, as they disapprove of all taking of life. The problem of reconciling these two views is solved as little by the Jains as by the Brāhmanical schools.

3. **Hinduism, mediæval and modern.**—Hinduism stands firmly on the position reached in the *Dharmasūtras*, which permits religious suicide, while censuring ordinary forms of self-murder. Manu⁶ expressly permits a Brāhman, in circumstances explained (doubtless correctly) by his commentators as disease or great misfortunes, to walk straight on in a north-easterly direction subsisting on water and air until his body sinks to rest, and declares that a Brāhman who has got rid of his body by any of the means practised by ancient sages obtains the world of *Brahman*; and *Medhātithi* interprets the methods in question as drowning oneself in a river, leaping from a height, burning, or starvation. The *Mahābhārata*⁷ fully recognizes the wickedness of suicide; nevertheless the prince Duryodhana himself resolves to die by starvation, and for this purpose, as the ceremony is a religious rite, dons old garments and holy grass, drinks water, and applies his mind to devotion, though his purpose is eventually defeated.⁸ An interesting tale,⁹ which appears also in the *Pañchatantra*,¹⁰ is that of the hunter for whom a pigeon roasts itself as a guest-offering; the wife of the bird declines to survive her husband, and the hunter, saddened by their sacrifice, repents and himself ends his life by fire. A new aspect of suicide appears in connexion with the development of the devotion paid to the sectarian deities which is characteristic of Hinduism, for suicide now means not so much absorption in an impersonal absolute as union with a very personal deity. The idea is reflected in the mythical account of the history of *Mirā Bāi*, the

devotee of Kṛṣṇa in the time of Akbar, who is recorded to have disappeared into a fissure which showed itself for a moment in the image of her chosen divinity when she was paying homage to him at Dvārakā. Similar considerations doubtless prompted some of the comparatively rare suicides which took place during the *yātrās* of Viṣṇu as Jagannātha at Pūrī. Neither Chaitanya, to whose teaching the fame of the shrine was largely due, nor any of his followers appears to have encouraged or approved this form of worship; no allusion is made to it in the elaborate account of the car-procession by Kṛṣṇadāsa or by Abul Fazl. It is not impossible that the conception may have been borrowed from a Śaiva sect, some fusion of the two cults having taken place at Pūrī, but Chaitanya's own end was mysterious, and in his lifetime he had sought mystic union with the god in ecstatic trance, so that the occasional suicides of ardent devotees beneath the wheels of the car of Jagannātha can hardly be deemed unnatural or surprising.¹

The wide-spread nature of the custom, and its prevalence both with and without Brāhmanical sanction, are attested by H. T. Colebrooke from personal observation just at the opening of the 19th century. In 1802 the legislature intervened to prevent the practice of suicide on the island of Sāgar, at the mouth of the Ganges, where, in pursuance of vows, not only were children cast into the sea to be devoured by sharks but grown-up persons voluntarily underwent the same fate. This practice was confined to the lower castes, as was also the custom by which men used annually to hurl themselves from a precipice in the mountains south of the Narmadā, sacred to Kālbhairō, in fulfilment of vows undertaken at an earlier period. This rite was carried out by mountaineers; great concourses gathered at the place on the new moon of Phālguna, the day appointed for the ceremony, and it is significant of the passion for public recognition as part of the motive of such suicides that the man meditating this fate was wont to proclaim his intention publicly and, attended by a band of musicians, to promenade in the neighbouring towns collecting alms. On the other hand, not only did the practice of *satī* (*q.v.*) flourish under Brāhmanical auspices, but the custom of suicide by drowning at the specially holy spot of the junction of the Jumna and the Ganges was approved, while the practice of lepers consenting to burial alive was promoted by the grant of obsequies which were otherwise denied. The Śaivas also allowed suicide by cutting the throat before the image of Bhavānī in the temple of Vindhyāvāsīnī, near Mirzapur. Interference with these rites was gradual, but the final adoption of the principle of treating as a criminal offence participation in a ritual suicide has deprived the act of much of its religious character, though it is of course impossible to prevent suicide on the part of those who regard such a fate as a logical outcome of the religious convictions which they hold.

So far as religious suicide has been approved in India, it is significant that it has been in cases of men who have lived a full life and acquired a high measure of ascetic power, and that suicide in other cases has never been authorized and has instead been strongly condemned. There is obviously comparatively little essential distinction between the practice of austerities to a pitch which deprives the ascetic of all mental and physical activity, and the actual termination of life; an intermediate stage is furnished by the cataleptic condition which the Yogi seeks to induce, and of which the most famous case is that of Haridās, who even survived

burial for considerable periods.¹ But in its essence the practice can hardly be traced to any origin other than the effort to supply a rationale for the old and inhuman usage by which the aged head of a family might be cast out to die, when he became too old to rule or be of service to his kindred—a usage for which there is clear evidence in the *Rīgveda*.² In place of the violent removal of the elders there was substituted the doctrine that in old age it was the duty and privilege of a man to adopt a hermit's life, unless he preferred to terminate of his own will an existence which had become burdensome. The essentially popular character of the practice is proved conclusively by the pertinacity with which the Jains have maintained it from the earliest period, though the doctrine of the sanctity of life as adopted by them would otherwise have forbidden approval of the custom.

The facts as to the *yātrā* of Jagannātha are examined in detail by W. W. Hunter, *Orissa*, London, 1872, i. 132 ff., 306 ff., *The Indian Empire*,³ do. [1893], p. 276 ff. The observations of H. T. Colebrooke are given in a paper quoted by T. E. Colebrooke, *The Life of H. T. Colebrooke*, London, 1873, p. 173 ff. A. BERRIEDALE KEITH.

SUICIDE (Japanese).—Japan is known as a country in which an unusually large number of people commit suicide. According to the latest statistics, compiled by the Bureau of Statistics of the Japanese Government, the number of deaths by suicide in the ten years preceding 1915 was as follows:

Year.	Population. ³	Number of Deaths.	Deaths by Suicide.	Number of Suicides per One Million Inhabitants.
1905	47,678,396	1,004,661	9,413	197
1906	48,164,761	955,256	8,906	184
1907	48,819,630	1,016,798	9,180	188
1908	49,538,804	1,029,447	9,595	193
1909	50,254,471	1,091,264	10,553	210
1910	50,984,844	1,064,234	10,773	213
1911	51,753,934	1,043,906	10,753	207
1912	52,522,753	1,037,016	11,128	212
1913	53,362,862	1,027,257	11,942	223
1914	54,142,441	1,101,815	12,705	234

The same returns give the number of deaths by suicide according to sex and age, as shown on Table 1.

According to the methods employed, the number of deaths is as shown on Table 2.

Some of the principal causes of suicide are shown on Table 3.

Among the methods of suicide used by Japanese the following three are unique and worthy of description:

(1) *Harakiri* ('belly-cutting'), more commonly

called *seppuku*, was, until the promulgation of the new criminal code in 1873, a method of punishment frequently required of offenders from the nobility and the military class. The laws of the Tang period in China, which for several hundred years had been the model of the Japanese legal system, recognized three forms of capital punishment: beheading, strangulation, and self-execution. The last was allowed to offenders of rank, that they might escape the shame of public death at the hands of others. The criminal laws of Japan allowed self-execution to members of the royal family and to others above the fifth court-rank, except in case of high treason. *Harakiri* dates from the Taira and Minamoto period in the 12th cent. and was widely practised during the Sengoku

period of internal strife. During the Tokugawa period the practice developed into a complicated system with much etiquette and formality.

'It was not mere suicide. It was an institution, legal and ceremonial, invented in the middle ages, by which warriors could expiate their crimes, apologize for error, escape from disgrace, redeem their friends or prove their sincerity.'¹

The most notable historical case of *harakiri* is that of the 47 Ronin, in 1703. The *daimyo* Asano had been obliged to commit *harakiri* to atone for an unjustifiable attack upon Kira, a nobleman in the Shogun's palace. A band of devoted followers, after long effort, avenged their master by assassinating Kira. They gave themselves up to justice and, under sentence, committed *harakiri* at the

¹ T. Harada, *Faith of Japan*, New York, 1914, p. 129.

homes of the *daimyos* to whom, in groups, they had been entrusted. Their bodies were buried with respect at a Buddhist temple in Tokyo; and to this day many admirers of their chivalrous loyalty pay homage at their tomb.

For the purpose of *harakiri* a site was usually selected in some garden facing a residence, sheltered at the back and sides by curtains of white cotton. Within the curtained enclosure were placed two mats covered with a mattress of light blue. The condemned seated himself upon the mattress in the presence of superintending witnesses, with a kinsman or special friend to act as an assistant. He was clothed in special garments, and, after certain formal ceremonies, was handed a short sword with which to make the horizontal cut through the abdomen. The cut having been made, it was the duty of the assistant to behead the sufferer, that the agony of death might be short.

Though *harakiri* is no longer recognized as a form of public execution, the method is still not uncommon among those who seek to avoid the humiliation of public condemnation and punishment or the supposed disgrace of capture by the forces of an enemy in battle.

(2) *Shinju* or *aitaishi* ('dying between two parties') is the death together of unhappy lovers who seek escape from the difficulties of their earthly lot and entrance upon a happier life in the next world. For the accomplishment of *shinju* drowning has been the most frequent method, the lovers often tying themselves together with a strong rope. So common was this form of suicide among the lower classes during the Tokugawa period that in 1723 the Shogunate issued special regulations forbidding it, refusing formal burial to the bodies, and condemning to shame or exile any one who might survive the attempt. At present *shinju* is of frequent occurrence; and in recent years other forms of death, such as poison or mutilation beneath trains, have been employed.

(3) *Junshi* is suicide upon the death of one's lord or master with the idea of following him into the next world. In ancient times this was an act of loyalty required by custom, until the emperor Suinin (29 B.C.-A.D. 70) ordered the substitution of clay images for the bodies of attendants and favourite animals. *Junshi* was revived during the feudal period, not as a requirement, but as a voluntary custom whereby loyal followers, through *harakiri*, expressed their devotion to their masters. The drowning of almost the entire Taira clan in the western sea at the downfall of that clan and the *junshi* of hundreds of the family of Hojo Takatoki at the end of his career are among the most striking manifestations of this *junshi* spirit. The custom was forbidden by the Shogunate in 1744, and, before the opening of the Meiji era, had become uncommon; but solitary cases have occurred from time to time. Of these the most startling in recent times was the death by *harakiri* of General Nogi and his wife, at the time of the funeral of the emperor Meiji, in Sept. 1912.

TASUKU HARADA.

SUICIDE (Jewish).—Only a very few cases of suicide are recorded in the OT. The ancient Hebrews were, on the whole, a naive people, joyously fond of life, and not given to tampering with the natural instinct of self-preservation. Nor are all of the few instances recorded on the ordinary level of suicidal occurrences. The case of Ahithophel (2 S 17²³) is the only one which, in the modern mind at any rate, excites loathing and reprobation. The suicide of Zimri (1 K 16¹⁸) and

of Abimelech (killed at his own request by his armour-bearer [Jg 9⁵⁴]) only leaves us cold; whilst, on the other hand, the death of Samson (Jg 16^{28a}) and of Saul and his armour-bearer (1 S 31^{4c}) inspire us with a sense of awe and a certain kind of admiration rather than any other feeling.

But, when later the people of the Dispersion became more and more affected by some of the evil influences around them, and the difficulties and perplexities of existence kept on increasing, a much less wholesome attitude towards life made itself perceptible. And, as cases of suicide became more frequent, it was at last found necessary to give a name to the evil. A suicide was thus, in exact legal terminology, described as 'one who purposely destroys himself.'¹ In accordance with a general Rabbinic principle of legislation, an effort was, moreover, made to find support in the Scriptures for the new ideas and enactments which the practice of suicide brought in its train. In *Midrash Rabbah*, 34, the prohibition of suicide is thus derived from the wording of Gn 9⁵, the little word *אם* in *אם רכבם* ('and surely your blood') being taken to include self-destruction. Dt 4⁹ ('Only take heed to thyself, and keep thy soul diligently') has been considered capable of a similar interpretation, and some² would even include suicide in 'Thou shalt not kill,' contained in the Ten Commandments. An indignantly rejected suggestion to commit suicide rather than suffer is also by some discovered in Job 29⁻¹⁰ (cf. 7¹⁵).

Considering some confusion of ideas which the elaborate treatment of the subject by J. Hamburger³ may produce in the reader's mind, it seems necessary to state that the Rabbinic, like the Christian and general, conception of the act entirely excludes submission to a death of martyrdom from even the category of condoned or permissible suicide, so long as the victims do not, under the stress of fear or suffering, lay violent hands on themselves (or, by mutual consent, on one another).

The difference between an act of self-destruction during martyrdom and martyrdom pure and simple is illustrated by the striking case of Hananiah b. Teradyon, who, whilst suffering the pangs of death by fire during the Hadrianic persecutions, is reported to have replied to his disciples' suggestion that he should open his mouth, so that the fire should enter it and consume him more quickly, in these words: 'It is right that he who has given life should take it away, but let not a man destroy himself' (though, on the other hand, he allowed the executioner to heap up the flames and otherwise hasten his end).⁴

We must, therefore, limit ourselves to cases in which the act of death is, in the literal sense of the term, self-inflicted, though a division into different categories is at the same time necessary. Concerning suicide induced by the martyr spirit of patriotism we find instructive information in Josephus, where both sides of the argument are forcibly stated from the points of view of warriors, philosophers, and men of the world.

In the speeches addressed to the Jewish garrison of Masada⁵ their commandant Eleazar lays special stress on their resolve, made long ago, 'never to be servants to the Romans, nor to any other than God himself,' and then exhorts them to receive their punishment for their past sins from none other than the Deity, 'as executed by our own hands'; and, on finding that his words had not yet produced the desired effect, he adds, among other things, the further argument that death 'affords our souls their liberty, and sends them by a removal into their own place of purity, where they are to be insensible to all sorts of misery.'

¹ הכאבר עצמו לרעת (e.g., at the beginning of *Sémahoth*, ii.). The terms *החנק את עצמו* ('one who strangles himself') and *הרוג את עצמו* ('one who kills himself') are also used. The act of suicide is represented by *עצמו לרעת*.

³ Art. 'Selbstmord,' in *Realencyclopädie*, Talmudic part.

⁴ T.B. 'Abodah Zarah', 18a.

⁵ BJ vii. viii. 6f.

the final result being that 900 persons (*i.e.* the whole garrison, including women and children, with the exception of two women and five children) consented to die rather than yield themselves up to the Romans. (The spirit of the act is, of course, the same as caused the self-destruction of Razis, as related in 2 Mac 14:37-46; and with the occurrence at Masada may be fitly compared the typical medieval instance of the death of a large number of Jews in York in the year 1190.)

Josephus's own attitude towards suicide, under similar conditions, is revealed in *BJ* III. viii.

In the speech which, after the fall of Jotapata, he addressed to the men who had taken refuge with him in a cave, he compares a suicide to a pilot 'who, out of fear of a storm, should sink his ship of his own accord,' reminds them that it is a wicked and perfidious act to cast out of one's body the soul which God had committed to it, and exhorts them not to endeavour, by an act of self-destruction, 'to run away from God, who is the best of all masters.'¹

A somewhat analogous, though much more pitiable, class is well represented by the case² of 400 captive boys and girls who, when they understood that they were being carried off for a life of shame, determined to end their lives by drowning. To quite another category belong a certain number of persons who are reported to have committed suicide under the stress of acute remorse for certain acts of theirs.³ A different case, again, is that of the executioner of Hananiah b. Tēradyon, already referred to, who, on receiving from the dying martyr the promise of future bliss, is said to have destroyed himself in the flames in which the saint had died, in order to enter at once on his inheritance. Rabbinic leniency by way of accepting excuses for young suicides is shown in the cases of certain children who had destroyed themselves because they lay under a threat of punishment from their respective fathers.⁴

The judgment of a person who, in our own legal phraseology, has been proved a *felo de se* is, in the main, left to God (לשמים),⁵ though a person who recklessly endangers his life is subject to judicial chastisement (כרת טרחה).⁶ With regard to the treatment of the body of a suicide, there is a mention in the speech of Josephus referred to of the custom which demanded that the remains should lie exposed till sunset. In *Sēmāhoth*, ii. 1,⁷ it is enacted that one should neither rend one's garments for a suicide nor bare the shoulder or engage in any other formal mode of mourning. Care is taken, however, not to offend the feelings of the relatives of the dead. Those present at the funeral, therefore, form themselves in a row and recite the necessary order of service. The general rule, indeed, is that one does everything required by respect for the living, but omits all the rest. There has also been a rule of burying a suicide away from the regular line of graves, but this is not always observed.⁸

It should be mentioned in conclusion that statistics comparing the prevalence of cases of suicide among modern Jews with those of other races and denominations are given in *JE*, *s.v.* 'Suicide.'

LITERATURE.—The literature has been indicated in the article.
G. MARGOLIOUTH.

SUICIDE (Muhammadan).—There is no specific text of the Qur'an which forbids suicide, though it would seem that the texts which bear upon the taking of human life in general are sufficiently clear as to their purpose to include any kind of wilful killing in private life. The following verses

¹ The manner in which Josephus finally escaped death, whilst all his companions save one lay slain around him, will be found described in *BJ* III. viii. 7.

² Recorded in *T.B. Gittin*, 57b.

will indicate the bearing of the Qur'an upon the subject:¹

'It is not for any soul to die, save by God's permission written down for an appointed time' (iii. 139; the reference is to him who 'dies or is killed'). 'It is not for a believer to kill a believer save by mistake' (iv. 93). 'And who kills a believer purposely, his reward is hell, to dwell therein for aye; and God will be wroth with him, and curse him, and prepare for him a mighty woe' (iv. 95). 'He respites them until a stated time; and when their time comes they cannot put it off an hour, nor can they bring it on' (xvi. 62).

The attitude of Muhammad has no doubt been correctly interpreted by *hadiths* which Bukhārī accepts as genuine:

'Whoever shall kill himself shall suffer in the fire of hell,' and 'shall be excluded from heaven for ever.'²

At the present time, and for many centuries past, there has been unanimity of opinion throughout Islām that suicide is a violation of a divine command contained in the Qur'an and the Sunnah of the Prophet. A tradition relates that Muhammad refused to bury a suicide, and his example has established a law to that effect in Islām. In spite of the law, however, it is customary to accord the funeral rites in such cases.

It is difficult to obtain statistics covering suicide in Muhammadan countries, but all authorities who treat of suicide in an exhaustive way agree that in those countries the practice is almost unknown. It is clear from the statistics presented in scientific works on suicide that the physical environment of different peoples offers no adequate explanation of the varying ratio of suicides among them, while difference of religious belief as between groups always results in a varying proportion of suicides. The regions of Islām show few suicides precisely because of the nature of the Muslim's belief in God and the future life. The right attitude for the Muslim is *islām*, an acceptance of life's events as settled by divine appointment, of death as fixed as to both time and manner, and of the hereafter as a pre-arranged order of retributive rewards and penalties distributed according to the individual's attitude of acquiescence in the arrangement of life and destiny or of revolt against it. Suicide is an act of revolt against God, and the perpetrator of the act risks the wrath of God and the indescribable penalties of the Fire. Whatever else Islām may lack in the way of ethical influence, its sense of obligation to make acceptance of Providence the cardinal factor in obedience to God has been an effective determinant of conduct, and its doctrine of future retribution has been efficacious in strengthening this virtue of active resignation to the will of God.

LITERATURE.—Most of the leading treatises on suicide contain a brief reference to the Muslim attitude on the subject. In none of these works is there any attempt really to cope with the question, the available materials not permitting any well-founded conclusions as to the extent and causes of the phenomenon. The most useful general discussion is found in *RGG* v., *s.v.* 'Selbstmord.' See also *DI*, *s.v.* 'Suicide.'

WALTER M. PATTON.

SUICIDE (Semitic and Egyptian).—Among the ancient Hamito-Semitic peoples the love of life was strong. They were (with the possible exception of the Egyptians) still in the earlier and less reflective stages of civilization, and consequently showed little of that melancholy which leads to frequent suicide.

I. Semitic.—Among the Semites not only was the love of life strong, but their primitive religion was a worship of the goddess of life. Most of their deities of later time were gods that were in some form closely associated with the idea that life was divine. Their general attitude towards life was one of joyous interest in objective things. Their philosophical and reflective powers never attained any great degree of vigour. There are, accordingly, no cases of suicide on record except where

¹ The translation is E. H. Palmer's, *SBE* vi. [1900].

² See *DI*, *s.v.* 'Suicide.'

the deed was committed in order to avoid a form of death that was considered particularly disgraceful.

An early and classical example of this is the suicide of King Saul of Israel (I S 31^b). Israel's armies had been defeated by the Philistines. Saul said to his armour-bearer: 'Draw thy sword, and thrust me through therewith; lest these uncircumcised come and thrust me through, and abuse me.' Naturally the armour-bearer was afraid to do this, so Saul fell upon his own sword and ended his life. Clearly the deed would not have been committed but for the desperate straits in which the king found himself. To him, as to many in all parts of the world, the foreigner was unclean. Philistine foreigners did not bear the sacred mark of circumcision; they were doubly unclean. He took his own life in order to avoid dying by such unholy hands after having been tortured by them.

A second case is that of Saul's armour-bearer. When he saw that his king had committed suicide, he followed the example of his master. His motive may have been in part the same as Saul's; it may have been in part despair at the death of his chief. At all events the armour-bearer, like Saul, took his own life only when a death which he regarded as disgraceful was inevitable.

Closely analogous to the suicide of Saul was the death of Abimelech, the son of Gideon (Jg 9⁵⁴). Abimelech had made himself king of Shechem and a small territory about it; he sought to enlarge his dominion by the conquest of Thebez, a city some miles to the north-east of Shechem. In attacking the city he drew near to the wall, whence a woman threw a millstone on his head and broke his skull. He thereupon commanded his armour-bearer to thrust him through, lest it should be said of him that a woman slew him, and the armour-bearer obeyed. Abimelech did not actually die by his own hand, but, since the death-wound was inflicted by his own command, it was practically suicide.

A similar case in the Maccabean period is reported in 2 Mac 14³⁷⁻⁴⁹. A certain Razis, imprisoned in a tower in Jerusalem, which Nicanor was besieging, when he saw that resistance was useless, fell upon his sword. As the wound thus inflicted was not fatal, he threw himself from the tower. When that did not kill him, he disembowelled himself.

At least two instances are recorded among the Hebrews in which traitors committed suicide.

Aithophel, one of David's trusted advisers, betrayed his master and conspired with Absalom. When he saw that David had eluded the traitors and that civil war would follow, he hanged himself (2 S 17²⁸). Similarly Judas Iscariot, the betrayer of Jesus Christ, when he saw that, as a consequence of his deed, Jesus was arrested and condemned, went and hanged himself (Mt 27⁵). Possibly his effort to end his life in this manner failed, for another account (Ac 1¹⁸) implies that he, like Razis, died from being disembowelled.

Conscience, then as now, sometimes drove traitors to end their own lives. Both the reasons for suicide which can be traced in ancient Israel operated in the case of Shamash-shum-ukin, king of Babylon, 668-648 B.C.

He headed an extensive conspiracy against his brother and suzerain, Ashur-bani-pal, king of Assyria. When Ashur-bani-pal, having defeated Shamash-shum-ukin's army and the forces of his allies, besieged him, Shamash-shum-ukin, reduced to extremity, threw himself into a burning pit rather than fall into the hands of his brother.¹ His rebellion had exposed him, in case of capture, to the kind of barbarous torture inflicted by the Assyrians on rebels—a prospect that might well drive a man to the less painful death of a burning pit. Shamash-shum-ukin might, however, have faced this, as many another had done, had it not been for an accusing conscience.

The cases cited sufficiently reveal the ancient Semitic attitude towards suicide. It was resorted to only in extreme cases.

2. Egyptian.—The attitude of the ancient Egyptians towards suicide was in general like that of the Semites. The love of life was strong in them, and their conception of the life beyond such that it presented to them deterrents of various kinds. The inscriptions present us with two sources of information on the subject, one practical, the other theoretical.

In the reign of Ramses III. (1198-1167 B.C.) a conspiracy against the life of the king was formed in the *harim*, in which a number of high officials were implicated. The king appointed a commission to investigate the matter and to try the criminals. From the records of this commission we learn that at least seventeen persons, who were found guilty, were left to themselves and permitted to take their own lives.² It was in a way compulsory suicide.

¹ Cf. KB II. 191.

² See J. H. Breasted, *Ancient Records of Egypt*, iv, §§ 414-454.

Death by their own hands was, however, apparently regarded as less humiliating than death at the hands of an executioner. An eighteenth person, when found guilty, committed suicide, apparently to the regret of the commission.¹ It appears from this record that the punishment of high and formerly trusted officials was probably accomplished by the ancient Egyptian government in this way.

An interesting document written during the Middle Kingdom (2100-1800 B.C.), which has been entitled by Erman and Breasted 'The Dialogue of a Misanthrope with his Own Soul',² indicates that, in the *mêlec* of Egyptian feudal development, as the failure of old religious forms to satisfy increased and a sense of the injustices of life attained power, suicide was contemplated by some as an escape from life's ills.

The beginning of the papyrus is lost, but from what remains it is clear that a certain man of gentle spirit (his name is lost) fell sick. He was forsaken by his friends; even his brothers left him uncared for. Deserted by all, he was robbed by his neighbours. His former good deeds were forgotten. Although a wise man, when he would plead his own cause, he was thrust aside. His name, which should have been revered, was defamed. He then determined to take his own life, but, as he stood on the brink of the grave, his soul shrank back in horror and refused to accompany him. The dialogue then began. The soul's first reason for not going with him was the fear that there would be no tomb to dwell in after death. This afforded the misanthrope an opportunity to expose to his soul the utter futility of all such preparations. The soul had counselled death by burning, but had then shrunk from that, as there would be no surviving friend to stand by the bier and make the mortuary offerings. He urged his soul to undertake these duties itself, but then the soul refused death in any form, declaring that, even when the great built pyramids and endowed mortuary services, their tombs were in time neglected and permitted to fall into ruins, so that they were in no better case than the poor. His soul urged that it was good for men to 'follow the glad day and forget care.' The misanthrope then proceeds to demonstrate that life, instead of being an opportunity for pleasure, is far more intolerable than death. The demonstration is embodied in four poems addressed to his soul. The first of these pictures the unjust abhorrence in which the speaker's name was held by the world. The second sets forth the corruption of society. The third, which speaks of death as a glad release, justifies suicide. It runs as follows:³

'Death is before me to-day
[Like] the recovery of a sick man,
Like going forth into a garden after sickness.

Death is before me to-day
Like the odour of myrrh,
Like sitting under a sail on a windy day.

Death is before me to-day
Like the odour of lotus flowers,
Like sitting on the shore of drunkenness.

Death is before me to-day
Like the course of a freshet,
Like the return of a man from the war-galley to his house.

Death is before me to-day
Like the clearing of the sky,
Like a man 'fowling therein toward' that which he knew not.

Death is before me to-day
As a man longs to see his house
When he has spent years in captivity.'

The fourth poem contributes to the argument in favour of suicide by expressing the conviction that in the 'beyond' that justice which is unattainable in this world will be experienced.

'He who is yonder
Shall seize (the culprit) as a living god,
Inflicting punishment of wickedness on the doer of it.

He who is yonder
Shall stand in the celestial barque,
Causing that the choicest of the offerings there be given to the temples.

He who is yonder
Shall be a wise man who has not been repelled,
Praying to Re when he speaks'⁴

This document shows how world-weary Egyptians looked at suicide 4000 years ago. An interesting feature of the point of view is that it betrays no

¹ *Ancient Records of Egypt*, iv, § 456.

³ As translated by Breasted, p. 195.

⁴ *Ib.* p. 197.

consciousness that self-destruction is wrong. In this respect it is in striking contrast to the Talmud. Rabbi Eleazar says that Gn 9⁵ means that 'I [God] will require your own blood from you'—a clear recognition of the sinfulness of suicide. The Egyptian misanthrope, so far from betraying any such consciousness, seems to hold that the fact that in the world beyond he can not only attain the justice that is denied him here, but also assist in the establishment of justice, is a reason for hastening by his own hand his release from life's intolerable conditions.

SUMATRA.—See JAVA, BALI, AND SUMATRA.

SUMERO-AKKADIANS.—1. The term.—The ethnic expression 'Sumero-Akkadian' does not occur in the inscriptions, but, as the compound *Kengi-Ura*, translated by the Semitic *Sumer u Akkad*, 'Sumer and Akkad,' is found, it is a perfectly legitimate name for the mixed population which of old occupied the alluvial plain of the Tigris and the Euphrates, where they flowed into the Persian Gulf.

2. Probable derivation of the names.—Many suggestions have been made as to the origin and meaning of *Kengi* (or *Kingi*)-*Ura* and *Sumer u Akkad*, but it must be admitted that both these points are doubtful even now.

J. D. Prince² suggests that it may be a combination of *kén* (long form of *ké*), 'land,' and *gi*, 'reed,' 'land of reeds' being 'an appropriate designation of Babylonia.' In the lists, however, *Kengi* or *Kingi* is rendered simply by *mātu*, 'country,' and here stands for 'the country' in the sense of 'our native land.'³ This being the case, it is probable that the above forms are nasalized from *kigu*, the name of the first character, suggesting that *kiki* may have been the unweakened form. As to *Ura*, that is the pronunciation given to the characters *bur*, superimposed, when they are used for *Akkad*. This group also stands for the highlands of Armenia and of Palestine, and therefore indicated a mountainous region.⁴ That the Akkadian Semites (not, as formerly supposed, the Sumerians) came from some highland district is quite possible, and that may be the meaning of *Ura*. *Akkad*, however, is probably shortened from *Agadé*, one of the names of the old capital of the northern district of Babylonia. In Gn 10¹⁰ *Acad* is named as one of the cities of Nimrod's kingdom, after Babel (Babylon), but *Agadé* seems to have come into prominence before the great capital city. In addition to *Kingi*, Sumer is also expressed by the characters *Eme-ku ki*, which have, perhaps, to be pronounced *Eme-lab*, '(the land of) the holy tongue (or language),' meaning the idiom used in the religious services of the Babylonian temples, and esteemed as sacred from pre-historic times. The connexion of Sumer with the OT Shinar (*Shin'ar*) is still uncertain. Suggestions will be found in *HDE* iv. 503f., that which makes it a changed form of *Shingi-Ura*, for *Kingi-Ura*, being the best.

3. The earthly paradise.—The tract wherein lay *Éridu*, 'the good city,' and the land of Tilmun,⁵ which traditionally enjoyed, in the beginning, the happiness and the innocence of the golden age, seemingly always appealed to the imagination of the Babylonians as being at that time the most desirable abode on earth. It was this, apparently, which led to the designation of Adam's first dwelling-place as 'a garden eastward, in Eden' (Gn 2⁸)—i.e. in the *Édinu* (Sumerian *edino*)—which, however, seems not to occur as a place-

¹ *Baba Qamma*, 91b.

² *Materials for a Sumerian Lexicon*, Leipzig, 1905-08, pt. ii. p. 206.

³ There is apparently another (variant) form for *Kingi*, viz. *Kibēgi*, but this may be due to a pun (see *PSBA* xxxv. [1913] 155).

⁴ If, however, *Bur* stands for a reservoir or waterway, *bur* would indicate the watershed of the Tigris and the Euphrates—see § 6 (b).

⁵ See below, § 6 (e).

name except in the compound *Sippar-edina* ('Sippar of the *eden*') and in the river-name *id edina*, 'the river of Eden (or of the plain).' Nevertheless, the idea always existed, and probably increased among the Babylonians, that their land was the site of the paradise of old time. This theory, moreover, is in a measure supported by the fact that *É*, which often stands for Babylon or Babylonia, may be an abbreviation of *Éridu*, and *Tin-dir*, 'the abode' or 'the grove of life,' probably refers to the wonderful vine therein. Many things, in fact, support the theory advocated by Friedrich Delitzsch,¹ and treated of by scholars and theologians before and since.²

4. Ethnic position.—As remarked above, it is probable that the Akkadians (the Semitic section of the inhabitants) came from some mountainous district, and it may have been originally an early stream from the west (the Amorite or Palestinian highlands) which preceded that of Hammurabi, who, having installed himself at Babylon, made that city the capital of the land. But both races were apparently, in their origin, mountaineers, as is suggested by the fact that the Sumerian word *leura* is the common word for both 'mountain' and 'country.' If de Lacouperie's contention³ (afterwards followed up by C. J. Ball⁴) is correct, that Sumerian, both tongue and writing, is an early form of Chinese, then their Mongolian origin would seem to be proved. The likeness of certain Sumerian words to Turkish suggests that they may have been a pre-historic race from the Far East, of Turko-Mongolian origin. Traces of oblique eyes are to be found in the small head from Tel-loh (Lagaš in S. Babylonia), given in de Sarzec;⁵ and another example is the bearded male head in relief.⁶ Good grounds for the theory exist.

5. Evidence of the Syllabary as to the probable original home of the Sumerians.—It was long ago noted that the absence of a special ideograph for 'river' implies that such a thing, in the ordinary acceptance of the word, did not exist in the country of their origin. This, in fact, seems to be true, as the compound ideographic form for 'river' shows the sign for 'water' (*a*) followed by a square representing a lake or reservoir with the character for 'to run,' 'to flow,' within. The Sumerians may, therefore, have come from a mountainous region where lakes and ponds were common, and rivers were mountain-streams or torrents. The word *kur*, which stands for both 'country' and 'mountain,' and seems to be a picture of three mountains, supports this. On the other hand, the existence of a character for 'date-palm,' *gišim-mar*, 'the fruit-tree' in a special sense, somewhat negates this evidence.

In the list of characters known as 'Syllabary b' we gather from the first entry that the Sumerians thought of the heavens (*ana*) as the abode of the deity (*dinġir*). They believed also in spirits (*gidim*, *utuk*, etc.), and made offerings (*sigiſſe*) to the gods. To all appearance they lived in houses (*é*), not tents, and those houses had doors (*giš-gal*) furnished with bolts and bars. The houses were situated in streets (*šila*), which formed cities (*uru*, dialectic *eri*). Their fields were more or less rectangular, and were protected, at least in Babylonia, by boundary-stones. It was apparently not until they had settled in their new home that their fields were called 'water-centres' (*a-šap*). They had dogs, and the dogs were faithful but quarrelsome. They also possessed goats, sheep, oxen, and swine. They did not at first know the horse, the ass (*anšu*) being the common beast of burden. Naturally they knew of wool (*sig*), and it would seem

⁷ *Ib.* pl. 21, no. 6.

that linen (*kat*, Semiticized as *kitá*) was one of the fabrics which they produced. They had pots (*duk*, *lut*) and dishes (*banšur*), and used ovens (*uduun*). Apparently the only simple ideograph for a metal was *urudu*, 'copper,' silver and gold being described as the 'day-bright' and the 'reed-bright' metals respectively. It is supposed that the only iron at first known—*an-bar*, 'the heaven-metal'—was meteoric. Tin was called *nigga* or *nagga*, and was probably originally pronounced *anagga* (Semiticized as *anaku*). They knew of fire, and used braziers, and a modification of the character for 'fire,' expressing the word 'new' (*ge*), suggests the purification of the metals and the completion of pottery and the like by its means.

6. Languages and literature. — (a) There has been much difference of opinion as to the existence of the non-Semitic Sumerian language as distinguished from the Semitic Akkadian. Halévy and his followers have even contended that it was merely an 'allography'—an invention of the Semites for expressing their own language in another way. Such an expression as 'to pour out speech' (*gu-de*), however, for 'to call,' 'announce,' is probably too foreign to the Semitic mind to admit of such an idiom replacing the common Semitic *nabá*—so, also, 'to set the breast' (*gab-ri*) for 'to resist.' Sumerian, moreover, has an involved and more widely-differing grammatical construction. The complicated system of verbal incorporations, the absence of case-endings, the use of 'postpositions' instead of prepositions, and other peculiarities, stamp Sumerian as being a language which Semites would be most unlikely to invent. Concerning its connexion with old Chinese,¹ there seem to be many analogies with regard to both characters and words, but the theory has not been very generally accepted. Many admit, on the other hand, that Turkish contains a certain number of similar roots, such as *mal* (*wal*) and *ol* in *olmak*, 'to be'; *ara* and *yuru* in *yurumek*, 'to go'; *du* and *de* in *demek*, 'to speak,' etc. Turkish, however, with its longer history, has naturally developed many new forms, and the numerals differ, but perhaps it is recognizable as a very late relative of Sumerian in its pronouns.

(b) Akkadian is now accepted as the correct designation of the speech of the Semites of Babylonia, derived from what was apparently the most ancient Semitic settlement in the tract, viz. the kingdom of Agadé. Akkad, as already remarked, was called by the Sumerians *Ura*,² and the ideograph ^{bur} *ur*, by which it is expressed, is suggested by J. D. Prince³ as referring to the two rivers which were regarded as 'the life of the land,' viz. the Tigris and the Euphrates. There is some uncertainty as to the division in which the Akkado-Assyrian language should be placed, but it may, perhaps, be regarded as the bridge connecting the Aramaic and the Canaanitish forms of Semitic speech. Its verbal conjugations belong to the former, whilst the consonantal system of its roots resembles that of the Semitic languages to which Hebrew belongs. In the use of the words, however, Akkado-Assyrian struck out a line of its own.

Thus 'hand' is not *idu* (Heb., Arab., etc. *yad*), but *qátu*; 'man' is not *ish*, as in Hebrew, but *áwétu*; 'servant' is not 'ebed' or 'abd', but *wardu*, the comparatively rare *abu* having been borrowed at an early date from W. Semitic speech. On the other hand, the roots of the words for 'God' (*úu*) and 'lord' (*bélu*) are the same as in the other Semitic tongues. The Heb. *melek*, 'king,' and *sar*, 'prince,' are represented in Semitic-Akkadian by *sarru*, 'king,' and *malku*, 'petty king' respectively. 'House' (*bitu*) and 'street' (*sáqu*) are from the same roots as in the other Semitic languages, but in Akkadian a temple was simply a 'house' (*bitu*), whilst the other Semitic languages used the word *hakat*, from Sum.-Akk. (*h*)*kallu*, 'palace'—(*h*)*gala*, 'great house,' in Sumerian. Similarly the Sumero-Akkadian word for 'city' was *áru*, but the Hebrews used the Sumerian dialectic *ir*, which appears as *yeru* (for *éru* or *úru*) in the name of Jerusalem.

(c) Most of the Sumero-Akkadian legends and

¹ See above, § 4.

² See above, § 2.

³ Pt. iii. p. 352.

mythical stories have been dealt with in the artt. BABYLONIANS AND ASSYRIANS and HEROES AND HERO-GODS (Babylonian). It is naturally difficult to distinguish the nationality of each legend, but most or all of them! have a more or less Sumerian foundation. Among the distinctively Sumerian legends of Babylonia may be classed that of Alorus and his five successors, as well as those of Alaparus or Adapa, Tammuz, and Euedoreschus.¹ From their names it seems that the ancestors of the hero of the Flood were Sumerian, and the origin of the legend of the Flood itself is now proved to be so, notwithstanding that his names, Atra-hasis and Ut-napištim, are Semitic. This is shown by the very noteworthy earlier version in the Pennsylvania University Museum,² which is written in the Sumerian language, without any Akkadian rendering.

In this text the mother-goddess (Nin-tu, Aruru, and Zér-pantum are some of her names) speaks of certain people whom she had created. At that time—long, probably, before the Flood—five great cities existed, viz. Eridu, the paradise-city, protected by the god Éa; Dür-Kiš, 'the fortress of Kiš,' which preceded Babylon as foremost city of the land; Larancha, allotted to the god Papih-hursag, who apparently became its patron; Zimbar (Sippar), which was given to the sun-god, and became the great centre of his worship; and Suruppak, now Fara, the Babylonian Noah's birthplace, allotted to the god Šuruppak or Sukurru. It will be noted that in this list of primitive Babylonian (Sumero-Akkadian) cities there is no mention of 'Babel, and Erech, and Accad, and Calneh' (Gn 10¹⁰). As in the case of the bilingual Creation-story,³ in which Merodach and Aruru not only create, but also construct the cities wherein men are to dwell, it may be supposed that these deities were not only the guardians, but also the builders of the foundations of which they were now appointed patrons. A fracture of the tablet here makes an unfortunate gap, and, when the inscription is again readable, we have, instead of the Creation, an old version of the Flood-story. The mother-goddess, here called Nin-tu ('lady of reproduction'), like Maḥ in the 11th tablet of the Gilgames-legend,⁴ bewails the destruction of the people whom she had created, and the gods invoke the compound deity Ana-Enlila ('heaven and welkin') possibly to prevent the Flood from taking place. At this point Zi-ú-suddu ('the being [or soul] of remote days'),⁵ an anointing-priest of the god Éa, went through certain rites and ceremonies, apparently with the object of saving mankind from the threatened destruction, but without effect.

'All the powerful wind-storms as one rushed forth—a water-flood raged over the [hostile]. After the water-flood had raged over the land for seven days and seven nights—after the mighty boat had been carried away by wind-storms over the swollen waters, Utu [the sun-god] came forth again, on heaven and earth shedding day. Zi-ú-suddu opened a window of the mighty boat—the hero Utu maketh his light to shine within the mighty boat. Zi-ú-suddu, the king, prostratheth himself in the presence of Utu—the king sacrificeth an ox, slaughtereth a sheep.'⁶

In the final column Zi-ú-suddu and his companions conjure Ana-Enlila, 'by the soul of heaven and the soul of earth,' to be well disposed towards them. This favour was duly accorded, and the twofold divinity, as in the Gilgames Flood-story, conferred immortality upon him. Afterwards, to make good the ravages of the tempest, which had slain so many of the human race, 'the seed of mankind' was taken up, and made to live again in the land of Tihmun,⁷ the district at the head of the Persian Gulf, which at that time extended much farther inland than now.

An analogous legend is that of Uttu (?)—probably one of the strangest records of the Creation and the Flood in existence. It was found at Nippur (Niffer) and was first translated by Stephen Langdon.⁸

⁶ The sacrifice seems to take place whilst the patriarch was still in the ark, and not after its inmates had come forth. But perhaps two acts of sacrifice were recorded.

⁸ *The Sumerian Epic of Paradise, the Flood, and the Fall of Man*, Philadelphia [1915]; see notice by A. H. Sayce, *ExpT* xxvii. [1916] 88 ff.; also S. Langdon, *ib.* p. 165 ff., and Pinches in the *Journal of the Transactions of the Victoria Institute*,

It begins with a description of Tilmun, the glorious and pure (or holy). There Enki (Ea) and his spouse (Damkina) had their home, and on that account the original condition of Tilmun was that of the world during the traditional golden age of the Greeks. The people who lived in this happy land were not afflicted by sickness and old age, nor, apparently, did crime exist. This happy state of things, however, was seemingly not to last, for Enki, the water-god, announced his intention to destroy the field (probably meaning the whole district) by means of a flood. This was to last for nine periods of a month each, during which mankind would disappear like butter when it melts. There was one man, however, who was faithful to the deity, and for him, according to Langdon's translation, 'Enki the king' waited on a boat. The context seems to show that the great and pious personage whom the god thus favoured was Uttu, saved by the deity owing to his faithfulness. After the gap which occurs here Uttu seems to be engaged in gardening-work, he having become, like Noah, an agriculturist.

After another gap certain plants, possibly cultivated by Uttu, are spoken of, and it is stated which of them he (probably Uttu) might or might not eat. One of the forbidden plants Langdon regards as the cassia, but this is doubtful. The parallel between this story and the Creation-story in Genesis, where Adam is forbidden to eat of the tree of life and the tree of knowledge, is noteworthy, though what is attributed to the first man in the one is attributed to a prototype of Noah in the other. But Uttu's plants were not trees, and they apparently did not confer either life or wisdom.

Among other Sumerian legends may be noted the story of Enlil and Ninlil, the older Bel and Beltis,¹ the legends of Merodach,² the legend of Tammuz, and probably that of Ištar's descent into Hades to seek him.³ The myth of Ura or Nergal, the god of plague and death, Nergal and Eres-ki-gal,⁴ Enlil, Tišpak, and the Labbu-serpent,⁵ together with others⁶ of which the names only are known, may be added.

But besides the legends there are many historical documents, of which the most noteworthy are the inscriptions of É-anna-tum (*Stèle des Vautours*), En-anna-tum II. (cone), Uru-ka-gina (cones), Gudea (statues and cylinders), with numerous others.⁷ As the dynasty of Ur seems to have been Sumerian, it is probable that detailed histories of the kings existed, and a fragment of one dealing with Sur-Engur and his son Dungi is known. This is the period (2300 B.C.) when the transformation of the Sumerian states into a Sumerio-Akkadian collection of nations may be said to have taken place.

There are also numerous temple-records and accounts, inventories, lists, a few letters and contracts, and chronological lists and mathematical tablets. The Sumerian lists of words are unaccompanied by Semitic-Akkadian renderings. These, as well as the lists of names (places and men), are generally classified.

(d) From a religious point of view, the Akkadian legends are most valuable and interesting. It seems not improbable that the accounts of the Creation and the Flood first published by George Smith were Semitic compositions, though based upon Sumerian originals. This is implied by the fact that most of the names, especially those of deities (Anu, the heaven-god, Enlil, the older Bêl, Éa and Damkina, the god and goddess of the waters, Merodach, the king of the gods, Anšar and Kišar, the host of heaven and the host of earth, etc.),⁸ are Sumerian, though Tiamat (Tiawath), the dragon of chaos, Kingu, her spouse, and Mummu, their son, seem to be Semitic-Akkadian. How Sumerian dominated in the religion of the Sumerio-Akkadians may be realized when it is remembered that Sumerian names in their pantheon exceeded enormously those of Semitic origin—Samaš, the sun, Bêl and Bêltu (Beltis), which

1915, p. 312 f. Instead of Uttu (?), the name was at first read as Tagtug (?), which is a transcription of the two characters by which it is expressed.

⁸ See art. SABAOTII.

generally stand for Merodach and his spouse, Nabû, the teacher, and his spouse, Tašmêtu^m, 'she who hears,' Addu (Assyr. Adad) or Rammānu (Hadad or Rimmon), and certain other descriptive divine names which possibly came into existence only after the Sumerian cult had conquered. Everything tends to show that the Sumerian element of the population preponderated in religious matters, as in the literature and the art of the Sumerio-Akkadians.

7. Social life.—Sumerian influence in the land of the Sumerio-Akkadians was, in fact, evident in every phase of their life.

The system of government was by a 'great man' (*lugal*) or 'king' (Sem. *šarru*), who had under him various officers, and was represented in the more important civic centres by a 'head-man' (*ig-sag*, Sem. *iššaku*, 'he who is head')—viceroy or mayor. To lighten the work of the supreme ruler, the tablets indicate that he had numerous 'servants,' or royal or vice-regal secretaries, whose cylinder-seals appear (generally beautifully-engraved specimens of intaglio art) on the documents written or drawn up on the king's or the *iššaku's* behalf. During the time of the dynasty of Babylon the *iššaku* had sunk to the position of administrative officer—probably something like a mayor.

Other officials were the superintendent (*nubanda*), often, apparently, the king's treasurer and palace-steward, and the business-agent (*danggar*), who acted sometimes as superintendent of the women's house or harim. Naturally, there were business-agents of various kinds, and belonging to the same class were apparently the messengers and ministers, political and other. These two classes of officials had to do with the transport of 'drink, food, and oil,' and apparently acted as political ministers. The number of documents referring to the transmission of goods, etc., suggests the existence of something analogous to posts as early as 2300 years B.C. Passing over the *ningir*, 'director' or 'governor,' of whom there were several grades, and the *ga-su-du*, 'grain-measurer' (Lau) or 'cup-bearer' (Zimmern), we have the *sag-nanga*, 'district-chief,' the *ningir-abzu*, director of reservoirs, springs, or watercourses, the *muwe*, distributors of rations, etc. Among the humbler civil servants were the carriers, labourers, gardeners, scribes, barbers—tonsure-cutters of the religious orders and apparently also hair-dressers (Sum. *šui*, Akkadian *gallubu*)—a few of them being women. Connected with the royal and temple domains were also smiths, shoemakers, carpenters, tailors or cloth-workers, goat-herdsmen, shepherds, ass-herdsmen, boatmen, gate-keepers, and various others.

Though it may be held that these details are of but little importance, they all tend to show how highly organized were the Sumerio-Akkadians at an exceedingly early date, and the social and industrial system which they had initiated naturally formed the foundation of those of the Babylonians and the Assyrians later on. One list of late date (perhaps a copy of an earlier one) from Nineveh contained, when complete, about 190 official titles or designations, some of them ethnic, like 'the Itu'ite,' 'the Assyrian secretary,' 'the Aramæan secretary,' etc. Priests and temple officials, judges and law-court officers, were also to be found with the Sumerio-Akkadians, as with the Babylonians and Assyrians at all times.

8. Ethical character.—The numerous names of men compounded with those of deities show, independently of the temple worship and ceremonies, how religious the Sumerio-Akkadians were. Each city had its favourite deity, and every man worshipped the form or aspect, shown by the appellation chosen, of the deity whom he regarded as his or his family's special protector. In addition to their religious tendencies, however, they were exceedingly superstitious, and fond of incantations and charms, of the efficacy of which they were never in doubt.¹ Every disease or sickness was capable of being cured by these means, and in all probability other advantages which men are accustomed to seek could be attained by the same means. Among these may be classed the destruction of one's enemy by melting away his waxen effigy, the cutting off of his life by the cutting of a string or thread symbolizing it, and the like. When seeking a sign, they generally appealed to the deities Samaš and Hadad, whose rays and wind, penetrating everywhere, revealed to them

¹ See art. CHARMS AND AMULETS (Assyro-Babylonian).

everything that passed on the earth. They were therefore the gods of judgment and justice, and appeal was made to them that the sign or pronouncement asked for might be true.

In the matter of morals the Sumero-Akkadians were probably not better than their neighbours, but there is one point which is worthy of note, viz. that in their literature, so far as we are acquainted with it (with the exception of the legend of Gilgamesh and one or two others), immoral or obscene passages are exceedingly rare. Moreover, it is in the same legend of Gilgamesh that the greatest hostility to the goddess Ištar or Venus is shown—hostility which brought upon that hero all the misfortunes which afterwards befell him. Slavery seems to have been in full force among the Sumero-Akkadians, but there is no proof that slaves were ever ill-treated. Ruthlessness in war was also not one of their failings, as far as their records are preserved, and they were probably the superiors of the Assyrians at all times in that respect. As a nation, whether the states be taken individually or as a whole, there is no doubt that they had a high opinion of learning and the advantages to be gained therefrom. To all appearance it was a meritorious thing to know the mythology which, to them, occupied the place of Holy Scriptures, and to be acquainted with the history of their land, which enabled them to judge of the dealings of their gods with their rulers during their long existence as a nation. In like manner, a knowledge of the methods of legal procedure enabled their scribes to employ themselves usefully by drawing up contracts; and those who made a specialty of such things could read the signs in the heavens and make known all kinds of omens, thus earning the gratitude of their fellow-citizens and their own living by the fees of those whom they served. Whatever their defects, their records exhibit them as worthy people, equal in social progress to all their contemporaries at the early age at which they flourished.

9. **Early Sumerian dominion.**—Whether the Sumerians or the Akkadians entered Babylonia first is another uncertain point, but it is to be noted that the earliest documents are in the Sumerian language, and the earliest records refer to Sumerian kings. Legends, ritual-texts, hymns, contracts, etc., and word-lists are all Sumerian at the earlier periods, and, when these documents came to be translated, the Sumerian text always preceded the Akkadian or Semitic. Their entry into the country must have taken place about 5000 B.C. or earlier, but the Semitic-Akkadians probably became prominent only about 2500 B.C. The Semites, however, were certainly numerous in the country at an earlier date, and were steadily growing in power. Sargon of Agadé or Akkad seems to have reigned about 2800 B.C. (Nabonidus's date for this ruler is equivalent to 3800 B.C.), and he was certainly not the first ruler of Semitic race. The presence of such Semitic-looking names as Qalumu^m and Zuqakip, 'the scorpion,' who reigned before the mythical Etanna,¹ notwithstanding that we have to make allowance for the inordinate lengths of their reigns, probably takes back Semitic (Akkadian) dominion in Babylonia to a date which can hardly be later than 4000 B.C. In that case we may carry back Sumerian dominion to 4500 or 5000 B.C., and even 8000 B.C. has been spoken of.

10. **Babylonia under Sumero-Akkadian rule.**—(a) *The large states.*—The number of states into which Babylonia was divided until the time of Hammurabi's dynasty (c. 2000 B.C.) is uncertain, but it can hardly have been less than 40 or 50.

This, naturally, only shows that each state had its own ruler, and claimed independence from all its neighbours. As may be imagined, the total of these states varied at different times, owing to conquest of the strong by the weak and to the gradual absorption of their smaller neighbours by the larger or more predominant centres of civilization. The name of each little state was generally that of its capital, and it is thus that we have the kingdoms of Agadé or Akkad, Kiš, Unug or Erech, Uriwa or Ur, Isin, Muru, Larsa, Lagaš, Ka-dingira or Babylon, Nipri or Nippur, and many others. Apparently after the Kassite conquest of about 1700 B.C. Babylonia was called Kar-Duniaš, 'the district of the lord of the world,' but the older name of Akkad, derived from the state of which Sargon the Babylonian was the ruler about 2800 B.C., clung to it even in the time of Aššur-bani-āpi, 'the great and noble Assnappar,' about 650 B.C. The name of Chaldea seems to have been applied to it, and that by non-Babylonians, only after the time of the Chaldean dynasty to which Merodach-baladan belonged. As has been remarked above (§ 4), the usual word for 'country' was *kur*, but another largely used is worthy of notice, viz. *kalama*, written with the character *un*, which generally stands for 'people.' This identification of the land with its people implies a strong sense of nationality in the minds of the non-Semitic Sumerians, but was less pronounced in the minds of the Semitic-Babylonians after the time of Nebuchadrezzar.

(b) *The smaller foundations.*—Though the capitals and larger cities (as understood in those days) were numerous, there were many smaller centres and settlements, sometimes founded by prominent agriculturists or traders, but in many cases they were religious foundations. Among the former may be mentioned the city of Idi-Uraš (*āl Idi-ū Uraš*) and the 'upper city of Elnanu' (*āl Elnana ēlā*) of tablet 23 of the Relph collection,¹ where also we find Larsa and Pulukku (*Larsa ki*, *Dūr āl Pulukku ki*, 'the fortification of the city Pulukku') mentioned. No. 26 of the same collection refers to the cities of men named Amat-ili, Sin-nūr-mātim, etc., the 'Taribum-district' (*kar taribum*), the '(god) Enki-district' (*kar ā Enki*), the 'new Broad-street district' (*kar sila daḡala-ge*), etc. These 'districts' were apparently instituted for the reception of the temple revenues, paid in kind.

11. **The Sumero-Akkadians' view regarding their native land.**—The idea gained by the study of the inscriptions is that the people of Babylonia (and probably of Assyria also) looked upon their dwelling-place as a holy land. Every state, every foundation, had its deity, and visits to the holy places were meritorious acts.² First and foremost, apparently, we have the paradise-city Eridu, the abode of the god Ea—the city whose ideograph was sometimes used, in later times, to express the land of Babylonia in general.³ Next came the great capital, Bāb-ili (Sum. *Ka-dingira*), 'the gate of God'—probably a folk-etymology brought about by the name *Babilam*, which was possibly (with *Babalam*) the true form. Near Babylon was Guduā (Cutha), the city of the god Nergal, and Dailem, the ancient Dēlmu, where Uraš (one of the names of En-urta) had his seat. Other foundations were Muru, where the god Muru (Hadad or Rimmon) was worshipped, Qatan, the seat of the god Qatnu, and Lasima, that of the god Lasimu, the swift runner. These similar names of the cities and their patron-gods remind us of Aššur, the old capital of Assyria, the centre of the worship of the national god Aššur, and Nineveh,

³ See § 3.

imitated from the Babylonian Nina, the former the city of the goddess Ištar as the goddess of war, and the latter that of Nina, her Babylonian prototype. Greatly favouring the gods, Babylonia was held to be greatly favoured by them—hence, perhaps, the reputation of the land as the district of the whilom Paradise (see § 3).

SUMMUM BONUM.—Modern ethical philosophy has at various times sought its constitutive principle in the will of God, the law of duty, the problem of the origin of the moral sense, the ideas or ideals of perfection, personality, progress, and evolution. For ancient ethics the ultimate reference was to the idea of good.

1. **Definitions and early ideas of the good.**—In its broadest acceptation 'good' is simply the term of general approval which no developed language lacks. Etymology cannot help us to a closer definition, for the etymology of ἀγαθός is not known and cannot be identical with that of *bonus* or of 'good.' The conjectural psychology of primitive man is of no avail, for it is uncertain, and in any case Homer was already far beyond that stage. It is obvious that primitive man did not draw our sharp distinction between moral good and other good or desirable things. There is abundant evidence in and out of Greek literature for the unmoral specification of good to courage in war, high birth, wealth, and other objects of approval or desire.¹ A unifying definition of good will always remain either a more or less plausible generalization from extant literature or an arbitrary deduction from metaphysical first principles. The Platonic *Euthyphro* and *Lysis* may serve as anticipatory illustrations of all such attempts, though the one nominally discusses holiness and the other the primal object of love or friendship (the φιλία). The *Euthyphro* leads to the *impasse* of the problem debated by scholasticism: Does God love holiness (or the good) because it is holy, or is it holy because God loves it?² The *Lysis* refers all particular loves to the primary love or end which seems to be the good.³ But what intelligible motive is there for loving the good save as a remedy against evil?⁴ Near the end of the dialogue the difficulty is evaded by renaming the good, in anticipation of Stoic terminology, the οἰκτιρῶν, the 'own,' the 'proper' (or, as Emerson sometimes renders it, the 'friendly'), and by calling evil the 'alien.'⁵ The association in the *Lysis* of the good with the end or purpose dominates all later discussions and is the basis of most modern definitions from Schopenhauer to Herbert Spencer and William James. It is of course not explicit in pre-philosophic literature.

2. **Homer.**—In Homer we find the ethical meaning of good already existing side by side with its unmoral or half-moral use in the sense of brave or well-born. This has been and will be denied. But it is the only reasonable interpretation of such passages as Achilles' saying: 'Every good and sensible man loves and cherishes his own bride.'⁶ The fact that Homer also speaks of a good meal, and of the menial services which the worse sort

render to the good,¹ need not signify more than does our own language about a good dinner or the best citizens. The abstract use of the neuter ἀγαθόν, 'a good thing,' is also found in Homer and in Hesiod's *Theogony*.²

3. **The pre-Socratics.**—The philosophic discussion of the good begins with Socrates. But a few passages of the pre-Socratics might be regarded as anticipations. Several fragments of Heraclitus suggest the idea of the relativity of the good eloquently developed by the Platonic *Protagoras*.³ And Aristotle says that Empedocles' use of the opposites love and hate is equivalent to the doctrine that good and evil are the causes of things.⁴ Later philosophy found the beginnings of a classification or scale of goods in the famous scolium:

'Health is the best when all is done,
The gift of beauty is next in worth,
The third is riches fairly won,
To be young with comrades is the fourth.'

It is with latent reference to that that Plato affirms with emphasis that not even health takes precedence of the virtue or good of the soul.⁵ It may be the highest of popular or so-called goods. It is not the good.

4. **Socrates and Xenophon.**—The Xenophontic Socrates identifies the good with the useful: 'If you ask me for a good that is good for nothing, I do not know it, nor have I any use for it.'⁶ There is no proof that this is a genuine report of distinctive Socratic teaching and no presumption that Xenophon had any ideas on the subject which he did not pick up from Plato.

5. **Plato.**—Plato's doctrine of the good has been obscured by the unnecessary mystery that has been made of its allegorical elaboration in the imagery of the sun, the divided line, and the cave in the *Republic*.⁷ The essential meaning of this allegory is demonstrably quite simple. It is merely the postulate that ethical, political, or social science presupposes the conscious apprehension of some co-ordinating purpose and final test of all endeavour.⁸ In the lack of such a vision of the idea of good, the so-called statesman is only an empiric and a rhetorician. The statesmen of Plato's reformed republic must possess this vision and this insight.⁹ They can attain it only through the scientific and philosophic education which he prescribes¹⁰ and the practical experience of affairs with which it must be supplemented.¹¹ Further than this Plato does not wish to define the idea of good¹² except through the implications of the entire moral and social ideal embodied in the *Republic* and the *Laus*.¹³

Plato's is the earliest and most effective presentation of these ideas. But so obvious a thought has of course occurred to many other moralists. Locke¹⁴ uses it to prove that moral rules are not innate or self-evident, since their 'truth . . . plainly depends upon some other antecedent . . . from which they must be deduced.' Höfding¹⁵ expresses it thus: 'Every ethical reasoning has validity only so far as the disputants recognize a definite primordial value which determines all more

special goods.' In the words of G. Lowes Dickinson:¹ 'For we must live or die; and if we are to choose to do either, we must do so by virtue of some assumption about the Good.' Whether by accident or design, a witty page of G. K. Chesterton's *Heretics*² is an admirable statement of Plato's postulate that we must know the good before we can rightly know or do anything else. The conception pervades all Ruskin's preaching.³

If these and countless other modern writers still find occasion to dwell upon this elementary truth, there is no presumption that it is too simple to constitute the underlying significance of Plato's allegory. The difficulty is in the prevailing quest for subtler or more mystical interpretations to obtain a hearing for the demonstration that this in fact was Plato's essential meaning. It is then, as we shall see later, mere misapprehension when modern scholars identify the idea of good with God, confuse its plain ethical and political interpretation by the introduction of the metaphysical problems common to all Platonic ideas, or read into its ethical application in the *Republic* all the teleological developments of the *Timæus*.

Apart from this misapprehension, Plato's doctrine of the good is his entire ethical and social philosophy as collected from the minor dialogues, from the discussion of utilitarian hedonism in the *Protagoras*, *Gorgias*, and *Laws*, and from the closer psychological analysis of the same problem in the *Philebus* and the 9th book of the *Republic*, 583 B ff. Throughout the minor dialogues the undefinable good is the test that all tentative definitions of the virtues or exaggerated claims of the sophists fail to pass. The phrasing of *Republic*, 505 B f., is equivalent to a reference to these discussions. The virtue which we are trying to define, the ability of which you boast, must be a good, Socrates urges, and the interlocutor is unable to show that it is always and unconditionally good. The consistency and symmetry of this method point directly to the idea of good in the *Republic* as the symbol of such an absolute good, and to the Platonic guardians' knowledge of it as distinguishing them from the politicians, the sophists, and their pert disciples whom Socrates puts to confusion.

The other approach to the problem of the good is through the hedonistic utilitarian controversy. Is the good pleasure or is it something higher—virtue, knowledge, or communion with God?⁴ The Socrates of the *Protagoras* formulates the obvious hedonistic utilitarian argument in a way that leaves nothing for Epicurus and very little for Bentham and Mill to add. The eloquent rejection of this point of view in the *Gorgias* and *Phædo* is an inconsistency only for critics who fail to observe by what nice distinctions Plato's affirmations are guarded or who refuse to interpret the apparent antimony by the psychology of the *Philebus* and the conclusion of the whole matter in the *Laws*.⁵ The measured preponderance of pleasure might arguably be the good if pleasure were really measurable and rightly measured⁶ or if what the multitude call pleasures were really pleasant.⁷ Plato's final feeling is aptly expressed in the words of Matthew Arnold:

'That joy and happiness are the magnets to which human life inevitably moves, let not the reader . . . confuse his mind by doubting. The real objection is to low and false views of what constitutes happiness. *Pleasure* and *utility* are bad words to employ because they have been so used as to suggest such views.'⁸

² London, 1905, p. 33.

³ See in particular the preface to *The Crown of Wild Olive*, and in *The Two Paths* the passage beginning: 'If you will tell me what you ultimately intend Bradford to be, perhaps I can tell you what Bradford can ultimately produce' (lect. iii. § 87).

⁴ *Rep.* 505 B, *Phileb.* *passim*, *Theæt.* 176.

⁵ 733 f.; cf. *Classical Philology*, Oct. 1914, p. 364.

⁶ *Laws*, 733, 734 A B.

⁷ Cf. *ἀνευρος* in *Rep.* 576 A, and Arist. *Eth. Nic.* 1176 b 19; *Rep.* 586 A ff., 583 B.

⁸ *God and the Bible*, popular ed., New York, 1883, p. 141.

Plato did not object to the Greek equivalent of utility, but he did to *ἡδονή*, as Cicero did to *ἡδονή*, *voluptas*. In *Laws*, 733 A, Plato substitutes *χαλπεῖν*, but to make his meaning clear he, in a sentence which Epicurus might have written,¹ allows *ἡδονή*.²

To return to the idea of good, the Socratic censure of Anaxagoras in *Phædo*, 98, is sometimes misunderstood. What Plato plainly says is that a teleological explanation of the universe in terms of the good³ would most completely satisfy his feeling. He is unable to find or to construct such an explanation⁴ and so falls back upon a different thing, the safe and second best method of the ideas—a kind of working logic which renounces both the speculative physical hypotheses of the pre-Socratics⁵ and the hope of a teleological interpretation.⁶ In spite of this, interpreters persistently identify the doctrine of ideas with the method of teleological deduction from the good. The *Timæus* does attempt such a deduction, but avowedly in the form of poetry and as a probable tale. There is nothing to justify the transference of this line of thought to the idea of good in the *Republic*. Amid the 'demonic hyperboles' of the *Republic* passage, 509 C, there may be phrases that suggest the dependence of the physical universe on the idea of good and the subordination of all other ideas to this *summum genus*.⁷ But the main emphasis and purpose of the passage is to stress the ethical and political significance of the idea of good as we have already met it in the minor dialogues. Plato does not say that all other ideas are included in the good as a logical *summum genus*, nor does he say that mathematics and the sciences are to be deduced from the idea of good. He says that, rightly studied, these disciplines will quicken the mind's eye for the apprehension of all abstract truth and so ultimately for that of the idea of good.⁸ In other words, the sociologist and the statesman must be prepared for their tasks by the severest scientific and philosophical education which the age affords.

Space fails to show how every significant part of the allegory confirms our simple and rational interpretation.⁹ The idea of good is the cause of both existence and knowledge because all human institutions originate in the founder's purpose or idea of good and are, as Coleridge often said, best understood in the light of their purpose—the good they were intended to accomplish. This could be extended to the physical universe by the teleology of the *Timæus* and the *Phædo*.¹⁰ God's idea of good in the *Timæus* is the cause of the world, so far as necessity permitted; and we understand the world best when we apprehend His designs. But the *Republic* is not directly concerned with these applications, and we distort Plato's meanings when we force them into the systematic metaphysical construction from which he abstained.

The comparison of the idea of the good with the sun is of great interest for the study of the history of religion, but need not detain us here.¹¹ Nor can we delay for the enormous influence of this passage in the history of Neo-Platonism,

mysticism, and superstition. In Apuleius 'Platonis τὸ ἀγαθόν' actually occurs in a context which might cause it to be mistaken for one of a list of demons.¹

6. The idea of good and God.—The identification of the idea of the good with God could do no harm if taken merely as religious poetry. The goodness of God is His chief attribute both as a negative criterion in the theological canons of the *Republic*²—so the Stoics held that God was the cause of good only, never of evil—and positively in the teleology of the *Timæus*. Plato is perhaps not unwilling to hint at the identification in such passages as *Rep.* 508 C and 517 B. God and the idea of good are both expressions of the highest ethical ideal, and the language which Plato used of both is, as Emerson and Arnold would put it, an ejaculation 'thrown out as it were at certain great objects which the human mind augurs and feels after.'³ As Epictetus says,

'God is beneficent, but the good also is beneficent. It is natural therefore that the true nature of the good should be in the same region as the true nature of God.'⁴

But in fact the two terms and the two ideas came to Plato in different trains of thought and as symbols of distinct traditions, and they cannot be identified without wresting the Platonic texts from the plain purport of their contexts and attributing to him a system of metaphysics which he did not care to construct.⁵ By the same methods of interpretation one could identify God and the idea of good in the philosophy of Jesus with the aid of Mt 19⁷, Mk 10¹⁸, Lk 18¹⁹.

7. The minor Socratics.—We shall make only brief reference to the so-called minor Socratics. The fundamental theory of the Cyrenaic hedonism differed little from that of Epicurus and of the Socrates of the Platonic *Protagoras*, though special points of distinction were laboured in the schools.⁶ The alleged doctrine of Aristippus, that only the pleasure of the present moment counts, perhaps because 'the next may never come,' is a temperamental attitude rather than a philosophy. This attitude was illustrated by many anecdotes, and strongly appealed to Horace.⁷ Walter Pater's *Renaissance* and the chapter on the 'New Cyrenaicism' in *Marius the Epicurean* commend the Cyrenaic *summum bonum* to an æsthetic generation in the form: 'Be perfect in regard to what is here and now.' 'Burn always with this hard, gem-like flame.'

Cynicism is only a cruder, harsher anticipatory form of Stoicism. Antisthenes is said to have affirmed toil and hardship (πρόσος) to be the good and to have prayed, 'Let me be mad rather than feel pleasure.'⁸

We do not know enough about the 'Megarians' to interpret Euclides' pronouncement that the one is good,⁹ though Gomperz¹⁰ undertakes to interpret it.

8. Aristotle.—The first sentence of Aristotle's *Ethics* and the first sentence of the *Politics* repeat as a truism the main thought that emerges from the Platonic quest for the good. Aristotle recognizes that the problem of ethical theory is to ascertain and define the nature of this good that all action and choice presuppose. As he proceeds, Aristotle seems to repudiate the debt to his teacher, to which every page of the *Ethics* testifies, by his insistence on metaphysical objections to the theory of ideas in general and so to the idea of good in particular.¹¹ The polemic has of course no relevance

to the ethical problem. And, when Aristotle contemptuously asks,¹ 'How would a weaver or a carpenter be profited by knowing the absolute idea of good?', he forgets that he himself has just borrowed the Platonic imagery of the unifying σκοπός, or aim, to prove that a generalized conception of the good will be practically helpful.² As Sir Thomas Browne aptly puts it,

'Aristotle, whilst he labours to refute the ideas of Plato, falls upon one himself: for his *summum bonum* is a chimæra, and there is no such thing as his felicity.'³

Aristotle himself admits that the synonym happiness, εὐδαιμονία, which he substitutes for the good, is only a blank cheque.⁴ Happiness is of course, as Plato said before him and Pope after, 'our being's end and aim.'⁵ Cicero, while repudiating pleasure, assumed happiness to be the end as a matter of course,⁶ and Leslie Stephen says:

'Good means everything which favors happiness. . . nor can any other intelligible meaning be assigned to the words.'⁷

It depends upon your conception of happiness or your definition of pleasure whether, with Epicurus, Bentham, and Herbert Spencer, you add pleasure as a third synonym or with Plato, Cicero, Coleridge, Hazlitt, Macaulay, Arnold, and Jowett, protest that to do so is either to confuse the right use of language or to suggest a false ideal of happiness. The definition of happiness with which Aristotle fills out the blank cheque is a somewhat lame and impotent conclusion of so elaborate a discussion. What hinders us, he asks, from pronouncing happy the man who energizes in accordance with complete virtue and is sufficiently equipped with external goods, not through any chance time, but for a complete life?⁸ Later philosophers interpreted the Aristotelian definition of happiness as a trimming compromise between Epicurean hedonism and the severe idealism of Plato's *Gorgias* and the Stoics. Cicero sometimes argues that in theory there can be no adequate sanction for virtue except on the Stoic principle that nothing else is a good.⁹ Sometimes he affirms that in practice the Peripatetics, who recognize external goods, give no larger place to them in their own lives than do the Stoics, who evade this concession by a change of terminology and denominate what the rest of mankind call goods not goods, but 'preferred.'¹⁰ Otherwise Aristotle's contribution to our topic is slight. He is not deeply interested in the fundamental problem.¹¹ He reviews the hedonistic controversy, in substance concurring with Plato, but unable to refrain from a tone of condescending superiority to Plato's pursuit of edification.¹² The poetical allegory of the idea of the good in the *Republic* would of course be unsympathetic if not incomprehensible to him. But the statement of an eminent scholar, that he never alludes to it, overlooks the fact that Plato's distinction there between the method of pure dialectic and that of the sciences¹³ is one of Aristotle's fundamental ideas recurring throughout his writings.

In the end Aristotelianism, in this matter as in others, comes back to an extreme form of the Platonism which it begins by repudiating. In Neo-Platonic interpretation and in the philosophy of the Middle Ages and the Renaissance the desire by which the Aristotelian first mover moves the heavens is the yearning of all creation towards him as the supreme god. This interpretation, supported by one metaphor and two or three ambigu-

ous verbs in the Aristotelian text, was blended with the poetical doctrine of Platonic love as the aspiration for ultimate beauty¹ identical with ultimate good. But this theme would demand a volume.

9. The post-Aristotelian schools.—The *summum bonum* was one of the two or three chief topics of debate in the post-Aristotelian schools.² Cicero tells an amusing story of a Roman pro-consul who proposed to convene a world's congress of philosophers and settle the question once for all.³

Locke⁴ argues from the diversity of human tastes that 'the philosophers of old did in vain inquire whether summum bonum consisted in riches, or bodily delights, or virtue, or contemplation.' Locke's argument has been used against the utilitarian reference of all things to 'happiness' or pleasure by Coleridge, Hazlitt, Macaulay, and many others. But, as Mill⁵ says, the question concerning the summum bonum is the same thing as that concerning the foundation of morality. And it is idle to expect men to cease discussing that. Horace, *e.g.*, was no metaphysician. He is interested only in

'quod magis ad nos
pertinet, et nescire malum est,'⁶

and he sums up this necessary knowledge in the three problems: (1) 'Divitiis homines, an sint virtute beati,' which was the ordinary man's conception of the difference between the Peripatetic and the Stoic good; (2) 'Quidve ad amicitias, usus rectumne, trahat nos,' the compatibility of disinterested friendship with Epicurean principles—a question much debated between the Epicureans and their opponents;⁷ (3) 'Et quae sit natura boni, summumque quid ejus.'

Locke's impatience of the problem is perhaps a survival of Renaissance distaste for the scholasticism of the mediæval literature *de bonitate pura* as seen in Albert's report of the treatise of al-Farabi.

The title of Cicero's *de Finibus* exhibits the continued association of the 'good' with the 'end,'⁸ and Cicero resumes for all practical purposes the net outcome and the influence on modern literature of the post-Aristotelian discussion of the *summum bonum*.⁹

10. The Epicureans.—The Epicureans revived the thesis of Plato's *Protagoras* and insisted that pleasure 'rightly understood' is the only conceivable end for a sentient creature.¹⁰ They then, like modern utilitarians, devoted themselves to the revaluation or the restatement in their terminology of all ethical values—what the Epicurean in Cicero¹¹ styles 'ad eam accommodare Torquatos nostros,' 'fit our examples of Roman virtue into the theory.' They also, like their modern analogues, complained bitterly of the critics who had misunderstood their meaning.¹² These tactics irritate Cicero, who thinks that he knows the meaning of the Greek ἡδονή, a perfect synonym of the Latin *voluptas*.¹³ The Epicurean *summum bonum* may be discussed in a corner. No one would dare proclaim it to a large audience.¹⁴ And the heroic deeds of Greek and still more of Roman worthies who gave their lives for their country¹⁵ are sufficient proof that 'the quadruped opinion will not prevail.'¹⁶

11. The Stoics.—The Stoic doctrine is more sympathetic to the moralist and the orator and has the further interest of a strictly deduced and ingeniously elaborated scientific system.¹⁷ In essence

it is the old paradox of the Socrates of the *Gorgias*, that nothing is really good except the good moral will. All other so-called values are either non-existent or insignificant when weighed against this. 'Sunt enim Socratica pleraque mirabilia Stoicorum,' says Cicero in *Lucullus*, 44, and in the *Tusculans*, v. 12, he takes for the text of the entire doctrine a single sentence of Plato's *Menæxenus*.¹

In the refutation of Epicurean hedonism and the working out of the system the supreme end was variously defined and deduced, and the schools and sects of philosophy were minutely classified by the various 'ends' or principles of the supreme good which they adopted.² The demonstration that pleasure is not the end and the detailed deduction of Stoic ethical principles could take their start from the idea of nature and the life accordant with nature³ or from the abbreviated formula, the consistent life.⁴ The argument from nature, as set forth in Cicero,⁵ presents startling analogies both with the 17th and 18th cent. philosophy of 'self-love' and with the modern logic of evolution. Pleasure is not the end, because it is not in fact the beginning, of animal or human activity.⁶ The earliest and fundamental *conatus* of all sentient life is not towards pleasure as such, but towards self-preservation.⁷ The pleasure is, so to speak, a by-product.⁸ Upon this supervenes in the rational animal man the recognition that the true self, the higher self, is the spiritual and moral self. The conservation of this self then becomes the end. And it matters little in practice whether all other ends are annihilated or merely dwindle to insignificance in comparison with this.⁹ Thus Cicero sometimes treats the entire suppression of the animal or lower self as a fallacy of Stoic paradox¹⁰ and sometimes as a rebuke of Peripatetic compromise and as an indispensable condition of absolute and disinterested virtue.

12. The sceptics.—The various schools of sceptics impartially assailed all dogmatic systems. But they did not for that reason admit that they lacked a moral ideal or the conception of the supreme practical end. Their scepticism was a means to the end of tranquillity or imperturbability of soul and the guidance of life by reasonable probability.

13. Developments of Platonism: the ascetic ideal.—In the Græco-Roman empire the eclectic literature of moral and religious edification reproduces all these points of view and ideas, but retains little interest in the dialectic of the schools and the philosophic theory of ethics. The cumulative influence of Platonism reveals itself not only in the softening and refinement of Stoic technicality and paradox, but also in the increasing prominence of another ideal, if not idea, of good—the ideal of detachment from the world and the flesh and approximation to God through the lonely purity of a spiritual and contemplative life. Plato's *Phædo* and the eloquent digression of the *Theætetus* are the earliest explicit Greek expression of this ideal. It is a human mood or temperament of renunciation and reaction. The opposition of the theoretic and the practical life was debated in the *Antiope* of Euripides.¹¹ And recent conjecture attributes to Pythagoras the three types of life associated with the tripartite psychology of Plato's *Republic* and employed as an ethical commonplace in the beginning of Aristotle's *Ethics*.¹² Thenceforth philosophy was the way of life, and the *summum bonum* was the happiness embodied in or to be attained by the wise man.¹³ The latent and still unresolved contradiction between the social conception of virtue and this personal ideal of salvation and happiness is apparent already in Plato and Aristotle. The artist Plato paints the two companion pictures of the Socrates of the

Symposium and the Socrates of the *Phædo* and leaves their reconciliation to the ingenuity of modern interpretation. Will the sage take part in politics? To this question of the later schools the idealist Plato answers: 'Only in the politics of his own city, the city of God.'¹ But Plato's practical decision appears in the prescription of the *Republic* that the philosopher must descend into the cave to help his fellowman,² in his journeys to the court of Syracuse, and in his devotion of the last years of his life to the laborious composition of the *Laws*.

In Aristotle the contradiction is disguised, but pervades the entire *Ethics*. Happiness is activity in accordance with virtue,³ but it finally appears that there are intellectual as well as moral virtues,⁴ and the highest activity is the pure contemplation of thought which the student may enjoy interruptedly and God eternally.⁵ The life in accordance with ethical virtue is secondary.⁶ The Stoic sage is distinguished from the Cyrenaic and Epicurean in Horace⁷ by his immersion in political activities.

Chrysippus said that Aristotle's theoretic life was only a form of hedonism.⁸ The literature of Stoicism harps on the word *κοινωνικός*, as the literature of to-day on the words 'social' and 'socialized.' And many modern critics have taken the Stoics at their own estimate and praised Stoicism on this score as against Platonism. But Cicero points out that in fact the Academy and the Lyceum were the chief schools of oratory and political science. And Seneca says epigrammatically:

'Quorum tamen nemo ad rempublicam accessit, at nemo non misit.'⁹

14. Neo-Platonism.—The divorce between culture and life in the declining period of the Græco-Roman empire confirmed these tendencies, and

Neo-Platonism, the predominant philosophy of the last three centuries, constructed its system and its ideal out of the eloquent passages of the *Phædo*, the *Gorgias*, the *Republic*, and the *Theætetus* that preach purification from sin or sensualism, flight from the world, concentration of the mind upon itself, and assimilation of the human to the divine as the way of salvation and of good.¹ These conceptions were blended with the doctrine, derived from the Platonic *Symposium* and Aristotle's *Metaphysics*, of the upward striving and aspiration of all creatures towards the primal source of the good and the beautiful, God.

It is not a practicable final philosophy of the supreme human good for any race of men in whom the will to live persists. It is only the beautiful legacy which the dying philosophy of Greece bequeathed to the idealism and the religious poetry of the world:

'If, in the silent mind of One all-pure,
At first imagined lay
The sacred world;

Ô waking on a world which thus-wise springs!
. . . O waking on life's stream!
By lonely pureness to the all-pure fount
(Only by this thou canst) the colour'd dream
Of life remount!'²

With this poetic interpretation of Matthew Arnold we may compare the last words of Plotinus' *Enneades*, *φυγή*, with Plato, *Theæt.* 176 B, *φυγή δὲ ὁμοιωσις θεῷ κατὰ τὸ διωκτόν*, and with the closing words of Emerson's last essay, 'Illusions,' in his *Conduct of Life*: 'They alone with him alone.' But the final good of Plato and of Greece in her prime is rather that of Tennyson's *Ancient Sage*:

'Let be thy wail
And help thy fellow men.'

SUN, MOON, AND STARS (Introductory).

—In every quarter of the globe the star-studded heavens have attracted the attention and challenged the scrutiny of mankind. Very especially was this the case in the low-lying plain of Babylonia, with its pellucid atmosphere, and hence the study of astrology and astronomy, while practically universal, reached a remarkably high stage of development in that region. On the one hand, the fixed stars, of various degrees of brilliance, are ranged immovably in groups that stamp themselves upon the visual organs; while, on the other, the moon, the sun, and the five visible planets seem to be constantly changing their respective positions. Such phenomena were interpreted by primitive man in a subjective and anthropomorphic fashion, and his notions regarding them were still in vogue when genuine scientific

inquiry entered the field, so that until about 1500 A.D. astrology and astronomy remained an inextricable mass of confusion.

1. The seven planets.—In the northern regions of the Old World every object was regarded by the primitive mind not merely as personal, but also as sexual. In the north-east the twin concepts of *Yang* and *Yin* long survived amongst the Chinese as a philosophical formula, classifying all existing things as male (= good) or female (= evil). Persian dualism retains the twofold principle in its most incisive form. In the Middle Ages, Christian ideas were for a time excessively influenced by the antithesis of God and Satan, though here the sexual dichotomy characteristic of the primitive mind has disappeared.

Now this tendency of the aboriginal mind towards sexual personification left some of its earliest deposits upon the observation and study of the stars. Even the simplest observations of the planetary movements brought to light the striking fact that

² Matthew Arnold, 'In Utrumque Paratus' (*Poems*, ed. London, 1881, i. 70).

the elongations of the two inferior planets, Mercury and Venus, never reached beyond a certain limit, and that these bodies traversed the zodiac as if held within the magic circle of the sun. The moon and the three superior planets were less restricted in their motions. It was therefore quite in keeping with the imaginative and symbolizing proclivity of the primitive intellect to represent the Sun, Mercury, and Venus as a family, travelling, in relatively close company, like nomads in the ecliptic. Of this family the Sun came to be regarded as the father, Venus as the mother, and Mercury as their son. The other planets were looked upon as mere vagrant males, who on occasion, however, might act as a disturbing influence in the union of the Sun and Venus.

In speculations of a still earlier period it was the sun and moon alone that formed the marriage relationship, the sun being usually the husband and the moon the wife; only in exceptional cases were the positions reversed. Occasionally, too, the relations between sun and moon were represented as homosexual and pederastic. But in the ancient Orient and in Egypt the septet of planets had already attained to such prominence in comparison with the two greater luminaries that the idea of a marriage between sun and moon hardly left a trace behind.

Even in the most remote ages the periods of revolution peculiar to the several planets had been studied, with results which led to their being arranged in the following sequence (with the earth, of course, at the centre of the universe)—Moon, Mercury, Venus, Sun, Mars, Jupiter, Saturn. The sun's superiority in size was enough of itself to give him the median position. The planets named before the sun alternated as morning and evening stars, or in other ways; and of the twofold characteristic thus exhibited one aspect might be regarded as good and the other as evil. The three last-named, or exterior, planets formed a triad by themselves, and they appeared to the observer as less under the control of the sun than his own family or the moon. The middle place amongst them was occupied by Jupiter, who might thus be deemed their king; and the king as such, according to Oriental ideas, was good. But as the sun, the giver of life and light, was likewise good, it followed that Mars and Saturn must be evil—by the principle of alternation, namely, which is even yet resorted to, as, e.g., in the counting of one's coat-buttons, in ideas about even and odd, and in other primitive superstitions. Mars with his relatively short period of revolution became the youthful turbulent demon, while the slowly-revolving Saturn was figured as the hoary-headed begetter of evil.

Not only, however, do men look upwards towards the planets, but the planets themselves look downwards upon men and events on the earth. They were even supposed to impress their own characters upon earthly affairs, intervening therein as their nature prompted. In the case of the sun and the moon such action was obvious to all, and by analogy it was attributed to the other five planets as well. These ideas were so simple and natural that, at the time when, in the oldest civilized lands, such as Babylonia and Egypt, the earliest scientific observations and records of the planetary motions were collected, they had permeated all study of the subject. The consequence was that these naive ideas continued to mingle with the subsequent results of genuine astronomical inquiry.

Aboriginal man came upon a fresh vein of ideas when he divined a mutual connexion between the lustre of the stars and that of the metals. The metals with which he was acquainted being pre-

cisely seven in number, it was natural to associate with them, not the fixed stars, but the seven planets. The parallels were as follows: the Sun with gold, the Moon with silver, Mars with iron, Mercury with quicksilver, Jupiter with tin, Venus with copper, and Saturn with lead. Hence in mediæval, and even until modern, times, the metals were indicated by the planetary symbols. Then alchemy attached special symbols to other substances; and as alchemy and astrology were intimately connected with each other throughout their entire course, it may be well to give a list of the symbols used by alchemists in the Middle Ages:—

☉ gold, ☽ silver, ♂ iron, ☿ quicksilver, ♃ tin, ♀ copper, ♁ lead, ⚛ antimony, ♁ lime, ♁ sulphur, ♁ tartar, ⊖ salt, ⊕ saltpetre, ⊕ sulphuric acid, ♁ ammonia, ⚗ distillate and sublimate, ⚗ precipitate. As will be shown in dealing with the horoscope, the symbols of the four traditional elements were derived from the two 'houses' known as *ὑπερειον* and *μεσουράνημα* respectively.

We have thus sketched the main lines of thought by which the planets came to have their particular significance in astrological speculation. More remote considerations must here be left aside. Suffice it to say that, in the final scheme of astrology, Mercury became the lord of wisdom, cunning, artifice, and craft, and was likewise bi-sexual; Venus became the lady of love; Mars, the lord of war and violence generally; Jupiter, the ruler of gods and men; Saturn, the lord of cruelty and truculence. The Sun, Jupiter, and Saturn were propitious by day, and the Moon, Mars, and Venus by night. The planets infected with their own qualities such as were born under their influence, but in certain situations their normal action might be completely reversed.

2. The ecliptic and the zodiac.—Civilized man is still affected by the variation of times and seasons, and in a yet higher degree this was the case with primitive man. The latter could hardly remain inattentive to changes of temperature and weather in their connexion with day and night, or with summer and winter, or, again, with the varying position of the sun in the sky. In his ingathering of marine products for daily food and his cruising expeditions off the coast he became aware of the connexion between the ebb and flow of the sea and the course of the moon. His interest in the chase and his sexual relations obliged him to take notice of the fluctuating brightness of the moon by night. He noted that the period of menstruation coincided with that of a lunar revolution. In the life of primitive man, accordingly, there was no concern of importance but was somehow related to the movements of the sun or the moon. As soon, however, as the planets came to be regarded as endowed with personality, the interventions of sun and moon in human affairs began to be thought of as the conscious and voluntary actions of higher beings, whose purpose it was to bring the fortunes of nations, monarchs, and individual human beings into continuous correlation with their own particular activities in the higher sphere.

The planets Venus and Mercury, being represented as respectively the wife and the son of the sun, must inevitably, according to human notions, exert an influence upon the actions of the being personified as husband and father. But, this being so, it was impossible to leave Mars, Jupiter, and Saturn out of account. Now these five smaller planets, equally with the larger two, confined their movements to a certain narrow belt of the firmament. The only difference between the circular paths of the sun and the moon and the

paths of the smaller planets is that the latter exhibit certain peculiar convolutions, which were called epicycles, and may be illustrated by a curved line as follows: . The orbits of the sun and the moon, no doubt, also showed many deviations from the path of simple revolution about the observer's own point of view. But the only change which a dweller upon the earth could discern in the smaller planets was the shifting of their several positions among the fixed stars, and their concomitant variations in apparent magnitude. Investigation of these planets, therefore, did not reach beyond investigation of their paths in the firmament.

After sunset about one-half of all the stars are visible. The great mass of these lie in the broad equatorial girdle of the heavens between the sun and a point 180° E. of the sun. The lines bounding the stars of the circumpolar vault and those of the southern hemisphere are not constant, but fluctuate inversely. The stars, however, that come into consideration in regard to the planetary orbits travel from east to west, passing below the horizon one after another, so that just before sunrise the other half of the stars, *i.e.* those lying between the sun and 180° W., are within the field of view. Thus, an examination of the sky made twice in one night, *viz.* shortly after sunset and shortly before sunrise, will embrace practically every important phenomenon in the starry heavens. These accordingly were the two times of astronomical observation to which prime importance was ascribed throughout antiquity, and into relation with which all observations were brought.

In the course of one night, then, primitive man could see almost all the stars visible in our latitude. One of the few exceptions was formed by the stars which happened to be situated in the sun's meridian for the time being. Their light was lost in the sun's beams, and they were meanwhile invisible. After sunset and before sunrise, moreover, there was a short period of twilight, causing a degree of obscuration such that brighter stars remained visible only when they were over 12° , and fainter stars only when over 15° , E. or W. of the sun. In virtue of the sun's movement in the zodiac, the observer of the morning and the evening sky might witness the following phenomenon. On a particular evening of the year a star, especially one situated in the zodiacal belt, would be visible for a few minutes after sunset, and on the following evening be seen no more. Now, such a star remained invisible for a certain time every year, and the astrologer spoke of it as being 'combust,' *i.e.* dissolved in the overpowering beams of the sun. Then, after a period of 24 to 30 days, according to its brilliance, the same star reappeared shortly before sunrise. The star's disappearance from the evening sky in the west was termed its heliacal setting, and its reappearance in the morning sky to the east its heliacal rising.

In the astrology and astronomy of both East and West throughout the entire ancient era the heliacal rising of various groups of stars was carefully noted, and employed in registering the date of events. So far, the earliest known instance of this, found more than once in historical records, is the heliacal rising of Sirius, the Δ^* of the Egyptians, which was pronounced $\Sigma\delta\theta\epsilon\iota\varsigma$, and translated $\tau\omicron$ δ α σ τ ρ \omicron τ η ς ι σ ι \omicron s, by the Greeks. By this means, long before the building of the pyramids, was indicated the beginning of the sidereal year, as well as a particular era of about 1500 years, at the end of which the first day of the sidereal year coincided with that of the tropical year. Half-way through the period of invisibility

the star and the sun lie in the same meridian. The corresponding proximity of a star to any of the planets but the sun is called a conjunction, and every conjunction was astrologically of great importance. But when the sun is one of the coincident pair, the occurrence is known as the cosmical rising of the star in question. It is to this cosmical rising, not as in ancient times to the heliacal rising, that special prominence is attached by modern scientific astronomy.

The Egyptian sacred year was subsequently adopted by the Romans as the Julian year, with the intercalation of a day in every fourth year. This computation allowed for the fact that the sun seems to move forward some $\frac{1}{441}$ of his orbit every day. This might have suggested a division of the ecliptic into 365 parts, only a trifling error being thus involved. What was actually done, however, was to divide the great circle into 360 parts, involving a still larger error of adjustment. The calculation of the yearly period and its division into twelve months—of which we shall treat more fully below—together with many other things, were thereby greatly simplified. But the sun's orbit of 360 degrees, with a day for each degree, left some $5\frac{1}{4}$ days of every year out of account. Now we still speak of a summer solstice and a winter solstice, meaning thereby the two points at which the sun reaches his greatest declination north and south respectively. Originally, however, the residual $5\frac{1}{4}$ days were divided between the two solstices, the sun being actually represented as pausing in his declination, so that he could still traverse the 360 degrees of the ecliptic in 360 days. In the ancient Egyptian calendar this whole redundant period was transferred to the time just anterior to the heliacal rising of Sirius, five days being inserted in ordinary, and six in leap (or temple) years. In the early Roman calendar the intercalation was made at the winter solstice. To the Babylonian calendar, which, with a displacement of the year's beginning, is still in use as the Jewish calendar, we must return when we deal with lunar computations. (Be it noted here, however, that for astrological and astronomical purposes the Babylonians placed the compensatory interval for the most part at the beginning of spring, but sometimes at the beginning of autumn.)

The time at which this yearly intercalation was made was dependent in the main upon the fixing of the zero meridian in the movable vault of heaven. The points through which this zero line might be conveniently drawn were, of course, many. Once it was fixed, astronomy and calendar were brought into harmony, and a definite instant established for commencing the day. The Babylonians began the day with sunrise, and the year with the spring equinox, thus placing the zero of the ecliptic upon the first point of Aries. (Among the Jews the day began with sunset, and the civil year with the autumn equinox; and, had the Jews studied astronomy independently, they would have drawn the zero of the ecliptic through Libra.) In the early Roman, as in our modern, calendar the day is reckoned from midnight, and the year from the winter solstice; here, therefore, the zero would lie in the first point of Capricornus. The Romans, however, as classical writers inform us, borrowed their astronomy and astrology from Babylonia, and accordingly it is the Babylonian zero point that is found among the Romans, as also in later developments, and even in the astronomy of the present day. The Egyptians dated their year from the rise of the Nile on the 19th of July, and the corresponding zero meridian passed through Sirius. With this, however, the beginning of the day did not harmonize, for, according to notices found in the Mantelpaviane and other hieroglyphic texts,

the Egyptian day was reckoned from sunrise. This dislocation likewise is probably due to Babylonian influence of a very remote date.

We have seen that the ecliptic, and indeed the circle generally, was divided into 360 degrees, to correspond approximately with the sun's daily change of position among the stars throughout one year. These divisions, however, were found inconveniently small, and the ecliptic was then portioned out into constellations, each having an arc of 30 degrees, and three subdivisions of 10 degrees, or decanates. This division came about in two ways. In the first place, at any given time something like one-twelfth of the ecliptic was 'combust'; and, secondly, each of these twelfths was traversed by the sun in about the same time as the moon required for one complete revolution. In this way the annual course of the sun was furnished with the 12 zodiacal signs of the ecliptic. Moreover, in the earliest times the synodical period of the moon was divided into three, viz. waxing, dominant, and waning moon, and this division was adhered to by later astrology. Now to each of these synodical thirds of the moon's course corresponded a movement of the sun extending to some 10 degrees, and thus in time arose the division of the ecliptic into 36 decanates.

The trisection of the moon's period just noted probably led in very remote times to the institution of weeks of ten and five days. It does not appear, however, from what we have so far learned of ancient Eastern history, that these measurements had any practical significance. It was only in astrology and astro-mythology, with its historical legends, that the 36 decanates (or the 72 semi-decanates) were actually made use of. This chronometry, no less than that explained above, was in vogue throughout Babylonia and Egypt, if not elsewhere. (A final vestige thereof was the Egyptian practice of assigning 401 *ushabti* for the dead—365 for the days of the year and 36 as guardians for the ten-day weeks.) In astrology of the higher type, to the time of Kepler, calculations were made by means of the degree and, above all, of the decanate; and the moon from her tenth to her twentieth day was always spoken of as being in her domain. In general, however, the method of reckoning which superseded all others, for both astronomical observation and astrological interpretation, was that of the well-known 12 zodiacal signs, although these were variously designated in the several civilized lands of antiquity. It likewise forms the foundation of the Babylonian scheme of months, as appears from the following parallelism: Libra, *tasritu* (Bab.), Tishri (Heb.), followed by Scorpio, *arah-samna* (Bab.), Marcheshvan (Heb.); then Sagittarius, *kislumu* (Bab.), Kislev (Heb.), etc. The names of the months were also indicative of their meteorological conditions; thus, e.g., the winter rainy season was symbolized by Capricornus (originally the marine animal *Hippocampus guttulatus*), Aquarius, and Pisces, all in some way connected with water.

Here, moreover, we again meet with the practice of portioning out good and evil, or rather male and female, alternately. Astrologically the zero point of this distribution lay between Cancer and Leo, approximating, therefore, to that of the Egyptian Sirius-year. Leo, Libra, and Sagittarius came to be regarded as male; Virgo, Scorpio, and Capricornus as female. It is worthy of remark that as a result of this law of alternation the astrologer was actually forced for thousands of years to speak of Taurus as feminine. Then the constellations of the zodiac were also allotted severally to the planets; thus Cancer was assigned to the moon, Leo to the sun, Gemini and Virgo to Mercury, Taurus and Libra to Venus, Aries and Scorpio to

Mars, Sagittarius and Pisces to Jupiter, and Capricornus and Aquarius to Saturn. The particular planet was called the 'lord of the mansion' belonging to its respective sign or signs. Tradition tells us, however, that there were other 'gods (or lords) of the mansion.' (Those of the Egyptians have been transmitted to us not only by the reports of Marcus Manilius, but also by an almanac notice found in the Ebers Papyrus; some of their names likewise survive in the Coptic designations of the months. A comparison of the various lists shows us that in the course of thousands of years the tradition remained unaltered, though in that of Manilius there is a dislocation to the extent of one zodiacal sign.)

The ecliptic of the sun is traversed approximately also by the moon, and in relation to the latter it was measured by a unit of the sun's course, viz. the arc described by the moon in one day. In order to correspond, therefore, with the moon's period of 28 days, the ecliptic was divided afresh into 28 lunar stations. But as the sun, during the moon's sidereal period, has moved onward by about two lunar stations, astrological calculation assumed a period of about 30 lunar stations, i.e. the time between one new moon and another, as the measure of a month. In order to delimit these stations, however, the astrologer did not portion out the ecliptic in a fresh series of constellations, but distinguished each of the 28 by a dominant star in the ecliptic. In contradistinction to the older method of dividing the 30 days of the moon's synodical period in three, there arose subsequently the plan of dividing its sidereal period in four. Once in each of these quarters each of the seven planets was recognized as the lord of a lunar station, the order of sequence being the same as that in which, in the horoscope of the hours, the planets became lords of the ascendant at sunrise.¹ Thus came about the division of the sidereal month of 28 days into four weeks of 7 days, with Sun, Moon, Mars, Mercury, Jupiter, Venus, and Saturn as successive lords of the lunar stations in each week. This astrological scheme of naming the days of the week after the rulers of the lunar stations still survives throughout Christendom, while, on the other hand, the canonical books of the Old and New Testaments entirely avoid the use of such designations, distinguishing the days of the week by ordinal numbers alone.

The various locations of the five smaller planets were usually designated by the 12 zodiacal signs into which the sun's path is divided, as is specially shown in regard to Egypt by the Berlin Demotic Papyrus, p. 8279.

3. Spherical astronomy and the astrological houses. — Observations of the astral motions within the scope of natural vision are designated spherical, and when these have been duly adjusted they are, by way of contrast, called cosmical, while the actual occurrences themselves are spoken of as sidereal. Modern scientific astronomy likewise must always take the direct spherical observations as its starting-point, only then proceeding to elaborate its way towards the higher levels of knowledge. The astrology and astronomy of the ancient world never got beyond the spherical stage. Hence it was necessary from the outset to lay down fixed bearings for observational purposes, such as would be furnished by two lines, one run-

¹ If we take the planets, therefore, in the reverse order of their propinquity to the earth, viz. Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon, and suppose that each planet in turn presides over an hour of the day, then, if, e.g., Saturn presides over the first hour of a particular day, he will also preside over the 5th, 15th, and 22nd hours; the 23rd hour accordingly will fall to Jupiter, the 24th to Mars, and the 1st hour of the new day to the Sun: hence Saturday is followed by Sunday, and so on.

ning east and west, the other north and south, through the observer's own position.

In connexion with nearly all ancient systems of religion are found sacred edifices of great age whose longitudinal axes lie exactly east and west. The determination of this east and west line, *i.e.* the parallel of latitude, was thus one of the early triumphs of the human mind. The oldest known instrument employed for the purpose was the stile, which afterwards developed into the gnomon of the sun-dial, and, indeed, the sun-dial itself. The stile was a vertical shaft fixed in the centre of a circle. In the morning, and again in the evening, the shadow of the pillar extended a considerable distance beyond the circle, while for an hour or two before, as also for an hour or two after, midday the extremity of the shadow lay within the circle. It was necessary, therefore, to mark the two points at which the shadow, forenoon and afternoon, terminated precisely upon the circle. The straight line joining these two points supplied an accurate east and west alignment, which could thus be secured on any sunny day at any season of the year. The use of the gnomon, in some form or another, seems to be common to primitive and the older civilized peoples.

Simple trial and observation showed that a stationary point was to be found in the north pole of the firmament and the star lying nearest to it. The direction of the meridian line through any given point of observation could then be ascertained by the following expedient. Two horoscopes stood face to face upon a line lying roughly north and south. The observer on the south, holding up before him the split rib of a palm leaf, moved it into such a position as enabled him through the fissure to see the pole star directly above the crown of his companion's head. Then the observer on the north, looking through the slit, saw all the then culminating stars from the southern point of the horizon upwards, and in this way projected his meridian upon the celestial vault.

The east and west points of the horizon, and the meridian of the observer, having been ascertained, the earliest facts of observation regarding the paths of the planets could be brought into relation therewith. The fixed stars, indeed, never varying in their positions relative to one another, also rose and set at constant distances from the east and west points respectively. On the other hand, the sun, the moon, and the five smaller planets rose and set at points never twice the same successively, and sometimes north, sometimes south, of due east and west. As regards the sun, the most northerly point of his rising and setting was reached as he entered Cancer, and the most southerly as he entered Capricorn, while his rising and setting were due east and due west respectively twice a year, viz. as he entered Aries and Libra. The extreme limits of his northward and southward movements in the ecliptic were called the tropical points, and the two constellations concerned came to be known in astrology and astronomy as the tropical constellations of the zodiac. Corresponding results were established with reference to the other planets.

But there is likewise an apparent daily revolution of fixed stars and planets alike around the position of the observer, each of them crossing his meridian once in every 24 hours; while if they lie in the equatorial circle the intersection takes place exactly 6 hours after they rise in the east, and 6 hours before they set in the west. Hence the observer's celestial equator, too, is always laid out in 12 segments corresponding to the 12 constellations of the zodiac; and if we disregard the sun's daily eastward movement of one degree, we find that every two hours the zodiac changes its position

relatively to the equator by one whole zodiacal sign of 30 degrees. Now the intermediate positions of the signs during these two hours being left out of account, the observer's celestial equator was once for all divided into 12 apparently stationary parts, each of these having its own meridian. The illustration below shows an equatorial section traversing the horizon and the celestial sphere. These parts were called 'houses,' and all the conditions found within them were treated as if stationed in their respective middle lines. Now, as the enumeration of the houses began in the east, and then proceeded downwards under the eastern horizon, *i.e.* according to the order in which the phenomena of each successive house would appear above that horizon, the due east point fell exactly in the middle of the first house, the due west point in that of the seventh, the meridian in that of the

tenth, and the opposite meridian in that of the fourth. All primitive astronomical and astrological study of the sky was occupied, and indeed necessarily occupied, with the rising, culmination, and setting of the heavenly bodies, with the passage of planets, normal stars, and constellations from one house to another, and with the mutual positions of the planets as measured by the houses they happened to occupy at any given time.

It would appear that these houses were sometimes divided in two, as, *e.g.*, in Egypt in the time of King Seti; and this led quite naturally to the division of the day into 24 hours, and eventually to the arrangement of the dial-plate of our clocks. For more exact observations, however, each house was subdivided into three decanates, and each decanate into ten degrees, the advantage of this being that the sphere of the observer had the same number of parts as the ecliptic, while the boundary lines defining the parts of each coincided every four minutes.

This method of parcelling out the sun's apparent daily course must have been instituted at a very remote period, in an age indeed when the astronomer had not yet grasped the idea of a circular orbit, but still thought of the solar path as a square. In

the figure representing the horoscope this quadrangle form was retained, and it has remained in use till modern times, and, in fact, till the present day. To this method of delineating the stellar paths in

the horoscope by means of the square we shall frequently have occasion to return, as a considerable number of symbols relating to God and the world were evolved therefrom. In interpreting the horoscope the various positions were so far as possible brought into relation with the first house, and with the latter as starting-point the astrologer, applying the principle of even and odd as in the case of the exterior planets, Sun, Mars, Jupiter, and Saturn, alternately assigned to the other houses an essential character of benefit or bane. Thus the twelfth house was unfavourable, the eleventh favourable, the tenth—apart from its special position—unfavourable, the ninth favourable, the eighth supremely unfavourable, and so with the rest. This mode of interpretation was also arrived at along another line of thought, and, being thus supported by two ostensible proofs, it was believed to be established beyond dispute. The second proof in question was that supplied by the 'aspects,' of which we shall treat presently.

The plan of indicating position by means of zodiacal signs and houses could at best give approximate results. For the sake of simplicity it was assumed that the boundary lines of the several signs always coincided with those of the several houses, and that accordingly at the end of a Babylonian double-hour each sign moved instantaneously into another house, whose number was one less than that of the house which it had vacated. For all further deductions within the limits of plane geometry, the entire contents of any particular zodiacal sign were regarded as concentrated in the middle point of the sign and the house then congruent therewith.

The enumeration of the astrological houses from the east downwards towards the west, then eastwards again above the horizon, so that account is first of all taken of the invisible regions of the stellar heavens, had its origin in the fact that the attention of the astrologer was primarily directed towards the rising of the stars, and accordingly the houses were numbered in the order in which the stars contained in them at any given time would reach the eastern horizon and become visible.

4. Aspects. — The term 'aspects' was used in astrology to denote the relative positions of the houses and zodiacal signs, or of the stars situated in the houses at any given time. Planets in the same sign and the same house were said to be in conjunction; planets in opposite signs and houses, in opposition. The other possible relations amongst the celestial phenomena were defined with reference to regular inscribed polygons. Thus, if a planet were situated in the twelfth or the second house, then the line joining the middle point of either of these houses and that of the first house would form one side of a regular inscribed dodecagon; in

which case the planet in question was said to be in dodecagonal aspect to the east point, or 'horoscope' in the original sense. As in the same way planets in the eleventh and third houses furnished the side of a regular hexagon, their aspect towards the east or the horoscope was spoken of as sextile. Similarly planets in the tenth and fourth houses were in quartile or square, and those in the ninth and fifth were in trine. The line joining the middle point of the eighth or the sixth house with the east

point was not a constituent part of any regular figure within the circle, and suggested at best a cross dodecagon, formed thus, which was regarded as the violation of all order. But as conjunction and opposition were reckoned amongst the regular aspects, the eighth was the only visible house having no aspect towards the horoscope. The principle of alternate numeration likewise pronounced this house unfavourable. In the astrological application of spherical astronomy it therefore signified the house of death.

Prior to the stage now reached, the exclusive concern of the astronomer had been to map out the heavens with such precision as would enable him to fix his observations by means of a verbal record. His conception of aspects, however, *i.e.* of the relations of the stellar positions to the horoscope, led him to assign values to the stellar positions themselves, and as soon as these came to be represented as anthropocentric or concentric, the initiative was given to the science of Judicial Astrology. Nevertheless we must emphasize the fact that the original scheme of the horoscope was depicted as a square, and that, before it became possible for astrology to speak of regular polygons, the conception of the sun's apparent diurnal motion as a circle must have come to the front. Thus the very language of astrology shows it to have been a kind of exerescence, not inherently connected with astronomy at all. Even in the Middle Ages a distinction was still maintained between Natural Astrology and Positive Astrology. The former dealt with the actual, and especially the baneful, influence of the planets upon meteorological changes—wind, storm, hurricane, thunder, flood, and earthquake. It was accordingly bound up with the naive and fantastic weather-lore of primitive man, and is to some extent still in evidence in scientific meteorology. In regard to the latter it is even yet frequently true that *sub iudice lis est*.

Positive or Judicial Astrology, on the other hand, was concerned from the earliest times with the supposed influences of the planets upon the fortunes of men and nations. It is now regarded by all sober minds as an extravagance of the human intellect, as something that the race has finally left behind. In Judicial Astrology it was no longer merely the aspect of a star to the horoscope, *i.e.* the east point, that was specified and appraised, but also the aspect of two planets with respect to each other. If one planet, for example, was situated in the eleventh house and another in the eighth, the two were said to be mutually in quartile. Here again, moreover, we find the alternate distribution of good and evil: conjunction was good; adjacent aspect or aspect in dodecagon was evil; sextile was good; quartile relatively evil; trine specially good; absence of regular aspect was specially evil, and opposition relatively good.

Since the line between the eighth or the sixth house and the east point did not form the side of a regular inscribed polygon, these two houses were deemed of inferior value. For the anthropocentric mind of the astrologer it was therefore a short step to regard them as houses of misfortune. The eighth house thus became the house of death, and the sixth the house of pains. We shall see later that in the reciprocal relations between the macrocosm and the microcosm the left arm became a synonym for the house of death and the left leg for the house of pains, and that in consequence these bodily parts themselves came to be regarded as of evil omen.

As emphasis was laid likewise upon the mutual correspondence of east and west—an idea that was corroborated by the principle of alternate numbering—the twelfth and second houses were counted

unfavourable. In primitive plane geometry the inscribed triangle and hexagon were deemed pre-eminently regular figures, and once more the alternate enumeration gave the same result. Consequently the eleventh, ninth, fifth, and third houses were reckoned favourable; while the tenth and fourth, again, were relatively evil. These symbolical interpretations, however, were sometimes set aside, sometimes even reversed, especially those connected with the invisible half of the sky.

The tenth house, as that in which the stars culminated, was supposed, by a very natural symbolism, to preside over dignities and offices, while the fourth house, lying directly beneath us, came in similar fashion to be associated with parents and ancestors, as those who had passed into the under world, and inferentially with all the other ties of kinship. On the ground of a certain analogy with the eighth house, *i.e.* that of death, the twelfth became the house of enmity (*κακοδαίμων*), and, by a further analogy, the second became the house of poverty. As the second house, however, was situated in the sky belonging to the under world and therefore opposite to ours, it became the house of fortune and riches, and for the same reason the sixth house, that of pains (or, according to another interpretation, that of service), became the house of health. Next to the house of death came the ninth as the house of the tutelary deity, while the eleventh, adjacent to the house of enmity, became that of friendship (*ἀγαθοδαίμων*). On the ground of similar considerations the third became the house of brothers, and the fifth the house of children. Finally, as the first house was specially associated with the querent of the astrological oracle, the seventh belonged to the querent's counterpart, *i.e.* in the ordinary course of things, wife or husband.

The designations of the various houses were therefore as follows: (1) life, (2) riches, (3) brothers, (4) parents, (5) children, (6) health, (7) marriage, (8) death, (9) religion, (10) dignities, (11) friendship, and (12) enmity. But this arrangement gave only the general scheme of astrological prognostication, and in the course of thousands of years various changes were introduced. Our information regarding any particular era of astrological speculation is defective, and we speak only in a general sense when we assert that from first to last the system detailed above remained essentially unchanged. It was all along recognized, moreover, that the scheme must be specially adjusted to special circumstances. Thus in the case of sickness the real querent was the invalid himself, and it was about him, therefore, that the first house supplied information. The counterpart was meanwhile not the wife, but the disease itself, upon which accordingly light was cast by the seventh house. The tenth house, in which the stars culminated over the patient, symbolized the physician, while the fourth, lying directly beneath in the under world, signified medicine. Account was also taken, of course, of the eighth house as the house of death, and of the sixth as the house of health. The houses of friendship, enmity, riches, brothers, and children were not supposed to wield any influence upon the course of the disease. Nor was much importance attached, in such cases, to the symbolism of the sun's planetary family; and, in fact, according to Greek accounts of Egyptian astrology, neither Venus nor Mercury was taken into consideration at all.

5. The astrological conception of the world.

—The enormous advances that have been made within modern times in the study and practical application of the natural sciences, as well as the great contrast that obtains between the ancient and the modern scientific point of view, are matters

of common knowledge. It is impossible to understand the theories of nature held by the ancients without a clear conception of the difference between their fundamental standpoint and our own. According to the older view of the world, which can be traced backwards for 5000 years before Christ, and which still held unquestioned sway for 1000 years after Christ, all natural objects issued in parallel lines from certain primary causes of universal operation. Modern science, on the other hand, assumes that the various groups of physical phenomena proceed by differentiation from certain primordial forms. While the ancients, therefore, looked upon the diversity of things as original, and their common elements as due to external influences, the moderns assume that the properties which objects have in common are inherited from a single primary form, and that their differences have been produced by external conditions, such as, *e.g.*, the struggle for existence.

The two conceptions, however, are not held stringently apart, nor does history show a rigid line of demarcation between the later and the earlier. Even in Genesis (10th), for instance, we have a table of nations which stands in complete agreement with the modern point of view, more particularly in the circumstance that it traces back the ancestry of all mankind in a series of converging lines. Much more in accordance with the ancient conception, on the other hand, is the Greek Deluge-story of Deucalion, according to which human beings were generated spontaneously from stones acted upon by the formative powers present in the air.

The theory of parallel processes may be called the 'ancient astrological,' or, again, the 'Oriental astrological' view of the universe. It had its birth amongst the early civilizations of the East, and its leading science was astrology; nor is it yet a spent force among certain Asiatic peoples of to-day. Now even our modern science, with its discovery of steam-power and its remarkable utilization of electricity, does not enter so profoundly into contemporary experience as did the ancient astrological conception into the life, thought, and feeling of the distant past.

Perhaps the most effective resistance to the more harmful issues of the astrological theory of the universe was made by the peoples living around the Mediterranean. But the Scriptures of the Old and New Testaments are likewise free from the evil outgrowths of that view. Nevertheless, we must remember that even the Biblical writers were children of their time, and could therefore hardly avoid expressing their thoughts in terms of the recognized philosophy of their age. Hence, just as we have come to recognize that the thoroughgoing study of Biblical Hebrew cannot dispense with the philological investigation of Arabic, Ethiopic, Babylonian, Syriac, etc., so we are now beginning to realize the impossibility of understanding the tenor of Biblical modes of expression apart from a knowledge of the astrological conception of the world common to the Babylonian, the Egyptian, and other ancient civilizations.

We must again refer to the square form of the horoscope, as furnishing the ground-plan of this theory of the world. The figure shows us the link which the theory had with astrology, and also with other two occult sciences, *viz.* Alchemy and the Kabbala.

It is of interest to note that the symbols used in astrology for the four cardinal points were simply the triangles corresponding to the first, fourth, seventh, and tenth houses respectively. But while, according to the expedient already noticed (p. 52*), the positions of the stars in the ecliptic were determined by the observer on the north, the fixing of the cardinal points was effected by his fellow on the south. The horoscope was therefore seen by the latter from the opposite point of view, and the

four houses in question took a reverse form, so that \triangle came to mean north, ∇ south, \triangleright east, and \triangleleft west. With this exception, however, all further inferences were drawn from the proper form of the horoscope, i.e. from the figure it presented to the observer on the north.

The tenth house, as the *summum cælum*, and the fourth, as the *imum cælum*, embraced everything in the world above and the world below respectively. The upper world as a whole, however, consists of the eighth, ninth, tenth, eleventh, and twelfth houses. In the hieroglyphic script of Egypt, accordingly, heaven is represented by the exterior boundary of these five houses, thus:

which, of course, according to the Egyptian practice in such matters, is only a contour, and really stands for . The same proportions and angles are likewise retained in the Egyptian representation of the goddess of heaven, who broods over the earth-god—a phenomenon which will meet us again when we treat of Egypt. The under world was represented, of course, by the same figure inverted. Now we find two different ideas attaching to each of the houses numbered ten and four. According to one conception the *summum cælum* contains the heavenly upper ocean, from which rain falls (עַרְפָּת הַשָּׁמַיִם in the Biblical narrative of the Deluge), while the *imum cælum* embraces both the ocean of the under world and the subterranean water from which the fountains of the deep are fed (מַעְיָנוֹת הַקְּדוֹת) also the sources of the Nile in Herodotus). According to the other conception there lies above us first of all air, then fire; and beneath us, first earth, then water.

Now the latter theory furnished also the alche-

- a= Fire \triangle
- b= Air \triangle
- c= Earth ∇
- d= Water ∇

mistic symbols of the elements—symbols which are still written by doctors in old-fashioned mysterious receipts, and were in common use among physicians and apothecaries a hundred years ago. Thus, for example, ∇ sigill. signified *terra sigillata*; lumbric. ∇ restr.=*lumbrici terrestres*; ∇ flor. \odot rant.=*aqua florum aurantium*; or something was to be boiled *leni* \triangle , i.e.

leni calore. Distilled alcoholic liquors were known as 'burnt water,' and were denoted by a combination of the symbols for water and fire, thus

To this day the device  displayed upon rustic inns indicates the licence to sell brandy.

This combined symbol  was used not only

in alchemy but also in the Kabbala, where it represented the *Star of David*. It became, in fact, a symbol for God (just as the fire-eye, i.e. \triangle , was employed in Christian symbolism to signify the Holy Spirit); for, by the rules of the Kabbala, the combination of the principal consonants of אש ('fire') and מים ('water') yielded the word עֶשְׂמִים ('heaven'), which in its turn was the cabalistic equivalent of אֱלֹהִים ('God'). Thus the term God

could be expressed by the secret sign  as the

synthesis of fire and water. In the synagogue all pictorial representation of God was forbidden, nor was it allowable to give utterance to the tetragram יהוה unless absolutely necessary. In the same way, therefore, as the word אֱלֹהִים had to be resorted to as

the oral designation of God, the symbol  came to be used in the architecture of the synagogue

as His graphic designation. This figure, moreover, not only contains within itself the symbols of the four elements, interlaced with one another, but, besides the upper and lower triangles signifying fire and water respectively, it also shows four extra-mundane triangles, which could thus be regarded on cabalistic principles as metaphysically symbolizing the four consonants of the tetragram. Hence, even in passages of ancient Christian works where we might expect some such phrase as 'with God,' we actually find the cabalistic device

signifying יהוה.

According to the astrological theory of the world, however, not only the perpendicular section through the universe, but the surface of the earth itself, was thought of as quadrate, since the cube, as the ideal geometrical figure, was the accepted symbol of the world as a whole. This idea finds

frequent expression even in later cabalistic writings treating of the origin of salt, which, of course, also crystallizes in cubes. The scheme of the horoscope, accordingly, became a comprehensive map of the world as well. As previously explained in

connexion with the points of the compass, the horoscope was in this case constructed, as it were, from the opposite point of view. In the centre was the navel of the world, which every nation sought to claim for its own territory, and as the site of the national sanctuary. The figure also supplied the four pillars, viz. N.E., N.W., S.E., and S.W., upon which the heavens are supported. Of these the best known was the S.W. pillar, as it was there that Atlas had been relieved by Hercules.

6. **Anthropomorphic nomenclature of the sphere.**—The square horoscope was not the only expedient resorted to in setting forth the relations of the stars, as another method was also in use among the Egyptians. From a time anterior to Menes until the final period, the high priest of

Heliopolis was known as  *i.e.* 'chief

astrologer.' We may note in passing that this office was held by Poti-pha (of which name the literal Greek translation was Heliodoros), the father-in-law of Joseph (Gn 41⁴⁵). Tables of observations made in Egypt during the Twentieth Dynasty are still extant, and in these are recorded the times at which the fixed stars cross the middle lines of the houses, *i.e.* the beginnings of the double-hours. The astrologer on the north found the meridian of the place of observation by looking through the slit of the palm-leaf rib above the bald crown of his companion. The middle meridians of the first and seventh houses were given by the horizontal line, while the observer found those of the eleventh and ninth houses by lines projected over his companion's right and left eyes respectively, and in similar fashion those of the twelfth and eighth houses by lines above the right and left elbows. It is probable that the sixth house was in like manner associated with the left knee, and the second house with the right.

From this point of view the left arm corresponded with the house of death and the left leg with the house of sorrows, and on this account there eventually arose a superstitious aversion to using the word 'left' at all. In particular, all actions performed by the left hand came to be regarded as unlucky. It may well be the case that mankind was right-handed rather than left-handed before astrology asserted its sway, but the ban thus laid upon the left extremities of the body undoubtedly supplied a further reason for excluding the left side and especially the left hand from all actions of great and critical moment.

7. **Applied astronomy and astrology.**—Alike in the greatest and in the smallest affairs of life uncivilized man is affected by the changes incident to the day and the season, by the phases of the moon by night, and by the ebb and flow of the tides. Hence the observation of sun and moon with a view to a standard measurement of time, or, in other words, to the construction of a calendar, was a vital condition of all progress in civilization. But, as the periods of the earth's rotation about its axis (*i.e.* the apparent diurnal movement of the sun), of the moon's revolution, and of the sun's apparent annual revolution, are incommensurable with regard to each other, the early attempts to frame a serviceable calendar were attended with no small difficulty. As the lunar month made more impression upon the primitive mind than the actual solar year, endeavours were made in the earliest calendars to base the latter upon an integral number of the former, and all sorts of expedients were tried in order to harmonize the two periods. At a further stage in the growth of civilization

the determination of the true solar year became the subject of inquiry, the length of the true lunar month being then left out of consideration. Here again, however, the residual fraction of days provided difficulties, and the difference between the calendars of Western Europe and Eastern Europe (Russia) shows that these difficulties have not yet been overcome. In the pre-Christian era there was a disparity between Babylon, with its cyclically adjusted lunar year, and Egypt, with its solar year, or, rather, its two unequal solar years. Other civilizations employed other types of calendar. A purely lunar calendar is still in use among Muhammadans.

The outstanding periodic phenomena of the apparent courses of sun and moon were registered in these calendars, and were celebrated as occasions of joy or sorrow according to their influence upon human life. In such feasts and fasts the moon and the sun were, first of all, personified, and they still continued to be revered as divine or heroic beings even after the particular days connected with their movements by astrology and astronomy had been duly set down in the artificially corrected and adjusted calendars of ancient and modern civilized peoples.

8. **Lunar, solar, and planetary deities.**—The ascertainment of such varying influences of the moon and the sun as could be registered in the calendar was undoubtedly a forward step in the mental development of primitive man. But the notion that the movements of moon, sun, and planets were effected by powerful and conscious beings, more or less endowed with free will, was an open door to all illusion. The religion and mythology of the lowest races are permeated with this idea. Amongst more highly civilized peoples, again, we find a stock of myths of like purport, which, partly indigenous and partly exotic, forms a kind of illicit religion or superstition, and which shows many points of contrast with the teachings of the recognized national cult. In periods distinguished by a high state of civilization this supplementary religion finds acceptance only amongst the lowest and least enlightened ranks of the people, while at times, when culture is at a low ebb, it extends its sway over the leading classes as well.

In cases, however, where a relatively advanced and purified form of religion found its way into a region already civilized, the old representations of moon and sun as personal beings, as also the narratives that had grafted themselves upon their festivals, degenerated into mere legends. As illustrations of the process we may name the *Metamorphoses* of Ovid in the Roman religion, the stories of the Thousand and One Nights in Islam, and Grimm's domestic and popular tales in Christianized Germany.

But it was also possible that a fusion might take place between the older and the newer narratives. Thus, apart from the sphere of religious history as such, there are many mediæval kings and heroes whose actual experiences, on the one hand, stand forth in the clear light of history, but whose legendary adventures, on the other, show unmistakable deposits from the personifying narratives about the moon and the sun. The same process has been at work practically everywhere; we trace it not only in the *Nibelungenlied* and the *Iliad*, but also in connexion with all the great figures who as gods or prophets occupy the supreme place in the various systems of religion. Popular imagination, in fact, clinging as it does to the ancient legends, is quite indifferent as to the figure around which it throws them; it may fix upon Confucius, Buddha, Zarathushtra, Jesus, or Muhammad. Even the older religions, with deities unmistakably of planetary origin—the Babylonian

Shamash, the Egyptian Rê, the Greek Apollo—show such secondary deposits from various astro-mythological sources.

The disengagement of this secondary astro-mythological element from the Christian system of thought has now become one of the prime tasks of theological criticism. It is no longer possible for any earnest scholar to reject the fundamental idea of such analysis, and the extent to which the work of elimination shall be pursued depends entirely upon whether the individual theologian leans towards the more orthodox or the more liberal side. In regard to Confucius, Buddha, Zarathushtra, and Muhammad, as also in regard to the Alexander romances, the Christian theologian concedes the rights of the method without hesitation. Further, the OT and the Life of Jesus have from ancient times been the nuclei of a mass of legendary stories (the Talmud, etc.; Gospels of the Infancy, etc.), which all theologians have for centuries regarded as apocryphal; and it cannot be disputed that the study of astro-mythology has rendered valuable service in throwing light upon the origin of these spurious additions to the lives of the leading personalities of our religion. Once more, there is a group of writings which, though reckoned apocryphal by evangelical Churches, are still included in the Roman Catholic canon; and, as might be expected, the bearing of the astro-mythological theory upon these writings is estimated by the two great parties within Christianity in precisely opposite ways. And when at length the theory is applied to certain constitutive elements in the OT, and to the life of Jesus as given in the evangelical records, the theologians who concede its rights in these domains are fewer still in number. The explanation of this, of course, is that such criticism seems to undermine the historicity of the Biblical narratives, and to leave nothing but a mass of mythical stories about the planets, which have crystallized around certain more or less unreal figures in the history of Israel. The logical result of the process appears to be the subversion of every constituent of Christianity save its ethics.

Taken in this sense, the comparative study of astrology and astro-mythology rests upon an impregnable foundation. The implications of its results, as was said above, may quite well be brought into harmony alike with the most rigid orthodoxy and the broadest liberalism. Hence it cannot be non-suited by either of the warring schools; it is reconcilable even with the aims of its critics. Just as comparative philology is an ideal and impartial science, so must the comparative study of myths assume a like impartiality; and the indispensable framework of this study is formed by the planetary deities of astrology.

9. **Prophetic astrology.**—From the theological point of view, prophetic astrology must be regarded as a by-way towards superstition, and, indeed, as one of the main sources of superstition. It was evolved by gentle gradations from what we may call 'calendar astronomy.' Primitive man discerned parallelism not only in the processes of nature, but also in the State and in human life; nay, even in the forms and organs of animals he read analogies and homologies, and many other fields of observation presented similar correspondences. But by far the most obvious and unmistakable cases of parallelism were those which subsisted between the motions of the sun and the moon, on the one hand, and the periodic variation of the tides, of light and heat during the day, and of the seasons, on the other. Hence arose the notion of planetary deities or angels—beings who acted according to highly complicated laws, ordained either by themselves or by a superior power, and

who sought to bring all events, great and small alike, within the range of parallel uniformities. Where the trend of thought was polytheistic, the planets were regarded as gods; where it lay towards monotheism, they were but the messengers of a Divine will beyond them; or, as the case might be, an inevitable fate was supposed to hang over the gods themselves.

From the standpoint of the ancient astrologer, the supreme function of all learning was the observation of certain simple phenomena and the drawing of inferences bearing upon a parallel series of facts otherwise veiled. The primary task of astrology was to ascertain the positions of the planets in relation to one another, to the zodiacal signs, and to the observer himself, and then to make deductions therefrom. This was astrology properly so called, and it required for every particular case a direct reading of the sky. A cloudy night, however, rendered such direct readings impossible. Now, the Kouyunjik inscriptions, dating from the time of the Assyrian king Assurbanipal, yield evidences for a continuous series of actual observations. From these we learn that, notwithstanding the complexity of the planetary movements, the periodic repetition of essential phenomena had been calculated for each particular planet. Thus the astrologer could fall back upon tabulated records covering every particular sequence of planetary movement, and could substitute these for direct observation. It is true that, owing to trifling inaccuracies in the data thus supplied, this course was avoided for thousands of years; but at length the momentous step was taken. No doubt, it still remained necessary to bring certain recorded positions to the test of actual observation; but, with these exceptions, the researches of the practical astrologer were thenceforth pursued in the study. Our earliest evidences for this procedure date from the period of the Persian monarchy.

So far as astronomy itself is concerned, this was a progressive movement; but, from the standpoint of observational science, it was a backward step. It issued finally in the determination and mathematical calculation of the planetary orbits by Kepler. But, in our estimate of Kepler's discoveries, we must always bear in mind that he was still under the spell of the astrological conception of the universe. It was his firm belief that his discoveries supplied the key to all events of history, and had exalted astrology to the level of a perfect and independent science of simple calculation, while in reality he had given the death-blow to its pretensions.

From the time of the earliest attempts to draw up a calendar—through the period of the Sumerians and Akkadians—to the days of Kepler astrology underwent no essential change, save that it gradually abandoned the method of direct observation of the heavens in favour of, first, a partial use of tables containing earlier observations, and, finally, a purely arithmetical determination of the positions occupied by the planets at any given time. Astrology, be it remembered, was a study of international importance. Wherever, therefore, in the history of any civilized country we can trace some slight advance in astronomical science, we find corresponding records, practically contemporaneous, in all the civilized countries of that epoch. Additions to men's knowledge of the stars were valued only as ancillary to the determination of the planetary positions. As all the available evidence goes to show, however, astrology, throughout its entire career, had but one method of adapting this knowledge to oracular ends—the method, namely, of symbolical interpretation, with a more or less clearly realized principle of alternation. In the main, the positions of the planets were made

the basis of prognostications of the unborn future, but they were also used as a means of filling up *lacuna* in the knowledge of the past and the present.

10. Astrology and medicine.—In the ancient Oriental view of the world, astrology, religion, and therapeutics went hand in hand. In the conviction that all things in the universe proceeded in parallel lines, men spoke of a macrocosm (primarily the stellar world as the province of Deity) and a microcosm (primarily the human body), and sought for far-reaching analogies between them. Thus—to take one of many examples found in Sanskrit literature—the Vedas and their allied texts exhibit attempts to establish an exact equivalence between the number of the bones in the human body and that of the days in a year. Simple as would have been the task of enumerating the bones accurately, they were purposely numbered wrongly, so that the desired numerical relations might be educed; the lower jaw, for instance, was said to be composed of eighteen single pieces, not including the teeth, just because this number, while purely factitious, could, as the twentieth part of 360, be used for purposes of speculation. The method was applied in every field, and things which did not harmonize in fact were arbitrarily made to do so.

In the ancient East the therapeutic art was based upon the two fundamental postulates of air in motion and liquid in motion, and it was supposed that in the human body the air passed along the arteries, while the liquid traversed the veins. The solid substance of the body (its earthy constituents) and its native heat (its igneous constituents) were regarded as forming a fixed and constant mass: earth and fire, in fact, were probably never considered in their physiological aspects until the Hellenistic period. The astrological references hitherto discovered in Babylonian and Egyptian texts show that air and liquid alone were taken into account. In the further development of these notions, special prominence was given to the air by the pneumatists, and to the blood (*i.e.* liquid, and a mixture of the four principal humours, *viz.* water, phlegm, yellow bile, and black bile) by the hæmatists. We cannot enter here into the particulars of the antagonism maintained between the two schools for several thousand years, an antagonism which we can trace in the period when the Pyramids were built, and which, again, moved the hæmatist Aristophanes to the mortal hatred wherewith in the *Clouds* he arraigned the pneumatism of Socrates before the Athenian populace. Suffice it to say that, in all references to the facts of nature found in the Pentateuch, the Jahwistic sections (of Genesis in particular) represent the pneumatic, and the Elohist portions the hæmatic, point of view, whereas the Priestly Code exhibits no scientific tendency at all. The pneumatists regarded the nose as the most important organ of the body. We may recall the numerous phrases formed with \aleph in the OT, and the large noses of the singers in the chorus of the *Clouds*. Even amongst the inscriptions from Nineveh, which must, on the whole, be reckoned to the hæmatic school, the present writer has found no fewer than fourteen different texts referring to divination by the nose.

According to the hæmatist, life was concentrated in the liver, the \aleph , or heavy organ, which, accordingly, together with the blood, plays a prominent part in the OT and the Talmud. Amongst the Babylonians and Etruscans, again, as also among the various peoples influenced by them, haruspicy took the special form of divination by inspection of the liver. The cuneiform texts which treat of this hepatoscopy are without number, and have been read and translated mainly by Jastrow.

In the ancient East, and even in Greece, the hæmatists were for the most part firm believers in astrology, omens, and all that we now brand with the name of superstition. To dreams, above all, they attached great importance, while the pneumatists, on the other hand, as is shown by the writings of Hippocrates, declared dreams to be unworthy of consideration. The pneumatists seem to have borne the reputation of being enlightened persons, or sometimes even atheists, as was the case with the pneumatist Socrates as delineated by Aristophanes. From certain fragmentary indications we may perhaps gather that in the main the Christians of the early centuries were pneumatists in their knowledge of nature.

From the mental standpoint of the hæmatic astrologer every actual group of relations amongst the planets mirrored itself in all synchronistic events and conditions, and thus the entire horoscope would be reproduced in the variations and peculiarities found in the liver—the central organ—of the newly-born sacrificial animal. An expert examination of the liver could therefore quite well take the place of a direct observation of the sky. The practice of hepatoscopy was extensively diffused, and diagrams illustrative of the art are still extant. The method adopted by the Babylonians was to portion out the liver in what may be called oracular squares by means of a right-angled system of ordinates, a device reminding us of the square sections shown by the extant Egyptian projection of the heavens made in the time of King Seti, and likewise of the square figure used as the ground-plan of the normal horoscope. Amongst the Etruscans, however, hepatoscopy employed a polar projection in its construction of oracular fields, and to this arrangement corresponds the system of regular polygons designed to represent the relative positions of the planets in the circular horoscope.

Another way of dispensing with direct observation of the heavens was to watch the forms assumed by certain substances when suddenly placed under new conditions, as it was supposed that the forms thus produced were determined by the configuration of the planets at the time. Oil or melted tallow was dropped into water, or water into oil, and the diviner took note of the resultant forms. We possess two comprehensive lists drawn up in the reign of King Hammurabi of Babylon for the express purpose of interpreting these formations. This mode of divination still survives in the superstitious practice of dropping molten lead upon a cold surface.

A further variety of oracle was found in dreams, to which reference has already been made. Dreams also were believed to run parallel to the facts of astrology, and might, therefore, be substituted for the latter. But, as dreams were held to have their origin in the blood, their significance was conceded by the hæmatists only.

Finally, every unaccountable phenomenon of nature—from the movement of an animal to a monstrous birth—everything, in short, that touched human life at any point, came to be associated with planetary influence, and might become the basis of divination. The library of Sardanapalus contains thousands of tablets in which such superstitious ideas and practices are expounded with the most precise casuistry. They seem to have been regarded as the supreme and final expression of wisdom, and might relate to matters a thousand years old. But these fallacious issues of man's search for knowledge, involving such a prodigal expenditure of energy in collecting data, and their ultimate explanation in the fundamental misconception of astrology, *viz.* that the incidents of life, being dependent upon the contemporaneous con-

figuration of the planets, must exhibit a parallel order in their occurrence, and that accordingly valid inferences regarding either of the parallel series may be drawn from the other. The underlying conception of the whole procedure, however, was that of the astrologer, and hence we find that in the system of divination by bowls which was practised in the time of Hammurabi, the instantaneous formations of dropped grease were regarded as yielding actual knowledge of the planetary deities.

11. **Subsidiary tables.**—The various substitutes for astrological diagnosis might become, and, indeed, necessarily became, very important, as it was often difficult to determine the requisite facts concerning the planets. We must remember that the problem usually set before the astrologer was to draw the horoscope of the birth or conception of an individual at a time when years had elapsed since these events, and by this means to forecast the future. His task was, in short, to re-construct the astrological conditions of a past event, and he had in consequence to refer to tables or lists of earlier astronomical observations. As regards the sun and the moon, the information he required was furnished by the calendar, but special lists were necessary for the five smaller planets. An extensive table of this kind, written in the Demotic character of Egyptian, and dating from the reign of Augustus, has been preserved. The Julian emperors, let us remember, used to settle their retired soldiers in Egypt. Colonies of veterans thus established in the Fayum would be largely drawn from those who had been born in the reign of Augustus. It was therefore necessary that the astrologer who practised his art in this province should possess lists of the successive positions of the planets during that reign. The example before us is but the transcript of a transcript: whole lines are wanting, and figures have been misread. We may thus infer that such lists were produced in great profusion to meet the needs of astrologers in the various districts and villages. In order to make the proper entries in the horoscope required, the astrologer needed simply to know the zodiacal signs in which the several planets were situated at the time, and accordingly the information supplied by the astrological lists regarding any particular planet was confined to the day of the month on which it entered a new sign. The ancient lists of ephemerides were thus neither more nor less than astrological tables.

For predictions of a general kind the astrologer constructed 'nativities,' while for cases of sickness he drew horoscopes of the *κατάκλις*, i.e. the inception of the disease, and otherwise adapted his art to special circumstances. He had to be informed of the day, month, and year of the critical event. The signs occupied by the smaller planets at the given date were then noted down from lists like that of the Berlin Papyrus 8279; the moon, together with the day indicating its age, was inserted in the proper sign according to the calendar of the lunar cycle, its lunar station being also fixed by established rules; the sun was placed according to the date. The next step was to arrange these particulars systematically in the twelve houses, the exact hour of the event, or, failing that, the time of sunrise, being used as the determining point. From this, again, the positions of the planets relative to one another, to the eastern point, and to the different zodiacal signs, were deduced and interpreted.

12. **The horoscope of Jesus Christ.**—As an illustration we shall take the horoscope of the conception of Jesus, according to the form in which we are able to re-construct it from the Demotic table of the planets in the Berlin P. 8279.

The dates given are themselves products of astrological speculation, and cannot be regarded as historically established, but they are nevertheless worthy of notice. On the 24th of June, B.C. 7 (or previously), took place the conception or birth of John the Baptist. On the 15th of April, B.C. 6, 5 a.m., the annunciation to Mary (instead of the conception of Jesus), and, at the same time, the observation of this 'nativity' by the Magi. Between the 24th of June, B.C. 6, and the 25th of November, B.C. 6, occurs the visit of the Magi to King Herod. After the 25th of November, B.C. 6, the Magi notice the re-appearance of the stellar configuration at the annunciation. On the 27th of December, B.C. 6, the stellar configuration becomes stationary (*ἀσθηρ ἔστη*), and the Magi worship the infant at Bethlehem.

Now the horoscope of the 15th of April, B.C. 6, can be re-constructed thus:

and supplies the following apotelesmata capable of interpretation:

- (1) The horoscope of the day appears (with sunrise).
- (2) Aries is in the ascendant.
- (3) Mars, as lord of the house of Aries, presides over the birth.
- (4) The sun is in the ascendant.
- (5) Saturn in the ascendant.
- (6) Jupiter in the ascendant.
- (7) Mercury in the ascendant.
- (8) Saturn in the ascendant, and above the horizon.
- (9) Saturn is intercepted between the favourable planets Venus and Jupiter.
- (10) Mars in the second house.
- (11) The moon enters the eighth house.
- (12) Venus is in the twelfth house.
- (13) Mercury in the house of Mars, and likewise in immediate proximity to Mars.
- (14) Saturn is in his *κατέννομα*, or 'detriment.'
- (15) The sun in his *ὑψωμα*, or 'exaltation.'
- (16) The moon in her *κατέννομα*.
- (17) Venus in her *ὑψωμα*.
- (18) Venus is *ματινῆ* (morning star).
- (19) Jupiter is in proximity to his house Pisces.
- (20) Jupiter in trine (*ἀδσπεκτὸς τριγωνάλῃς*) with his house Sagittarius.
- (21) The sun in trine with his house Leo.
- (22) Saturn's motion is direct.
- (23) Jupiter is direct.
- (24) Mars is direct.
- (25) Venus is retrograde.
- (26) Mercury is direct.
- (27) Mercury is combust.
- (28) Mercury in immediate proximity to the sun.
- (29) Mercury is invisible.
- (30) Mars is not combust.
- (31) Mars is nevertheless invisible, and is, in fact, entering upon its invisible period of three months.
- (32) Mars is separated from the sun by Mercury.
- (33) Saturn is separated from the sun by Jupiter, though the latter is combust.
- (34) Jupiter is combust.
- (35) Jupiter is separated from the sun by small planets.
- (36) All the morning stars are visible.
- (37) All the evening stars are invisible.
- (38) Mars is situated in his nocturnal triangle.
- (39) The terrestrial triangle contains Mars only, its nocturnal lord, situated in Taurus.
- (40) Mars is in opposition to his house Scorpio.
- (41) The moon in trine with her house Cancer.
- (42) The moon is in her domain.
- (43) The trigonum of fire contains its lords conjoined in Aries.
- (44) The trigonum of water contains its diurnal lady Venus.
- (45) The trigonum of water contains its nocturnal ruler, the moon.
- (46) The moon and Venus are in trine.
- (47) The trigonum of air is empty.
- (48) Saturn and Jupiter are in conjunction.
- (49) This conjunction occurs in Aries, and is thus *conjunction maxima*, and dominates the entire horoscope.
- (50) This *conjunction maxima* was preceded by a *conjunction magna*, occurring in Pisces (indicating the astrological necessity for the forerunner, John the Baptist).
- (51) Saturn is in conjunction with the sun (but cf. 33).
- (52) Saturn is in conjunction with Mercury.
- (53) Mars and Mercury are in different houses, but close together.
- (54) Saturn and Venus are in the same relation.
- (55) Jupiter is in conjunction with Mercury.
- (56) Venus is visible.
- (57) Saturn is visible.
- (58) Jupiter is visible.
- (59) Saturn has no aspect with the moon.
- (60) Saturn is in *ἀδσπεκτὸς confinῃς* with Venus.
- (61) Saturn is in *ἀδσπεκτὸς confinῃς* with Mars, but triply intercepted.

(62) Jupiter has no aspect with the moon. (63) Jupiter is in *adspectus confinis* with Venus, but intercepted by Saturn. (64) Jupiter is in *adspectus confinis* with Mars, but doubly intercepted. (65) The sun has no aspect with the moon. (66) The sun is in *adspectus confinis* with Venus, but doubly intercepted. (67) The sun is in *adspectus confinis* with Mars, but intercepted once. (68) Mercury has no aspect with the moon. (69) Mercury is in *adspectus confinis* with Venus, but triply intercepted. (70) Mercury is in *adspectus confinis* with Mars. (71) Mars is in opposition to the moon. (72) Mars is in trine aspect with Venus. (73) Full moon is just past. (74) No planets are in quartile with each other. (75) Of the tropical signs only Aries is occupied, but it contains four planets. (76) All the planets except the moon are clustered near the sun. (77) All the planets except the moon and Venus are under the influence of the sun (Mars as lord of the sun's house). (78) Jupiter emerges from the sun's beams. (79) Hence the *conjunctio maxima* also emerges. (80) All the visible planets and the moon are situated in the diurnal sky. (81) All invisible planets are in the nocturnal sky. (82) The lord of Saturn's house is Mars. (83) The lord of Jupiter's house is Mars. (84) The lord of the sun's house is Mars. (85) The lord of Mercury's house is Mars. (86) The lord of Venus's house is Jupiter. (87) The lord of the moon's house is Mars. (88) The lord of the house of Mars is Venus. (89) The horoscope, *i.e.* Aries, is masculine. (90) The other occupied houses are feminine.

Several points of detail may be left out of account. By making the horoscope more precise, and dividing it into decanates and degrees, we might multiply indefinitely the ninety particulars given above. These data of the positions occupied by the planets were known as *apotelesmata*. The ninety *apotelesmata* enumerated here can be interpreted only in part at the present day, as our information regarding ancient modes of astrological interpretation is at best fragmentary. According to rules still extant, interpolations and adjustments, no doubt, have also been made in certain particulars. So far, however, as we can test the interpretations of this horoscope, it corresponds with the evangelical narratives of the life of Jesus even in its smallest details.

13. The development of astronomy and astrology among the various peoples.—The foregoing sketch makes it evident that primitive peoples constructed their calendars by direct observation of the heavens. Similarly, it is amongst these primitive peoples, as indeed we might expect, that we find the first steps of the transition from astronomy to astrology. Thus, in the interior of some of the larger South Sea Islands, as, *e.g.*, Borneo, a primitive astronomy and astrology are found amongst the aborigines, while the inhabitants of the sea board, as also of the smaller islands, exhibit a higher development in the science of the stars, partly because their nautical interests demanded a more thoroughgoing observation of the heavenly bodies, and partly because they were influenced by the higher standard of culture attained by the Asiatic races, as is shown, for example, by the fact that the Malay language contains words borrowed from Chinese, Sanskrit, Arabic, and Persian. Of the pictorial writing of ancient Mexico, part of the calendar is all that has hitherto been deciphered; but even this suffices to show striking correspondences between the civilizations of America anterior to its discovery by Columbus and those of the ancient Asiatic races, and not least in astronomy and astrology. The development of these sciences already attained in the Babylonian period or later in the time of Alexander the Great is practically the same as now prevails throughout China, in part of Japan, and, above all, in India.

In the West, likewise, the results of astronomical inquiry were still encumbered with the old superstitious conceptions. The earliest successful attempts to eliminate these conceptions and their effects from astronomy were made about A.D. 1500. It is true that at the zenith of Roman civilization the educated classes tried to throw the lumber of astrology overboard. Certain of the Church Fathers wrought strenuously to oust it from its place. But,

on the one hand, the vexed question regarding the date of Easter, which was simply a consequence of combining the lunar calendar of Babylon with the solar calendar of Egypt, and, on the other, the attempt to fix a year for the birth of Christ, gave astrology once more a certain adventitious prestige in Christian life and theology. Fresh vantage ground was also won for it in the secular learning of the Middle Ages by the Western drift of Islām and the Jewish Kabbala. As a matter of fact, the astronomy of the West, and, in particular, the coalescence of astronomy and astrology in the later culture of Western lands, is a development or an importation from the astronomy and astrology of the ancient East.

Until the time of Kepler, astronomy was always bound up with astrology, and its progress was for the most part of a meagre kind. This may seem incredible so long as we confine our investigation to a short period abounding in records, but it is always unsafe to argue from the silence of the earlier records that the apparently fresh facts set forth in the later constitute an actual advance. No candid observer in the field of astrology could fail to notice that, while this or that forecast might happen to be correct, yet in many cases the configuration of the planets, however skilfully interpreted, could not be reconciled with the facts of experience. Certain details of astrological procedure were, therefore, constantly being left behind, as in an ever-seething witches' caldron; and, on the other hand, long disused methods were once more resorted to. This was especially the case when, in periods of unrest, races and civilizations were shaken and mingled together. Detailed research in a narrowly circumscribed period may thus produce the illusion of rapid development in a science which, in its leading features, really remained unchanged from age to age.

The fundamental tenets promulgated by astrology as inviolably true were manifold. From the fourth house, as it seemed, welled up the sub-soil water and the springs which fed the rivers, while from the tenth house came the rain. Now when primitive man found the moon in either of those houses he anticipated a flood. But the moon was evidently connected also with the occurrence of menstruation, which was regarded as a periodic overflow of blood. The astrological explanations of these phenomena tended to corroborate one another so fully that the sovereignty of the moon over the liquid element was deemed indisputable. An example of a different kind is furnished by the horoscope of disease, or rather of the *κατάκλισις*. Here the invalid was the querent, and his malady the quesited, and information regarding them was supplied by the first and seventh houses respectively. Now, in the regular horoscope the sixth house was significant of pain and the eighth of death, and thus the entire western section of the sky from 45° above the horizon to 45° below it was the region of disease. In this expanse, however, the sun, distinguished among the planets as the source of heat, is situated between three and nine o'clock p.m., and this again is the time when the invalid shows symptoms of fever. An easy explanation was thus provided for the increase of febrile temperature, while on the other hand the validity of the science was demonstrated once more. Astrology simply abounded in spurious proofs of this type.

Thus the leading principles and ideas of astrology were looked upon for centuries as incontrovertible. Its failures were attributed to points of secondary moment, save in cases where it seemed more convenient to change the time premised by a whole double-hour, and so to shift the entire horoscope by one house—an artifice

which would in general quite invert the first interpretation. Corrections and alterations were thus made in matters of detail, while among the more progressive peoples the general tendency was towards over-refinement in interpretation and an ever-expanding casuistry.

Accordingly there was no real development in the astronomy and astrology of the ancient East within historic times. The extant evidences of the inscriptions go as far back as the period of Sargani-sar-ali and Narâm-Sin. From the reign of the former eight short texts are all that have as yet been brought to light, and from that of the latter sixteen only, all of the same date. It is not to be expected, therefore, that we shall trace all the details of later astrology in such meagre records. It is surely sufficient for our purpose that the later period, the archives of which may quite well extend backwards to the monarchs just named, yields a mass of evidence to show that astronomy and astrology had by this time reached the status of a closed and rounded system. Inscriptions from the age of Hammurabi make it clear that full instructions had already been drawn up for the practice of divination by cups in connexion with planetary configurations. From a period about a thousand years before Christ come the inscribed boundary-stones, the dates of which are indicated by their arrangement of the planetary symbols. Thereafter the richest vein of astrological records is found in the library of Sardanapalus. We learn from these that there was a system of observatories covering the whole kingdom, that there was an established scheme of relays for the professional astrologers and of serial reports regarding their work, and that a State library had been established for the purpose of supplying all needed information in astrology and the auxiliary arts of divination. It is to be regretted that as yet only the *Reports* of the astrologers and the instructions regarding hepatoscopy have been properly edited. The cuneiform texts of the period between Sardanapalus and the beginning of the Christian era are not so rich in relevant information. The astronomical texts of this epoch, however, have found a thoroughly capable editor in Kugler, whose labours were based on the preparatory studies of Strassmaier and Epping, but who, unfortunately, engaged as he was with the productions of a relatively short period, has failed to grasp the subject in its entirety. A final residuum of Babylonian astrology was the perfunctory knowledge of 'the science of the Chaldeans' current in the days of the Roman Empire. From the beginning of our era astrology and astronomy languished on in the various Asiatic countries, but they were borne westwards by the Arabs. Mesopotamia always remained more or less of a *terra incognita* for countries influenced by Græco-Roman civilization.

On the other hand, Egypt became permanently merged in the Roman Empire, and, at a later period, in the Byzantine Empire. It was Egypt, therefore, that brought Babylonian astronomy and astrology into real contact with the West. Even in the most remote times, in a period, it may be, anterior to the First Dynasty, astrology, religion, and medicine were combined as one science at Heliopolis. The high priest of Heliopolis, officially invested with the star-spotted panther's skin, was all along the supreme State astrologer until the imperial age of Rome, and he bore the title of 'great in vision' already alluded to. A hierarch of this order is named in the Bible (Gn 41⁴⁵) as the father-in-law of Joseph—of that Joseph who was himself an interpreter of dreams (40^{5d}, etc.), and practised the art of divination by bowls (44^{5, 15}), referred to in connexion with Hammurabi. On the

wall of a tomb dating from the reign of Seti I. we find lists of stars, times of culmination, etc. Extensive tables of ephemerides and a fragment of planetary divination according to the different houses, together with corresponding dream-tables, have survived from the age of Augustus. We possess even horoscope-texts drawn up in the Imperial period. Our minor records of later Egyptian astrology are thus fairly numerous.

Græco-Roman civilization throughout its entire geographical and historical range, until the establishment of the world-empire and its swift decline, never produced such monuments as we find in the great empires of the East. Observatories of colossal proportions, attached to primeval temples containing archives by which the positions of the planets might be traced and tested for centuries and millenniums, were never the work of Greece and Rome. Among the Etruscans, therefore, and subsequently among the Romans, it was the surrogates of astrology that occupied the central place. Apuleius explicitly asserts that the Chaldeans were the founders of astronomy and astrology. But, so far as the Romans concerned themselves with the study, they appealed to the works of an assumed Egyptian king called Nachepto and his astrologer Ptoemasis of Sais. At a later period Claudius Ptolemæus (A.D. 100-178) was regarded as the final authority in our twin sciences, and beside him we catch a glimpse of the somewhat legendary Hermes Trismegistos. But, as has been already indicated, the claims of astrology were not left unchallenged in this period. About the year A.D. 200 the famous physician Sextus Empiricus wrote a work in six books *πρὸς μαθηματικούς*, of which the fifth was directed *πρὸς ἀστρολόγους*. He prefaces his confutation by a sketch of the entire system of knowledge possessed by the *Χαλδαῖοι*, and in this he provides valuable materials for a thoroughgoing digest of the astrological texts in the library of Sardanapalus.

In this later period, however, astrology has maintained some degree of progress in the Far East. Among the Chinese and Japanese, occult art, in the modern 'fengshui,' seems rather to have taken the form of geomancy. Just as in the Near East astrology gave birth to hepatoscopy, so in China and Japan the interpretation of the planets in the celestial vault has been transformed into divination by the carapace of the tortoise. Similarly the Gypsies have developed a system of fortune-telling from the open hand; and the designation of the convexities of the palm as 'mounts' of the various planets shows us that this practice also is a surrogate of astrology.

LITERATURE.—The significance of astronomy and astrology for the interpretation of the religious conceptions of the ancient East, as also for the exegesis of the Bible, has only recently been recognized. There is as yet no comprehensive work dealing with the subject. Contributions to the study have come mainly from the hand of H. Winckler (especially in *Im Kampfe um den alten Orient*, Leipzig, 1907), of whom A. Jeremias (*Die Panbabylonisten, der alte Orient und die ägyptische Religion*, Leipzig, 1907) has proved an able ally. Fugitive essays have appeared in considerable numbers, principally in publications of the *Vorderasiatische Gesellschaft* and the *Orientalistische Literaturzeitung*; Hinrichs (Leipzig) has also issued a number. At first the new exegetical theory encountered very strong opposition, but afterwards seemed to have won a general assent; more recently, however, the work of Kugler, already referred to and appraised, has given it a partial reverse. K. Sudhoff (*Iatromathematiker, vornehmlich im 15. und 16. Jahrhundert*, Breslau, 1902) and the present writer, starting from the history of medicine, have studied the ancient astronomy and astrology, and have arrived at the same results as Winckler, though by a very different path. The present writer has also written numerous essays on the subject, and these have appeared in various periodicals, medical, philological, and theological, esp. *Die Angaben der Berliner Planetentafel*, p. 8279, Berlin, 1903, *Das Horoskop der Empfängnis Christi*, do, 1903. These publications are based upon cuneiform and hieroglyphic (or demotic) texts which have only recently become accessible.

The leading work for the discovery of the relevant cuneiform texts is C. Bezold, *Catalogue of the Cuneiform Tablets in the Kouyunjik Collection of the British Museum*, 5 vols. The shorter texts are to some extent accessible in Thompson, *Reports of the Magicians and Astronomers of Nineveh and Babylon* (1900). Outgrowths of Oriental astronomy and astrology are found in the writings of Claudius Ptolemaeus, Claudius Valens, Paulus Alexandrinus, Julius Firmicus Maternus, and Marcus Manilius, and also in the works of opponents, such as Sextus Empiricus, Cicero (*de Divinatione*), Horace, Juvenal, Pliny, and, in the 15th and 16th cents., Hieronymus Cardanus and Pico de Mirandola. Boll, *Sphæra*, is a modern comprehensive work dealing with classical astrology and astronomy, but the author had not the requisite data for a corresponding treatment of the ancient East. The latest cuneiform texts from the period of the Persian kings and the Seljuks have been utilized by Kugler in vol. i. of a work to be completed in 5 vols. E. Stucken, *Astralmýthen* (Leipzig, 1907), admirably depicts the process by which the myths and legends of the various races of mankind grow out of the same original astrological conceptions, and arranges the stupendous mass of materials according to their affinities with the Biblical narratives regarding Abraham, Lot, Jacob, Esau, and Moses. A short manual of astrology by Ernst Mayer, entitled *Kurzes Handbuch der Astrologie*, and giving technical information about the placing of the horoscope, was published by Dekker (Berlin, 1891). A vast aggregation of data relating to the vestiges of astrology in Asia and the South Seas may be gleaned from the *Mittheilungen der deutschen Gesellschaft für Natur- und Völkerkunde Ostasiens*, in *Der Janus (Archiv für Gesch. der Medicin)*, and in the publications of Sanskrit scholars. The attempt to furnish a more detailed bibliography than the present is always confronted with the difficulty of knowing which of the manifold ramifications of our subject the reader is interested in. In one or other of the leading works here cited, however, the student will find a more complete list of works relating to the particular field of inquiry with which he is concerned.

F. VON OEFELE.

SUN, MOON, AND STARS (Primitive).— Knowledge of the movements of the heavenly bodies is possessed in varying degrees by most primitive peoples. In the earlier stages of civilization that continued observation which is necessary to arrive at a reasoned explanation, which is the foundation of astronomical science, is not possible through lack of proper means of recording its results, nor is it called for by the practical requirements of a population which lives chiefly by hunting. For an agricultural people, however, foreknowledge of the recurring seasons becomes essential, and it is necessary that some means should be found to mark the proper seasons for performing the operations to ensure the food supply. In the stars, with their regular motions of rising and setting, primitive man has found the earliest and most convenient calendar. In default of a theory based upon a series of observations, the supposed movement of the sun round the earth, the phases of the moon and the motion of the stars, the shape and character of the sky, have been explained by formulæ composed of material drawn from the texture of man's religious beliefs. The celestial bodies, equally with his fellows and material surroundings, he considers to be animated with a personality like his own, though more powerful. Starting from this fundamental assumption, primitive man has fashioned for himself, in his legends, a fairly complete explanation of the celestial phenomena which come under his observation.

1. Sun and moon.—It is almost universal among primitive races that both sun and moon should be regarded as alive and quasi-human in nature. Their sex differs among different races, but the moon is more commonly male and the sun female. Relation between them, varying in character, is also recognized. Among the Dieri of Australia the sun is the daughter of a Dieri woman, who after her birth sank into the earth in shame. The natives of Encounter Bay say that the sun is a woman who has a lover among the dead. Each night she descends among the dead. At her rising she appears in a red kangaroo skin, given her by her lover. A Wotjobaluk legend relates that the sun is a woman who was digging yams and reached the West; after wandering round the earth she came back to the other side, and has done the same

ever since. The Wurunjerri say that the sun is the sister of every one. This may be compared with the story of the origin of the sun told by the Arunta. At Alice Springs there is a tradition that in the Alcheringa the sun came out of the earth at a spot now marked by a stone in the country of the Bandicoot people, in the form of a spirit woman, accompanied by two other Panunga women, who were sisters, the elder of whom carried a child. The spirit woman went up into the sky, and she does this every day, visiting the old spot at night and rising in the morning. A medicine-man could see her in the hole, but not a person with ordinary vision. The two women settled among the Bandicoot people, and originated a local sun totem. This totem may be compared with the sun totem of the Incas. The sun has a definite relation to each individual member of the various divisions, belonging itself to the Panunga division, as did the two women. Among these people a ceremony connected with the woman and the child is performed, in which symbols of the sun are worn.

The Masai say that the sun married the moon, and they had a fight. Each damaged the other. The sun was so ashamed that he became bright, in order that people might not be able to look at him. The moon was not ashamed, and it is possible to see that her mouth is damaged and that one eye is missing.

It is interesting to note that, while the sun is a man and the moon a woman, the Masai word for sun, *eng-oloŋg*, is feminine, and *ol-apa*, 'the moon,' is masculine. The Bushman story goes that the sun was an old man, from whose armpit light radiated; some children threw him up in the sky, where he stuck.

Occasionally both sun and moon are feminine. Among the Mantras the sun is a woman, who is continually being pulled by a string held by her lord. The moon is a woman, the wife of Moyang Bertang, who sits in the moon making nooses for men.

(a) *Origin and movements of the sun.*—The origin of the sun, as related in the Tembeh legend of Sam-mor and his battle with Naing, has advanced beyond the anthropomorphic stage. When Sam-mor had imprisoned Naing, he rolled the fire with which he had fought into a ball, and this, as the sun, still revolves round the mountain to watch Naing. This conception of the sun as inanimate is probably due to external influence, but it has a parallel among the Gallineros of Central California, where the hawk and the coyote, after jostling one another painfully in the darkness which then prevailed, collected two masses of inflammable substance; the hawk then flew up into the sky with them, and lighted them with flint. They give light as the sun and the moon. The Wurunjerri believe that the sun was made by Poppu-imbul, one of the race inhabiting the earth while everything was dark. This personage, it is hardly necessary to point out, belongs to the race of demiurges of which Prometheus is the type.

The sun did not always cross the sky in the same leisurely manner as at present. The great feat of Maui, the Maori hero, was that he tamed the sun. According to one version, he beat him so unmercifully that he lamed him, and he has walked slowly ever since. In Samoa the sun had a child by a Samoan woman, who trapped the sun by a rope made of vine. Another Samoan lassoed the sun, and made him promise to go slowly. The same or an analogous explanation is found in Aztec folk-lore and in North America. On the other hand, in Australia and in Melanesia the sun did not set. In the myth of the aborigines of Victoria, Norralie decided that the sun should disappear at intervals, and addressed it in an incantation, 'Sun,

sun, burn your wood, burn your internal substance, and go down.' The sun now burns his fuel in a day, and goes below for fresh firewood (R. Brough Smyth, *Aborigines of Victoria*, iv. 430). In Melanesia Qat (the Melanesian hero) went to Qong ('night') and begged assistance. The latter put him to sleep, and, in twelve hours or so, crept up from the horizon and sent the sun crawling to the West (Codrington, *JAI*, Feb. 1881). In a Brazilian myth, a man ('the great serpent') who owned night sent it in a gourd to his daughter on her marriage; the messengers opened the gourd and let it out.

Various explanations are given of the sunset. The simplest is that the sun sinks into a hole, occasionally the hole from which he arose. The Dieri say it sinks into a hole near Lake Eyre, and in the night travels underground to the East, in the same manner as it was believed to do in ancient Egyptian belief. Not infrequently the sunset myth takes the form of a legend of a personal hero plunging into the body of a personal night. Maui was caught in the mouth of Hine-nui-te-po, 'Great Daughter of Night,' and thus brought darkness and death into the world. Since then the sun descends into the under world, and repeats the battle with Hine-nui-te-po every night. An explanation of sunset is that Maui took fire, and when it burnt him he plunged into the sea. Among the Basutos, all men but Litaolane were devoured by a monster. He also was swallowed, but cut his way out. The Zulu story of the rescue of Princess Utombende is of a similar character.

(b) *Origin and movements of the moon.*—The moon occupies a prominent place in primitive folklore for which her periodical growth, diminution, and disappearance, phases more marked than those of the sun, may not unreasonably be held to be responsible. Like the sun, the moon is regarded as a living person. Allusion has already been made to the variation in the attribution of sex to the moon among different peoples. One or two further instances which illustrate other points of lunar mythology may be added. Among the Aruntas the moon is a big man (*etwa oknurcha*). They say that, when there was no moon in the sky, a man died and rose again as a boy. The people ran away. He said, 'Do not run away or you will die. I shall die, but will rise again in the sky.' He grew up and died, reappearing as the moon. Since then he dies periodically. When he is not visible, he goes away to his two wives who live in the west. A second legend of the origin of the moon, which is found among the same tribes, relates that the moon was carried by a blackfellow in the hollow of his shield, who hid it in a cleft of the rocks during the day. Once it was stolen from his shield while lying on the ground. He pursued the robber but could not catch him, so he shouted that the moon should go up into the sky and give light to the people during the night. In South-East Victoria in one myth the moon is an old man who climbed a tree to pick grubs. His sons made the tree grow to the sky, where he became the moon. The Dieri say that there was once no moon; the old men held a council, and a *mura-mura* gave them a moon in order that they might know when to hold their ceremonies. The same reason for the moon's existence is given among the Todas.

The marks on the face of the moon are explained in various ways. The Eskimos say that these marks are the ashes which were smeared on his face by his sister the sun, when he tried to embrace her. Among the Besisi it is said that their chief ancestor Gaffer Engkoh once fell to earth and climbed back to the moon by means of a festoon which he plaited. His comrade Porang Aliyan ascended with Engkoh, but the latter slipped back quickly, taking his rope with him. Porang now dwells in

the moon, protecting the souls of the dead who visit the moon from wild beasts. The Mantras believe the dark spots on the moon to be a tree. The Malays see in the moon a banyan tree, under which sits a hunchback plaiting a fishing line. When the line is finished, he will fish up everything on earth, but a rat always gnaws away the line. This belief also occurs in Sumatra. The Malays also say 'the moon is great with a mouse deer,' a belief possibly derived from the Sanskrit idea of the hare which was taken up into the moon for protection. In Mexico it was said that a god smote the moon in the face with a rabbit (Sahagun, viii. 2); in Zululand and Tibet a hare was translated to the moon. The connexion between the hare and the moon is also found among the Namaquas of South Africa. The hare was sent to men to confer upon them a return to life after death, but by a mistake in the message made them mortal. In Fiji the same point of human mortality was argued between the moon and the rat. The latter prevailed.

The Wotjobaluk also connect the moon with a resurrection after death. When all animals were men and women, the moon used to say, 'You up again,' and the dead came to life. An old man said, 'Let them remain dead'; none then came to life except the moon. The connexion is obviously suggested by the necessity for finding an explanation of the phases of the moon. Various explanations are current. The Masai say that the sun carries the moon in his arms when she is tired. After carrying her for two days, he leaves her in his setting-place. On the fourth day she is visible to donkeys. On the fifth day men and cattle see her again. The Wiimbaio say that the moon did not die periodically until so ordered by Nurelli. The natives of Encounter Bay held that the moon was a dissipated woman who spent her time among the men, but when she wasted away they drove her out. While she is in seclusion she feeds upon nourishing roots and becomes plump again (Brough Smyth, *op. cit.* i. 432).

(c) *Eclipses.*—An eclipse, whether of the sun or of the moon, is at all times regarded with dread; it is almost universally believed, at the early stages at least, to be caused by a monster who devours, or attempts to devour, the luminary. See art. PRODIGES AND PORTENTS, vol. x. p. 368 f.

2. *Stars.*—The belief that the stars are great men and divinities translated to the heavens occurs among nearly every people in the world. Stars are grouped together in constellations which represent persons, many of them large, sometimes including one or more of the constellations of our astronomy. The inhabitants of Torres Straits include in their constellation Tagai—a hero who stands at the head of a canoe holding a spear and a bunch of fruit—the Southern Cross, Scorpio, Sagittarius, Corvus, and stars of Lupus and Centaurus. The 'Shark' includes the Great Bear and Arcturus and Gemma. In New Zealand Orion's Belt is Maui's Elbow, while the Southern Cross is identified with the stern of the canoe of Tamarete. Among the Wurrujerri of Australia α and β Crucis and α and β Centauri and other stars are the sons of Bunjil, the latter himself being Altair. Two stars on either side of him are his wives, who belong to the black swan totem, while his brother Nurong and his wives are Antares and adjacent stars. Bunjil and his sons were translated to the sky in a whirlwind. The whole group is intimately connected with the totemic system, Bunjil or Pund-jel being an Australian demigod. At Alice Springs in Australia the Aruntas say the Evening Star is a woman who went into the earth at a spot marked by a white stone at Temple Bar in the Macdonnell Range, leaving her *churinga* behind. Every child

conceived at this stone belongs to the Evening Star totem, although it is in the lizard totem country, and any child conceived *near* the stone is a lizard. Orion's Belt is said to be a group of young men dancing corroboree. Jupiter, the 'foot of day' (Ginabong-Bearp), was a chief among the old spirits, a race translated before the appearance of man. Among the Eskimos of Greenland, Orion's Belt is 'the Lost Ones,' a number of seal hunters who lost their way home. The Pleiades, an extremely important group of stars for primitive peoples, were known to the Indians of North America as 'the Dancers,' to the Lapps as a company of virgins, and to the Australians as a group of girls playing corroboree. The Aruntas believed them to be women who went up into the sky and have remained there ever since. A legend of the Wurunjerri runs that, when some young women were digging yams, the crow stole their yam sticks. They were swept into the air, when Bellin-Bellin let the whirlwind out of the bag, and the stars are the fire on the end of their yam sticks. Another version says that the group is Bunjil's daughter and two men who were turned into women by Bunjil's son, each receiving yam sticks from Bunjil's daughter. The almost unvarying association of the Pleiades with women among different races is remarkable. It thus appears that the legends which attribute an heroic and human origin to the stars and constellations contain the germs of conceptions which have been utilized by modern astronomy in mapping out the heavens.

Stars, however, are not always translated human, divine, and 'semi'-divine beings. Allusion has already been made to the Malay and Sakai belief that stars are clefts in a superincumbent rock. Take-mahuta, in the Polynesian story, after separating his father and his mother, stuck stars all over his father's body. Maui, after slaying his sons, placed an eye of each in the heaven as the morning and evening star respectively—a story which represents a transition stage between the two groups of animate and inanimate origin.

It is not surprising to find the stars regarded as the moon's children. The Mantras say that once the sun and moon, who were both women, had many children, the stars. They agreed to devour them. While the sun did as agreed, the moon hid her children, producing them afterwards. The sun, being very angry, now pursues the moon but cannot catch her, though sometimes she succeeds in biting her, causing an eclipse. The same story is told by the Hos of Chota Nāgpur. In this story, however, the sun threw a hatchet at the moon and cut her in two.

For practical purposes among most primitive peoples the stars perform a more important function than the sun. By their rising and setting the times of the feasts and ceremonies are determined, and among agricultural peoples their movements serve as a calendar by which the various operations in cultivating the soil are regulated. In the Torres Straits, Tagai marks the time for new yams and the migrations of turtle; Seg, the time for another kind of yam. The Murray Islanders also use Tagai as a mark in navigation. The rising of the constellation Dorgai, which coincides with the North-West Monsoon, is the time to 'make dance.' The natives of Borneo, especially the Dayaks, watch for the Pleiades to determine when to prepare their ground for planting. When it is estimated that the wet season is approaching, men are sent to the forest to watch for the rising of the Pleiades. The Kenyahs and Kayans of Borneo measure the length of the sun's shadow by means of a marked stick with the same object (C. Hose, *JRAS*, Straits Branch, Jan. 1905). The importance of such observation of sidereal phenomena is evi-

dent when it is remembered that in tropical regions the seasons bring little or no sign of change to serve as the farmer's calendar. The Masai recognize that the rainy season is approaching when they see the Pleiades, while in the Society Islands the year is divided into two halves, *Matari-i-inia* and *Matari-i-raro* according as this constellation is visible above the horizon after sunset or not. In fact, over nearly the whole world the rising of the Pleiades is the beginning of the year or a cycle, marks the time for feasts, and is an occasion of ceremonial observance. It may be recalled in passing that Penrose found that the Hecatompedon and the old Erechtheum had been ascribed to the heliacal rising of the Pleiades on May day; and in Britain, it is suggested, while Stonehenge appears to have been built in relation to the rising of the sun at the summer solstice, the 'Hurlers' in Cornwall on *prima facie* evidence seem to have been built in relation to the heliacal rising of the Pleiades on May morning B.C. 1600 approximately.

In some cases the use of the stars as a calendar is not immediately obvious, but is a matter of interpretation. In Australia, Yuree and Wanjel (Castor and Pollux) pursue the Kangaroo (Capella) and kill him at the beginning of the great heat, and the mirage is the smoke of the fire they roast him by. Marpean-Kurrrk and Neilloan (Arcturus and Lyra) discovered the ant-pupa and the eggs of the loon bird and taught the aborigines to use them for food. As Tylor points out, these legends and their analogues may fairly be interpreted as indicating the seasons when the pupa and eggs may be found, the great heat expected, and so forth.

3. Signs and omens.—The train of thought underlying primitive astronomical theory would seem peculiarly adapted to foster the magical conceptions and analogies upon which astrological reasoning is based. Omens and signs, favourable and unfavourable, are and have always been the object of constant observation in the past of savage and semi-civilized people. It is, therefore, not surprising that peculiar powers in controlling human events should be attributed to those heavenly bodies which are regarded as endowed with powers similar to but greater than those possessed by human beings. Even when a stage has been reached at which the magic powers of the witch no longer gain credence, belief in the power of the moon or the first star of the evening to grant a wish remains as evidence of a time when the favour of the heavenly bodies was essential to success. Lacking the knowledge necessary for the pseudo-scientific cartography of astrology, primitive races never attained the heights of judicial astrology. Yet the belief that, for instance, a child born under Leo would possess qualities usually associated with a lion is one with which a savage would find himself in full sympathy. The Malays possess an elaborate system by which the year is mapped out into lucky and unlucky periods depending upon a rotation of days, each associated with deities, planets, and lucky and unlucky colours, and are acquainted with the use of the magic squares. But their astrological science has been borrowed from the Hindus and Arabs. In the case of races which may truly be described as primitive, the germ of the science rather than the science itself is found, while vestigial traces of these primitive beliefs linger in the popular folk-lore of civilized countries. The belief that the weather changes with the phases of the moon is found among the Ewe peoples of West Africa, where a certain number of days' rain is said to accompany each of the four changes of the moon. At these times they are forbidden to take purgatives, and children and cattle are born. At the rising of Ezā (Orion) rain

falls for seven days in accordance with the number of stars in the group; three days' rain follows the rising of the group Atielo, while the star Toro is peculiarly favourable to huntsmen, who call this time *Ladorgbe*, 'animal chop grass' (P. Fr. Müller, 'Folkloristische Ewhetexte' (Ge-Dialekt), *Globus*, lxxix. Jan. 17, 1901). These beliefs, however, may be regarded as generalizations from imperfect data assisted by magic, rather than as originating in a magical connexion. A less doubtful case of intimate relation between celestial and terrestrial phenomena occurs in the widely distributed belief, still common in European folk-lore, that fertility of crops and success in an enterprise depend on an action undertaken under a waning moon. The Lithuanians wear boys on a waxing, and girls on a waning moon, believing that in the one case it provides strength, in the other, slenderness and grace.

An instance of a belief which most nearly approaches judicial astrology is quoted by Tylor (*Prim. Cult.* i. 129) from Shortland. The Maoris when besieging a 'pa' believed that the result could be foretold by the relative position of Venus and the moon; if the planet were above the moon, the foe would conquer; if below, the home force would be victorious.

LITERATURE.—No comprehensive study of primitive astronomy on scientific lines has been made; reference to astronomical legends and a few identifications of stars known to the natives will be found scattered in works dealing with individual races. General principles of study will be found in E. B. Tylor, *Prim. Cult.* 2 vols., 1904, and A. Lang, *Myth, Rit. and Relig.* 1899. See also Sir N. Lockyer, *Dawn of Astronomy*, 1894. For ceremonies connected with the Pleiades see R. Andree in *Globus*, lxiv. no. 22. Instances here quoted are taken chiefly from W. W. Skeat, *Malay Magic*, 1900; Skeat-Blagden, *Pagan Races of the Malay Peninsula*, 1906; A. W. Howitt, *Nat. Tr. of S.E. Aust.*, 1906; Spencer-Gillen, *Nat. Tr. of Cent. Aust.*, 1898; A. C. Haddon, *Head Hunters*, 1901; A. C. Hollis, *The Masai*, 1905; Sir G. Grey, *Polynesian Mythology*, 1855. E. N. FALLAIZE.

SUN, MOON, AND STARS (American).—

I. Sources.—A large part of our knowledge of the astrology and astronomy of the American Indians is derived from their traditions as reported by early European and American missionaries and travellers. These writers had the advantage of contact with the various tribes before European influence had extensively modified their modes of thought, but they paid little attention to astronomical traditions. The few constellations mentioned by them are seldom identified, and the identifications are frequently indefinite or incorrect. A number of works by native authors give tribal tradition in authentic form, but little astronomy.

In Mexico and Yucatan a few codices, which escaped destruction at the hands of the Spanish priests, contain many complex astronomical symbols of which little is definitely known as yet, but from which, undoubtedly, much will eventually be learned. They are supplemented by hieroglyphs on structures and monuments. In Guatemala there is the *Popol Vuh*, or 'Book of the People' (ed. and tr. Brasseur de Bourbourg, Paris, 1861), and in Peru Salcamayhua's Spanish account of Aymara Quichua antiquities (tr. Markham, Hakluyt Society, 1873). These manuscripts either are of pre-Columbian origin or present pre-Columbian material with slight European modifications. They include some myths and legends having an astronomical basis (cf. also Brinton, *Annals of the Cakchiquels*, Philadelphia, 1835; and *Tres relaciones de antigüedades peruanas*, ed. Ximénez de la Espada, Madrid, 1879). Until recently even scientific travellers have often shown indifference towards astronomical traditions, but ethnologists now recognize the importance of this subject and are collecting material which, in spite of the long contact between Indians and Europeans, affords sufficient evidence of native origin.

In North America these traditions are supplemented by a few valuable star charts. Three have recently been collected amongst the Osages, Pawnees, and Itiichols (Dorsey, in *REBW*, p. 378; *Field Columbian Museum Report*, xi. pl. 72; Lumholtz, in *Memoirs of the American Museum of Natural History*, iii. 57 ff.). The two first are intimately associated with the ritual of the tribal secret societies. The Osage chart represents the Hyades, Pleiades, morning and evening stars, sun and moon, and probably the Milky Way and part of Scorpio. The Pawnee chart shows the Pole Star, Great and

Little Bear, Northern Crown, Orion, Hyades, Pleiades, Milky Way, and probably Capella; that of the Itiichols depicts as stars or constellations the Scorpion (Scorpio) and its Heart (Antares), the Deer (Taurus?), which is pursued by the Dog, a Woman bearing a child, the Crab, Beehive, Humming Bird, and other objects. The winter counts of the Western tribes represented each year by some important event, which is pictured upon a buffalo hide. Naturally they include astronomical figures. That of Lone Dog, for example, presents the meteoric shower of 1833, a comet, and a solar eclipse. The altars of Pueblo secret societies furnish numerous stellar symbols, as is shown by the researches of Cushing and Fewkes in *REBW*, *JAFI*, and *Amer. Anthropologist*. Tablets inscribed with astronomical characters have been found at Rockford, Illinois, Mitchell Co., North Carolina, and in Missouri. Excepting the rayed solar face, crescent moon, and morning and evening stars, the characters upon these tablets have not been satisfactorily deciphered.¹

The Mexican calendar stones present another and an elaborate source of astronomical symbolism, to which considerable study has been directed (see CALENDAR [Mexican]). Inscribed stones of astronomical significance have also been found in the Chibcha region of Colombia. The symbols seem to correspond with those ascribed to the Chibcha calendar and constellations by Duquesne (cf. Bollaert, *Antiquarian Researches*, London, 1860; also Humboldt, *Researches*, and Lemly, in *Century Mag.*, 1891, p. 885). A circular gold 'zodiac' from Cuzco presents a solar rayed face surrounded by twelve unknown symbols (Bollaert, *op. cit.* p. 146; Markham, *Cuzco and Lima*, London, 1856, pp. 107-108; Winsor, *Critical and Narrative History of America*, Boston, 1884-1889, i. 235). A wooden box from the west coast of South America figured by Kingsborough (*Mexican Antiquities*, London, 1831, iv.) presents Peruvian symbols of the sun and moon, Orion, Taurus, the Pleiades, and other constellations, but they are associated with symbols of European origin.

A most valuable source of astronomical knowledge is the Peruvian star chart of Salcamayhua, a pure-blooded Aymara of the ruling class, who wrote during the first quarter of the 17th century. With the exception of a prudential reference to the symbol of the Southern Cross, this chart presents only native concepts. It gives symbols of the sun and moon, morning and evening stars, southern pole, Coal Sack, Milky Way, and all the zodiacal asterisms (cf. Hagar, in *Compte Rendu du Congrès international des Américanistes*, Paris, 1900, p. 271 ff.).

2. Scientific knowledge.—The use of gnomons, natural and artificial, was wide-spread in America. Amongst many of the tribes there are still old men who delight in determining the seasons and the time of day by the position and direction of the solar shadows. The Pueblos have measured and named the sunrise points on the eastern horizon so as to divide the year into two periods of six months, and the time of the equinox is determined with great care. The Zuñis used as a gnomon an erect sandstone slab adorned with a solar effigy (Dellenbaugh, *North Americans of Yesterday*, New York, 1901, pp. 305-306; Fewkes, *Annual Ceremonies at Walpi*, Leyden, 1895).

At Chapultepec, in 1775, a stone was found under which three crossed arrows pointed accurately to the equinoctial and solstitial sunrise points (Bollaert, in *Memoirs of the Anthropological Society of London*, i. 210 ff.). The main doorway of the chief temple of Cuzco fronted the north-east, so that at the June solstice the rays of the rising sun would penetrate into the temple and illumine the solar plate at the opposite end, thus recalling the temples of Egypt and Greece; and the early Christian cathedrals oriented to the sunrise point on the day of the saint to whom they were dedicated. It is not unlikely that the orientation of Mexican and Peruvian structures will enable future investigators to determine the dates of their construction by means of the method so brilliantly pursued by Lockyer in Egypt and Penrose in Greece (Lockyer, *Dawn of Astronomy*, London, 1894). Beebe has shown that the monolithic gateway and a large stone platform at Tiahuanaco probably served as a solar dial. The

¹ See *Proceedings of Davenport Acad. of Sciences*; J. P. McLean, *The Mound Builders*, Cincinnati, 1879, p. 118; Short, *North Americans of Antiquity*, New York, 1880, p. 38. W. S. Beebe, who made a special study of the Davenport and Piqua tablets, attempted a full explanation of both. He makes the former wholly and the latter partly astronomical, but his interpretation of the latter stands little chance of acceptance in the present stage of our knowledge. A copy of his privately printed notes is deposited in the Davenport Academy, Davenport, Iowa. One is in the author's possession.

sides of the pyramids of Mexico and Central America are often aligned to the cardinal points. In Mexico, Nobel describes a perpendicular shaft in the pyramid of Xochicalco which permitted the rays of the zenith sun to fall upon an altar in an interior chamber. The shadows cast by the steps of the pyramid of Papantla were observed for calendar purposes (Humboldt, *Researches*, ii. 87), and tradition indicates a similar use of the steps and platforms at Cuzco known as the 'Monkeys' Dance.' Mrs. Zelia Nuttall, moreover (*Boas Anniversary Volume*, New York, 1906, pp. 290-299), points out various pictographs in the Mexican codices which represent priests observing the stars to determine the time. The different divisions of time were marked by the sounding of drums or trumpets in the temples. The priests used various methods to fix the position of the asterisms. They observed them through the doorway of the temple, which was elevated above the surrounding country, sometimes placing forked or bifurcated sticks within the doorway to define the position more exactly, and sometimes using a peculiar figure representing the drawn-up limbs of a seated man for the same purpose. A possible use of rows of upright sticks is also indicated.

The Peruvians are also said to have noted the solstices and equinoxes by means of the shadows cast by certain columns. Those on the equator were held most sacred, because at the equinox they cast no shadow (Garcilasso de la Vega, *Commentarios reales de los Incas*, vi. 22). These columns have never been found, but circular stone sun-dials, called *intihuatana*, 'the sun tied up,' exist on the Carmenca hill at Cuzco, where the 'columns' are said to have stood, and elsewhere. A shadow is cast thereon by a small erect stone, which, Squier suggests, may rightly have been known as the *inti rucana*, or 'sun-finger.'

Alleged telescopic tubes have been found in the mounds of the United States and in Peru (Bollaert, *op. cit.* pp. 213, 276; du Goureq, in *Popular Science Monthly*, xlv. 832), but were probably used by the physicians, who in the latter country were expert in sucking poison from wounds and diseased tissues. The Mexican astronomers, however, seem to have employed obsidian mirrors in their observations (Nuttall, 'Fundamental Principles of New and Old World Civilization,' in *Peabody Museum Publications*, ii., Cambridge, Mass., 1901).

The more advanced American nations, such as the Mayas and Aztecs of Mexico, and the Aymaras and Quichuas of Peru, seem to have attained an astronomical knowledge nearly, if not fully, equal to that of any people prior to the invention of telescopes; they had learnt all that could be learnt by the unaided eye. Their principal practical incentive to stellar observation was the accurate determination of seed-time and harvest, this being elaborated into a calendar. They do not seem to have attained to the heliocentric system, but they knew the cause of the lunar phases, and distinguished the five brighter planets. The Mexicans estimated their synodic periods accurately, and the Peruvians observed the sun-spots (Humboldt, *Vues des Cordillères*, ii. 302, *Researches*, ii. 173; Salcamayhua, *op. cit.* p. 131; du Goureq, *op. cit.* p. 825), large spots being sometimes visible to the naked eye through the mist or light cloud (*garua*) which is of common occurrence in Peru. In some myths the sun and other celestial bodies, and even the earth, are represented as balls or globes. This does not necessarily imply either European influence or exact knowledge. It may be an analogy derived from the supposed hollow ball of the sky.

3. *Astrology*.—A system of astrology was undoubtedly in vogue in America. The *Tonalamatl*,

or book of lucky and unlucky days, included in the Mexican codices, indicates the propitious and unpropitious times for performing certain actions. In the Codex Vaticanus a human figure appears surrounded by the day signs, which have also zodiacal associations. The commentator says that the influence of month signs upon the moment of birth was an established belief.

'The Mexicans,' says Saliagun (*Historia general de las cosas de Nueva España*, iv. Introd.), 'take much care to know the day and hour of birth of each person in order to conjecture his destiny, life, and death, but they do not base their prognostications upon the positions of the stars.' Nevertheless, the stars warn a god that he must go away in five years (H. Phillips, jun., in *Proc. of American Philosophical Soc.* xxi. 617 f. [Philadelphia]). In Guatemala diviners were called upon to determine the propitious date for each monthly festival. As soon as a child was born, it was brought before the diviner, who, observing the day of birth, told what the child would be and what disposition it would show. He announced these things after consulting a book which contained the month and day signs (Ximenez, *Las Historias del origen de los Indios de Guatemala*, Vienna, 1857, pp. 158-160). In Peru one class of priests devoted themselves to divination by observation of the stars, and the chief priest dwelt away from the Inca capital that he might observe them and meditate more freely upon them. In the solitude of the mountain deserts lived priests who contemplated and adored the stars 'almost without ceasing.' People visited them to learn about lost articles, absent friends, and future events. Even the wild tribes of Eastern Peru regard some constellations as propitious to man, others as hostile (Lorente, *Hist. del Peru*, Lima, 1860, p. 229; Markham, *Cuzco and Lima*; von Tschudi, *Travels in Peru*, New York, 1854, p. 288; 'Relacion anonima,' in *Tres relaciones de antigüedades peruanas*, pp. 157, 164, 178).

It is said that the coming of the Spaniards had been predicted many times by these observations. Atahualpa's general is quoted as saying to his ruler just before the arrival of the Spaniards became known: 'My lord, I watched the stars last night, and saw in them the presage of a great calamity.' Later, Atahualpa himself declared that the appearance of a comet in the Sword of Perseus presaged the death of a man of high rank, and that a similar sign had been seen in the skies a short time before the death of his father, Huayna Capac. He was murdered soon after. A diviner, by observing the appearance of the moon, is said to have foretold to Huayna Capac the civil war between his sons and the destruction of the Inca rule. Comets and a thunderbolt which fell upon that Inca's Cuzco palace occasioned analogous predictions. Similar prophecies in Mexico were not so clearly attributed to the stars (Garcilasso, *Commentarios reales*, tr. Markham, Hakluyt Society, v. 23, ix. 14; Humboldt, *Views of Nature*, London, 1856, p. 429; Prescott, *Conquest of Peru*, bk. ii. ch. 6).

4. *Ritual*.—The ceremonials of the various tribes also include astronomical features; in fact many of their elements seem to have originated in the wish to imitate on earth the aspects and movements of the celestial world. The imitations of animals in the dances of the primitive tribes arise among those more advanced to elaborate figures, dances, and processions reflecting the orderly movement of the sun and stars across the sky and the progress of time and of the seasons. The American Indians as a whole are a thoughtful and religious race, much given to ceremonials. Even their games and sports, even their ordinary details of domestic life, are made part of the religious ritual to be ceremonially performed, and from the grandest to the most insignificant details of their ritual much is based upon astronomical symbolism.

In the various ball games found from one end of the continent to the other, the movement of the ball originally represented that of the sun (Brinton,

Myths of the New World, New York, 1868, *American Hero Myths*, Philadelphia, 1882, p. 119). Among the Cherokees, prior to the contest, the opposing teams were carefully instructed in the use of magic formulæ, and the issue was supposed to depend upon the amount of magic power thereby developed (Mooney, in *RBEW*, p. 301 ff.). In Yucatan and Central America the ball court itself represented the celestial field. The game was won by the player who drove the ball through a stone ring upon which two interlaced serpents, symbols of the eternal years, were sculptured. The *Popol Vuh* describes contests at this game, the result of which determined the control of *Xibalba*, or Shadow Land; and Mrs. Nuttall asserts that the ball courts were also used as astronomical observatories. The Araucanians saw the divine will in the result of the game, and used it to decide the fate of those accused of crime.

It is probable that the annual ceremonial hunts, once common in the South-western United States, formed a terrestrial imitation of the celestial Hunter, as in Peru, and foot-races also symbolized the solar journey. In the Mexican game of 'those who fly' the celestial revolution was symbolized by four men masked as eagles who circled about a pole at the end of four cords wound round it (Clavigero, *Historia*, ed. Mora, Mexico, 1844; Nuttall, *op. cit.* p. 24 f.). Dice games, common in North America, reflect the celestial imagery on both dice and board. The Mexican game of Patolli uses a cruciform board representing the four celestial regions, through the divisions of which a stone marker progresses like one of the celestial bodies (Sahagun, *op. cit.* vi. 8; Culin, 'American Indian Games' in *RBEW*; Nuttall, *op. cit.* pp. 82, 87). A serpent-dance in which the dancers imitated the motion of the serpent existed until recently among the Micmacs and other Northern tribes, and in Peru. In the North the dance symbolized the movement of the Pleiades across the sky (Hagar, in *Congrès international des Américanistes*, New York, 1902, and *JAFI* xiii. 92 ff.). The famous serpent-dance of the Hopis, figured on Mexican and Central American monuments, was a rain-making ceremonial performed in August under the sign of the Tiger Sun (Leo). The well-known mural paintings in the Temple of the Tigers at Chichen Itza represent a similar ceremony also dedicated to the Tiger Sun. In the Mandan buffalo-dance, twelve dancers divided into groups of four represented the cardinal points, and doubtless also the twelve regions and the months. Two of the middle four were painted black and dotted white to represent the night sky and the stars. The other two, painted red, personated the day (Catlin, in *Smithsonian Report*, 1885, p. 359), and the movement represented alternating day and night. The Natchez ceremonially gathered to watch the rising and setting solstitial sun through the doorway of their temple. The sun-dances of various tribes dramatize the progress of time and the seasons. The nocturnal Iroquois feast of the dead seems to have celebrated the return of the spirits to earth over the Milky Way in spring and fall.

At the end of each fifty-two years' period the Mexicans expected that the midnight culmination of the Pleiades would mark the end of the cosmos, or its renewal for a like period. All fires were extinguished, and the advance of the Pleiades towards the critical point was observed from the summit of the mountain called 'Hill of the Star.' The stars having passed the meridian, a fire was kindled upon the summit, from which fires were re-lighted elsewhere, and the people gave themselves over to rejoicing (Sahagun, *op. cit.* tom. i. lib. 4, tom. ii. lib. 7; Torquemada, *Monarquía*

Indiana, tom. ii. 292-295; Boturini, *Idea*, pp. 18-21; Clavigero, *Storia antica del Messico*, tom. ii. pp. 62, 84, 85; Mendieta, *HE*, p. 101; Acosta, *Hist. de las Yndias*, pp. 398-399). In Peru as in Mexico this date marked the entrance of the sun into the sign of the dead, symbolizing death, destruction, and renewal.

The rising of the morning star, the Pleiades, and Gemini was hailed with songs and dances by many tribes. In Mexico there was an annual sacrifice of a human being, who enacted the yearly course of the sun. He ceremonially ascended the steps of the *teocalli*, or god-house, to represent the sun climbing from the south to the northern solstice. At the moment when the sun reached the meridian he was slain, and his body was hurled down the steps to represent the declining course of the sun after the northern solstice (Hagar, *Peruvian Astronomy*). Similarly, among the Chibchas a human victim fastened on a pole was annually slain by the arrows discharged by a ceremonial procession of people masked and costumed to represent the various zodiacal asterisms (Duquesne, in Bollaert, *Antiquarian Researches*, p. 47).

About the time of the December solstice, though in recent times not every year, the Skidi Pawnees sacrificed a maiden to the morning star. There is no reason to doubt the indigenous origin of this very remarkable and suggestive ritual, which is described in art. PAWNEE, vol. ix. p. 699*.

In similar obstacle legends among the more advanced tribal families of the American Indians there are indications that the astronomical symbolism was itself used to typify as the ultimate meaning the progress of the human soul (cf. Dorsey, in *Congrès international des Américanistes*, *XVe session*, Quebec, 1907, ii. 66-70, and Natalie Curtis, *The Indians' Book*, New York, 1907, pp. 102, 103; the deductions are the writer's, and will be found further developed in his *Peruvian Astronomy*).

A monthly ritual is known to have existed among the Pueblos, Mexicans, Mayas, Central American tribes, Peruvians, and probably the Chibchas. Among all of them the features of these festivals referred to some attribute of the zodiacal asterism through which the sun was supposed to be passing at the time.

The plan of the Peruvian temple of Cacha, or 'the messenger,' as well as the remarkable legend connected with it, points to a ceremonial procession enacting the yearly course of the sun within the building. The importance of the stellar cult in Peru is indicated by the fact that the Peruvians made images of all their constellations.

5. Mythology and star-lore.—The arch of the sky was generally regarded as a kind of transparent roof, over which the heavenly bodies walk. The Chinooks on the north-west coast and the Peruvians represented it by two oblique lines meeting in an acute angle. Possibly the 'Maya arch' possessed a similar symbolism.¹ On the Peruvian box the sky is seen as a woman's breast. It forms the clothing of the Huichol eagle-goddess and of the wife of the Pawnee Spirit of Life, and is symbolized by the concave interior curve of some Central American and Pueblo vases (Dorsey, *op. cit.* p. xviii; Stevenson, *op. cit.* p. 24). Above the sky dwells the Sun Father, with his wife the Moon Mother (who is sometimes also his sister), attended by the divine pair of the morning and evening stars, and surrounded by their stellar children.

The sun and moon were regarded as the progenitors of the stars and of mankind, but seldom or never as the supreme celestial powers. They

¹ Collection of A. F. Chamberlain; Hagar, *Peruvian Astronomy*, Saicamaybus Chart.

were the objects of a celestial cult existing practically everywhere in America, in which, at different times and places, sun, moon, and various constellations seem to have assumed predominance without occasioning more than a relative change of influence. Nor is there much evidence of conflict between the votaries of the various aspects of the astronomical cults. Sectarianism was almost unknown in the natural religions of America; such tortures and persecutions as existed in Mexico, for example, had little or no connexion with religious or theological differences. In Mexican tradition two men, one of them leprous, threw themselves into a fire and came out respectively the sun and the moon.

The gender of the sun and moon is sometimes reversed. A legend found in almost identical form among the Eskimos, the Cherokees, and the Amazon tribes personifies the moon as a man who secretly visited his sister at night. She, desiring to identify her unknown visitor, rubbed upon his face some black substance, which produced the lunar spots. A similar legend occurs among the Caddos (Dorsey, *Traditions of the Caddo*, Washington, 1905, pp. 11-12). The Iroquois saw in these spots an old woman who each month stirs a bowl of hominy with her cat (dog?) seated beside her. The Peruvians interpreted them as resulting from the embraces of a fox enamoured of her beauty; the Mexicans as a form of a rabbit, with which the gods struck the face of the moon, wishing to lessen its light, which formerly was as great as that of the sun. According to the Mexicans, the moon is always running after the sun, but never overtakes him. The divine being Quetzalcoatl made his son the sun, the god of water made his the moon (Phillips, *op. cit.*). The Onas of Patagonia make the sun pursue the moon (his wife) because she overheard some of the secrets of the male secret society. In terror she sprang off a cliff, the sun followed, and both jumped into the sky, where the pursuit continues (Barclay, in *Geographical Journal*, xxii. 62). In Corvichan tradition the sun, moon, and stars were shut up in three boxes, which were opened by the hero Yehl, whereupon they escaped to the sky (Deans, in *AAOJ* x. 111).

In higher Peruvian symbolism, the sun was tied by an invisible cord to the invisible pole of the sky, and was driven round it like a llama by the power of the Universal Spirit, although generally, after passing over the sky, he was thought to enter a cave in the west and to proceed by a subterranean passage to emerge next morning in the east. An equally interesting explanation of the origin of night and day is found in the Wichita legend (echoed by the Caddo) of the three deer, who are three stars, pursued by a fourth, which is a hunter who will overtake them at the end of the world. One deer is white, representing day, one black, representing night, one half black and half white, representing alternate day and night. The last was wounded, whence we have day and night (Dorsey, *Myth. of the Wichita*, Washington, 1904, pp. 21, 25-26, *Traditions of the Caddo*, pp. 13-14).

Among the Peruvian coast tribes, according to Garcilasso, the sun plunged into the western ocean and dried up the waters with his heat both where he entered and where he emerged—whence, apparently, the tides. In numerous North American legends he is visited by terrestrial travellers, whom he receives kindly, and to whom he sometimes imparts supernatural powers. The Mexicans described how he was once caught in a snare which a hero had contrived for him. This legend, which is also Polynesian, probably refers to the solstices, when the Indians generally thought of him as seated or resting, since they observed that for

several days at these seasons he moved neither north nor south at his rising, but appeared at the same point on the horizon. The Mayas accordingly called these days 'the bed of the sun'; and at this time the Mexicans, Mayas, and Peruvians refrained from labour in imitation of the solar repose. The Mayas symbolized the June solstice by a tortoise, that of December by a snail, because of the slow motion of these animals (Forstemann, 'Commentary on Maya MSS' in *Peabody Museum Papers*, vol. iv. no. 1, p. 45, Cambridge, 1904; Schellhas, 'Representation of Deities of the Maya Manuscripts,' *ib.* no. 2, p. 115, Cambridge, 1906).

The Peruvians represented the sun as a bearded man in the prime of life, who impressed his footprint on a rock to mark the height of his power. This affords an explanation of a world-wide type of solar legends. Throughout America the solar rays were symbolized by hair. In Peruvian art the sun becomes the conventionalized face of a man upon which appear marks called tears by some, but perhaps having a pathological meaning. The Mexican hero Citli shoots three arrows at the sun and succeeds in wounding him. The enraged sun returns one arrow, which pierces Citli's forehead (Mendieta, *op. cit.* p. 77). The sun is the Spider Woman of some western tribes, the Ojibwa Wigwam of the Great Spirit, and the Zuni shield of burning crystal which he carries, while the Kutenai Coyote manufactures the sun out of grease made into a ball (Chamberlain, in *AAOJ* xvii. 69). In Peru an oval plate, the symbol of the All-pervading Spirit, ultimately manifested in fire, earth, air, and water, was called the image of the true sun, of which the solar orb was only the reflexion. The sun, says the Quichua, Blas Valera, was the child of the Creator, and his light was that part of his divinity which the Creator had imparted to him. It was considered sacrilegious to look at his face; but early writers give several accounts of Inca rulers (particularly Huayna Capac) who did so, and who declared their scepticism of the supremacy of an object which never rested, but eternally moved upon its track like a driven animal, whose face the clouds obscured. From the nature of their light, gold was sacred to the sun and silver to the moon.

Eclipses were regarded as attacks made by some insect or animal upon the object enshadowed. In accordance with a world-wide custom, a terrific noise was made to frighten away the attacking monster, although the Tlascalans believed that the sun and moon were fighting. To induce them to cease, red-skinned people were sacrificed to the sun and albinos to the moon. The Peruvians thought the sun was angry when his face became obscured, while under like conditions the moon was believed to be ill. If her light disappeared altogether, she was dead and would fall from the sky upon earth, killing every one upon it. Dogs were beaten, as the moon was thought to be fond of them because they had rendered her a certain service, and it was hoped that their cries would induce her to uncover her face. A similar custom existed in Mexico (Ixtilxochitl, *Hist. des Chichimeques*, Paris, 1840, cap. 6; Oviedo, *Hist. gen. y nat. de las Indias*, Madrid, 1851, xxix. 5; Piedrahita, *Hist. del Nuevo Reyno de Granada*, Antwerp, 1688, v. 1, vii. 6; Garcilasso, *op. cit.* xi. 1).

The altruistic spirit of the Pueblo community may be seen in the legend that the moon was once as bright as the sun, but gave up part of her light that people might sleep at night. According to the Sioux, the diminishing of the moon is caused by the nibbling of field mice, who thus prevent it from growing too large and injuring the earth (*Red Man*, xvi. no. 45). The profile face of the woman in the moon is figured on the Salcamayhua

chart. The Osages and the Mexicans seem also to have observed her. As the sun, being a male, watches over the fortunes of men, so the female moon is the guardian of women, to whom appeals for help were addressed in childbirth.

According to the Micmacs and Ojibwas, the stars are the lights of camp-fires before the wigwams of the dwellers in the land of the sky. Here and there we see them grouped in villages, and the brightest represent the largest fires before the dwellings of the chiefs. By other North American tribes they are described as birds that fly to the sky at night, by the Mexicans as eyes. Some Brazilian tribes regard them as rifts in the canopy of the eternally glowing sky-land (Seler, *Codex Vaticanus*, London, 1902, p. 44; Hagar, 'Micmac Star Lore,' MSS; Nery, *Land of the Amazons*, London and N.Y., 1901, p. 47). These simple and primitive notions existed coincidentally with the division of the sky into constellations bearing the names of animals, plants, and frequently of inanimate objects.

Among the American tribes we find single stars named after individual objects, and groups forming true constellations; but probably nowhere in America is a constellation recognized which has become conventionalized like our own to such a degree that the derivation of the name is not really apparent from the alignment or other features. The morning and evening stars were naturally the most important of the stellar host. In the legends of the Cherokees, Peruvians, and others, the morning star appears before the first rising of the sun. It is the great star, the warrior, or messenger who goes in advance to announce the coming of his solar master. Its advent was hailed with incense and dances. It was widely symbolized by an equal-armed red cross. An Ojibwa legend makes it an older sister, who at her own desire was borne by the winds into the eastern sky, whilst her brother ran up a high mountain to hunt. So, according to Diodorus Siculus, the divine youth Hesperus went to the summit of a mountain at night to study the stars and a great wind carried him into the sky, where he became the evening star (Schoolcraft, *Hiawatha Legends*, Philadelphia and London, 1856, p. 90 ff.).

Among the Caddos the morning star was the errand man selected by the moon to be his assistant chief and to call the people together. He used to get up early during war expeditions, long before dawn, to go round the camps and wake the people so that the enemy would not find them. That is the reason why he gets up so early now. Morning Star has three brothers, Evening Star, North (Pole) Star, and South Star. Their father's name was Great Star, and he was the chief of the people (Dorsey, *Traditions of the Caddo*, pp. 7-8, 15).

In America the evening star was usually regarded as a woman, because it governed the time of family re-union at home, though among the Zuñis it is the twin brother of the morning star. In Mexico it is the Lord who comes with his torch to light the dwellings on high, in Peru the female maize-grinder, the torch in the west, while among the Micmacs it is leader of the stellar tribe. Its symbol is frequently a white cross. It is the mother of all things to the Skidi Pawnee, who keeps a garden in the west in which the sun rests at night, where the corn is always ripening and much buffalo meat is stored (Schoolcraft, *op. cit.* p. 90 ff.; Cushing, *Zuñi Folk Tales*, New York, 1901, p. 378; Dorsey, *Traditions of the Skidi Pawnee*, pp. xv, 5; Hagar, *Peruvian Astron.*, ch. on 'Cult and Symbol,' pp. xv, 3). As the converse of the morning star, the Caddos believe that the evening star would go back a long distance upon the trail and warn his people if the enemy

approached (Dorsey, *Traditions of the Caddo*, p. 15).

The identity of the planets, whether the morning or the evening star, was recognized in Peru, Mexico, California, and parts of South America. The Peruvians made Mercury the ruler of merchants, travellers, and messengers. The Amazon tribes call it 'Deprived of Fish,' since it is believed to cause a scarcity of food fishes. Venus, in Peru, governed the daughters of the rulers, and women generally, dawn, rains, and flowers; Mars, war and soldiers; Jupiter, public matters and food supplies, and to him they offered firstfruits. The Peruvians placed Venus alone of all the stars in the dominion of the sun, evidently because it alone is sometimes visible in the full solar light. Because of its brilliant rays they called it Chasca, 'Curling Hair.' Because of its beauty they said that the sun never permitted it to wander far from his presence—a poetical interpretation of the fact that Venus never departs as far from the sun as the major planets. They also called this planet Chasqui, 'the Messenger,' because its swift passage from star to star suggested the swift running messenger upon the highways (Hagar, *Peruvian Astron.*, ch. on 'Cult and Symbol'). In the codices it is represented by numerous symbols, in the temple of Mexico by a high column, and in the myths it is identified with Quetzalcoatl. The Californian Indians say that the sun has two daughters, Mercury and Venus. Twenty men kill them, and after fifty days they return to life (Mendieta, *op. cit.* pp. 82, 83; Nuttall, *op. cit.* p. 53; Emerson, *Indian Myths, Legends, and Traditions*, Boston, 1885, p. 481; Nery, *op. cit.* p. 251; *Explication Codex Telleriano-Ramensis* in Kingsborough, *Mexican Antiquities*, 191).

The Milky Way in North America generally, and among the Guaranis of Paraguay, was the path of spirits, over which the souls of the dead pass between this world and the sky-land of the hereafter. Those of the good follow the broader and easier arm, those of the evil-doers the narrow and difficult arm. It is the Cherokee and Pueblo 'Way of Meal,' the Micmac 'Ancient Trail' and 'Way of Reeds,' the Californian 'Backbone of the Sky,' the Pawnee 'Dust raised by Buffalo Racing.' A Zuñi legend calls it the 'Great Snow Drift of the Skies' (Stevenson, *op. cit.* p. 25; Cushing, *op. cit.* p. 581; Dorsey, *Traditions of the Skidi Pawnee*, p. 57; Hagar, *Cherokee Star Lore* [in *Boas Anniversary Volume*, p. 354 ff.]). In Peru and at Zuñi, as among the ancient Sumerians, it is associated with a gigantic celestial serpent. On the Osage star chart it is figured as a river, and it appears as a celestial stream in the mythology of the Peruvian and Amazon Indians. In Peru, as in the legends of the Ojibwas and Cherokees, and as in the Euphratean region, China, and Japan, this river is associated with the passage of souls. The Cherokees and the Kutenai also call the Galaxy 'the Way of the Dog,' the tribes of Guiana 'the Way of the Tapir' and the 'Path of the Bearers of Whittish Clay' (Brett, *Indian Tribes of British Guiana*, New York, 1852, p. 107; Chamberlain, in *AAOJ* xvi. 69).

In the sand paintings of the Mission Indians of California the outer circle is called 'Our Spirit,' a name of the Milky Way. The whole represents the world resting on the Milky Way. A gate or door to the north permits the escape of the soul at death.

The Cherokees recognize two dog stars, Sirius and Antares. In spite of the identical name of the former in our tradition, this is probably a native name, for it is explained by a Cherokee legend which bears no resemblance to its Oriental analogue. In it the two dogs act as guardians of

'the Way of Souls,' at the extremities of which they are stationed, and they must be propitiated with food before they will permit the souls to pass. The Winnebagoes, Ojibwas, and Huichols also recognize a dog star, and the Hindus and Zoroastrians likewise place two dogs upon the way of souls. The Caddos say that a dog gifted with prophetic powers talked with its master, the pair becoming two bright stars in the south (Dorsey, *Traditions of the Caddo*, p. 25).

The Pleiades are the most conspicuous constellation in the star-lore and ritual of the American Indians, though in North America they share the leadership with Ursa Major. Throughout America they are known as the stars of harvest and of the propitious rains. Their Peruvian name 'Granary' is echoed by the Eskimo 'Sharing-out of Food.' In allusion to their alignment they were generally known as a group of various objects: in Peru 'the Doves,' in Guatemala 'the 400 Young Men,' and in Mexico 'the 400 Rabbits,' patrons of feasting and of intoxication. They are also the Algonquian 'Sweating-Stones,' referring to the seven stones with which the sacred bath of the medicine-man was heated. Their Maya name and Micmac symbol, the rattle of the rattle-snake, suggest an association with the group of small mounds on 'the Way of the Dead' at Teotihuacan, for these mounds are traditionally dedicated to the stars, and from some of them have been exhumed large and erect rattle figures, which were evidently used as altars.

Another important aspect of the group is that of 'the Dancers,' suggested by the twinkling of the closely grouped stars. The whole stellar world follows the group, as they perform their cosmic dance across the sky; and so on earth their rising was hailed by Brazilians, Cherokees, Micmacs, and probably many other tribes, with an imitative song and dance referring more or less directly to the eternal procession of the heavens. The Iroquois, Housatunnuks, and Cherokees have, or had, an explanatory legend which describes how a group of boys, while dancing, ascended to the sky and became the Pleiades. Among the Caddos there are seven brothers who played all day long. Being scolded by their mother and refused food, they danced round the house, gradually rising from the ground until they reached the sky. As they disliked work, they disappeared in spring, when work time begins (Dorsey, *Traditions of the Caddo*, p. 64). The Blackfeet believe that they ascended because their fathers gave to their sisters, instead of to them, the yellow skins of the buffalo calves they had slain. In revenge they determined to go away each year when the buffalo calf skins became yellow. This occurs in May, when the Pleiades are hidden in the sunlight. The Kiowas call the Pleiades 'the Star Girls,' and they are probably represented by the dancing stellar maidens who descend to earth in the poetic legend of Algon. The seventh Pleiad appears in the Cherokee and Iroquois legends, in the former as a boy who is knocked down with a pole before reaching the sky, in the latter as a star whose light is dimmed because of his desire to return to earth (James Mooney, letter to author; R. W. Wilson, *AAOJ* xv. 149; Emerson, *op. cit.* p. 72; Sergeant, *Housatunnuk Indians*, Boston, 1753; Domenech, *Deserts of North America*, London, 1860; Schoolcraft, *Hiawatha Legends*, p. 116 ff.; Mrs. Erminie Smith, in *2 RBEW*, p. 80).

Almost invariably seven stars are attributed to the group, thus including one star which, though of the sixth magnitude while its companions are of the third and fourth, may be seen by one with strong sight or in a clear atmosphere. The

Cherokees also relate that the seventh Pleiad fell to earth, leaving a fiery trail. He became a bearded man, who warned them of the coming flood. So in Peru the approach of the Pleiades to the meridian enabled the llamas of Ancasmarcha to warn their shepherd of the coming of the annual deluge or rainy season in November. In Mexico the six *tzontemocque*, or stars which fall at the deluge, seem to have been Taurid meteors (Mooney, in *17 RBEW*, p. 621; *Explication Codex Telleriano-Ramensis*). 'If people will look at these stars (the Pleiades),' runs the Pawnee song, 'they will be guided aright.' Many tribes actually did use them as a guide by night (Morgan, *League of the Iroquois*, Rochester, N. Y., 1857, ii. 106). Everywhere the Pleiades are a peaceful, beneficent, and friendly constellation; and there are some indications in Peru and elsewhere that they were once regarded as being (or having special influence over) the home of souls.

The pole star of the Northern hemisphere seems to have been observed by all, or nearly all, the northern tribes. It is the Ojibwa 'Man who walks behind the Loon,' a disappointed lover, who, metamorphosed into a firefly, flew to the sky; in another version a hunter of bears. The Kutenai call it a female grizzly bear; but this apparently refers also to a constellation which includes Ursa Minor and Ursa Major. The Sioux declare that 'all stars walk around the pole star, which is the star that does not walk.' The Micmacs describe it as a bear hidden in a den, about which a group of hunters (Ursa Minor) eternally circle in a vain attempt to discover it. The Pawnees call it 'the star that does not move,' and regard it as the chief of the stars. In the Southern hemisphere the pole is indicated on the Salcamayhua chart as the apex of two slanting lines, which form the sky roof of the world. To it point three stars of the Southern Cross, called the male group, and having phallic attributes. The Maya name of Vega is 'Scrotum Star,' but this star ceased to mark the north pole several thousand years ago. The Peruvians used the Southern Cross to indicate the divisions of the night, the Mayas to indicate the seasons (Emerson, *op. cit.* p. 58; La Flèche in *AAOJ* vii. 106; Chamberlain, *ib.* 1770; Copway, *Traditional History of the Ojibway Nation*, London, 1850, p. 113 ff.; Dorsey, *Traditions of the Skidi Pawnee*, pp. 3-4).

The stars of Ursa Major seem to have been called 'the Bear' by the Indians of practically the whole of British America and the United States. An accompanying legend is found in almost identical form among the various Algonquian tribes, the Housatunnuks, Iroquois, and the Cherokees, but is given most fully by the Micmacs. The four stars of the body of Charles's Wain, or the Dipper, as Americans call it, form the body of the bear. The three following stars, ϵ , ζ , η , with four trailing behind them in the form of a bow (γ , ϵ , η Bootis, and Arcturus), are seven hunters, who are pursuing the animal. The little star, Alcor, close to the second hunter, is the pot in which they intend to cook her meat. Corona Borealis and μ , δ Bootis form the den from which she climbs down in the spring. In the summer she runs across the sky with the hunters in full pursuit; in the fall she is overtaken and shot, and begins to fall over on her back. The blood from her wound causes an eternal stain upon the breast of the foremost hunter, the robin, and, dripping upon the trees of earth, it gives to the foliage its blood-red autumn hues. But the bear eternally returns to life. Through the winter she lives in her den invisible (below the horizon), to issue forth again in spring, and thus eternally to renew the celestial drama. The seasonal features of the

legend correspond accurately with the actual positions of the stars in the early evening. There is good reason to believe that this is a native legend, or at least one of pre-Columbian origin, though the earliest reference to it seems to be by Le Clerq in 1691 (Hagar, in *JAF* l. xiii. 92 ff.). In connexion with the hunting concept, it is noteworthy that the Wichitas regard the Great Bear as the patron of those about to engage in war expeditions (Dorsey, *Myth. of the Wichita*, p. 18).

The Blackfeet know the principal stars of Ursa Major as seven boys, all save the youngest of whom (Dubhæ) had been killed by their sister. The Sioux call the four body stars the coffin. It is borne by four men who are followed by mourners. Mizar and Alcor are called 'She who Comes with her Young One Weeping.' The Ojibwas also called these stars 'the Fisher,' and the Zuñi represented them by seven white pebbles in the rites of the 'Priesthood of the Bow.' The Pawnees described Corona Borealis as a circle of chiefs, in whose honour was founded the society of 'Chief Dancers.'

The Belt of Orion among the Point Barrow Eskimos becomes three men who were buried in the snow, the Micmac 'Three Fishermen,' the Zuñi 'Hanging Lines,' and the Patagonian 'Three Bolas,' or round stones with which animals are slain by hunters. The Peruvians, like the Basques and the people of Deccan, call it 'the Steps.' The whole constellation is the Zuñi 'Celestial Hunter' pertaining to the sun. In Peru it is symbolized by crossed arrows, and relates to hunters and hunting. A myth makes it the Promethean figure of a criminal raised aloft for punishment by two condors. It may be connected with the Mexican Citli, 'the Bowman.' The names of a few other constellations and single stars have reached us, but present no features of special interest.

In view of the similar and wide-spread symbolism associated with some constellations in America, a more or less uniform system of celestial symbolism may have existed through a large part of the continent, similar to the primitive symbolism of the eastern continent in some elements, yet unique in others.

Unquestionably many of the symbolical concepts have been transmitted from tribe to tribe for long distances. Many of them are of pre-European, or at least of pre-Columbian, origin, and the analogies which they present with Oriental symbolism must be explained either as like effects of like independent causes or by pre-Columbian intercommunication between the continents. The weakness of the former explanation lies in the complexity and conventionality of the concepts, and in the difficulty of tracing the symbolism to any natural basis. The American zodiacs, for example, reveal analogies with the ancient Oriental zodiacs in every sign, yet in few if any instances, either in the Orient or in the Occident, are we able to explain why these signs were so named or why their symbolical attributes are what they are. The zodiac is older than its seasonal associations; its origin remains unknown, yet we find it in similar form in America and in the Orient. The same argument applies, although perhaps less forcibly, to a large part of the astronomical symbolism of America.

LITERATURE.—The literature has been given throughout the article.
STANSBURY HAGAR.

SUN, MOON, AND STARS (Buddhist).—The astronomical ideas found in Buddhism do not form an independent system, but have developed in close relation with Hindu theories. The problem is rather to determine what stages of development

are to be found in the canonical and later books. Thibaut¹ divides Indian astronomy into three periods: (1) that of the Vedas and *Brāhmaṇas*, (2) the middle period with a fully developed native Indian system, (3) the third period, showing Greek influence. The Buddhist scriptures cover a long time, some of the later containing references to the Greeks, but it is to the middle period, and rather to the early stages of this, that the astronomical notions of these works belong. They are in the main the same as those that we find in the *Purāṇas*. The Hindus had two important uses for astronomy: the sacrifices and astrology, neither of which was countenanced by the Buddhists. The latter had no special motive for paying close attention to astronomical theory beyond that required for determining the periods of the lunar month with its fast-days, the period of Retreat in the rainy season, and the divisions of the day. According to *Vinaya*, ii. 217, a monk who lives in the forest is to learn 'the positions of the lunar signs (*nakṣatras*), either the whole or one section, and is to know the cardinal points.'² At the end of the ordination service the process of 'measuring the shadow,' *i.e.* calculating the time of day, is performed in order to determine the seniority of the monk, and he is instructed in the length of the seasons and division of the day.³

1. Position of sun and moon.—The heavenly bodies that we see are the vehicles of gods, who have been thus reborn through their merit, and who are associated with the thirty-three gods, but below them in rank.⁴ The moon, the sun, and the constellations come as gods in the retinue of Sakka to visit Buddha,⁵ and in *Dharmasamgraha*, 10, the moon, sun, earth, and the *asura* Rāhu occur along with the guardians of the ten quarters as world-protectors. When sun and moon occur together, the moon is always mentioned first.

In the scriptures there is no systematic description of the heavenly bodies, but the account given in the *Sārasamgraha*⁶ corresponds to scattered notices in earlier works and probably underlies them. The earth, a flat disk, is 1,203,450 leagues (*yojanas*) in diameter and 3,610,350 in circumference. In the centre is Mt. Meru, rising 84,000 leagues above the surface of the earth, and round it circle the sun, moon, and stars, shining in turn on the four continents round Mt. Meru.⁷ Night is caused by the sun passing to the other side of Mt. Meru. The diameter of the moon is 49 leagues and the circumference 147; of the sun 50 and 150 respectively.⁸ The sun as the vehicle (*vimāna*) of the god is one league higher in position than the moon. It is of crystal outside, gold within,⁹ and hot within and without. The moon is of silver outside, of jewel within, and cool within and without. The sun has three paths—*ajāvithi*, *nāgavithi*, and *govithi*—according to its apparent course in the ecliptic during the seasons along the equator, and above or below.¹⁰ This fact appears to be referred to in the *Silāni*,¹¹ where the sun and moon are spoken of as going along their paths or out of their paths. Whether there was any early theory

¹ *Astronomie, Astrologie, und Mathematik*, Strassburg, 1899, p. 4.

⁴ *Jātaka*, no. 450.

⁵ *Digha*, ii. 259.

⁶ Cosmological passages are quoted in R. S. Hardy, *Legends and Theories of the Buddhists*, London, 1866, appendix.

⁷ *Aṅguttara*, i. 227.

⁸ The ratio of the diameter and circumference of a circle is thus 1 : 3, as in *Jātaka*, v. 271. This illustrates the rudimentary character of Buddhist astronomy.

⁹ We should expect gold outside, but such is the text.

¹⁰ So, but more elaborately, in the *Vijṇu Purāṇa*, bk. ii. ch. 8.

¹¹ *Digha*, i. 10; cf. *Dialogues of the Buddha*, tr. T. W. Rhys Davids, London, 1899, l. 20.

of the cause of revolution, apart from the choice of the god of the luminary, is not clear. The Chinese sources of A. Rémusat state that five vortices of wind support and move the vehicle of the sun in the required directions, and five other vortices similarly move the moon.¹

2. Eclipses.—Eclipses are due to the *asura* Rāhu, who is stationed at the moon's nodes, and periodically swallows the sun and the moon. The legend that Rāhu is the monster's head, severed when he was drinking the ambrosia produced at the churning of the ocean, appears not to be early Buddhist, nor even ancient Hindu. It is absent from the account of the churning in the *Viṣṇu Purāna*.² Buddhaghosa describes Rāhu not as a head, but as having a complete body, of which he gives the dimensions.³ The Puranic notion of Ketu as the severed body of Rāhu at the descending node, although mentioned in *Mahāvīryūtpatti*, 164, and implied in *Abhidhānappadīpikā*,⁴ 61, among the 'nine planets,' is a late borrowing from Hinduism. Two ancient *suttas* describe the moon and sun as being afflicted by Rāhu and appealing to Buddha, who commands Rāhu to let them go.⁵

3. Planets.—The stars also are said to move along and out of their paths.⁶ The term here used for star is *nakkhatta* (Skr. *nakṣatra*), and probably refers to the planets, as Buddhaghosa understands it in this context.

The only planet distinctly mentioned in the *Suttas* is *Osadhī-tārakā*. That this is Venus may be inferred from its being described as the brightest of the luminaries next to the moon and as appearing in the morning.⁷ The Sanskrit recension of the *Dīgha* passage in *Mahāvīryūtpatti*, 71, definitely identifies it with Venus by substituting *Uśanas*, one of the Sanskrit names of this planet, for *Osadhī*. The name *Osadhī-tārakā* is unexplained. The phrase *Osadhī viya tārakā*, 'like the star *Osadhī*,'⁸ shows that it does not mean 'star of plants' (as in *osadhīpati*, 'lord of plants [or of the soma-plant], a title of the moon). The possibility that *osadhī* is a corruption of *ausāsi*, 'star of dawn,' is attractive, but there is nothing in texts or commentaries to support it. The same is the case with the view of Kern that it is a corruption of *osani*=Skr. *ausāni*, a derivative of *uśanas*.⁹

4. The lunar zodiac.—The term *nakṣatra* has been from late Vedic times applied especially to 27 or 28 constellations lying roughly along the ecliptic and forming a lunar zodiac; and from the Buddhistic use of many of them as proper names it may be inferred that they were known to the earliest Buddhists. They are as follows:

(1) *Assaruja* (β, γ Arietis), (2) *Bharani* (35, 39, 41 Arietis), (3) *Kattikā* (Pleiades), (4) *Rohini* (Hyades), (5) *Magasira* (α, φ Orionis), (6) *Addā* (α Orionis), (7) *Punabbasū* (Gemini), (8) *Phussa* or *Tissa* (θ, δ, γ Cancer), (9) *Asileśa* (ε, δ, σ, η, ρ Hydrae), (10) *Maghā* (Regulus), (11) and (12) *Pubba*- and *Uttara-phagguni* (δ, θ, β, 93 Leonis), (13) *Hatthā* (δ, γ, ε, α, β Corvi), (14) *Chīttā* (Spica), (15) *Sāti* (Arcturus), (16) *Viśākhā* (Libra), (17) *Anurādhā* (δ, β, σ Scorpiomis), (18) *Jeṭṭhā* (Antares), (19) *Mūlā* (α Scorpiomis, etc.), (20) and (21) *Pubba*- and *Uttara-asāḷha* (δ, ε, σ, ζ Sagittarii), [(22) *Abhijj* (Vega)], (23) *Savaṇa* (Aquila), (24) *Dhanitthā* or *Savitthā* (Delphin), (25) *Satabhisaja* (α Aquarii, etc.), (26) and (27) *Pubba*- and *Uttara-bhaddapādā* or *poṭṭhapādā* (the square of Pegasus), (28) *Revati* (ζ Piscium, etc.).¹⁰

No. 22 in this list is not in the *Abhidhānappadīpikā*. It was early omitted in Hindu astronomy, but the existence of *Abhijj* (Skr. *Abhijit*) in the Buddhist system may be inferred from the statement that the number of *nakṣatras* is 28¹¹ and from the

existence of *Abhijjka* as a proper name.¹ It also occurs in *Mahāvīryūtpatti*, 165, and in the list of Rémusat.²

References to other fixed stars than *nakṣatras* are rare in all Indian literature. The descent of the Heavenly Ganges, a myth relating to the Milky Way, is referred to in the canon, but never in any astronomical connexion. In *Jātaka*, vi. 97, seven sages are mentioned, but their names are not those which Hindu mythology gives to the seven *r̥sis*, after whom the seven stars of *Ursa Major* are named. The name *Sakata*, 'the cart,' in *Dīgha*, ii. 234, is probably a name of *Rohini*, as suggested by S. Konow.³ It is so named by several Hindu astronomers.⁴

5. Months.—The moon in the course of a year may be full in any of the *nakṣatras*, and we find such expressions as *Viśākhapunnamā*, 'full-moon when the moon is in *Viśākhā*'; but there had been established earlier than Buddhism a system of twelve lunar months, with names derived from certain of the *nakṣatras*. These are:

(1) *Chitta* (Mar.-Ap.), (2) *Viśākhā* (Ap.-May), (3) *Jeṭṭhā* (May-June), (4) *Āsāḷha* (June-July), (5) *Sāvaṇa* (July-Aug.), (6) *Poṭṭhapādā* (Aug.-Sept.), (7) *Assaruja* (Sept.-Oct.), (8) *Kattikā* (Oct.-Nov.), (9) *Magasira* (Nov.-Dec.), (10) *Phussa* (Dec.-Jan.), (11) *Māgha* (Jan.-Feb.), (12) *Phagguna* (Feb.-Mar.).

These names were later applied in Hindu systems also to the twelve solar months, but in the canon the reckoning appears to be always lunar, as well as in the Ceylon chronicles.

The month is divided into two parts (*paḅkha*), the dark (*kāḷa*) from full to new moon, and the light (*sukka*, *junha*) from new moon to full. Whether the month ended with full or new moon is not clear, but the fact that the dark half is mentioned first and that the months of Retreat began the day after a full-moon day and ended on a full-moon day, suggests that the full-moon day was the end. Both methods were in use by the Hindus in Vedic times, as they are at the present day.⁵

6. The week.—The division of the half month at the eighth and fourteenth or fifteenth day easily led to the reckoning of seven days as a usual period (*sattāha*), but there is no trace in the Pāli writings of the system (no doubt non-Indian in origin) of naming the week-days from the names of the sun, moon, and planets. These names occur in the order of the days of the week as the first seven of the nine planets in *Mahāvīryūtpatti*, 164.

7. The year.—In *Anguttara*, i. 213, where the length of a year of the gods is given, it is said to be a year of twelve months, the month being made up of 30 nights (and days). This gives a year of 360 days, and is the exact number in use in the Vedic period.⁶ The number 30 is probably obtained by adding together the 15 days of each half of the lunar month. In practice the number would be sometimes 29 and sometimes 30, as the synodic lunar month is rather over 29½ days. There must have been a mode of intercalating months to bring the lunar months and solar year into harmony from time to time, as in the case of the Hindu systems, but the process is unknown. The modern Siamese have a year of 354 days, the months being alternately of 29 and 30 days. In every third or second year (seven times in 19 years) the eighth month is reckoned twice, and in every fifth or sixth year one day is added to the seventh month, bringing the lunar year into harmony with the solar year.⁷

The Hindu systems have two modes of beginning

¹¹ *Mahāvīryūtpatti*, 382; *Jātaka*, Com. vi. 476.

the year: (1) with the full moon of Kattika, (2) with the month Chitta.¹ The former is implied in the usual Buddhist reckoning of the three seasons, in which the cold season is always mentioned first.² This period was also the end of the Retreat, in which the annual redistribution of robes took place. The second mode of beginning the year is implied in the *Dīpavaṃsa* and in the list of lunar months in the *Abhidhānappadīpikā*, which begins with Chitta.³

8. Seasons.—The ancient Hindu seasons are three: *hemanta*, the cold season from Māgasira to Phagguna; *gimha*, the hot season from Chitta to Asalha; and *vassa*, the rainy season from Sāvāna to Kattika. These dates, however, would vary from year to year through the irregularity caused by the lunar months and occasional intercalation.⁴

Dīpavaṃsa, xii. 44, calls Jetṭha the last of the hot months. *Vassa* in the sense of Retreat does not correspond with the rainy season, but extends over three months of that period. The Hindu subdivisions of the three seasons into five or six⁵ are not found in Pāli works, but there are occasional references to autumn (*sarada*) as the early part of *hemanta* and to spring (*vasanta*) as the early part of the hot season.⁶ *Mahāvīyupatti*, 253, gives the list of six, and I-tsing⁷ also describes other systems of division used in various localities.⁸

9. Astrology.—Indian astrology, as the science of omens drawn from celestial phenomena, is a branch of divination. It is stigmatized in *Digha*, i. 10, as a base science and false means of livelihood. In the *Sutta Nīpāta*, 927, the monk is forbidden to devote himself to magic (*āṭhabbana*), to (the interpretation of) the dream, the sign, and the *nakṣatra*. That such a science is possible is generally taken for granted, but in the *Jātaka* there is a tendency to ridicule the belief in lucky *nakṣatras*,⁹ omens,¹⁰ names,¹¹ and sneezing. There is no reason to think that this sceptical attitude is primitive; it is rather the rationalizing of a single individual or of a school. The survival of the belief within orthodox Buddhism is shown in the collection of *suttas* drawn from the canonical books called the *Paritta*, which, among other formulas intended to ward off hostile powers or to win their favour, contains the two *suttas* on the eclipse of the moon and of the sun.¹²

A fragment of a MS of an astrological work in corrupt Sanskrit has recently been discovered in East Turkestan at Khotan.¹³ It is shown to be Buddhist by the phraseology, as well as by the reference to the ११ Kharuṣṭa, who makes known to the congregation the knowledge of 'nights, days, moments, planets, half-months and months.'¹⁴ The matter is similar to that in Hindu astrological works, such as: what *nakṣatras* are effective for conception, which are causes of misfortune or success in certain undertakings. There can be little doubt that it is borrowed from some Hindu work, and,

like later works of this kind, it shows the influence of Greek astronomy in the use of such terms as *hora*, and the names of the 12 signs of the zodiac (Pisces, Scorpio, etc.) along with those of the *nakṣatras*.

EDWARD J. THOMAS.

SUN, MOON, AND STARS (Celtic).—1. Very little is known about the astrology and astronomy of the Celts. The Druids, as we learn from Cæsar (*de Bell. Gall.* vi. 14), discussed and transmitted to their disciples many questions regarding the stars and their motion. They had observed the course of the moon, and by it they regulated their calendar. Their months and years began with the sixth day of the moon (Pliny, xvi. 95, 250); they counted by nights (Cæsar, vi. 18. 2); and their cycle was one of thirty years (Pliny, xvi. 95, 250).

The discovery of the calendar of Coligny has made it possible to determine these general ideas for the Gallo-Roman period. This calendar gives a year of 354 days, divided into twelve months of twenty-nine and thirty days alternately. To establish agreement between the lunar and the solar year a month of thirty days was intercalated every two and a half years. At the beginning of every fifth year there was complete agreement between the two methods of calculation; and probably this was the occasion, as Julian remarks, on which were offered the quinquennial sacrifices of which Diodorus speaks (v. 32. 6).

Astrology, properly so called, does not seem to have been practised by the pagan Irish. But in the 'Lives of Saints' there are to be found some superstitious practices derived from the observation of the stars. The foster-father of Columcille goes to ask a prophet when he should begin to teach the child to read. The prophet after having examined the heavens replies that he must begin immediately (*Lives of Saints from the Book of Lismore*, l. 812). Manannan mac Lir used to know by studying the sky when there would be fine weather and when bad (*Cormac's Glossary*, p. 114).

The scientific observation of stars was also in use among the ancient Irish. Loeg observes the stars to ascertain when midnight comes (*Mesca Ulad*, 13). Some treatises on Irish astronomy dating from the early Middle Ages have been preserved. They are founded on the system of Ptolemy, and seem to be translations of foreign works. The words used to denote the sun-dial are borrowed from the Latin. Yet the Irish were particularly clever at calculating dates, and in the *Saltair na Rann* it is told that every intelligent person should know the day of the solar month, the age of the moon, the flow of the tide, the day of the week, and the chief saints' festival days. Perhaps in the ancient Irish and Welsh texts there are traces to be found of the primitive Celtic calendar. The year was divided into two halves or into four periods of three months, the month being divided into two parts. The periods of time most in use were those of three nights and three days, or nine nights and nine days, while the most common cycles were those of three years and of seven years. In Armorican Brittany and in Wales the names of the complementary days which served to convert the lunar year into a solar year (Brit. *gourdeziou*, Welsh *dyddiau dyddon*) have been preserved. Several popular superstitions are attached to them. Thus a medical manuscript mentioned by O'Curry contains a list of unlucky days, and in Irish literature there are numerous examples of births delayed in order that they may take place on a lucky day, and of disasters which might have been prevented if an undertaking had not been engaged in on an unlucky day.

² *Vinaya*, i. 137.

³ There is no reason for thinking that the year ever began with Sāvāna. The recurring phrase *Komuḍi chātumāsini* does not mean the full moon of Kattika 'in the fourth month,' but 'at the Chāturmāsya festival.' See T. W. Rhys Davids and H. Oldenberg, in *Vinaya Texts*, pt. i. (*SBE* xiii. [1881]) p. 324, n. 2; *Jātaka*, vi. 221; *Dīpavaṃsa*, xv. 1. On the Chāturmāsya, or 'Four month' celebration, see art. FESTIVALS AND FASTS (Hindu).

2. The Gallic god Belenos had been assimilated to Apollo as a healer rather than as a sun-god. We have no evidence of worship of the stars among the Gauls except a few dedications to the sun and the moon in Gallo-Roman inscriptions (A. Holder, *Altceltischer Sprachschatz*, 3 vols., Leipzig, 1896-1913), and the mention of the worship of an image of the sun (*AS*, 4 Sept. ii. 197 C). No conclusion can be drawn from the representation of stars on the shields of the Orange-arch, from the *rouelles* dug out in so great a number, or from the wheel that is an attribute of a Gallo-Roman god assimilated to Jupiter; for the stars may be ornaments or armorial bearings, and the wheel may be a divination-wheel or a symbol of the thunder as well as a symbol of the sun. Some customs of the ancients may be connected with the beliefs relating to the stars—*e.g.* the gathering of the mistletoe and the beginning of the years and months on the sixth day of the moon (Pliny, xvi. 250), the dread of the Asiatic Galatians during an eclipse of the moon (Polyb. v. 78).

The evidences of the worship of the sun and the moon in ancient Ireland are not numerous. The most explicit text is in the *Confessio* (§ 60) of St. Patrick, in which he alludes to worshippers of the sun. G. Keating (*History of Ireland*, ed. D. Comyn and P. Dinneen, 1902-1903, bk. i. § 12) says that one of the Dè Danann was named Mac Gréine, 'Son of the Sun,' because his god was the sun. A passage of *Cormac's Glossary* (p. 54) tells us that Irish pagans used to carve some pictures—*e.g.* that of the sun—on the altars of their idols, and Keating (ii. 11) relates that in Columcille's time a priest of Tirconnell who had set up images of the sun and the moon in the church was carried off by a devil. The king of Ulster, Loegaire, swore by the name of the elements—the earth, the sun, and the wind (W. St. Boroma, *RCel* xiii. [1892] 52 f.).

G. DOTTIN.

SUN, MOON, AND STARS (Chinese).—I. INTRODUCTION.—The Chinese view of the sun, moon, and stars taken as a whole may be likened to a web woven of three different threads: the thread of astronomy, the thread of religion, and the thread of astrology. Astronomy means here the observation of the heavenly bodies and the truths deduced therefrom, chiefly for practical purposes. It may therefore be called 'observational' astronomy, as distinguished from what is called 'physical' or 'descriptive' astronomy, founded by Galileo after his invention of the telescope, and it may also be called 'practical' astronomy, as distinguished from what is called 'theoretical' astronomy, founded by Newton on the hypothesis of the law of gravitation. The religious view of the Chinese concerning the heavenly bodies may be called astrological, and their astrological view may be called religious in the comprehensive sense of the term. But a clear line of distinction can be drawn between them. The idea of deity or God is always present and predominant in the religious view, whereas it may be vague and even absent in the astrological view. The latter is concerned chiefly with the influences of the heavenly bodies upon men, while the former is concerned chiefly with the relation of God to men as revealed in the heavenly bodies—*i.e.* God's messages and warnings derived by means of the observation of the heavenly bodies.

The Chinese term for the study of the heavens is *tien wen*, literally 'the system (or order) of heaven.' The term is not limited to purely astro-

nomical knowledge, but has been applied equally to astrological and religious beliefs or views concerning the heavens.

Chinese astronomy has been of much interest to many European scholars, its great antiquity being widely admitted.

'The progress of Astronomy among the Chinese,' says John Williams, 'is a subject of highest interest whether it be considered as recording observations of the heavenly bodies made by one of the most ancient and primitive races of mankind, which appears in extremely remote time to have advanced to a high degree of civilisation; peculiar, however, to itself; and which has preserved the manners and customs established by its early rulers more than two thousand years before the Christian era, in a great measure unaltered to the present day. Or whether the fact that at a period long anterior to the commencement of civilisation among the Western nations, and when almost universal barbarism prevailed among them, astronomy had been carried to a great degree of perfection by the Chinese, as manifested by their still existing records, whose authenticity is not only strongly asserted by that people, but is acknowledged by some of the most eminent European scholars of the present day.'¹

It has been said by some of the authorities of our own century that the antiquity of Chinese astronomy is 'greater even than that of almost any other nation.'² But the study of the heavens in China is not pursuit of knowledge, or astronomical knowledge, for its own sake. Being a highly practical nation, the Chinese, when they seek to know anything, generally have some end or ideal in view to the attainment of which knowledge is merely a means. The present case is not an exception. Having to arrange all their religious ceremonies, social and governmental affairs, and, most important of all, their agricultural work according to the seasons, the Chinese, even at the earliest period of their history, felt the great need of a proper calendar, the formation of which required astronomical knowledge. Apart from this, there were other motives—the religious and the astrological. The latter explains itself, and the former has a double purpose. On the one hand, the Chinese sought to know the laws of the heavens, which were for them, in some sense, divine, in order to apply them to their own conduct, social as well as individual. The doctrine of the imitation of, or the conformation of men's conduct with, the laws of the heavens has been much held by Confucianists, and especially by Taoists, and can be found in most of the Chinese classics. On the other hand, as they believed the celestial phenomena to be God's revelations or warnings to men, they wanted to know them in order to re-adjust their conduct.

Both the astronomical and the religious views of the Chinese concerning the heavens are as old as their history, and it is difficult to tell which is earlier; their astrology is a later development. The Chinese term for 'astrologer' is *erh tse* or *sing tse*, which may be translated 'the man of sun' or 'the man of stars.' According to the Chinese records, the former term did not occur until the 5th cent. B.C., and the latter is of still later date. Kepler says that astronomy is the wise mother and astrology the foolish daughter. If we may adopt this saying with a little modification, we can regard the astrology of the Chinese as the daughter of their astronomy and religion. These three different views have for thousands of years influenced the Chinese mind, and the astrological view, though the latest, has almost since its birth been the most powerful. Even at the present day among many of the Chinese astronomy has not divorced itself from religion, nor has it disowned or rid itself of astrology, as Western astronomy has since the 16th century.

II. THE ASTRONOMICAL ASPECTS. — The

¹ *Observations of Comets*, London, 1871, p. vii.

² E. B. Knobel, 'Abstract of a Lecture on Chinese Astronomy,' in *Journal of the British Astronomical Association*, xix. (1905-09) 333.

Chinese are great believers in their ancient classics, so that to deal with their ancient views and beliefs is to a great extent to deal with their modern ones as well. The great antiquity of Chinese astronomy has been admitted by many of the best European scholars of both the last and the present century. According to tradition, a sort of calendar was invented by Fu Hsi (3328 B.C.) as a result of observations of the phenomena of the heavens. The reformation of the calendar and the rectification of intercalation are attributed to Hwang Ti, or the Yellow Emperor (2698 B.C.). In the record called *Ssü Ki* of Ssü Ma Chien, China's most famous historian (2nd and 1st centuries B.C.), it is recorded:

'Hwang Ti commanded Hi Ho to take charge of the observation of the sun, Yih Chang the observation of the moon, and Yu Chu the observation of the stars.'

He is also said to have brought into use the lunar cycle of nineteen years, by which the conjunctions and oppositions of the sun and moon can be calculated, and the intercalary months regulated. This was more than 2000 years before the introduction of the same system among the Greeks by the astronomer Meton.¹ *The Annals of the Bamboo Books*² record that at the time of the reign of Tsuan Hsu (beginning 2513 B.C.) a conjunction of the five planets was observed by the Chinese in the constellation called Yin Shih or Shih.³ It has been carefully calculated and asserted by the French astronomer, Jean S. Bailly, that such a conjunction did take place on 29th Feb. 2449 B.C., which would be the 65th year of Tsuan Hsu's reign. In the time of the emperor Yaou (2356 B.C.) the Chinese already knew the exact, or almost exact, number of days in a year, had a way of determining solstices and equinoxes, and had in use an intercalary system and some instruments for the survey of the heavens, and the knowledge of the five planets and of the twelve zodiacal signs, and most probably of the 28 stellar divisions.

In the 'Canon of Yaou,'⁴ the first book of the *Shu King* ('The Canon of History'), we read:

'Thereupon Yaou commanded He and Ho⁵ to have reverence to the great heavens, and to calculate and delineate the movements and appearances of the sun, the moon, the stars, and the zodiacal spaces; and so to deliver respectfully the seasons to the people.'

He separately commanded the second brother He to reside at Ye-e, in what was called the Bright Valley, and there respectfully to receive as a guest the Rising Sun, and to adjust and arrange the labours of the Spring. "The day," he said, "is of the medium length, and the star is in Neaou;⁶ you may thus exactly determine mid-spring. The people begin to disperse; and the birds and beasts breed and copulate."

He further commanded the third brother Ho to reside at Nankeaou, and arrange the transformations of the summer, and respectfully to observe the extreme limit of the shadow. "The day," said he, "is at its longest, and the star is Ho;⁷ you may thus exactly determine mid-summer. The people are more dispersed; and the birds and beasts have their feathers and hair thin, and change their coats."

¹ See Williams, *Observations of Comets*, Introduction.

² A large collection of ancient documents, discovered A.D. 279; see James Legge's tr. in *Chinese Classics*, Hongkong, 1861-72, vol. iii. pt. 1.

³ One of the 28 stellar divisions determined by α, β , and other stars in Pegasus, extending north and south from Cygnus and Piscis Australis and east and west 17° and comprising part of Capricornus and Aquarius.

⁴ Legge, *Chinese Classics*, vol. iii. pt. i. [1865] pp. 15-27.

⁵ Names of two families which had been hereditary officers of the Board of Astronomy since the time of Hwang Ti.

⁶ Neaou is a space of heavens extending over 112° and embracing the seven constellations of the southern quarter. The star in Neaou is, according to the view held by Chinese scholars and adopted by many Western scholars, such as James Legge, John Williams, etc., the star Tsun Hvuou, corresponding to Cor Hydra. After an elaborate calculation Williams says (p. xi) that that star should culminate at sunset on the day mentioned in the *Shu King*. He then says: "Thus a strong presumptive proof is again afforded of the veracity of the Chinese history as recorded in the *Shu King*."

⁷ The central star of the seven constellations of the eastern quarter, corresponding to the heart of Scorpio.

He separately commanded the second brother Ho to reside in the west, in what was called the Dark Valley, and there respectfully to convoy the setting sun, and to adjust and arrange the completing labours of the autumn. "The night," he said, "is of the medium length, and the star is Hiiü;¹ you may thus exactly determine mid-autumn. The people begin to feel at ease; and birds and beasts have their coats in good condition."

He further commanded the third brother Ho to reside in the northern region, in what was called the Sombre Capital, and there to adjust and examine the changes of the winter. "The day," said he, "is at its shortest, and the star is Maou;² thus you may exactly determine mid-winter. The people keep their cosy corners; and the coats of birds and beasts are downy and thick."

The emperor said, "Ah! you, He and Ho, a round year consists of three hundred, sixty, and six days.³ By means of an intercalary month do you fix the four seasons, and complete the determination of the year. Thereafter, in exact accordance with this, regulating the various officers, all the works of the year will be fully performed."

In the 'Canon of Hsun,' the second book of the *Shu King*, it is recorded that, having accepted the throne which had been often offered to him by the emperor Yaou, the emperor Hsun examined the gem-adorned sphere and the gem transverse tube in order to regulate the seven directors or planets.

Both the commandment of Yaou and the examination of Hsun are supposed to have taken place at the beginning of their reigns. The observation of the heavens then must have been of great importance. According to another book of the *Shu King*, called 'The Punitive Expedition of the Prince Yin,' in the reign of King Tsung Kang (2159-2146 B.C.) there were astronomers who failed to foretell an eclipse of the year 2153 B.C. (?), and it was considered such a great crime that the prince of Tin, who was then commander-in-chief of the imperial armies, received orders from the king to punish them with the imperial forces.

The Chinese then commenced their observation of eclipses from a time not later than the 22nd cent. B.C., though some European scholars regard the eclipse of the sun on 29th Aug. 775 B.C., recorded in the *Shi King* ('Book of Odes'),⁴ as the earliest recorded eclipse in all history. In Ma Twan Lin's *Encyclopædia* more than 600 eclipses of the sun are recorded from 2168 B.C. to A.D. 1223. There are many other kinds of heavenly phenomena which have been keenly observed by the Chinese from a very early period as well. From 611 B.C. to A.D. 21 alone comets are recorded 372 times, as shown in Williams' *Observations of Comets*. The spots of the sun were observed and recorded by the Chinese not later than A.D. 301, i.e. 1308 years before the assumed first discovery of solar spots by Galileo in A.D. 1610 and 1300 years before the invention of the telescope. 48 observations of solar spots, from A.D. 301 to 1205, are recorded in Ma Twan Lin's *Encyclopædia*, which was published in A.D. 1323, i.e. 288 years before Galileo's observation. In the same *Encyclopædia* a great number of instances of the observation of moving or shooting stars are recorded from 1122 B.C. to A.D. 1230. Meteors have been observed, and recorded by the Chinese since, as early as 1578 B.C. The *Bamboo Books* record: 'In the tenth year [of the emperor Kwei of the Hia dynasty, i.e. 1579 B.C.] the five planets went out of their courses. In the night stars fell like rain.' Comparing it with the year A.D. 1866, remarks E. B. Knobel, when they had the great display of meteors, the interval gave 104 periods of 33.11 years. Now Leverrier's period for the November meteor is 33.25. Thus it is hardly possible to doubt that

¹ The central star of the seven constellations of the northern quarter, corresponding to β Aquarii.

² The culminating star of the seven constellations of the western quarter, corresponding to the Pleiades.

³ 'When it is said,' says the editor of Yung Ching's *Shu King* (James Legge's tr.), 'that the year consists of 366 days, we are to understand that Yaou was speaking in round numbers. The period in question is now called the value of the years. It has been differently estimated by the astronomers of successive dynasties.'

⁴ n. iv. 9; Legge's tr., London, 1876, p. 229 f.

we have here the earliest record of a shower of those meteors.¹

III. *DIVISION OF THE STARS*.—I. The 28 *siūs* or *shēs*.—In common with the Hindus, Arabs, Babylonians, Persians, and Copts, the Chinese have the division of the ecliptic into 28 mansions, which are called *siūs* or *shēs*. According to the interpretation of Ssu Ma Kuang, a great scholar of the Sung dynasty (A.D. 960-1279), *shē* has the meaning 'to reside (or to stop) somewhere' and *siū* means 'an abode,' and both words express the idea of the sun, the moon, and the five planets in their revolution residing in turn in the divisions of the sphere indicated as the 28 abodes. This meaning is very similar to that of the Hindu *nakṣatras* ('stars' or 'asterisms') and the Arabian *manāzil al-kamar* ('lunar mansions'). There is, according to Knobel's calculation, a concordance of the determinants of the *siūs*, the *nakṣatras*, and the *manāzils* in fifteen divisions, of the *siūs* and the *nakṣatras* in four divisions, of the *siūs* and the *manāzils* in five divisions, and of the *nakṣatras* and the *manāzils* in four divisions. This remarkable resemblance attracted the attention of many Western scholars and seemed to them a sufficient reason for presuming that all three systems sprang from a single source. The conclusions arrived at are different. Some hold that the system originated in India and the Chinese borrowed it from there; others are of opinion that the Chinese borrowed from the Arabs; another opinion is that the Babylonians were the originators; while still others say that the origin is to be found in Central Asia or some part of Persia. Unfortunately none of these conclusions is supported by satisfactory evidence.

But there are differences as well as resemblances between these three systems, and the Chinese division has its own peculiarity. The Chinese divisions are very unequal in the angular intervals and therefore cannot present the daily stations of the moon, as the Hindu divisions do. They are measured on the equator rather than on the ecliptic. According to G. Schlegel,² there is no connexion at all between the Chinese asterisms and the lunar zodiac. Some of the names of the 28 *siūs* were known to the Chinese as early as the time of the emperor Yaou (2356 B.C.), while the earliest Babylonian record concerning the lunar mansions and the earliest Hindu record of the *nakṣatras* named after the Vedic deities are much later than that.³

The *nakṣatras*, in their recent forms at least, are apparently assimilated to the Chinese *siūs*, and the whole system of junction stars is undoubtedly an imitation of them.⁴

J. B. Biot and his son were the first to demonstrate the identity of the Chinese *siūs* and the 28 lunar mansions of the Hindus and Arabs. They concluded that this arrangement of celestial divisions was invented by the Chinese and borrowed from them by the Hindus and Arabs for purely astrological purposes.

'To this day,' says J. J. M. de Groot, 'no considerations of importance have cancelled these views [of Biot], and though they have been rigorously combated by Weber, Max Müller, and other authorities of renown, yet it seems that most investigations of oriental astronomy silently subscribe to them.'⁵

¹ *Journ. of the British Astronomical Association*, xix. 337-345.

² *Uranographie chinoise*, The Hague, 1875.

³ *Observatory*, xxxii. [1909] 187.

⁴ According to Agnes M. Clerke's art. 'Zodiac' in *EB11*, the *siūs* were of Chinese invention and the *manāzils* were of Indian derivation. The *nakṣatras* in their recent organization were, as far as possible, assimilated to the Chinese *siūs*. 'The whole system of junction stars,' she says, 'was doubtless an imitation of the *siūs*; the choice of them by the Hindu astronomers of the 6th century A.D. was plainly instigated by a consideration of the Chinese, compiled with a widely different intent.'

⁵ *The Religious System of China*, Leyden, 1892-1910, bk. I. vol. iii. p. 974, footnote.

2. The twelve *kungs*.—Besides the division of the lunar cycle into 28 unequal mansions, the Chinese, in common with the Hindus and Western nations, divide the zodiac into twelve equal parts as follows:

(1) Ta Liang, Aries-Taurus; (2) Hsi Chen, Taurus-Gemini; (3) Tsun Hseo, Gemini-Cancer; (4) Tsun Go, Cancer-Leo; (5) Tsun Vi, Leo-Virgo; (6) Hseo Sing, Virgo-Libra; (7) Ta Ho, Libra-Scorpio; (8) Ssi Mu, Scorpio-Sagittarius; (9) Sing Ki, Sagittarius-Capricorn; (10) Huan Hio, Capricorn-Aquarius; (11) Tsu Tsu, Aquarius-Pisces; (12) Hiang Lo, Pisces-Aries.

These names are found in Chinese books written several centuries B.C.—e.g., *Tso Tsuan*, *Erh Ya*, etc. The Hindu zodiac signs, which are probably of Greek origin, entered China at a much later date.

3. The four quarters and the five *kungs*.—The Chinese divide the heavens into four quarters. The eastern quarter is called Tsang Lung ('the Blue Dragon') and is associated for astrological purposes with the season of spring, the planet Jupiter, the element wood, the colour blue, the taste sour, and the virtue of benevolence. The southern quarter is called Chü Niaoou ('the Red Bird') and is associated with the season of summer, the planet Mars, the element fire, the colour red, the taste bitter, and the virtue of propriety. The western quarter is called Pe Hwu ('the White Tiger') and is associated with the season of autumn, the planet Venus, the element metal, the colour white, the taste hot, and the virtue of righteousness. The northern quarter is called Hsian Wu ('the Black Warrior,' or 'the Black Tortoise,' as it has also been interpreted) and is associated with the season of winter, the planet Mercury, the element water, the colour black, the taste salt, and the virtue of wisdom.

In Ssu Ma Chien's *Ssü Ki* the stars are divided into five *kungs*, or palaces—middle palace, eastern palace, southern palace, western palace, and northern palace. The middle palace consists of the northern circumpolar stars, and the other four are like the four quarters stated above. This system of division is followed by Pan Ku in his *History of the Later Han Dynasty*.

4. The three *yuans* and the two *kuans*.—The three *yuans* (palaces or stellar spaces) are (1) Tsu Vi Yuan (the Middle Palace), consisting of the northern circumpolar stars, (2) Tai Vi Yuan (the Upper Palace), consisting of stars in Leo, Virgo, Corvus, etc., and (3) Tien Su Yuan (the Lower Palace), bounded by two chains comprising Hercules, the upper part of Ophiuchus, etc.

The two *kuans*, or kinds of officers, are (1) *tsung kuan*, the internal officers, consisting of groups of stars inside the equator, and (2) *wusi kuan*, the external officers, consisting of groups of stars outside the equator.

This system of the division of the heavens is peculiarly Chinese and is very ancient. In the *Tien Wun*, consisting of eight chapters, written by Wu Hian, an astronomer of the Yin (or Shang) dynasty (1766-1122 B.C.), the astronomer assigned to the Middle Palace four seats or officers, consisting of eight stars, to the Upper Palace one seat, consisting of one star, to the Lower Palace four seats, consisting of eight stars, to the internal officers five seats, consisting of 24 stars, and to the external officers nineteen seats, consisting of 93 stars. In the *Tien Wen Sing Chan*, written by Kan Te, an astronomer of the state of Tsi, and the *Tien Wen*, written by Hsi Hsen, an astronomer of the state of Wui (both astronomers lived about the 4th cent. B.C.), the method of division is identical with that of Wu Hian, but the numbers of officers and stars are greatly increased. Adding these estimates together, we get 283 officers, consisting of 1464 stars.

5. The three *yuans* and the 28 *siūs*.—There is a

popular book consisting of 31 songs by Tan Yuan Tsu of the Sui dynasty (589-617), called *Pu Tuen Ko*. It divides the stars into three *yuans* and 28 *siüs*. There are in all 193 *kuans*, or officers, consisting of 1457 stars. The stars which have been named by the Chinese are not many more than this, except in the book of Chang Heng, which gave 320 *kuans*, consisting of 2500 stars, and, besides these, 11,520 stars. This system of division is followed by Ma Twan Lin and others.

IV. *THE RELIGIOUS ASPECTS*.—1. Animistic view.—The animistic view which the Chinese took of many things in nature is seen in their attitude to the sun, moon, and stars. Many of them regard the heavenly bodies not as merely inanimate bodies, but as dwelling-places of spiritual beings or as spiritual beings themselves; e.g., there is, it is said, a cock in the sun and a hare in the moon, the palace of angels; the hare is said to be sitting under a tree pounding medicine in a mortar. Those spiritual beings have superhuman powers, though the supreme power is not attributed to any of them, but to *Tien*, *Shang-ti*, or God alone. Hence the movements and appearances of the heavenly bodies are not regarded as mechanical, lifeless, or inevitable, for within or behind them there is a will which causes them. This will may be the will of the heavenly bodies, of the spiritual beings who dwell in them, or of God, the Supreme Ruler.

2. Comparison of the heavens with the earth.—In the heavens there are the sun and the moon; correspondingly on the earth there are the *yang* and the *yin*, the two contrary conceptions applied to phenomena mental and moral as well as physical. *Yang* is the male principle, associated with heat, day, etc., and *yin* is the female principle, associated with cold, night, etc. Hence the sun is called 'the great *yang*,' and the moon 'the great *yin*.' It is also said that the sun is 'the crystallization of the *yang*' and the moon 'the crystallization of the *yin*.' The five planets are said to correspond to the five elements of the earth, and therefore Mars is called 'the planet of fire,' Mercury 'the planet of water,' Venus 'the planet of metal,' Jupiter 'the planet of wood,' and Saturn 'the planet of earth.' Similarly, the different stars and constellations are believed to correspond to the various portions of the surface of the earth. In the chapter called *Tien Kwan* ('The Heavenly Officers') in Ssü Ma Chien's *Ssü-Ki*, in which all the beliefs mentioned above may be found, we read: 'The twenty-eight *siü* or constellations correspond to the twelve *chou*s, or provinces. . . . The source of this (saying or belief) is of remote antiquity indeed.'

It is a popular saying in China that 'the stars of the heavens above and the configurations of the earth beneath correspond with each other.' A great number of stars—e.g., the twenty stars constituting the two chains of the Tien Ssu Yuan, or the Lower Palace—are believed to correspond to certain countries in China and are given the names of those countries.

In some of the ancient books the heavens are said to be spherical and the earth square, the heavens dynamic and the earth static. There are also ancient stories or mythologies which represent the heavens as having a hollow place in the north-west round which all the stars revolve, and the earth as having a hollow place in the south-east towards which all the waters run.

3. Comparison of the heavenly bodies with men.—Heaven, earth, and men are believed to be the three great powers or geni in the universe. The heavenly bodies are regarded not merely as separate individuals, but as having a society like that of men. As the Chinese state was an empire,

so the heavenly society was believed to be an empire. This can be observed in the names of the stars. The coining of significant poetical or mythological names for the heavenly bodies was probably to render easier the task of discriminating and remembering them. Many stories grew round those names, which are regarded by some as fables and by others as true. According to the names of the stars in the Tai Vi Yuan, the Upper Palace, the northern polar star (Polaris) is where the emperor is. The reason is quite plain, as Confucius said: 'He who exercises government by means of his virtue is like the northern polar star, which keeps its place, and all the other stars turn towards it.'¹ The Great Bear, or the Spoon, as it is called in China, is said to be the imperial chariot, and its motion round the northern polar star is said to be the emperor viewing his empire in all directions. Names of some of the other stars are: the Empress's Palace, Crown Prince, Prince, Princess, Guards, Civil and Military Officers, Law-Court, Prison, Armoury, Storehouse, Kitchen, Bed, Canopy, etc.

4. Relation between the heavenly and the earthly empires.—These two empires are not separated from one another without inter-communication. *Tien*, or *Shang-ti*, the Supreme Ruler, governs both, but the heavenly one more directly. The ruler of the earthly empire used to be called Tien-tsu, 'the son of Tien (or God).' Enthronement used to be regarded as the appointment of God, the rewarder of the good and the punisher of the bad. Therefore, when the Son of Heaven was good and his empire well governed, auspicious phenomena used to appear from God in the heavens, and, when he was bad and his empire in disorder, threats used to appear. There are many heavenly phenomena which are regarded as God's threats—notably eclipses. The *Canon of Odes* refers to an eclipse of the sun of the date 29th Aug. 775 B.C., which was carefully verified by John Chalmers.

'The sun was eclipsed—
A thing of very evil omen,
First the moon looked small,
And then the sun looked small,
Henceforth the people
Will be pitiable indeed.
The sun and moon presage evil
By not keeping to their proper paths;
All through the kingdom there is no [good] government.
Because good men are not employed.
For the moon to be eclipsed
Is a small matter,
But now the sun is eclipsed,
How dreadful is that!'

In the Confucian classic called *Tsun Tsiu* ('Springs and Autumns') the eclipse of the sun which took place on 20th April 610 B.C. is recorded. The writer says:

'On the occasion of an eclipse of the sun, the Son of Heaven should not have his table spread so lavishly as usual, and should have drums beaten at the altar to the spirits of the land, while the feudal princes should present offerings of silk to the spirits of the land and have drums beaten at their courts, thus manifesting their own service of the spirits and so teaching the people to serve their rulers, according to the respective rights of each, as was customary in ancient days.'

The word 'eclipse' used here is the same as the word 'eat.' The eclipse of the sun or the moon is described, in some of the Chinese stories, as the sun or moon being eaten by a certain animal, and the beating of drums is said to frighten the animal away.

The sun in the heavens is also said to correspond to the ruler on the earth; e.g., when the people wished the death of Kie, the tyrant (reigned 1818-1753 B.C.), they said: 'O sun, why exiprest thou not? Let us die together with thee.' Therefore the eclipse of the sun is generally regarded as a threat from God to the emperor. There are

¹ *Analeets*, bk. ii. ch. 1.

numerous examples, and the edict of the emperor Ming Ti (A.D. 227-239) after the eclipse of the sun in 233 is most illuminating:

'We have heard,' says the emperor, 'that if a sovereign is remiss in government, God terrifies him by calamities and portents. These are divine reprimands sent to recall him to a sense of duty. Thus, eclipses of the sun and moon are manifest warnings that the rod of empire is not wielded aright. Ever since We ascended the throne, Our inability to continue the glorious traditions of Our departed ancestors and carry on the great work of civilization has now culminated in a warning message from on high. It therefore behoves Us to issue commands for personal reformation, in order to avert impending calamity. The relationship, however, between God and man is that of father and son; and a Father, about to chastise his son, would not be deterred were the latter to present him with a dish of meat. We do not therefore consider it a part of Our duty to act in accordance with certain memorials advising that the Grand Astrologer be instructed to offer up sacrifices on this occasion. Do ye governors of districts, and other high officers of State, seek rather to rectify your own hearts; and if anyone can devise means to make up for Our shortcomings, let him submit his proposals to the throne.'¹

Comets, even more than eclipses, are regarded as God's threats. When the comets appeared in 524 B.C., travelling eastward towards the Milky Way, an officer said: 'This is a broom to sweep away the old, and give us new. God often makes us such signs. The feudal princes will suffer from calamities by fire.'² The stars or the spiritual beings who dwell in them sometimes descend from the heavens, either by themselves or by the will of God, are born on earth, and go back to their positions in heaven after their earthly life.

In *The Annals of the Bamboo Books* there are the following legends:

'He's mother (the mother of Hwang Ti, 2963 B.C.) was called Tu Paon. She witnessed a great flash of lightning, which surrounded the star Chu (or Dubhe) of the Great Bear with a brightness that lighted all the country about her, and thereupon became pregnant.'

'His mother was called Niu Tsie. She witnessed a star like a rainbow come floating down the stream to the islet of Hwa. Thereafter she dreamed and received it, and was moved in her mind, and bore *Shaon-Haon* [the emperor Che, 2597 B.C.]'

'His mother was called Niu Chu. She witnessed the *Yaou Kwang* star (or Bemuash) go through the moon like a rainbow, when it moved herself in the palace of Yio-Fang, after which she brought forth *Tsun Hu* [the emperor, 2513 B.C.]'

'His mother was called *Sis-Ki*. She saw a falling star which went through the constellation Maou, and in her dream her thoughts were moved till she became pregnant, after which she swallowed a spirit's pearl, . . . and gave birth to Yu (king 2205 B.C.) in Shih Nic.'

There are 28 heroes in Chinese history who were believed to be the 28 *sius*, or constellations, descended. A great man on earth may become after death a spiritual being in heaven and dwell in one of the stars. Some stars are named after historical heroes. There are a great many stories, love stories, and mythologies based upon beliefs of this kind.

5. **Sacrifices.**—We read in the 22nd book called *Ki Tung* ('The Foundation of Sacrifices') of the *Li Ki* ('The Book of Rites'), a collection of treatises on the rules of propriety or ceremonial usages, one of the five Confucian books or canons:

'Of all the methods for the good ordering of men, there is none more urgent than the use of ceremonies. Ceremonies are of five kinds, and there is none of them more important than sacrifices.'³

Among various sacrifices there are sacrifices to the sun, moon, and stars. We do not know when these rites began, but they have been performed under each dynasty from the 23rd cent. B.C. down to the time of the present Republic of China. In the 20th book of *Li Ki*, called *Ki Fu* ('The Laws of Sacrifices'), it is said:

'With a blazing pile of wood on the Grand altar they [the Emperors, from Emperor Shun 2255 B.C. to King Wu 1122 B.C.] sacrificed to Heaven; 4 by burying (the victim) in the Grand

mount, they sacrificed to the Earth. (In both cases) they used a red victim.'

By burying a sheep and a pig at the (altar of) Great brightness, they sacrificed to the seasons. (With similar victims they sacrificed to (the spirits of) cold and heat, at the pit and the altar, using prayers of deprecation and petition; to the sun, at the (altar called the) royal palace; to the moon, at the (pit called the) light of night; to the stars at the honoured place of gloom; to (the spirits of) flood and drought at the honoured altar of rain; to (the spirits of) the four quarters at the place of the four pits and altars; mountains, forests, streams, valleys, hills, and mounds, which are able to produce clouds, and occasion winds and rain, were all regarded as (dominated by) spirits.'²

In the 21st book of *Li Ki*, called *Ki I* ('The Meaning of Sacrifices'), it says:

'The sacrifice in the suburb of the capital was the great expression of gratitude to Heaven, and it was specially addressed to the sun, with which the moon was associated. The sovereigns of Hsia [dynasty, 2205-1766 B.C.] presented it in the dark. Under the Yin dynasty [1766-1122 B.C.] they did so at noon. Under the Kau [dynasty, 1122-255 B.C.] they sacrificed all the day, especially at daybreak, and towards evening.

They sacrificed to the sun on the altar, and to the moon in the hollow;—to mark the distinction between (the) gloom (of the one) and (the) brightness (of the other), and to show the difference between the high and the low. They sacrificed to the sun in the east, and to the moon in the west;—to mark the distinction between (the) forthcoming (of the former) and (the) withdrawing (of the latter), and to show the correctness of their (relative) position. The sun comes forth from the east, and the moon appears in the west; the darkness and the light are now long, now short; when the one ends, the other begins, in regular succession;—thus producing the harmony of all under the sky.'³

These are the sacrifices at the equinoxes; that to the sun at the vernal equinox in the eastern suburb, and that to the moon at the autumnal equinox in the western suburb. These had been performed under each dynasty, and can also be found in *Ta Tsing Tung Li* ('The Ritual of the Manchu Dynasty'). The former is called *Chow Zi*, 'The Morning Sun,' and the latter *Si Yüe*, 'The Evening Moon.'

In the dynasty of Chin (255-206 B.C.) they sacrificed to what they called the eight gods, *i.e.* the god of the heavens, the god of the earth, the god of war, the god of the *yin*, the god of the *yang*, the god of the sun, the god of the moon, and the god of the four seasons. In *Han Shu* ('the Book [or History] of the early Han Dynasty') [206 B.C.-A.D. 25] it is said: 'There were such eight gods in the ancient times, but their origin is unknown.'

In the dynasties after the China dynasty different temples were built for their sacrifices. Even at the present day temples connected with the sun, moon, and stars can be found in different places. In Peking there is the world-famous Tien Tan ('Temple of Heaven'), and in it there are altars of the sun, of the moon, of the 28 constellations, and of some other stars and groups of stars. In the Manchu dynasty (1644-1911) sacrifices were offered in the Temple of Heaven once every spring and once every autumn. Even since the establishment of the Republic of China (1911), a grand sacrifice was offered in the Temple of Heaven by Yuan Shi Kai, the first Chinese President.

The 15th of the eighth lunar month is a Chinese holiday called *Tsung Tsiu Tse* ('the mid-autumn holiday'). The moon is said to be always at its fullest and brightest on this evening if it is visible, whereas this need not be so on the same date of other lunar months. A family festival used to be, and in some places still is, held in Chinese houses on that evening. The offerings to the moon consist chiefly of fruits, and the ceremony is similar to that of Chinese ancestor-worship. On this holiday schools, shops, etc., are closed, and farmers cease work for a few days. Relatives and friends exchange presents, chiefly

1 Red was the special colour of victims under the Chow dynasty.

⁴ On the blazing pile were placed the victim and pieces of jade; in the square mound were buried the victim and pieces of silk.

eatables, and invite each other to dinner on one or more of the days following the mid-autumn holiday.

With regard to the sacrifices to the stars we read in *Urh Ya*, an ancient dictionary, one of the Thirteen Confucian Classics: 'The sacrifice to the stars is called Pu.' Even in our day tablets of stars can be found in public temples and private houses in different provinces.

6. Significance or purpose of sacrifices.—The significance of these sacrifices is not merely religious, nor is their religious significance always the most prominent. Sometimes these rites were used for political purposes by the rulers. This is the case not only in ancient times; there was a time in our present century when *Shinkio Riyo Mondai* ('The Problem of the Utilization of Religions') was of great interest to statesmen and politicians in Japan, and the political significance of the sacrifices at the Temple of Heaven performed by Yuan Shi Kai was sufficiently obvious. When the sacrifices are performed by the people, their purpose is sometimes social as well as religious. In any case the idea of keeping up the custom seems to play a great part. Western scholars are apt to take these sacrifices purely as the expression of religious faith and devotion. The following passages in *Lt K'i* may show that they are not always so.

As sacrifices are the most important of ceremonies or rites, let us first indicate the purposes for which they are offered.

'The rites to be observed by all under heaven were intended to promote the return (of the mind) to the beginning (= Creator of all); to promote (the honouring of) spiritual Beings; to promote the harmonious use (of all resources and appliances) of government; to promote righteousness; and to promote humility. They promote the return to the beginning, securing the due consideration of their originator. They promote (the honouring) of spiritual Beings, securing the giving honour to superiors. They promote the (proper) use of all resources, thereby establishing the regulations (for the well-being of) the people. They promote righteousness, and thus there are no oppositions and conflictings between high and low. They promote humility, in order to prevent occasions of strife. Let these five things be united through the rites for the regulation of all under heaven, and though there may be some extravagant and perverse who are not kept in order, they will be few.'¹

There are two other passages, one of which indicates the objects to whom sacrifices should be offered and the other the purposes of the sacrifices.

'According to the institutes of the sage kings about sacrifices, sacrifice should be offered to him who had given (good) laws to the people; to him who had laboured to the death in the discharge of his duties; to him who had strengthened the state by his laborious toil; to him who had boldly and successfully met great calamities; and to him who had warded off great evils.'²

'Sacrifices were for the purposes of prayer, or of thanksgiving, or of deprecation.'³

The sun, moon, and stars fall under none of the above five classes except that in later dynasties some stars were sacrificed to for the power of warding off evils. With regard to the three purposes that of thanksgiving seems to be the sole motive for which the Chinese sacrificed to the sun, moon, and stars.

The Chinese were grateful to the sun, moon, and stars, and expressed their gratitude by means of sacrifices, because, says a passage: 'As to the sun and moon, the stars and constellations, the people look up to them.'⁴ The phrase 'look up to' (*jan yang*) in this case has an ethical meaning, as when we speak of looking up to a great man with a view to modelling our behaviour on his. The Chinese believed that they could adjust their conduct by observing the appearances and movements of the heavenly bodies, which were regarded as God's revelation.

¹ *Lt K'i*, xxi. i. 20 (*SBE* xxviii. 219 f.).

² *Ib.* xx. 9 (*SBE* xxviii. 207 f.).

³ *Lt K'i*, ix. iii. 23, in *Sacred Books of China*, pt. iii. (*SBE* xvii. [1885] 448).

⁴ *Lt K'i*, xx. 9 (*SBE* xxviii. 209).

There seem to be other reasons why the Chinese should be grateful to the sun, moon, and stars—especially to the sun for its great and various benefits—but the fact is that they attribute these benefits to *Tien*, God, rather than to the heavenly bodies themselves. Indeed their sacrifices to these bodies are sometimes an indirect way of expressing their gratitude to God.

7. Sun-worship, moon-worship, and star-worship.—Is there, or has there been, sun-worship, moon-worship or star-worship in China? The answer to this question depends upon what we mean by the term 'worship.' If by worship we mean the 'adoration, sacrifice, praise, prayer, thanksgiving, or other devotional acts performed in honour of the Supreme Being or God,'¹ it is certain that there is no such worship in China, and perhaps also that such worship has never existed there. None of the heavenly bodies is conceived by the Chinese as the Supreme Being. The Supreme Being is, for them, *Tien*, God, and God only. Nor can we find such worship in China if we take the term 'worship' to mean (1) the 'prostration which arises in presence of a superior being on whom we are absolutely dependent and whom we fear or reverence,' or (2) 'the feeling and act of worship' which 'involves primarily submission and fealty,' and 'is the attitude of the weak to the strong on whom they are absolutely dependent.'² The Chinese do not regard themselves as absolutely dependent on any of the heavenly bodies or on the spirits dwelling in them, but they regard the heavenly bodies or their indwelling spirits as dependent on *Tien*, 'God,' as they themselves are. It is true that they believe these heavenly bodies to possess powers which do not belong to men, but they also believe that men have powers which these bodies do not possess. What is more, some of them believe that certain men have the power of subjugating the spirits of the heavenly bodies, as magicians have the power of controlling spirits.

There are certain passages which have been regarded as evidence of sun-worship in China. In the 9th book of *Lt K'i*, called *Kiao Teh Seng* ('The Single Victim at the Border Sacrifices'), a passage says:

'At the (Great) border sacrifice he [the Son of Heaven] welcomed the arrival of the longest day. It was a great act of thanksgiving to Heaven, and the sun was the chief object considered in it.'

Legge, commenting on this, says:

'The sun became for the time the "spirit-tablet" of Heaven. Fang K'ueh says: "(The Son of Heaven) was welcoming the arrival of the longest day, and therefore he regarded the sun as the residence (for the time) of the spirit of Heaven. That spirit could not be seen; what could be looked up to and beheld were only the sun, moon, and stars."³

The present writer need not give his own translation here, but he must point out that the idea that the sun was regarded as the residence of the spirit of Heaven is not implied either in Fang K'ueh's commentary or in the text.

With reference to the passage in the book⁴ on the meaning of sacrifices, namely:

'The sacrifice in the suburb of the capital was the great expression of the gratitude to Heaven, and it was specially addressed to the sun, with which the moon was associated,'

Khân Hào, a Chinese commentator, says, according to Legge:

'Heaven is the great source of *táo* (the course of nature and duty), and of all the visible bodies which it hangs out, there are none greater than the sun and moon. Therefore, while the object of the suburban sacrifice was a grateful acknowledgment of Heaven, the sun was chosen as the resting-place for its spirit (or spirits). The idea in the institution of the rite was deep and far-reaching.'⁵

¹ *The Century Dictionary of the English Language*, London, 1889, s.v. 'Worship.'

² *DPhP* ii. 822.

³ *Lt K'i*, xxi. i. 18.

⁴ *SBE* xxvii. 427, n. 1.

⁵ *SBE* xxviii. 218, n. 2.

The same remark may be made on the translation of this passage, viz. that there is neither in the text nor in the commentary the idea that the sun was chosen as the resting-place of the spirit (or spirits). The ultimate purpose in both these cases was to express gratitude by means of sacrifices to Heaven, but not to the sun or the spirit of the sun. Heaven is invisible, and they thought that for the object of sacrifice something visible was required. Therefore the sun was chosen as a symbol. Neither of these two cases therefore can be regarded as an example of sun-worship. There does not seem to be any other case. Legge says concerning the last example:

'It must be borne in mind that the rites described in the text are those of former dynasties, especially of that of K'au. I cannot bring to mind any passages in which there is mention made of any sacrifice to the sun or sun-spirit in connexion with the great sacrifice to Heaven, or Shang Ti, at the service on the day of the winter solstice in the southern suburb.'¹

Hence it is only by taking the term 'worship' in a very comprehensive sense, and by ignoring the purpose of the sacrifices, that we may say that the fact that the Chinese sacrificed to the sun implies that they worshipped it. It is the same with regard to their worship of the moon and the stars. In whatever sense we may be justified in saying that some of the Chinese worshipped the sun, moon, and stars, such worship occupies a very insignificant position in China compared with the worship of other natural phenomena or the spirits of them. If by sun-worshiper, moon-worshiper, etc., we mean one who regards the sun or the moon as the only or the supreme object of worship, we may say with conviction that the Chinese are not, as they have never been, sun-worshippers, moon-worshippers, or star-worshippers.

LITERATURE.—See the works quoted in the footnotes.

T. F. U.

SUN, MOON, AND STARS (Hebrew).—The Hebrew conception of the universe, as we find it in the OT, is not scientific in the modern sense of the term. The cosmology of the Hebrews (see art. COSMOLOGY [Hebrew]) is characterized by the simplicity and naïveté of primitive folk. The attitude of mind is one of awe and wonder, not of critical inquiry; and to pry closely into the secrets of the divine government is felt to indicate a want of reverence, and even to be dangerous. Moreover, it would be natural to a people which seems to have had an innate genius for religion to think, even after it had progressed beyond the stage of quite primitive ideas of the universe, that religion itself constituted the whole of true science or knowledge.² We need not expect, therefore, to find in the OT any inkling of the modern science of astronomy. The Hebrew shepherds without doubt, like the Phœnician mariners (cf. Pliny, *HN* vii. 57), closely observed the sky, and learned from the scrutiny many lessons of practical value for their every-day life. It is equally likely that at an early date the Hebrews were wont to worship the stars and planets. There are later traces of this worship in the OT (cf. 2 K 17¹⁶).³ And, besides

¹ *SBE* xxviii. 218, n. 2.

² On this point Laurie Magnus's '*Religio Laici*' *Judaica* (1907) will be found suggestive. It has been argued elsewhere (W. Jay Hudson, *Law of Psychic Phenomena* 10, 1907) that ignorance of, or indifference to, what we term science might co-exist with a perfect knowledge of the laws of the moral and spiritual life.

³ It is quite unnecessary to suppose that the idea of worshipping the stars and planets was borrowed, though, of course, the Hebrews came more and more into contact with people who were addicted to this worship. Whether and to what extent they came under direct Babylonian and Egyptian influence is a disputed matter (see K. Marti, *Religion of the OT*, p. 36 ff.). Cf. the proper names עֲבֵשֶׁן (Jg 13²⁴) and שָׁשֶׁן (Ezr 4⁸), derived from שָׁשֶׁן, 'sun'; the Palmyrene רִיחַ, and the Biblical רִיחַ, Jericho, derived from רִיחַ, 'moon.' Cf. also Beth-shemesh, a place sacred to the sun-god. Commentators have seen in Mal 3²⁰ (4²) the conception of a winged solar disk such

this, the figures suggested by various constellations no doubt gave rise to a number of curious fables and fancies. On the other hand, the OT, as we have it, a collection of much-edited writings, preserves few traces of the astronomical and astrological lore of the Hebrews themselves. Since in the course of their national development the study of the stars and planets became more and more associated with the idolatrous practices of surrounding nations, later editors would be anxious to avoid, or even to remove, references to astronomy and astrology (cf. Dt 18¹⁰). This would account for the fact that most of the references preserved in the OT are of a very general nature.

The chief planets are, of course, alluded to frequently. The sun (*shemesh*) is spoken of as ruling by day (Ps 136⁸), and is often referred to as coming forth (from one chamber) in the morning and going in (-to another chamber) in the evening. Its magnificence (Jg 5³¹) and its wonderful power for good (Dt 33¹⁴) or for evil (2 K 4¹⁸; cf. Ps 121⁶) impressed the Hebrews, as they have impressed all peoples. Jahweh Elohim Himself might be compared to a sun (Ps 84¹¹).¹ There are four words for 'moon' in the OT. *Yarēah* is used especially in poetry (Gn 37⁹, Jos 10¹² etc.). To this word is closely related one of the words for 'month,' *yērah*, a word which is common to all the Semitic languages, though not in frequent use in the OT. Another word, *lebhanāh*, which occurs only three times (Ca 6¹⁰, Is 24²³ 30²⁶), designates the moon as the 'white one' or the 'pale one.' Rarer still is a word *kese* (perhaps connected with the Assyr. *kuse'u*, 'headdress' or 'cap'), which denotes the full moon (perhaps the moon-god clothed in the splendour of his tiara).² The most common word is *hōdesh*, which means 'new moon,' and also 'month.' Thus the new moon was regarded as marking a new period or month, and the use of *yārahah*, *yerah*, and *hōdesh* for both moon and month shows that among the Hebrews the month and year were lunar. The moon rules the night (Ps 136⁹), and, like the sun, is a power for good (Dt 33¹⁴) or for evil (Ps 121⁶). Its pale brilliance made it the emblem of beauty (Ca 6¹⁰). In a few passages reference seems to be made to eclipses (Am 8⁹, Is 38⁸, Job 9⁷ etc.). And we are once told that 'the sun stood still, and the moon stayed, until the nation had avenged itself on its enemies'³ (Jos 10¹²). In late writings there are several allusions to the worship of the sun (Ezk 8¹⁶, Job 31²⁶; cf. 2 K 23⁵) and moon (Dt 4¹⁹).

Other planets are mentioned more incidentally. Thus, in all probability, Venus⁴ as the Morning Star is referred to in Is 14¹² under the name הֵלֶל, *hēlāl*, or הֵלֵל, *hēlāl* (lit. 'the glittering one'), though it should be mentioned that some expositors have seen in the term an Arabic name for the moon (هلال, *hīlāl*). W. Lotz (*PRE*³, s.v. 'Sterne') indeed argues that the Arabic word means 'new moon,' which would be unsuitable;

as we find among the ancient Egyptians, Babylonians, Assyrians, and Persians. But the present writer has pointed out (*Journal of the Manch. Egyptian and Oriental Society*, 1917, pp. 67-70) that the word usually translated 'wings' will bear another meaning. The meaning may be 'skirts' rather than 'wings,' and the figure that of the glorious robe that flows from the sun.

¹ In Jg 14¹⁸, Job 9⁷ the word translated 'sun' is not *shemesh*, but *heres* (cf. Is 19¹⁸, and the place-names in Jg 13⁵ 8¹³). It is probable that in Jg 14¹⁸ the text is corrupt.

² The name Sinai is probably derived from Sin, the name of the moon-god in Babylonian. In Ex 3¹ Sinai is described as 'the mountain of Elohim,' i.e. the sacred mountain. This suggests that it had long been sacred.

³ The writer clearly intends a miracle to be understood (so C. Steuernagel in Nowack's *Handkommentar*, 1899). Other expositors (e.g. W. H. Bennett in 'Joshua,' *SBOT*, 1899) regard the passage as poetic and figurative (cf. Jg 5²⁰).

⁴ Another designation of Venus is *meleket ha-shamayim* מְלִכַת הַשָּׁמַיִם, 'the queen of heaven,' mention being made of cakes which were baked for her (Jer 7¹⁸ 44¹⁷, 25).

but, according to Zimmern and Buhl's edition of Gesenius's *Lexicon* (*Handwörterbuch*¹⁴, 1905) it can denote the old moon as crescent.¹ Further, in Am 5²⁶ we probably have an allusion to Saturn (שַׁבְּתַי, *sikkuth* = שִׁבְתָּי, *sakkuth* = Assyr. *sakkut*; and קִיּוּן, *kiyyun* = קִיּוּן, *kēvān* = Assyr. *kavānu*).

The stars, again, are alluded to frequently in a general way; but there are a few references to particular stars or constellations, and these require special attention. The earliest of them is found in Am 5⁸. Since, however, the same terms occur, with others, in passages in the late book of Job which contain more precise references to astronomy, it is best to consider the Job passages first.

In Job 9⁹, in a description of God's almighty power as manifested in the marvels of the material world, Job is represented as pointing to God as one 'Who shaketh the earth out of her place, and the pillars thereof tremble.

Who commandeth the sun, and it riseth not; and sealeth up the stars.

Who alone spreadeth out the heavens, and treadeth upon the waves of the sea.

Who maketh 'ash, *kēsīl*, and *kīmāh* and the chambers of the south.'

The context indicates that the terms in the last two lines (שָׁחַ, 'ash; כְּסִיל, *kēsīl*; קִמָּה, *kīmāh*; and תְּרָי, *hadrē tēmān*) designate particular stars or constellations. We are helped, too, by the fact that three of them occur again (*kīmāh* in Am 5⁸, Job 38³¹; *kēsīl* in Am 5⁸, Is 13¹⁰, Job 38³¹; 'ayish' = 'ash in Job 38³²); but there is considerable uncertainty as to the correct interpretation of some at least of the terms.

1. שָׁחַ, 'ash, or better שָׁחַ, 'ayish, as in Job 38³², and better still שָׁחַ, 'ayush, as suggested by the Syriac (Pesh. שְׁמַח). In Job 9⁹ LXX has Ἑσπερος, Vulg. 'Hyades'; in Job 38³² LXX Ἑσπερος, Vulg. 'Vesper.' Modern expositors have found in the word either the Great Bear, the Pleiades, Hyades, or the Northern and Southern Crown. 'Ash in Job 9⁹ has to be taken in connexion with the other passage, 38³², in which, according to the Massoretic text, it is said: 'or dost thou guide 'ayish with her young?' (וְעֵינַי עַל-בְּנֵיהָ תִּהְיֶה).² It is noteworthy, too, that what in Arabic corresponds to the Great Bear is called *na'sh*, 'the bier,' and that the three tail stars of Ursa Major are called *banāt na'sh*, 'children of the bier' (i.e., in this case, 'mourners'). It is true that no philological connexion can be established between the two words, but the Arabic phrase 'children (or daughters) of the bier' is suggestive as regards 'ayish and her children. It might seem natural to expect to find a striking constellation like the Great Bear mentioned in Job 9, and it would be fitting that it should be assigned the first place, though it may be mentioned in passing that possibly the Hebrews thought of this constellation not as a Great Bear, but as a lioness with her young (cf. with Ewald, Arabic 'ayuth, and see A. Dillmann's Commentary). But there is some force in the argument that 'ayish can hardly be Ursa Major, because the constellations in Job 38³¹ are referred to on account of their meteorological importance. Some expositors, therefore (e.g., M. A. Stern, Nöldeke, Schrader), have thought that 'ayish represents the Pleiades. The great objection to this is that there is very good reason to think another Hebrew term (see below) designates that constellation. The 'children' of 'ayish would certainly suit the Pleiades, which are sometimes represented as a hen with its chickens. But, on the other hand, the

smaller stars surrounding or adjoining a star of the first magnitude might in several cases be described as its children. The Pleiades not being probable, some scholars agree with the Vulgate of Job 9⁹ in thinking that 'ayish represents the Hyades (so, e.g., Hoffmann, Schiaparelli); and this view has the support of the Syriac (Pesh. שְׁמַח).¹ Moreover, the constellation is suitable as being one of great meteorological importance. Elsewhere in Hebrew 'ash means 'moth.' Friedrich Delitzsch has suggested that it may have the same meaning here, since the name 'moth' (*sāsu*) seems to have been given to a star by the Assyro-Babylonians (see T. G. Pinches, in Hastings' *DB*, s.v. 'Astronomy'). Now, the Hyades, a great red star of the first magnitude (Aldebaran) and five stars of the fourth magnitude, resemble our letter V or the Greek Δ. And Schiaparelli points out (p. 58) that in the butterfly stage, when the moth is at rest, 'its wings are not held detached from the body, as happens with most other butterflies, but spread themselves over it in such a way as to form a cloak, more or less similar (according to the several species into which the animal can be divided) to an isosceles triangle.' The suggestion is that to the author of the passages in Job 'ash meant 'moth,' which was a name for the Hyades. In that case, assuming the identity of 'ash and 'ayish, the 'children' of 'ayish would be the minor Hyades which surround Aldebaran. Against this it might be urged that it is easier to explain 'ash as short for 'ayish than to account for 'ash as the original form, and that 'moth' does not seem a likely name for a constellation (especially the Hyades, apart from its form). The question of identification cannot be decided definitely. But, as the Pleiades has to be excluded (see below), there are reasons for thinking that either the Great Bear or the Hyades is intended. The Great Bear was no doubt as well known to the Hebrews as to other ancient peoples; but it would not be in the least surprising to find no mention of it in the OT, the references to astronomy being so few.

2. כְּסִיל, *kēsīl*, usually translated 'fool.' In Job 9⁹ LXX has Ἀρκτοῦρος, Vulg. 'Orion'; in 38³¹ LXX Ὠρίων, Vulg. 'Arcturus'; in Am 5⁸ LXX omits, Vulg. 'Orion'; in Is 13¹⁰ (כְּסִילֵיהֶם, their 'kēsīlīm') LXX Ὠρίων, Vulg. 'splendor earum.' Some of the Rabbis of the Middle Ages (Saadya, Abulwalid, and others) identified the word with the Arabic *Suhail* and interpreted it in its later sense, Canopus. The preponderating view of the versions is in favour of Orion, a constellation which was popularly thought of as a giant who was bound in chains to the sky. *Kēsīl* occurs elsewhere in Hebrew with the meaning 'duillard' or 'fool,' and modern expositors commonly think of the giant (Orion) as a fool in the sense of an impious person who had rebelled against God. But the Arabic equivalent of the root (كسلا, *kasala*) means 'to be thick, plump,' which suggests that *kēsīl* itself need not mean anything more than giant (the big, burly one); and, as Cheyne says (art. 'Orion' in *EBi*), *kēsīl* ought not to be confounded with *nābāl* ('fool' in the sense of impious person). In Job 38³¹ there seems to be a reference to some myth current among the Hebrews, the giant being spoken of as bound with cords; but what exactly the myth was is quite uncertain. In Am 5⁸ *kīmāh* (see below) and *kēsīl* are again mentioned together ('seek him that maketh *kīmāh* and *kēsīl*, and turneth black darkness into morning,' etc.) as well as in Job 38³¹ ('Dost thou bind the bands of *kīmāh*, or loose the cords of *kēsīl*?'). Further, in Is 13¹⁰ we find the curious expression 'their *kēsīlīm*' (often translated 'the stars of

¹ P. Jensen, however, thinks (*JE*, s.v. 'Astronomy') that there is little ground for supposing that any star or planet is referred to; the reference in Isaiah is too vague.

² For כְּסִיל, however, it is better to read כְּסִילֵיהֶם ('and dost thou console 'ayish for her children?'). See, further, below.

¹ It seems certain that the Syriac word does denote the Hyades or the chief star of the group (cf. Barhebraeus).

heaven and the Orions thereof').¹ This seems to indicate that primarily *kēsīlīm* was used to denote stars of the first magnitude, in distinction from lesser stars (*kōkābīm*). In any case it is pretty generally agreed that *kēsīl* represents Orion. It is one of the most brilliant constellations, and did not fail to arrest the attention of the ancients.

3. *kīmāh*, literally 'a group, cluster,' cognate with Arabic *kāma* (كأ), 'to heap up.' In Job 9⁹ LXX has *Πλειάδες*, Vulg. 'Arcturus,' Pesh. and Targ. *קִמָּה*; in 38³¹ the renderings of the Versions differ only to the extent that the Vulg. has 'Pleiades'; in Am 5⁸ LXX omits, Vulg. has 'Arcturus,' Pesh. and Targ. *קִמָּה*. Most of the ancient authorities, in fact, understand the Pleiades by *kīmāh*. Several modern expositors, however, prefer to think of Sirius (e.g., G. Hoffmann). But the word itself suggests that we are to look for a compact cluster of stars, and, of course, we must seek for one that early attracted attention. The Pleiades, as Schiaparelli says, is the best known of such clusters, 'and also the only one which has in consequence of its conspicuous light awakened universal attention at every time and among all peoples' (p. 62).² The expression 'the bands of *kīmāh*' in Job 38³² is no doubt to be understood metaphorically.³ The Arabic name for the Pleiades, *thwrayya*, also means 'cluster,' and Bar Ali mentions it as an explanation of *kīmāh*. The word *kīmāh* itself has also been connected with the Arab. *kūmat*^{un}, 'house,' and the Assyr. *kīmtu*, 'family.' In either case the name would suit the Pleiades.

It should be noted, further, that, according to some ideas found in the Talmud (*B'rakhōth*, 58b; *Rosh ha-shanah*, 11b), God brought the flood by causing *kīmāh* to set instead of rise in the morning, and by removing two stars from it. This is given as the explanation of Rabbi Joshua. According to R. Eliezer, the changes took place at a season when *kīmāh* is wont to set in the morning, and what God did was to make *kīmāh* rise in the morning on the day in question and lose two stars. This caused the flood. According to Stern, the dates mentioned suit exactly the morning rising and setting of the Pleiades, and seem to prove that in the time of Rabbi Joshua and Rabbi Eliezer (beginning of 2nd cent. A.D.) the Jews identified the Pleiades with *kīmāh*. It is further represented in the Talmud (*ib.*) that God afterwards set things right by taking away two stars from 'ayish to diminish its rain-producing force.'

4. *hadrē tēmān*, lit. 'chambers of the south.' The LXX renders *ραμεία Νόρου*, Vulg. 'interiora Austri.' We seem to require mention of another definite constellation. This has given

¹ Kittel would read *בְּקִיָּהֶם*, 'their stars.' But this is not necessary. Nor is it necessary to follow Cheyne in emending the whole of the beginning of the verse thus: *עֵשׂ בְּקִיָּהֶם וְקִיָּהֶם*, 'the Great Bear, the Pleiades (?), and Orion.'

² An old English name for them is 'the seven stars' (AV in Am 5⁸).

³ The Hebrew has *בְּקִיָּהֶם*, *ma'dannōth kīmāh*, which AV translates 'sweet influences,' some such idea being suggested by the root as found elsewhere. It is better, however, to follow many modern expositors, and regard *ma'dannōth* as equivalent to *ma'naddōth*, 'bands' or 'feters,' from 'ānad, 'to bind' (so Ewald, Dillmann, Duhm, and others). It we translate 'bands,' we may think of the Oriental poets' habit of comparing the Pleiades with an ornament (Ideler, *Sternnamen*, p. 147).

⁴ According to Stern, the Talmudists undoubtedly understood the Hyades by 'ayish. May there not be references to an earlier form of this kind of legend in Job 38^{31f.}? The passage might be translated thus (interchanging *תָּקַם* and *תָּרַח* in ver. 31):

Dost thou loosen the bands of the Pleiades (*kīmāh*)

or bind fast the cords of a giant (star, *kēsīl*)?

Dost thou lead forth the rainers (*mazzārōth*) in due season

and comfort the Hyades for its children?

The 'rainers' (from *רָר*, lit. 'to scatter') would be the stars taken from the Hyades, and are referred to in the next clause as 'its children.'

rise to the suggestion that the phrase designates the bright star Canopus or the constellation to which it belongs (so Stern). Other expositors regard the text as corrupt, and, emending *תָּרַח תָּקַם*, see in the first word some uncertain constellation, and in the second (*תָּקַם=תָּקַן*) Gemini, 'the Twins.' But we are not obliged to find in *hadrē tēmān* a special constellation. 'Chambers (or store-houses) of the South' might, as K. Budde says ('Hiob,' in W. Nowack's *Handkomm. zum AT*, 1896), denote a whole group of constellations in the southern sky. Dillmann (*loc. cit.*) thinks that the author of Job cannot have known anything of the stars of the southern hemisphere, but that it was known to him, as one who had travelled, that the farther one goes south the more stars and constellations become visible. To those who dwell in the north these were, so to say, enclosed in the inmost chambers of the vault of heaven, and were therefore invisible. This would explain the expression 'treasure-houses of the South' (cf. Pr 24⁴; Job 37⁹). The word *heder*, coming from a root meaning literally 'to conceal,' in the plural would bear the meaning 'penetralia.'¹ Schiaparelli gives reasons for thinking that the reference is to the imposing constellation found on the charts of to-day 'distributed between Argo, the Southern Cross, and the Centaur'; but whether this was visible to the author of Job depends upon the date of the book, which is uncertain.

In Job 38^{31f.} we find another difficult astronomical term. The passage is as follows:

'Dost thou bind the bands of *kīmāh*,
or loose the cords of *kēsīl*?

Dost thou bring out *mazzārōth* in his season,
or dost thou lead out 'ayish with her young?'

We have already dealt with three of the terms which occur here. We have now to consider—

5. *mazzārōth*. The Vulg. has 'Lucifer'; Targ. *שְׂפַר כּוּלַיָּה*. The word may come from *רָר*, *zārāh*, which means literally 'to scatter,' but can be applied to powder (Ex 32²⁰), hair (Ezk 5², Is 30²⁰), etc. *Mazzārōth* would then mean 'scatterers' or 'sprinklers,' the reference being to rain. On this supposition, Stern and Hoffmann understand the Hyades to be meant, since the heliacal rising of their chief star, Aldebaran, announces the season of rain.² Gesenius derived the word from *נָזַר*, *nāzar* (Arab. نذر), and explained it as 'astra præmonentia.' Another suggestion is that it is derived from *זָהַר*, *zāhar*, *mazzārōth* being for *mazhārōth*, and meaning the 'brilliant' stars which shine with a special lustre, the planets, either all of them or the brightest and most striking. But the word is more commonly regarded as identical with *mazzālōth* (מזלות) in 2 K 23⁵, the interchange of *l* and *r* presenting little difficulty. The LXX has *μαζουρόθ* in both cases. In 2 K *mazzālōth* has been supposed by some expositors to mean 'the signs of the zodiac,' being apparently a loan-word from Assyr. *manzaltu* or *mazaltu*, 'station, abode (of gods),' which, again, is from *nazāzu*, 'to stand.' But in the passage in question it would be more natural to find mention of the planets, and some expositors so interpret *mazzālōth* (in Rabbinic *mazzālōth* means 'planets' as well as 'signs of the zodiac'). *Mazzālōth* would be the stars and planets regarded as 'mansions' (Assyr.) of the great gods (see *EBI*, s.v. 'Mazzaloth').³

¹ Cf. A. B. Davidson, 'Job' in *Cambr. Bible*, 1893: 'probably the great spaces and deep recesses of the southern hemisphere of the heavens, with the constellations which they contain.'

² Stern identifies *mazzārōth* with *mazzālūth*, and would derive the latter from *הִזְזַל*, *hizzūl*, 'to cause to flow.' This, again, would give some meaning equivalent to 'rain-producers.'

³ P. Jensen (*JE*, s.v. 'Astronomy') says that *mazzālōth* may mean either 'planets,' 'signs of the zodiac,' or 'stations of the moon.'

It is not necessary, however, to regard *mazzārōth* and *mazzālōth* as identical. We have found reason to think that another word denotes the Hyades as a constellation. That does not prevent us from supposing that *mazzārōth* may be a further description of some of the stars in this group.¹ The word *mazzārōth* has also been identified with the Great Dog, whose chief star is Sirius. This, as the brightest of the fixed stars, and for meteorological reasons as well, everywhere attracted the notice of the ancients.

6. It should be noted further that in Job 37⁹ another word occurs (מְזָרִים, *mēzārīm*) which bears some resemblance to *mazzārōth*. The passage runs: 'Out of its chamber cometh the whirlwind, and cold out of *mēzārīm*.' This word might also come from *zārāh*, 'to scatter.' On that assumption, it has been supposed to mean 'scattering' or north winds. Another suggestion, however, is that it is a corruption of the Babylonian *mīšri*, 'the northern (star)' (so *EBi*, s.v. 'Mazzaroth'). A more recent conjecture is that of Schiaparelli (p. 69 ff.). He suggests that the correct punctuation of מִזְרִים is *mizrim* or *mizrayim*, i.e. the plural or dual of מִזְרָה, *mizreh*, which is referred to in Is 30²⁴ and Jer 15⁷ as an instrument for winnowing. Schiaparelli points out that the arrangement of the stars of the Great Bear is such that they might be thought to resemble a winnowing fan. To the ancient Chinese these stars actually suggested a ladle, which, with its cavity and handle, is very like a winnowing fan. The plural *mizrim* would indicate more than one instrument. Schiaparelli therefore thinks that the word might designate the Great Bear and the Lesser Bear; and in that case, of course, the dual *mizrayim* would be a still more suitable description. The fact that the Phoenicians used the Lesser Bear when at sea to find the direction of the north is noteworthy in this connexion. The suggestion is very ingenious. But unfortunately *mizreh* is not the term which denotes a winnowing instrument of the shape required. The word for that is *rahath* (the other term mentioned in Is 30²⁴). *Mizreh* is apparently the *midhrā* of modern Syria, a pitch-fork with six prongs, and the Great Bear can hardly be said to resemble that.

7. Some expositors have found yet another reference to astronomy in Job 26¹². Meaning literally 'the fleeing serpent,' the words have been supposed to refer to the Dragon between the Great and the Little Bear. There is nothing in the context, however, to indicate that the author had any star or constellation in mind.

The OT contains very few definite references to astrology, though the prohibition in Dt 18¹⁰ shows that it was practised. We can hardly say that there was no astrology amongst the ancient Hebrews, in spite of the fact that the present allusions are late and due to Assyro-Babylonian influence. In Is 47¹³ (post-Exilic) we read: 'Yea let them deliver thee, the dividers (?) of heaven (הַקְרֵי הַשָּׁמַיִם), the gazers on stars (הַחֹזֵים בְּמִנְכֻקֵּי), those who make known each new moon (מְבַרְרֵי הַלְּחָשִׁים), the things that are coming upon thee.' The word translated 'dividers' occurs here only, and LXX has for the whole phrase *οἱ ἀστρολόγοι τοῦ οὐρανοῦ*. It has been connected with an Arabic word 'to divide' (*habara*, lit. 'to cut into large pieces'), a meaning which suits very well, since the Babylonians divided the sky for astrological purpose into signs of the zodiac. 'Those who make known each new moon' (or the 'monthly prognosticators') would be persons, like the Assyrian and Babylonian astrologers, who noted lucky and unlucky days, preparing monthly

¹ See the conjecture made above on p. 82^a, note 4.

almanacs or calendars based on astrological calculations (see Cheyne, 'Isaiah,' *PB*, 1898). In Dn 5¹¹, according to AV, Daniel became chief of the 'astrologers' (ܐܫܘܪܘܢܝܢ) in Babylon; but the correct translation of the word is 'conjurers' or 'enchanters.'

SUN, MOON, AND STARS (Hindu).—I.

The sun.—Solar worship has been described as the real religion of India. Nor is it difficult to understand how in a land flooded with sunshine, where every phase and function of life is dependent upon the kindly warmth of the sun and his destructive energy and power are felt in the uttermost extremes of heat, it should have been man's primary business to win his favour and placate his wrath. In the ancient verse of the *Gāyatrī* every Hindu begins his day with prayer and ascription of praise to the sun, the giver of light, heat, and fertility. In his mid-day devotion also he remembers and renders homage to the same deity. It is apparently true that at no period in India was the worship of the sun to any great extent exclusive. There are no distinct sects at the present time who reverence the sun alone and bear his name. The essentials of his worship, however, are present everywhere and in all the sects, more or less avowedly, or in disguise, and combined with other cults; and his practical and decisive influence on daily life is universally recognized.

In the *Rigveda* Sūrya, or the sun, is worshipped under many names and forms. The three chief aspects under which he presents himself to his worshipper are the rising, culminating, and setting sun. These are not separated or distinguished as three deities, but are varying forms of one and the same god, in each of which he displays himself with different attributes and as exercising different powers. Especially is he revered as Savitr, the giver and sustainer of life, who each morning wakes the universe and men from sleep. One of his most ancient cults, perhaps the most ancient of all, is under the name Mitra, the Persian Mithras; whence some have conjectured that India derived her solar religion from the West. If borrowing took place on either side, it is probable that in those early days the indebtedness was Persian. As Mitra, the sun was associated as a member with an early triad, symbolized by the sacred syllable *Om*, Agni or fire, Vāyu the wind, and Mitra. This triune aspect also was manifested in the sun as the heavenly fire, and he bore corresponding epithets or titles, as *tripād*, 'three-footed,' *trivikrama*, 'three-stepping,' and others. The last name was appropriated more particularly to Viṣṇu, the sun as the all-pervader, who in three strides traverses the three worlds, earth, heaven, and hell. He is invoked also as Pūṣan, the guardian and preserver of the cattle, the companion of travellers, and guide of the soul on its perilous way to the lower world.

In the mythology Sūrya is the son of Dyaus, the wide-spreading sky, and is described as 'all-creating' and 'all-seeing.' In this aspect his most ancient and significant name is Prajāpati, the 'lord of creation.' He traverses the heavens in his golden car, drawn by seven steeds, of which Uṣas, or the Dawn, is the charioteer; and the Aśvins, twin gods of the morning, are his children. By his power he drives away the demons of sickness,

and expels diseases and all the subtle and dreaded influences of darkness. The beneficent offices of physician and healer of bodily ills, which later are ascribed to the Āsvins, are in the first instance those of Sūrya himself.

There seems no reason to reject or doubt the statement of Śaṅkara in the 10th cent. that in his time there existed distinct sects of sun-worshippers, Sauryas, of one at least of which the members were accustomed to carry branded on their forehead and breast the symbol of their deity. They have, however, all died out and been forgotten.¹

Not many temples dedicated to the worship of the sun have survived, nor is it probable that at any period in Indian history they existed in any considerable number. That at Konārak in Orissa is the best known, and architecturally of the most interest. It is, however, neglected and ruinous, and attracts no worshippers. There is another at Gayā, and a small but much-frequented shrine at Benares, where the fire-sacrifice is offered in honour of the sun.

Among the non-Aryan peoples of India and the sub-tribes, who may be described as on the borders of Hinduism, sun-worship is much more open and confessed. By the Dravidians and Kolarians the sun is widely invoked as Paramēśvar, the creator and preserver, and is worshipped with prayer and sacrifice. The most popular form of offering is a white cock, whose head is struck off at the village shrine. He is Sūrāj Nārāyan (Sūrya-Nārāyaṇa), and the traders in the bazaars draw images or symbols of the sun at the entrance to their booths for good luck.² Similar representations or figures may be often seen on pillars. The *nīm*-tree is especially sacred to the sun, and there exists a popular legend or story which records its association with his cult. By many the *Holi* festival in the south of India is believed to have been instituted originally in order to propitiate the sun-god. He is invoked also to avert or to heal disease, and on the occasion of an eclipse the tom-toms are beaten and other ceremonies observed to rescue the deity from the powers of evil. The same conception, that worship and sacrifice are efficacious to avert disaster from the object of worship, may perhaps be recognized in the especial frequency of sun-ritual and adoration in the winter season among some northern tribes, at a time when the divinity may be supposed to be weak. A sacred meal is partaken of in his honour, and this must be eaten without salt. A similar ritual is observed when the sun enters a new sign of the zodiac. There are races and peoples in India at the present time who believe themselves to be descended from the sun.

2. The moon.—From the earliest times in India it would appear that the moon has been a popular subject of traditional story and mythology, but, so far as is known, there never existed any formal moon-cult or sectarian worship. A late work of the 17th cent. mentions 'moon-worshippers' and 'star-worshippers.' It is improbable, however, that any special sect was in the writer's mind. Worship of the moon in one or other of her aspects, either alone or in conjunction with other rites, is common in India at the present day, and such worship has in all probability never been intermitted. There are, however, no exclusive votaries or sects who make the moon their chief deity. In this respect, therefore, the popular worship of India is in contrast with the established cults of ancient Babylonia and other countries.

In the *Rigveda* and the early literature Soma (*g.v.*) is identified with the moon, and in one passage at least the waning of the moon is caused by the gods drinking up the nectar (*amṛta*).³ The great deities Indra and Agni are identified with its phases,

representing the new and full moon respectively; so also Varuṇa and Mitra are deities of the waxing and waning moon.¹ As usual among primitive peoples, the moon is a male divinity. A title of Śiva is *chandra-śekhara*, 'he whose crest is the moon,' i.e. the moon-bearer, and in this sense he is contrasted with Viṣṇu, who represents the sun. The ancient lunar dynasty of India (*chandravāṃśa*), whose capital was at Hastināpura, or Delhi, about 50 miles north-east of the modern city, claimed descent from the moon.

The moon also (Soma) was one of the treasures recovered at the churning of the ocean, together with the *amṛta* (nectar). Elsewhere he is enumerated among the eight *lokapālas*, or guardians of the universe. He is lord of the planets and of plants, of offerings and of penances.² More often he is regarded as one of the nine planets and is associated with them in worship, but especially with the sun. The departed go to the moon, and there is the abode of the *pitṛs*, 'fathers,' whither they are borne on the smoke of the funeral pyre. A more popular title or a more popular ritual for him is as *Osadhpati*, or *Osadhīśa*, 'lord of plants.' Agriculture in general is under his protection and is subject to his influence.

The phases of the moon are often decisive for the work of the fields; and the economy of the household, with its various anniversaries and important events, is similarly determined by the moon's position and aspects. The title 'lord of plants' is probably derived from the practice, common also in other countries, of collecting medicinal herbs, etc., by the light of the moon. In this character he is a god of healing, and for certain diseases—e.g., leprosy—to gaze at the reflexion of the moon in *ghī* or oil is an important and efficacious remedy. The periods of new and full moon are especially dangerous owing to the increased activity of the spirits at these times. In some parts of the country the conch-shell is a symbol of the deity of the moon. Among some of the primitive Kolarian tribes, instead of being regarded as a male divinity, the moon is mythologically the wife of the sun, and the stars are their children.

3. The stars.—The principal stars and constellations are known to the Hindus by name, and are recognized as beneficent or the reverse, especially in their relation to family and individual happiness or misfortune.

Thus the Pole-star is *āhruva*, 'fixed' or 'stationary,' although the same title is given to some of the *nakṣatras* (see below). The seven stars of the Great Bear are seven *ṛṣis*, translated to the heavens. Canopus also is a *ṛṣi*, Agastya, the sage and reputed evangelist of S. India. The Pleiades are the six *kṛtīkās*, 'nymphs,' the nurses of Skanda, the god of war, who bore from them the title of Kṛtīkeya. Orion represents the head of Brahmā in the form of an antelope's or stag's head (*mṛgāśīras*), struck off by Śiva, etc. Great regard is paid especially to the planets and the constellations or groupings of stars known as *nakṣatras*; and the star, planet, or constellation under which a man is born gives infallible indication of his future lot. In parts of N. India the stars generally are the cattle that the moon tends in the character of shepherd.

The full number of the planets is nine, but sometimes only seven or five are enumerated. There is a temple at Benares dedicated to the nine planets, where flowers and other offerings are presented. The complete number includes the sun and moon, and the others in order are Mercury, Venus, Mars, Jupiter, Saturn, with Rāhu and Ketu. The two last represent the ascending and descending nodes of the moon's orbit.

Rāhu is the cause of eclipses, when he swallows the sun or moon, and this he is said to do in revenge for the loss of his head, which was cut off by Viṣṇu as a punishment for his having stolen and drunk part of the nectar churned from the ocean. By drinking the *amṛta* he became immortal, and his wrath is perpetually exhibited in the eclipses, when the village folk seek to propitiate him with various rites. Rāhu is therefore known as the bodiless, and there exists at Benares a shrine dedicated to him under this form. Ketu is the progenitor of the numerous tribe of meteors and comets. In the *Purāṇas* they are all described as deities, each with his own car, that of Mars being golden with eight red horses. The days of the week also are named from them.

Some of the planets are favourable and some malevolent; but all need to be propitiated and their favour if possible secured before a marriage or other important event in the household. The omission of the *śānti* or *śānti-karman*, the 'propitiation' ceremony, would most certainly result in harm and disaster.

¹ See art. SAURAPĀTAS, SAURAS, or SAURYAS.

² See art. SYMBOLISM (Hindu).

³ *Rigveda*, x. lxxxv. 5.

¹ *Satapatha Brāhmaṇa*, II. iv. 4. 17 f.

² *Viṣṇu Purāṇa*, i. 22.

Rāhu and Ketu, with Saturn, are deities of ill omen who presage sickness and all kinds of trouble, and to be born when one of these is in the ascendant is a grave misfortune. The remaining planets are propitious, especially Mercury, Venus, and Jupiter, in whose hands are the gifts of wisdom and all knowledge and skill.

In the *Rigveda* *nakṣatra* is the name for a constellation in general. Universally, however, in later times and technically the *nakṣatras* are the lunar mansions, or stations, through which the moon passes, as the sun through the twelve signs of the zodiac. Originally these seem to have been 27 in number, but in the later literature and in astrological calculations more usually 28. Mythologically they are the wives of the moon and daughters of Dakṣa, one of the Adityas. Like the planets, the *nakṣatras* are important and influential deities, whose countenance is sought before undertaking a journey or making arrangements for marriage or other domestic rites. Every Hindu boy's horoscope contains a reference to the *nakṣatra* under which he is born, and he bears a secret name other than that which is given him at the special name-giving ceremony (*nāmadheyā*), which is written in the horoscope and is stated to contain always one letter at least from the name of the *nakṣatra* through which the moon was passing at the hour of his birth.

Geden, *Studies in the Religions of the East*, do. 1913, pp. 212 ff., 221 ff.; S. Reinach, *Cults, Myths, and Religions*, tr. E. Frost, do. 1912; H. Whitehead, *The Village Gods of South India*, Oxford, 1916; W. J. Wilkins, *Modern Hinduism*, London, 1887, *Hindu Mythology, Vedic and Puranic*, Calcutta, 1882. A. S. GEDEN.

SUN, MOON, AND STARS (Iranian).—Astronomy received much attention in ancient Persia, as is obviously implied by the current tradition that the Magi, the sacerdotal class of the Medes and Persians, were highly skilled in divination, an art which depended largely upon a knowledge of the heavenly bodies, astrology and astronomy being sister sciences in antiquity. The part which the veneration of the sun, moon, and stars played in the national religion of early Iran is well known (see art. ZOROASTRIANISM), and some of the Greeks regarded Zoroaster as much in the light of a professed astrologer and star-worshipper as in that of a wise man and prophet (cf. Diogenes Laertius, *Proem.* i. 6, ἀστρολόγος; Scholiast on the Platonic *Alcibiades*, i. 122; *Clementine Homilies*, ix. 3-6, *Recognitiones*, iv. 27-29; Suidas, *Lexicon*, s.v. ἀστρονομία, Ζωροάστρου—all collected in Jackson, *Zoroaster, the Prophet of Ancient Iran*, New York, 1899, pp. 226-273). The Avesta and the Pahlavi books, especially the *Bundahišn* and *Dinā-i Mainōg-i Khrat*, contain frequent allusions of an astronomical nature; and Persian literature, after the Muhammadan conquest of Iran in the 7th cent., contains similar references. These three sets of sources furnish our chief supply of information, supplemented by comparisons drawn from Babylonia and Assyria, as well as by other material.

1. Conception of the universe.—The ancient Iranians naturally based their astronomical system upon a geocentric conception of the universe. It is probable that in the earliest times the shape of the earth was regarded as round and flat, although it is not altogether clear whether the Avestan word *skarəna*, 'round' (cognate with the Greek σφαίρα), signified merely circular, or whether it actually meant spherical (*Yast*, v. 38, x. 95, xvii. 19). It is almost certain, however, that in later times the globular form of the earth was recognized by the Persian astronomers, possibly influenced by

Ptolemy, who was a great authority among the Arab-Persian scientists. The spherical shape may be inferred from two Pahlavi passages which apparently contain the idea of the cosmic egg—a wide-spread notion in antiquity. The first of these passages occurs in the *Dinā-i Mainōg-i Khrat*, xliv. 1-11 (tr. West in *SBE* xxiv. 85): 'The sky is arranged above the earth, like an egg, by the handiwork of the creator Aūharmazd; and the semblance of the earth, in the midst of the sky, is just like as it were the yolk amid the egg.' The second Pahlavi passage is found in the *Dinkart*, ii. 74. 2 (ed. Peshotan Sanjana, Bombay, 1876, ii. 72): 'The world and the other creatures are placed together in the midst of the sky, like the bird in the midst of the egg; the sky surrounds all, as the egg does the bird' (tr. Casartelli, *Mazdayasnian Philosophy*, Bombay, 1889, p. 107). In the arrangement of the universe the earth was regarded as encompassed by the atmosphere (Av. *vayu*, Phl. *vāi*; or Av. *θwāsa*, Phl. *spīhr*), above which was the sky or firmament (Av. O.P. *asman*, Phl. *Asmān*, lit. 'stone'), beyond which again rose the empyrean realm (Av. *anayra raēcā*, lit. 'endless lights'), the abode of Ormazd and his angels. Through a misapprehension of the true facts, moreover, the sun and moon were located beyond the sphere of the stars (cf. Phl. *Artā-Virāf*, vii. 1-x. 13; *Bundahišn*, iv. 4; *Zāt-Sparam*, vi. 6; *Šāyast lā-Šāyast*, xii. 5; *Gr. Iran. Bund.*, tr. Darmesteter, *Le Zend-Avesta*, ii. 310; *Dātistān*, ii. 1, xxxiv. 2; Av. *Vendidād*, vii. 52; and consult Jackson, 'Die iranische Religion,' § 66, in Geiger and Kuhn, *Grundriss der iranischen Philologie*, ii. 671-672).

2. Sun and moon.—In the Zoroastrian ritual, as preserved in the Avesta, both the sun (*ivar*) and the moon (*māh*) receive high veneration individually, and each has a special hymn of praise devoted to its glorification (*Yast*, vi. and vii.); besides, minor litanies and prayers are consecrated to their particular service (*Sirōzah*, i. 11, ii. 11; *Yast*, vi. 1-7, vii. 1-7; *Nyāis*, i. 1-10, iii. 1-11). A similar degree of reverence was accorded them during Parthian and Sasanian times, as is shown by the Pahlavi texts themselves and by allusions in the Greek and Latin classics (e.g., Phl. *Šāyast lā-Šāyast*, vii. 1-3; *Dinkart*, i. 51. 6, the former translated by West in *SBE* v. 297-298, and the latter by Peshotan Sanjana, Bombay, 1875, i. 47, and tr. p. 48: cf. also such classical writers as Strabo, xv. 3. 13, p. 732; Ammianus Marcellinus, *Hist.* xxiii. 6, xvii. 5; Dio Chrysostomus, *Orat. Borythenitica*, xxxvi; and Nicolaus Damascenus, frag. 66, p. 401, ed. Müller). The supremacy of the sun among the heavenly bodies is naturally emphasized in the Avesta (e.g., *Yast*, vi.), and its various positions in the heavens are described in *Bundahišn*, v. 1-7, and *Šāyast lā-Šāyast*, xxi. 1-7. In the latter passage there are to be found special observations of the midday and afternoon shadows with respect to the sun's altitude in the various zodiacal constellations. Solar observations were important in determining the various times of day for performing the sacrifice.

The moon, like the sun, is invoked because of its beneficial influence (*Yast*, vii. 1-7), and there are several specific allusions to its periodic phases (e.g., *Yasna*, xliv. 3; *Yast*, vii. 2-4; *Fragment*, viii. 1; *Dātistān-i Dinik*, lxviii. 1-6, lxxi. 2, tr. West, *SBE* xviii. 210-211, 215). The connexion between the moon and the tides was fully recognized in Sasanian times, and a crude attempt was made to explain it (see *Bundahišn*, xiii. 13-14; *Zāt-Sparam*, vi. 14-17). Eclipses, both of the sun and of the moon, were regularly taken into account 'in the calculations of the astronomers,' at least under the Sasanians, as is shown by *Dātistān-i*

Dinik, lxix. 1-7, and the cause of these obscurations was thought to be the intervention of two bodies that revolve below the two greater lights (*Dāt*. lxix. 1-7; *Sikand Gūmānīg Vījār*, iv. 46, tr. West, *SBE* xviii. 212-213, xxiv. 132).

3. Stars.—There is an abundance of star-lore throughout the entire literature, and particular stars, or groups of stars, are alluded to as guarding the quarters of the heavens into which the Zoroastrians divided the firmament. The chief star in the Avesta, as elsewhere, is called Tishtrya (Av. *tīštrya*, Phl. *tīštr*), and it is usually identified with Sirius. Tishtrya is regent of the eastern division of the sky, an opponent of the meteors, and the bringer of rain by overcoming Apaosha, the demon of drought (*Yast*, viii. 1 ff.; *Bundahišn*, ii. 7, v. 1, vii. 1, ix. 2). The fixed star Satavaēsa (Av. *sata-vaēsa*, Phl. *sat-vēs*, 'having a hundred servitors'), which is possibly to be identified with Fomalhaut, is an ally of Tishtrya, and lord of the southern heavens (*Yast*, viii. 9, 32, 43, 44; *Bundahišn*, ii. 7, v. 1, xiii. 12; *Sāyast lā-Sāyast*, xiv. 5, vi. 16). The guardianship of the west is entrusted to Vanant (Av. *vanant*, Phl. *vanand*, 'victorious'; cf. *Yast*, xxi. 1, viii. 12, xii. 16; *Nyāis*, i. 8; *Bundahišn*, ii. 7, v. 1; *Mainōg-i Khrat*, xlix. 12; *Sikand Gūmānīg Vījār*, iv. 23-38), while the keeping of the north is consigned to the constellation of Ūrsa Major, called Haptō-iringa (Av. *haptō-iringa*, Phl. *haptō-iring*, 'with seven signs'; cf. *Yast*, viii. 12, xii. 28, xiii. 60; *Bundahišn*, ii. 7, v. 1, xiii. 12; *Mainōg-i Khrat*, xlix. 12; *Sikand Gūmānīg Vījār*, iv. 23-38). The Pleiades (Av. *paivryaēvī*) are mentioned in the Avesta (*Yast*, viii. 12), and there are certain other allusions that may contain the names of special stars, though their interpretation is open to question (see Kuka, 'Stars mentioned in the Avesta' in *Zartosthi*, ii. 7-22, Bombay, 1904). In giving an account of creation, the Pahlavi book *Bundahišn* (ii. 5) sets the number of stars at 6480 (or 6,480,000, according to another reading). This figure is not uninteresting when taken in connexion with the fact that astronomers generally allow that between 5000 and 8000 fixed stars are visible to the naked eye. Regarding the identification of certain of the major stars, though some are positively sure, reference may be made to a monograph by Muncherji P. Kharegert, 'Some Heavenly Bodies mentioned in Old Iranian Writings,' in the *Sir Jamsetjee Jejeebhoy Madressa Jubilee Volume*, Bombay, 1914, pp. 116-153; see also Moulton, *Early Zoroastrianism*, London, 1913, pp. 23-27, 210-213, 279-281.

4. Planets, meteors, and comets.—In contrast to the fixed stars and regular constellations, the planets, meteors, and comets were held by Zoroastrians to be disturbers of the established order of the universe, and consequently to be of Ahrimanian origin and evil nature—a point of view directly opposed to that of Babylonia, where the planets were looked upon as distinctly beneficent in character (cf. Jastrow, *Religion of Babylonia and Assyria*, Boston, 1898, p. 373). To the planets Mercury, Mars, Jupiter, Venus, and Saturn (the only five then known, but making seven with the sun and the moon, by the side of which they were usually mentioned) there were given, respectively, in Pahlavi the euphemistic names *Tir*, *Vahrām*, *Aūharmazd*, *Anāhid*, and *Kēvān*, derived from divine names, including the name of the god Ahura Mazda himself, because these beneficent powers curb and restrain the maleficent influence exercised by the planets (*Bundahišn*, v. 1-2; *Sikand Gūmānīg Vījār*, iv. 1-5; *Zāt-Sparam*, ii. 10, iv. 7-10, vi. 1-2; and consult the list in al-Bīrūnī, *Chronology*, tr. Sachau, London, 1879, p. 172). The Persian treatise *Ulamā-i Islām* (tr. Vullers, *Fragmente über die Religion des*

Zoroaster, Bonn, 1831, p. 52) states that they originally bore the names of demons, but were afterwards given designations of good omen. At the same time it is not impossible that we have in their nomenclature a translation of the Babylonian names of the planets, *Nabu*, *Nergal*, *Marduk*, *Istar*, *Ninib*, as may be surmised from the equations, Marduk (lord of the gods)=Aūharmazd=Jupiter; Nergal (god of war)=Vahrām=Mars; and Istar=Anāhid=Venus; on the confusion between Tishtrya ('Sirius') and Tir ('Mercury') compare the note by Gray, *ERE* i. 798^b; and, for the Babylonian names of the planets, consult Jensen, *Kosmologie der Babylonier*, Strassburg, 1890, pp. 134-139; Jastrow, *Religion of Babylonia and Assyria*, pp. 370, 454-466. This parallel, in any case, is of interest because the Sanskrit names given by the Hindus to the planets show no likeness to the Babylonian (cf. Weber, *Vorlesungen über indische Literaturgeschichte*, Berlin, 1876, p. 267 f.). Shooting stars are alluded to in the Avesta (*Yast*, viii. 8) under the name of *kərəmā stārō*, a designation meaning, perhaps, 'worm stars'; and there are several passages, in both Avesta and Pahlavi literature, which allude presumably to comets (*Yasna*, xvi. 8; *Bundahišn*, v. 2, xxviii. 44, xxx. 17; *Dātistān-i Dinik*, xxxvii. 55, lxix. 2).¹

5. Signs of the zodiac.—The names of the twelve signs of the zodiac, at least in Sasanian times, correspond in concept with those familiar to us through the Greek and Latin designations, and are parallel likewise with the Babylonian, from which, like the Indo-Germanic zodiac in general, they are believed to be derived, and of which their names are translations—a phenomenon precisely paralleled in India and in other Asiatic countries (see Ginzler, *Handbuch der Chronologie*, i., Leipzig, 1906, pp. 78-88). Thus in Pahlavi we find *Varak* ('Ram,' Aries), *Tōrā* ('Bull,' Taurus), *Dō-patkar* ('Two-figures,' Gemini), *Kalakang* ('Crab,' Cancer), *Sēr* ('Lion,' Leo), *Khusak* ('Maiden,' Virgo), *Tarāzūk* ('Balance,' Libra), *Gazdūm* ('Scorpion,' Scorpio), *Nēmasp* ('Half horse,' Centaur or Sagittarius), *Vahūk* ('Goat,' Capricorn), *Dāl* ('Waterpot,' Aquarius), *Mahūk* ('Fish,' Pisces). The names of the twenty-eight lunar mansions, as recognized in 'the subdivisions of the astronomers' (Phl. *zūrtak-i hāmārikān*), are given in the *Bundahišn* (ii. 3); but the reading of the various designations is by no means sure, and the individual identification of the names remains, therefore, uncertain, even when compared with those in the Soghdian and Khorasman list, given about A.D. 1000 by al-Bīrūnī (*Chronology*, tr. Sachau, p. 227 f.).² Possibly some further light may be gained from a study of the terminology used for these asterisms by the Hindus, Chinese, and Arabs, if not by the Babylonians (see Ginzler, *op. cit.* pp. 70-76). Such an attempt has already been made from the Sanskrit side, in comparison with Avestan and Pahlavi, by a Parsi scholar named Anklesaria, in an article entitled 'Asterisms in Iranian Literature' in *Cama Memorial Volume*, Bombay, 1900, pp. 216-227.

6. Prediction of events.—Like the reference in the preceding paragraph to the minute subdivisions used by the astronomers (*Bund.* ii. 3), there are kindred allusions in Sasanian literature to 'the calculations of the astronomers' or to 'the com-

¹ The Soghdian names of the planets given by Manichæan fragments discovered at Turfan, in Chinese Turkestan, correspond in general to the forms given above (see F. W. K. Müller, 'Die "persischen" Kalendarausdrücke in chinesischen Tripitaka,' *SBAW*, 1907, pp. 463-465).

² The zodiacal names given by the Turfan fragments (Müller, *loc. cit.*) are identical with those of Eastern Asia, as found in China, Siam, and Cambodia, as well as in Tibet and in Old Turkish inscriptions (Ginzler, pp. 85-87, 404, 411, 452, 501), thus differing entirely from the Babylonian nomenclature.

putations made by astrologers' with regard to observing favourable or unfavourable conjunctions of the stars (e.g., *Dāḥistān-i Dinik*, lxix. 3; *Šikand Gūmānīg Vījār*, iv. 28; *Epistles of Mānūšihār*, II. ii. 9-11; see West, *SBE* v. 11, xxiv. 130, xviii. 212, 333-335, xxxvii. p. xlvii). Ardavān, the last of the Parthians and predecessor of Ardashir Pāpakān, who founded the Sasanian dynasty in the 3rd cent. A.D., is represented as consulting on grave matters with his 'wise men and constellation-knowers' (*dānakān va astar-mārān*, in the Pahlavi text *Kārnāmē-i Artakshshir-i Pāpakān*, ii. 4-5, iii. 5-6, ed. Darab Peshotan Sanjana, Bombay, 1896, pp. 10-11, 15-16), and their knowledge of the position of the stars at the moment enabled them to predict to him future events. In a Pahlavi work dated A.D. 881 and entitled *Epistles of Mānūšihār*, II. ii. 9-11 (re-translated by West, *SBE* xxxvii., Introd. p. xlvii), there is a specific allusion to a set of astronomical 'tables' (Phl. *zīk*, cf. Arab. *zīj*, and the Byzantine Gr. ζῳδιαί of Theodorus Meliteniotes, ed. Usener, *Ad historiam Astronomiae Symbola*, Bonn, 1876, p. 14), which were constructed by 'the great Shatro-ayār.' See, more fully, art. SUN, MOON, AND STARS (Muhammadan), p. 95^b below. The passage cited mentions the tables alongside of those of Ptolemy and of the Hindus.

7. Astronomical works.—Some of the works from which citations have been drawn above, like the one last quoted, actually belong to the early Muhammadan period of Persia, even though written in Pahlavi. Astronomy, influenced by Arab science, continued to flourish in Iran under Muslim rule. The notable scientific achievements of the great savant and chronologist, al-Bīrūnī of Khiva (973-1048), are sufficient to prove that fact, and it is certain that computations of the positions of the heavenly bodies must have played an important part in the reform of the calendar and establishment of the new Jalalian era, in 1079, by the Seljūk sultan, Jalāl-al-din Malikshāh, under the direction of a commission of scholars headed by the well-known astronomer poet, Omar Khayyam. Omar, in fact, had been summoned to Merv by the sultan, four years previously, to make observations in the royal observatory, and there he constructed the *Zīj-i Malikshāh*, 'Astronomical Tables of Malikshāh,' which were employed in the calendar reform. The names of two of his colleagues engaged upon the reform were Abū'l Muẓaffar al-Iṣfīzārī and Maimūn ibn Najīb al-Wāsiṭī (see Browne, *Literary History of Persia*, London, 1906, ii. 181, n. 2). A section of a large work composed in 1082-1083 by Kai-Kā'ūs and entitled *Qābūs-Nāmah* (ch. 34) was devoted to 'astrology and mathematics' (ed. Teheran, 1285 A.H.; tr. A. Querry, Paris, 1887; cf. Browne, *Lit. Hist. Pers.* ii. 277). The Persian poet Anvarī, of the 12th cent., was a great astrologer, and a conjunction of the planets in the sign of Libra, calculated to take place on September 16, 1186 (or in October of the preceding year, according to other accounts), led him to predict dire calamities for that day; but happily they did not occur (see Browne, *Lit. Hist. Pers.* ii. 368; Horn in *GIRP* ii. 262-263). In the 13th cent. the Mongol ruler Hulāgū Khān, grandson of Chingiz Khān, established a celebrated observatory at Marāghah, in Azarbaijan, Western Persia, the building of which was begun in 1259, and traces of its ruins are still to be seen (cf. Wilson, *Persian Life and Customs*, New York, 1895, p. 77). Hulāgū's astronomer-royal was the learned Naṣīr-al-Dīn of Tūs (1201-1274), whose *Zīj-i Ilkhānī*, or almanac and astronomical tables, was a notable contribution to science (see Browne, *Lit. Hist. Pers.* ii. 484-486). The names of several other mediæval Persian astronomers, with a mention of their tables, are found in the Byzantine treatise of Theodorus

Meliteniotes, referred to above (ed. Usener, pp. 13-14). Best known among the astronomical tables, however, are those of Ulugh Begh, grandson of Timur and founder of the observatory at Samarkand, in which city he died in 1449. These tables, written in Arabic, were translated into Persian and were made accessible in Europe through a Latin version by Greaves (Gravius, London, 1652), and again by Hyde in Persian and Latin (Oxford, 1665), and more recently by Baily (London, 1843) in *Memoirs of the Royal Astronomical Society*, xiii. 79-125. With reference to the present status of astronomical studies in Persia itself, one of the largest meteorites in the world is preserved as a curiosity in the Shah's palace at Teheran to-day; but there is no astronomer-royal to know its true value, and Persia must still wait a renaissance before independent work in studying the heavens is done by those of native birth.

8. Influence of the heavenly bodies.—The astrological aspects of Persia's early studies of star-lore have already been indicated above. In fact, there is little reason to doubt that 'judicial astrology,' or the attempt to determine scientifically the presumed influence of the heavenly bodies upon the destiny of human events, was often regarded more highly than natural astrology, or astronomy in our sense, which confines its investigations to determining the motions and positions of the stars, sun, and moon, in order to gain more strictly scientific results, as we regard them.

In some of the paragraphs given above there have been allusions to the beneficent part played by the sun and the moon in the development of the world and in advancing the welfare of mankind (e.g., *Yāst*, vi. 1-5, vi. 5; *Bundahišn*, vii. 2-4, and elsewhere), while the stars also entered into the sphere of human activity by exercising a kindly sway over the earth. Thus the great rain star Tishtrya, aided by Satavaēsa in the Avesta (*Yāst*, viii. 1-62; *Sīrōzah*, i. 13, ii. 13), combats the demon of drought, when invoked by men, and confers blessings upon his faithful worshippers. The victorious star Vanant (*Yāst*, xx. 1) repulses the influence of evil; and Haptō-iringa (Ursa Major) is effective even in tempering the torment of the souls in hell, a region located in the North (*Mainōg-i Khrat*, xlix. 15-21; *Šikand Gūmānīg Vījār*, iv. 31-33). The three fixed stars or constellations just named are regarded in the Pahlavi book *Sāyast lā-Sāyast* (xiv. 5-6), which was written about the 7th cent., but contains older material, as exercising an influence upon the efficiency of the sacrifice during the time of their ascendancy. In another chapter of the same work (*Sāyast lā-Sāyast*, xxi. 1-7) a specifically fortunate character is ascribed to the shadow of the noonday and afternoon sun when occupying certain positions in the zodiacal signs; and in *Dāḥistān-i Dinik*, vi. 9, the stars are synonymous with destiny. The malign influence ascribed to the planets has been sufficiently indicated above, and need not be referred to again in this section.

Sufficient reference has likewise been made to the part played by astrology, astrologers, and horoscopes both in Sasanian and in Muhammadan-Persian times. We need only recall the allusion to the last of the Parthian kings, Ardavān, and his astrologers (*Kārnāmē*, ii. 4-5, iii. 5-6), and we have the authority of the great Khorasman scientist al-Bīrūnī for the fact that the Persian astrologers, like others, held that the zodiacal sign of Cancer was 'the horoscope of the world' (al-Bīrūnī, *Chronology*, tr. Sachau, p. 55). A good illustration, in the 17th cent., of ephemerid tables that were used also for horoscopic purposes may be found in a work translated from the Arabic, Persian, and Turkish, with a Latin commentary,

by Beck, in his *Ephemerides Persarum per totum annum*, Augsburg, 1696 (especially chs. iii.-iv., vi.). Even to-day the astrologer's art in casting a horoscope holds an important place in the life of the ignorant and superstitious folk of Persia, and it still survives, though it is gradually disappearing, among the Zoroastrian Parsis of India (cf. Karaka, *History of the Parsis*, London, 1884, i. 160-162).

LITERATURE.—For a translation of the Avesta and the Pahlavi books consult the versions by Darmesteter and West in *SBE*, vols. iv., xxiii.; and v., xviii., xxiv., xxxvii., and by Mills, *ib.* xxxi.; likewise the French translation by Darmesteter, *Le Zend-Avesta*, 3 vols., Paris, 1892-1893. The more important single works on the subject have been given in the course of the article.

A. V. WILLIAMS JACKSON.

SUN, MOON, AND STARS (Japanese).—In the ancient mythology of Japan the sun-goddess plays the most important rôle, while the moon-god, her brother, occupies an insignificant place, and almost nothing is told about stars. The commonly accepted story is that the sun-goddess (Amaterasu, 'the heaven-shining deity') and the moon-god (Tsuki-yomi, 'the ruler of the moonlight night') were born, together with the storm-god (Susa-no-wo, 'the swift-impetuous'), of the couple who were the progenitors of the Japanese archipelago.¹ In this story the creation of these deities is conceived evidently as a generative act, whereas another version makes the emergence of the two deities from the 'white copper' mirrors the work of the male progenitor alone. Perhaps a more interesting version of the story is that the sun and the moon were produced out of the eyes of the progenitor, when he was washing in order to purify himself from the stains with which he had been contaminated on his visit to the infernal world after the death of his consort.² Though there are these different versions, the common trait and predominant factor in the story is that the sun-goddess is considered to be the supreme ruler of heaven and earth, and also the progenitrix of the ruling family, who claim to have handed down from the goddess herself the three insignia of the throne (see below). Now the relation between the sun-goddess and the moon-god is based on the natural phenomenon that the two are visible alternately by day and by night. The story is as follows:

The sun-goddess once commissioned her brother, the moon, to go down from their heavenly abode to earth to see Ukemochi, the female genius of food. When the latter entertained the moon with the food-stuffs taken out of her body, the moon became flushed with anger and slew the goddess of food. The sun-goddess was so displeased with her brother's wantonness that she said to him: 'Thou art a wicked deity. I must not see thee face to face.' Hence the sister and brother appear alternately in heaven.³

The intention of the story is evident, but at the same time it shows a characteristic of the sun-goddess as the matron of agriculture, which played a great part in the myths and worship of the goddess.⁴ Thus, in contrast to the prominent rôle played by the sun-goddess, the moon plays a very inferior part, and a much smaller part is played by the stars. A star-god is mentioned in the ancient myth, but his rôle is quite ambiguous, while a festival in honour of certain stars (the stellar constellations called the Herdsman and the Weave-maid) was derived from China. All other stories and worship of stars are much later and were introduced chiefly through Buddhist agency,

¹ See *Nihongi: Chronicles of Japan*, tr. W. G. Aston (*Proc. Japan Soc. of London*, Suppl. to vol. i. [1896]), p. 18 f.; and, for the following stories, pp. 20, 32, etc.

² See *Koji-ki, or Records of Ancient Japan*, tr. B. H. Chamberlain (*TASJ*, Suppl. to vol. x. [1883]), pp. 42-44. This version is preserved also in *Nihongi*, p. 32, and, for its connexion with the conception of life and death, see art. LIFE AND DEATH (Japanese).

³ *Nihongi*, p. 32.

⁴ Aston, *Shinto*, London, 1905, p. 232 f., where the ritual to the goddess for harvest is cited.

though some of them may have been derived from other sources—Hindu, Persian, or Chinese. The most prominent star-worship is that of the Pole star, together with Ursus Major. These stars, conceived as one deity, are worshipped by the Buddhists as the protector of the country as well as of individual fortune, while the Shintôists identify them with the Taoist 'palace of iridescent subtlety' (Shi-bi-kyū in Sino-Japanese), where the highest deity of Shintō, the 'eternal-ruling' (Minaka-nushi), is believed to reside. But this Shintō worship is of late origin; it was specially emphasized by a Shintō theorizer in the early part of the 19th century.

When Buddhism was introduced into Japan (6th cent.) and questions came up as to the relationship between the indigenous deities and the Buddhist pantheon, the Buddhist teachers tried to discover analogies between them and to explain that the Buddhist deities were the original noumena and the native ones their lateral manifestations. The most striking analogy was found between the sun-goddess and the aspect of Buddha's personality conceived in the sun-myth. The difference in gender concerned the syncretist but little, partly because the Japanese language had no genders and partly because the noumenon and the manifestation may take any sex. The result was an identification of the Japanese sun-goddess with Buddha Vairohana ('the illuminator'), and this conception exercised a wide influence on doctrine and worship during the sway of the syncretic Shintō from the 8th cent. down to the middle of the 19th, when the combination was dissolved by force. Among the theorizers of the syncretism we may cite one, Kanera (1402-81), who explained sun, moon, and stars as corresponding to the three insignia of the throne, *i.e.* the sun to the mirror, the moon to the jewel, and the stars to the sword.¹ This eclectic theory was backed by the popular conception of the 'three illuminating bodies' (*San-kō*) and their worship. People even nowadays regard a simultaneous appearance of the three as an auspicious occasion for worship and as a sign of special blessing to the country—*e.g.*, when on an autumn day the clear sky and the comparatively weak light of the sun cause the new moon and a certain star (Venus) to be visible to the eyes. Naturally, various configurations of the celestial bodies were used for methods of divination and predictions. In these methods Hindu, Persian, and Chinese elements may be detected, and their influence is still a living force among the mass of the people.

LITERATURE.—Besides the works cited in the footnotes, see M. Anesaki, *Japanese Mythology* (=vol. viii. of *The Mythology of All Races*), Boston, 1920. M. ANESAKI.

SUN, MOON, AND STARS (Muhammadan).—I. **ASTROLOGY.**—I. **Name.**—Among the Muslims the technical name of astrology is 'ilm (or *šinā'at*) *ahkām an-nujūm*,² 'science (or art) of the decrees of the stars,' 'ilm *al-ahkām*, 'science of the decrees.' Sometimes, though rarely, in place of *ahkām* its synonym *qadāyā* is found. Another name is *an-najāmah* (*nijāmah*) or 'ilm *an-najāmah*. On the other hand, the names 'ilm (*šinā'at*) *an-nujūm*, 'science (or art) of the stars,' 'ilm *at-tanjūm*, mean astronomy as well as astrology, and they also mean both of these sciences taken together. The word *ahkām* also signifies 'judgments,' 'judicial decisions'; accordingly the first of the denominations given above was in the Middle Ages translated in the Latin versions of Arabic works by *scientia judiciorum stell-*

¹ See art. PHILOSOPHY (Japanese), vol. ix. p. 870.

² As in the case of the other branches of scientific literature, so for astrology the Musalmān peoples made use of the Arabic language.

arum, and thence came the name of *astrologia judiciaria* or *astronomia judiciorum*, astrology, as opposed to *astrologia (astronomia) quadrivialis* (or *doctrinalis*), which is astronomy. Thus in the denomination of astrology among the Musalmāns there is a concept somewhat different from that contained in the Greek term [*ῥέχνη*] ἀποτελεσματική, 'science of the fulfilment [of astrological prognostications].' The astrologer is usually called by the same name as the astronomer, viz. *munajjim* (much more rarely *najjām*); sometimes, however, he is called by the special word *ahkāmī* (plur. *ahkāmīyyūn*, *aṣḥāb sināt al-ahkām*). It was only in the 19th cent. that the distinction between *munajjim*, 'astrologer,' and *falakī*, 'astronomer,' was introduced into Arabic (at least in Egypt and in Syria).

2. Divisions.—The Muhammadans usually arrange the science of astrology under five principal heads:

(a) The fundamental principles of astrology, viz. the different divisions of the ecliptic, the properties of the various celestial places and of individual planets, the methods of determining the ascendant and the 12 celestial houses (*buyūt*, 'domus'), the planetary conjunctions, etc.

(b) Prognostics of a universal character (*al-ahkām 'alā umūr al-'ālam*), viz. those which refer to the vicissitudes of kingdoms, dynasties, religions, and cities, to wars, epidemics, famines, winds, rains, the prices of goods, etc. This part of astrology, which Ptolemy calls ἀποτελεσματική καθολική, 'universal apotelesmatics,' is usually called by the Arabs *tahāwil sinī al-'ālam*, 'revolutions annorum mundi,' since a great part of these prognostics is deduced from the planet which has the dignity of 'significator' (ἀφέρης, *dalīl*, *haylāy*) at the moment when the sun enters Aries, i.e. at the beginning of each tropic year. This universal part of astrology is subdivided into three sections: (i.) predictions drawn from the various kinds of planetary conjunctions (*qirānāt*, *iqtirānāt*), (ii.) predictions based on the 'revolutions annorum mundi,' (iii.) predictions relating to the 'mutations æris' (*taḡhayyur al-hawā'*), i.e. to meteorological phenomena, and which are deduced from the lunar stations, or from the heliacal rising of Sirius, etc.

(c) Individual prognostications relating to the vicissitudes of individuals, derived from the planet or other celestial place which may happen to be the 'significator' at the moment of birth, and then from the 'significator' at each revolution of successive tropic years. This part of astrology Ptolemy calls γενεθλιαλογική, and the Arabs *al-mawā'id*, 'nativitates.'

(d) *Masā'il*, 'interrogationes' (ἐρωτήσεις), or that part of astrology which is concerned with replies to questions, e.g., the circumstances of a distant relative, the author of a theft, the hiding-place of a runaway slave, etc. The 'interrogationes' are always connected by the Muhammadan astrologers with the division of the heavens into 12 'domus.' The astrologers who follow the pure tradition of Ptolemy do not admit the 'interrogationes.'

(e) *Ihtiyārāt*, 'electiones,' i.e. the choice of the propitious moment for doing any particular thing. The most common method is that of determining such a moment by seeking in which of the 12 celestial 'domus' the moon is found at that particular moment. This was also very probably the method employed by the Greeks; but along with this some Muhammadan astrologers use another method, of Indian origin (but also attributed to Dorotheus), which consists in deducing the fitting moment for action from the place which the moon then occupies in one of the 28 lunar stations or mansions (*manāzil*). The 'electiones' also are not

admitted by the astrologers who follow Ptolemy's teaching.

3. Place among the sciences.—The science of the stars, says Ptolemy at the beginning of his *Tetrabiblos*, or *Quadrupartitum*, consists of two parts: the first studies the appearances of the motions of the heavenly bodies either with respect to each other or with respect to the earth; the second seeks to deduce, from the physical qualities of those appearances, the changes which take place in the sublunar world. The first part is a science which stands by itself, and can be studied independently of the second; this, on the contrary, cannot do without the first. This conception that astrology is but the sister of astronomy, a branch, that is to say, of the 'science of the stars,' which in its turn is a part of 'mathematics' ('*ulūm riyādiyyah*, '*ulūm tālīmīyyah*, *ta'ālīm*'), is common to all the Musalmān astrologers and astronomers, and is accepted also by some philosophers (al-Fārābī in his *de Scientiis*, and the Iḥwān aṣ-ṣafā', or 'sincere companions' of the 10th cent. in their *Epistles*), by the author of the *Mafātīḥ al-'ulūm*, or 'Encyclopædia of the Sciences' (10th cent.), and by the great historian philosopher Ibn Haldūn (*Proleg. lib. vi. cap. 13*; M. G. de Slane's Fr. tr., Paris, 1862-68, iii. 122 f.).

Astrology, however, is classified in a different way by the majority of the philosophers. Musalmān writers commonly divide all science into two great categories: (a) sciences which relate to religious law ('*ulūm shar'iyyah*'), that is to say, in addition to theology and canon law, the learning which serves as an introduction to them, namely, grammar, lexicography, rhetoric, poetry, history, etc.; (b) intellectual or philosophic sciences ('*ulūm 'aqliyyah* or *hikmiyyah*'), which the author of the *Mafātīḥ al-'ulūm*, thinking of their origin, calls '*ulūm al-'ajam*, 'foreign sciences.'¹ The intellectual or philosophical sciences in their turn are for the most part divided into the three sections² already fixed by the later Greek peripatetics and by the Neo-Platonic expounders of Aristotle (e.g., Ammonius, Simplicius, and Johannes Philoponus), namely: (a) metaphysic (*al-hikmah al-'ilāhiyyah*, θεολογία, τὰ μετὰ τὰ φυσικά); (b) natural sciences (*al-hikmah at-tabi'iyyah*, 'natural philosophy,' φυσική); (c) mathematical sciences (*al-hikmah ar-riyādiyyah*, μαθηματική). These last correspond to the *Quadrivium* of Boethius, namely, arithmetic, geometry, astronomy, and music; on the other hand, the natural sciences are subdivided into eight fundamental parts, named for the most part after the titles of the corresponding Aristotelian works, namely: *Auscultatio physica*, *Generatio et corruptio*, *Cælum et mundum*, *Meteoræ*, *Mineralia*, *Vegetalia*, *Animalia*, *de Anima*. Avicenna (*Fī aqsām al-'ulūm al-'aqliyyah*, in *Tis'rāsā'il*, Constantinople, 1298 A.H. [=A.D. 1881], p. 71 ff.), Muhammad al-Akfānī as-Sahāwī (*Irshād al-qāsid*, ed. A. Sprenger, Calcutta, 1849; the author died in 749 A.H. [=A.D. 1348]), Ḥajjī Halīfah (in the introduction to his *Lexicon bibliographicum et encyclopædicum*),³ and others consider astrology as one of the 7 (or 9) *furū'*, 'secondary branches' of the natural sciences, placing it, that is to say, beside medicine, physiology, interpretation of dreams, alchemy, the science of talismans, etc. This same classification of the natural sciences is found in al-Ghazālī († 505 A.H. [=A.D. 1111]), who, in his *Tahāfut al-*

¹ Each of these two great categories afterwards gives place to the distinction between theoretical (*nazarīyyah*) and practical (*amaliyyah*) science—a distinction which has its origin in Aristotle (E. Zeller, *Die Philosophie der Griechen*³, Tübingen, 1875-81, II. ii. 177).

² Other divisions, indicated in the writings of the Iḥwān aṣ-ṣafā', in the *Mafātīḥ al-'ulūm*, etc., are useless for our present purpose.

³ Ed. G. Flügel, 8 vols., London, 1835-53.

falāsifah, Cairo, 1319 (1901), p. 63 f., refers to it as common amongst the Musalmān peripatetics, and approves of it.

Averroës, in the *Tahāfut al-tahāfut*, Cairo, 1319 (1901), p. 121, admits, as corresponding to Aristotelian teaching, the eight fundamental parts of the natural sciences; but he denies that the so-called derived branches are sciences. Medicine, he says, is an art (*sinā'ah*) and not a science; it has a practical and not a theoretical character; accordingly astrology is included in the same category with divination from the flight of birds and from the movement of quadrupeds (*zajar*), with divination in the form of vaticinations (*kahānah*), with physiognomy and with the interpretation of dreams, all being arts which have as their aim the prediction of the future, but which 'are not sciences either theoretically or practically, however it may be supposed that one may sometimes derive some practical advantage from them.'

A curious classification is found at the beginning of the unedited book *de Interrogationibus* (*Fīl-masā'il*) of the astrologer Ya'qūb al-Qaṣrānī, who lived in the 3rd cent. A.H. (9th A.D.). According to the catalogue of the Arabic MSS of Berlin (W. Ahlwardt, *Verzeichniss der arab. Handschriften*, Berlin, 1887-99, v. 275, no. 5877), he maintains three degrees (*marātib*) of science: theology, medicine, science of the stars; the last, being based not on observation, but on deduction from analogy, occupies a place between the other two.

4. Sources.¹—(a) *Greek*.—These are represented by the classic (if we may call it so) astrology of the *Tetrabiblos* or *Quadripartitum* of Ptolemy; by the writings of Dorotheus Sidonius (1st cent. A.D.), which go back to the Græco-Egyptian tradition; by the great eclectic compilation of Vettius Valens (2nd cent. A.D.);² by the book on the 'decani,' the 'interrogationes,' and the nativities of Antiochus of Athens (2nd or 3rd cent. A.D.), which appears especially to follow the Babylonian tradition; by the *Kapōs*, or *Centiloquium*,³ falsely attributed to Ptolemy; by some works ascribed to the mythical Hermes;⁴ and by an author whose name (Rimos?, Zimos?) is cited by Arabic writers in a form so corrupt as to be unrecognizable. Of another Greek writer, Teucer or Teucrus of Babylon, the Arabs had knowledge through Iranian sources.

(b) *Indian*.—The Musalmān writers mention seven or eight Indian astrologers, whose names, however, it has not as yet been possible to identify with the corresponding Sanskrit. The most important is K.n.k.h or K.t.k.h, who, according to some Arabic writers, appears to have come to Baghdād to the court of the khalif al-Manṣūr, bringing thither astronomical books of India, and, according to others, making known Indian arithmetic. The Arabs attribute to him writings on the *numūdār* (that is, on the method of ascertaining a factitious ascendant of the nativity), on the nativities, and on the conjunctions of the planets; it is therefore plain that he had also treated of the part of Indian astrology called in Sanskrit *horā* or *jātaka*, which arose through Greek influence. This confirms a conjecture of F. Boll (*Sphaera*, Leipzig, 1903, p. 414 f.), who, from the citations contained in the *Introductorium* of Abū Ma'shar

(or Albumasar), infers that K.n.k.h had before him materials of distant Greek origin for his representation of the figures arising in the heavens together with the 'decani.' But in general, Musalmān astrologers cite simply 'the Indians' (*al-Hind*), without particular names of authors. We must further add that the influence of Indian astrology made itself felt sometimes through Iranian writings and oral teaching, as is apparent from some Indian words which have passed into Arabic terminology in an Iranian form—e.g., *darjān* (Ind. *drekkiṇa*).

(c) *Iranian*.—These are in the Pahlavī language or Middle Age Persian. The writings of Teucrus of Babylon (second half of the 1st cent. A.D.) on the figures arising in the heavens together with the 'decani' reached the Arabs through a Persian version, where the name of the author, on account of the ambiguity of the Pahlavī writing, was afterwards spelt by the Persians and Arabs Tinkalūs (also Tankalūsh or Tankalūshā); so that in the *Introductorium* of Abū Ma'shar his teachings were given as 'teachings of the Persians' (*madhhab al-Furs*) and contain also some Persian names of constellations (cf. Boll, p. 415 f.). Another source was Buzurjmihr's commentary on the astrological *Ἀνοδογίαι* of Vettius Valens; the Pahlavī translation of the Greek title was *vīzīdhak*, 'selected,' which became in Arabic *al-bīzīdhaj* and was afterwards variously and strangely corrupted by Arabic writers.¹ The Musalmāns also cited as a source of astrological teachings the mythical Zoroaster (Zarādusht in Arabic writings, Zardusht in modern Persian writings), whose name indeed was already frequently found in Greek astrology of the 4th and following centuries. A fourth source is the book on 'nativities' of [al-]Andar-zghar, son of Zādānfarrūh; but we lack information about this personage, whose name is corrupted into Alendezgōd in the Latin version of Alcabitius (al-Qabiṣī), and into Andruçagar in the Latin version of the book of the Jew Ibn 'Ezrā on nativities (which always draws on Arabic sources). Those astrological writings which are ascribed by the Arabs to Jāmāsp the Wise (the trusted counsellor of the mythic king Gushtāsp) seem to be late Muhammadan falsifications.

We do not know exactly when all these works hitherto mentioned were first translated into Arabic, but it is certain that the great majority of them were known in the second half of the 8th cent. A.D., that is, when Musalmān culture began. If the indication placed at the end of the unedited *'Arḍ miftāḥ an-nujūm* of Hermes (MS in Biblioteca Ambrosiana in Milan) is true, this book would seem to have been translated in the month Dhū 'l-qa'dah, 125 A.H., namely, in September 743 A.D., while the Umayyad khalifs were still reigning. The first version of the *Tetrabiblos* is due to Abū Yahyā al-Baṭrīq, a translator of the time of al-Manṣūr, the second 'Abbāsīd khalif (136-158 A.H. [A.D. 754-775]); Dorotheus and Antiochus are already mentioned in the writings of Mā shā' Allāh (Messahala) in the second half of the 8th cent.; all the other Greek authors mentioned above are amply cited by the astrologers of the 9th century. As has already been said, the writings of the Indian K.n.k.h seem to have been known at Baghdād in the time of the khalif al-Manṣūr; and about the middle of the 9th cent. we have already several small astrological works of al-Kindī (Alchindus) formed expressly on Indian models. It is almost certain that the Persian books were translated by members of the family

¹ For details see the present writer's Arabic lessons on the origins of astronomy among the Arabs (*Ibn al-falak, ta'rīḫuhu fī 'l-qurān al-vusṭā*, Rome, 1911-12), pp. 189-215 (Iranian sources), 216-220 (Greek sources), etc.

² Muhammadan astrologers were also acquainted with the *Anthologia* of Vettius Valens through an Arabic translation of a Pahlavī version; cf. below, under (c).

³ The Arabic tr. is rather a paraphrase, which attempts to interpret the theories obscurely indicated in the Greek text.

⁴ Some of the works attributed to Hermes seem to be Musalmān falsifications—e.g., the book *de Revolutionibus nativitatū*, which has reached us in a Latin translation.

¹ In the Latin version of Albhazen Haly filii Abenragel, *De iudiciis astrorum*, Basel, 1571, the name of the book is *Yūdidech* (p. 149, col. b), *Enzirech* (p. 176, col. a), *Endenadeyg Persarum* (p. 347b), *Endemadeyg Persarum* (345b), *Andilarehprosu* (404b).

Nawbaht, known by their translations from Pahlavi into Arabic (cf. *Kitāb al-Fihrist*, pp. 244, 274), whose head was astrologer at the court of al-Manṣūr; and in any case the antiquity of Iranian influence in astrology is attested by the fact that in the works of Mā shā' Allāh, according to the Latin translation of John of Seville, technical terms of Iranian origin are freely used: e.g., *al-hyleg* (*al-haylāḡ*), *al-cochoden* (*al-kadhūdāh*), *al-imbutar* (*al-jānbahān*).

Side by side with the written sources there was, without doubt, the oral tradition of the peoples converted to Islām.¹ Among the Syrians Christianity had almost suffocated astrology, although Bardesanes (154-222) had reconciled Christian dogma with an attenuated form of predestination by means of the stars; all the same we know that at Harrān, the ancient Carrhæ, special astrological traditions flourished along with other pagan sciences. It is further probable that Theophilus, son of Thomas, a Christian of Edessa who was astrologer of the khalif al-Mahdī (A.D. 775-785), and who has been cited by several Musalmān astrologers as an authority on the subject of 'electiones,' again took up with Syrian oral tradition. In the same manner it is natural that there were absorbed into Musalmān culture the astrological beliefs and practices of the Aramaic centres (tending to paganism) of Mesopotamia and Babylonia, of the Egyptians, etc. Finally, we must not forget the Judaic element which had a notable part in the first ages of Musalmān astrology; in fact, among the principal writers on astrological matters in Arabic in the 2nd and 3rd centuries of the Hijra are the Jews Mā shā' Allāh, Sahl ibn Bishr, Rabban aṭ-Ṭabarī, and Sanad ibn 'Alī.

5. Special character.—The civilized peoples over whom the Arabic domination of the 7th, 8th, and 9th centuries extended, viz. Greeks, Copts, Syrians, Persians, and Indians, had already imagined all the possible fundamental combinations concerning the influence of the stars over mundane events; consequently it was impossible for the Musalmān astrologer to find out anything substantially new. On the other hand, the principal justification of astrology consisted precisely in presenting itself as the jealous preserver of that which an age-long experience had taught the wise of preceding generations. The office of the Musalmān astrologers consequently was reduced to a choosing of what seemed suitable among the many principles and methods of their predecessors, and at times to a harmonizing of elements of very diverse origin, amplifying and completing particular points on which it was easy to give free rein to fancy. All this, as we have said, was done with the widest eclecticism. But, though nothing really original is met with in the field of apotelesmatics properly so called, there is, all the same, a point on which Arabo-Musalmān astrology is far superior to other astrologies, including the Greek, and represents a real progress. This consists of a wide and continued application of spherical astronomy and of exact mathematical processes to the methods of astrological research. Among the Greek astrologers the calculations are very rough; arcs of the ecliptic are substituted for arcs of the equator, right ascensions for oblique ascensions; rough tables, useful for a determined terrestrial latitude, are also employed for different latitudes; the latitudes of the planets are neglected in the calculation of the radiations ('projectiones radiorum,' *maṭāriḡ ash-shu'ā'*). Among the Greeks we seek in vain for a clear exposition of the method of determining mathematically the 12 heavenly 'domus,' which, however, form one of the hinges of the astrological system. Ptolemy

¹ Cf. Nallino, *Im al-falak*, pp. 326-332.

himself, teaching minutely in the *Tetrabiblos* how the 'directio' (*ἀφείσις*) is calculated, completely neglects the latitude of the planets. Characteristic is the fact that Ptolemy, in the *Almagest*, occupies himself with three problems useful only to astrologers (inclination of the shadow of the eclipses with respect to the ecliptic and to the horizon, position of the stars with respect to the sun in consequence of the daily motion of the sphere, appearances and occultations of the planets with respect to the solar rays), and which even in astrology are of very small importance; and, on the other hand, he does not make the slightest allusion to other problems of spherical astronomy which would be of capital importance for apotelesmatics. Musalmān astronomers, on the contrary, teach exact calculations, and often even prepare tables for all the mathematical problems required by astrology: determination of the 12 celestial houses, 'directio,' 'revolutiones annorum,' 'projectio,' 'projectio radiorum.' Thus astrology, among the Musalmāns, becomes an art which demands a solid scientific preparation, and which tends to give an ever greater mathematical complication and exactness to its methods of research among celestial phenomena. E.g., the *mamarr* ('passage [of one planet over another], *almanar*, or 'supereminencia,' of our astrologers) corresponds exactly from an apotelesmatic point of view to the *καθ' ὑπερέρησσις* of the Greeks; but whilst for the Greeks this takes place when a planet is situated to the west of another, viz. has a lesser longitude, for the Arabs the *mamarr* takes place when a planet in its own epicycle is distant from the apogee of the epicycle less than another planet is distant from the apogee of its own epicycle. Consequently, its calculation in Musalmān astrology is not a light matter, and requires the employment of complete planetary tables. We can understand, therefore, why the theory of the *mamarr* of the planets is not only expounded in several treatises of spherical astronomy, but has also given rise to special monographs. The importance of all this is plain: in the Hellenistic world astrology flourishes while astronomy decays; in the Musalmān world of the Middle Ages astrology becomes a potent ally of mathematical and observational astronomy.

6. Polemic concerning astrology.—From Islām astrology at first had a much less unfavourable reception than from Christianity. The latter had to combat in the teachings of astrology an entire world of pagan ideas and cults; it had to contend against the concept of necessity, which excluded Christian free will. In the 7th and 8th centuries A.D., however, the pagan elements of astrology were completely modified; they were so entirely hidden under a verbal formalism as to be no longer recognizable; and, on the other hand, orthodox Islām, with its doctrine of predestination, which excluded the freedom of human actions, was, at bottom, not very far removed from the *εὐμαρμένη* of the Stoics and of many astrologers of antiquity. When we consider that the first Musalmān theologians took no heed whatever of the sciences which did not appear to have any relation to the religious content of Islām, we easily understand how astrology had been able to advance unimpeded through its first stages almost up to the end of the 2nd cent. of the Hijra. It is not, therefore, astonishing that Abū Ma'shar, writing his *Introductorium* in 848 A.D., among the ten categories of persons hostile to astrological teaching, makes no mention whatever of opponents influenced by strictly religious reasons,¹ and he makes his defence of astrology to consist (*Introd.* I. 5, fol. b 2 v.-b 3 v.) only in an amplification of the arguments with which Ptolemy (*Tetrab.* I. 3)

¹ *Introductorium*, I. 4 (Augsburg, 1439, fol. a 7 v.-b 2 v.).

had already maintained the material and moral advantages of foreseeing the future, even if this should appear to be adverse to us. The 'philosopher of the Arabs,' al-Kindi, who died a little after 870 A.D., regards astrology as an integral part of philosophy (*hikmah, falsafah*); he seeks its basis not only in the four mathematical, but also in the physical and metaphysical doctrines;¹ and he opposes it to many popular prejudices. Al-Kindi was perhaps the only one who endeavoured to reduce to a completely rational and systematic form the principles and the methods of astrology.

But matters soon underwent a change. Towards the end of the 2nd cent. of the Hijra the knowledge of Aristotle's teaching grew more definite and profound, and in this there was no place for astrology; hence the philosophers commenced to make war against it. On the other hand, the theologians were not slow to see in the influence attributed to the stars over human actions a menace to the severely monotheistic conception of Islām, more especially when later on there filtered into Musalmān theology an opposition to the idea of necessary causality, and the atomistic doctrine of continued creative acts became more prevalent. Moreover, the daring predictions concerning the duration of Islām² became an evident danger to dogma. Thus the polemic against astrology became very acute.³

The most ancient confutation which we possess is that of Abū 'l-Qāsim 'Isā ibn 'Alī,⁴ drawn up in the first half of the 10th cent.,⁵ and preserved in a work of the Hanbalite theologian, Ibn Qayyim al-Jauziyyah, *Miftāh dār as-sā'ādah*.⁶

After an exordium in which he admits that the stars may have some influence on such natural phenomena as climate and temperament, but denounces the practice of foretelling the future by their means, he divides his dissertation into three distinct parts. The first has reference to the discordance among astrologers as to their fundamental principles concerning the nature of the influence of the stars, and an exposition follows of several fundamental principles for astrological calculations on which the various writers disagree—e.g., the method of determining the planetary 'termini,' the 'significator' (*dalil, ἀφέρτης*), the 'pars fortuna,' the male and female zodiacal signs. The second part consists of the examination of many principles which are affirmed by the astrologers, but which are repugnant to good sense (*mustabḥah*). In the third part 'Isā ibn 'Alī cites some of the arguments adopted by the astrologers in favour of their science, and refutes them.

Contemporary with 'Isā ibn 'Alī is the famous philosopher al-Fārābī (*q.v.*; † A.D. 950), who, as a profound student of Aristotle, could not but be opposed to astrology. We have a work of his against astrology,⁷ which, however, is not so vigorous a confutation as we should have expected from such a philosopher and contains some childish reasonings. This is explained by the fact

¹ Cf. the quotations in M. Steinschneider, *ZDMG* xviii. [1864] 134; and chs. x. and xi. of the anonymous Latin pamphlet *De erroribus philosophorum* (written in the second half of the 13th cent.), ed. P. Mandoulet, *Sigier de Brabant*², Louvain, 1908-11, Pt. II, pp. 19-21.

² E.g., Theophilus, son of Thomas, the astrologer of the third 'Abbasid khalif (see above, § 4), maintained that the reign of Islām would last only 960 years (Ibn Haldūn, *Proleg.*, lib. iii. ch. liv., tr. de Slane, ii. 223 f.). The philosopher al-Kindi calculated that the duration of the kingdom of the Arabs would be 693 years (see O. Loth, 'Al-Kindi als Astrolog,' in *Morgenländische Forschungen, Festschrift an H. L. Fleischer*, Leipzig, 1875, pp. 263-309).

³ Men like al-Jāhiz († 255 A.H., 869 A.D.) and the famous theologians al-Jubbā'ī († 303 A.H., 915-916 A.D.) and al-Ash'ari († 324 A.H., 938 A.D.) were declared enemies of astrology.

⁴ According to Ibn al-Qifṭī, ed. Lippert, p. 244 f., he died on Friday, 28 Rabi' ii., 395 A.H., i.e. 25th March, 1001 A.D.; cf. also *Fihrist*, p. 129.

⁵ It is, in fact, cited in the preface of the *Libellus isagogicus ad magistrum judiciorum astrorum*, which al-Qabisi had written for Saif ad-daulah, prince of Aleppo, who reigned from 333 to 356 A.H. [A.D. 944-967].

⁶ Cairo, 1323-25 A.H. [A.D. 1905-07], ii. 156-166.

⁷ Al-Fārābī, *Philosophische Abhandlungen*, tr. F. Dieterici, Leyden, 1892, pp. 170-186 (pp. 104-114 of the text published in 1890). Dieterici at some points has not understood the meaning of some technical terms of astrology, so that his version is not always perfect.

that the work is merely a series of notes, published by a disciple just as he found them.

The philosophers contemporary with al-Fārābī did not all share his hostility to astrology; in fact the schools which had been less subject to Aristotelian influence favoured it, as was already the case with al-Kindi.

With reference to this a special place is held by the Iḥwān as-Safā', 'Sincere Companions,' who flourished in al-Baṣrah towards A.D. 950-960, and whose writings set forth the philosophic doctrines of the heretical Bāṭinites, a branch of whom were the Carmatians (al-Qarāmitah), who towards the end of the 3rd cent. A.H. (9th cent. A.D.) caused political disorders in the 'Irāq, and who founded an independent kingdom in N.E. Arabia which lasted until after A.H. 474 (A.D. 1081-82). The Carmatians had reaped great advantage from astrological predictions based on the theory of the great planetary conjunctions.¹ One can therefore understand that the Iḥwān as-Safā' not only admitted, with Aristotle and other Arabic philosophers, that the changes (generation and corruption) of the sublunar world were consequent upon celestial movements, but also that the planets foretold the future and have a direct influence upon the will and the moral character. The great encyclopædic work of the Iḥwān is imbued with those astrological ideas, among which the theory of planetary conjunctions occupies the principal place.

Favourable to astrology also are those other philosophers who lead up to Abū Sulaimān Muḥammad ibn Tāhir ibn Bahrām as-Sijistāni al-Mantiqi, who, in the second half of the 10th cent., gathered about him at Baghdad a number of learned men for the purpose of discussing various subjects. Notes and summaries of many of these discussions were collected in the *Kitāb al-muqābasāt* of Abū Ḥayyān at-Tawḥīdī, a philosopher, mystic, and jurist († after 400 A.H. [A.D. 1009-1010]), about whose orthodoxy there is some suspicion. A record of a meeting in reference to astrology is preserved almost entire in the work already cited of Ibn Qayyim al-Jauziyyah.² Some of those present had attacked astrology, declaring it to be useless, since, after so much study and effort on the part of its supporters, it does not succeed in modifying those events which overwhelm both the wise astrologer and the ignorant man. There then rose up several questioners to refute these accusations, and they set themselves specially to explain how predictions can fail in spite of the truth of astrology, and that, in any case, the efforts of astrologers to discover the truth are always noble. Their defence of practical astrology is somewhat weak, and is probably the last that has been made in the field of philosophy.

Avicenna (*q.v.*; † 428 A.H. [A.D. 1037]) contends against astrology, not only in his great encyclopædia, *ash-Shifā'*, 'The Recovery of the Health [of the Soul],' and in the *an-Najāh*, but also in a special work of which a full résumé was made by Mehren.³ He demonstrates that astrology has no foundation, and proceeds to show that, even admitting its theoretical truth, it would be impossible for men to acquire a knowledge of it.

Averroës (*q.v.*), or Ibn Rushd († 595 A.H. [A.D. 1198]), is also a decided adversary of astrology, as appears from the severe judgment referred to above (§ 3) and from some passages of his comments on Aristotle. But it would be useless to continue the review of the philosophers, who after the 10th cent. A.D. are all in agreement on this question. It is more interesting to consider the position taken up by the theologians, who—from the motives indicated at the beginning of this section—engaged, towards the end of the 9th cent. A.D., in a relentless war against astrological theories.⁴

We have already seen the attitude of al-Jubbā'ī. We may add here that Ibn Ḥazm († 456 A.H. [A.D. 1064]), who fiercely opposed the scholastic or speculative theology of al-Ash'ari in Spain, gives his ideas on astrology in *Al-Fiṣal fī 'l-mīlāl wa 'l-ahwā' wa 'n-nihāl*.⁵ He divides those who believe that the future can be foretold by means of the stars into two classes: (1) misbelievers and polytheists, and (2) persons who are in error. The first are those who maintain that the stars and the

⁵ Cairo, 1317-21 A.H. (A.D. 1899-1903), v. 37-40.

heavenly spheres are intelligent beings, agents, of eternal duration, and disposing of earthly things either with or without God. The second are those who hold that the stars and the celestial spheres, whilst without intelligence, have been created and established by God as indicators of things which are to take place.

The preserver of Ash'arite dogmatic theology, al-Ghazālī († 505 A.H. [A.D. 1111]), opposes astrology in his *Ihyā' ulūm ad-dīn*, 'The Revival of Religious Sciences.'¹ And the same attitude we find in the books of the famous Ḥanbalite, Ibn Taimiyyah († 728 A.H. [A.D. 1328]).²

But the most vigorous and complete confutation of astrology is contained in the *Miftāḥ dār as-sādāh* of Ibn Qayyim al-Jauziyyah († 751 A.H. [A.D. 1350]),³ one of the most noted theologians of the Ḥanbalite school. Only the famous work of Pico della Mirandola, *Adversus astrologiam*, can be compared to the 110 closely printed quarto pages of the confutation written by this Muhammadan theologian, whose impassioned polemics press upon the adversary with an infinity of subtle distinctions which prove the force of his dialectic.

In the theological world perhaps the sole defender of astrology is Fahr ad-dīn ar-Rāzī († 606 A.H. [A.D. 1210]), cited above. Famous especially for his great commentary on the Qur'ān, he composed also many theological, philosophical, and astrological works, and studied medicine and mathematics. Without doubt his confidence in astrology is due to his cultivation of the sciences, and this confidence already appears in his commentary on the Qur'ān.

No theologian seems to have followed Fahr ad-dīn ar-Rāzī in his bold interpretations of Qur'anic passages and of religious traditions. Besides, after the writings of Ibn Qayyim al-Jauziyyah and his predecessors, polemics about astrology could no longer reckon on any novelty of argument. The considerations developed by the great philosopher of history, Ibn Ḥaldūn († 808 A.H. [A.D. 1406]), in his historical *Prolegomena*,⁴ are alone deserving of notice.

7. **Astrology in common life.**—The four orthodox schools of jurisprudence and the Shi'ite school were already in existence when the war of the philosophers and theologians against astrology became fierce; accordingly, the anathema launched against it in the name of religion did not occupy much space in Muhammadan law, notwithstanding the fact that this had its chief foundation in religious doctrine. Among some jurists of a rather later age, however, we meet with open hostility to astrology. In Muhammadan law the buying and selling of useless things is forbidden; therefore some jurists⁵ teach that one may not sell or buy books of astrology. Another legal prescript does not admit the testimony of misbelievers; therefore some jurists, regarding the astrologer as a misbeliever, deny him the right of acting as a witness.⁶ But, before theological anathema smote it, astrology was deeply rooted among all lay classes of society. The courts of the 'Abbāsīd khalifs at Baghdād and of the numerous small dynasties which arose in the Muhammadan world after the 3rd cent. of the Hijra received astrologers with great favour and consulted them on affairs of State as well as on trifling matters of daily life. At the

foundation of Baghdād in A.D. 762, and at that of al-Mahdiyyah (in Tunis) in 916, the astrologers, summoned for the purpose, indicate the propitious moment for beginning the work. Many writings on apotelesmatics are dedicated to khalifs, sultans, and princes. In Turkey, even at the beginning of the 19th cent., one of the chief posts at court was that of *munajjim-bāshī*, or chief astrologer; and the case was similar in Persia, in India, and in Muhammadan central Asia.¹ In the *Thousand and One Nights* not only is the astrologer with his astrolabe mentioned several times (e.g., Nights 28 and 50 of the Egyptian edd.), but there is also a complete dissertation on the elements of astrology (Nights 254-257, in the story of the slave girl Tawaddud). Further, the considerable number of old Arabic astrolabes still existing in the East and in South Europe would alone suffice to prove the great diffusion of astrology throughout the Muhammadan world; and it found strong support among the students of astronomy. Cases of persecution of astrologers by the State are extremely rare. Al-Ḥākīm, Fātimid khalif of Egypt, who in 404 A.H. (A.D. 1013-1014) prohibited the study of astrology and banished from Cairo those who cultivated it, was an astrologer himself, and that decree of his is one of many acts of madness committed in the last years of his life.

In the Muhammadan countries into which European civilization has penetrated (which with the Copernican system has destroyed the bases of apotelesmatics) astrology has lost its importance and remains the monopoly of the popular classes, among whom it has degenerated into a form of prediction without any serious mathematical and astronomical basis. On the other hand, in countries where there is little or no European influence (e.g., in many parts of Morocco) apotelesmatics still flourish, but accompanied by only rudimentary astronomical knowledge. To-day in S. Arabia the function of the astrologer is exercised especially by the *qādī*,² i.e. by those whose duty it is to see that canon law is observed!

8. **Influence on European astrology.**—The astrology of the Latin Middle Ages from the beginning of the 12th to the end of the 15th cent. is really Arabic astrology. Its sole sources are Arabic (Albohali, Albohazen, Albumasar, Alcabitus, Alchindus, Almanson, Alphadol, Aomar, Gergis, Hali, Haly Heben Rodan, Messahala, Zahel, and some pseudepigraphical works), or at least translations from Arabic (e.g., the *Tetrabiblos* or *Quadripartitum* of Ptolemy, and the *Καπρός* or *Centiloquium*); the technical terminology is literal translation or mere corruption of Arabic words. In the 16th cent. the humanists rescued from oblivion the poem of Manilius and the crude compilation of Firmicus Maternus; but this was a mere literary exercise of no importance for the astrology of the 17th century.

In the Byzantine world also Muhammadan astrology leaves deep traces in many versions from the Arabic and from the Persian;³ so that side by side with the works derived from the classic Greek authors appear those of 'Απομόσαρ (Abū Ma'shar), 'Αχμέτ (Ahmad ibn Yūsuf ibn ad-Dāyah), Μεσσάλα (Māshā' Allāh), Σέχλ (Sahl ibn Bisrah), and other Arabic writers. Thus there frequently occur in Byzantine astrological writings Arabic and Persian names of planets or technical terms which no longer correspond to those of classical Greek.

¹ Cf. e.g., F. Bernier, *Événements particuliers des états du Mogol*, Paris, 1671, p. 96. See also J. T. Reinaud, *Monumens arabes, persans, et turcs*, Paris, 1823, ii. 367 f. For Persia see *Voyages du chevalier Chardin en Perse, et autres lieux de l'Orient*, new ed., Amsterdam, 1735, i. 242, iii. 163-165, 174-183.

² R. Manzoni, *El Yēmen*, Rome, 1884, p. 209; H. von Maltzan, *Reise nach Südarabien*, Brunswick, 1873, p. 164.

³ The Arabs and the Persians are called indifferently Πέρσαι.

Finally, the Jewish astrological literature of Europe, in which a conspicuous place is occupied by the works of Abrahām ibn 'Ezrā († 1167), is based exclusively on Arabic sources.

LITERATURE.—There is no work setting forth the content and history of Muhammadan astrology. For biographical and bibliographical notices of individual astrologers reference may be made to H. Suter, *Die Mathematiker und Astronomen der Araber und ihre Werke*, Leipzig, 1900 (completed in 'Nachträge und Berichtigungen zu "Die Math. und Astron."' in *Abhandlungen zur Gesch. der mathematischen Wissenschaften*, xiv. [1902] 157-185). The mathematical side of Muhammadan astrology and the explanation of several technical terms are set forth in the present writer's annotations on al-Battāni, *Opus astronomicum*, 3 vols., Milan, 1899-1907. Beyond two or three small pseudepigraphical writings of no importance, printed or lithographed in Cairo, and the dissertation of al-Kindī published by O. Loth (see above, p. 92, n. 2), there are no edd. of complete astrological works in the original text; there are, on the other hand, edd. of Middle Age Latin versions (15th-16th cent.), several of which have been cited in the course of the article.

II. ASTRONOMY.—1. Name.—The names 'ilm (or *ṣināʿat*) *an-nujūm*, 'science (or art) of the stars,' 'ilm (or *ṣināʿat*) *at-taʿjīm* denote both astronomy and astrology. For the former science Averroës¹ adopts the expression *ṣināʿat an-nujūm at-taʿālīmīyyah*, 'mathematical art of the stars,' which is found also in the original Arabic of the *de Scientiis* of al-Fārābī, where Gerard of Cremona translated it by 'astronomia doctrinalis,' misled by the double signification of the adjective *taʿālīmī*. The astronomy of observation is designated by Averroës² *ṣināʿat an-nujūm at-taʿjībiyyah*, 'experimental art of the stars.' Special names of astronomy are 'ilm *al-haʿāh*, 'science of the form [of the universe],' and 'ilm *al-aḥlāk*, 'science of the celestial spheres.'³ The branch of astronomy which deals with the construction and use of instruments for determining the time, especially for the purpose of regulating the times of the religious services in the mosques, is named 'ilm *al-miqāt*, 'the science of the time appointed [for the canon prayers],' and he who cultivates it is called *muwaqqit*.

2. Scope.—The Greek and Muhammadan conception of astronomy does not exactly correspond to the modern conception.

Al-Fārābī says in his treatise *de Scientiis*⁴ that astronomy has for its object the study of the celestial bodies and of the earth from these three points of view: (a) number, figure, order, and respective position of the spheres and of the celestial bodies; their magnitudes and distances from the earth; immobility of the earth; (b) celestial motions and their consequences with regard to the stars themselves (conjunctions and oppositions, eclipses, etc.); (c) magnitude of the inhabited part of the earth and its division into zones or climates; determination of geographical co-ordinates; effects of the rotation of the celestial sphere in regard to parts having different latitudes (varying length of the day, right and oblique ascensions of the points of the ecliptic, etc.). This scheme of the content of astronomy is found also in later writers,⁵ with the sole difference that the study of the magnitudes and distances of the celestial bodies and spheres comes to be considered under a category (d) separate from (a).

According to Avicenna, the astronomer studies 'the parts of the universe as far as regards their figure, their respective positions, their magnitudes, and their distances from each other; he further studies the motions of the spheres and of the celestial bodies, the estimate (*taqdir*) of the globes, of the axes (*l. quāṭib*) and of the circles [ideal] on which those motions take place. All this is contained in the *Almagest*.'⁶

The limits of astronomy are well defined by Ibn Haldūn († A. D. 1406):

Astronomy consists of the study of the celestial bodies and

³ See also above, I. 1.

⁴ This has reached us only in the Latin version of Gerard of Cremona († 1187), Paris, 1558. The part relating to the mathematical sciences has been translated into German by E. Wiedemann, 'Beitr. zur Gesch. der Naturwissenschaften,' xi. (*Sitzungsberichte der physik.-medizin. Societät in Erlangen*, xxxix. [1907] 74-101).

⁵ E. g., Muhammad al-Akfāni as-Saḥāwī, *Irshād al-qāṣid*, Calcutta, 1849, p. 84 f.

⁶ *Risālah Fi-ʿaṣm al-ʿulūm al-aqliyyah*, in the *Tis' rasāʾil*, Constantinople, 1298 A. H. (1881). The same definition is found in the *Chahār Maqālāh*, written in Persian about 1160 by Niẓāmī-i-Arūqī-i-Samarqandī (tr. E. G. Brown, Hertford, 1899 [extract from *JRAS*], p. 89).

motions as they appear to us; 'it is a most noble science, but it does not give, as is often supposed, the form of the heavens and the disposition of the spheres and of the stars as they are in reality.' It only indicates that from those motions there result for the spheres these forms and these dispositions. Now, as is known, it is not strange that from one and the same thing there should result necessarily two different things; therefore, when we say that those motions give as a result [those celestial configurations], we seek to argue the mode of existence of the result by means of the necessary cause; a proceeding which does not at all guarantee the truth. Nevertheless, astronomy is an important science, indeed one of the fundamental parts of the mathematical sciences.¹

The diversity of criteria and of purposes by and for which the physicist ('naturalis') studies celestial phenomena, in contrast to the astronomer ('astrologus'), is shown also in a passage of Averroës.² This conception of the philosophers is shared by the Muhammadan astronomers, for whom astronomy embraces spherical astronomy (with the theory of instruments), mathematical chronology, spherical trigonometry, and geography as based on mathematics (like that of Ptolemy); and it excludes all that for us would enter into the field of stellar physics and celestial mechanics. This is evident from the summary³ of the best systematic treatise on Muhammadan astronomy, viz. the unedited *al-Qānūn al-maṣ'ūdi*, composed in Arabic by al-Bīrūnī († A. D. 1048):

(a) General notions and fundamental hypotheses for the geometrical representation of celestial phenomena; (b) mathematical chronology, conversion of one era into another, festivals of various peoples; (c) spherical trigonometry; (d) circles of the celestial sphere and systems of co-ordinates; phenomena of the diurnal motion of the sphere with reference to the earth (amplitudes, solar altitudes, right and oblique ascensions of the points of the ecliptic, etc.); (e) form, dimensions, etc., of the earth; problems relating to terrestrial longitudes and latitudes; the direction of Mecca with regard to other places on the earth; geography on a mathematical-astronomical basis; (f) theory of the sun; (g) theory of the moon; solar and lunar parallaxes; (h) syzygies, eclipses, appearance of the new moon; (i) fixed stars and lunar stations; (j) theories of the five planets; geocentric distances and magnitudes of the celestial bodies and spheres; (k) problems of spherical astronomy as subserving astrology (calculation of the twelve celestial 'domus,' of the 'applicaciones,' of the 'projectiones aediorum,' of the 'directiones' and 'profectiones,' of the 'revolutiones annorum,' of the *mamarr*, of the planetary conjunctions, of the millenary periods).

Muhammadan astronomical writings, almost always in Arabic, can be classified under four groups:

(a) General elementary introductions which represent a perfected form of what the *Isagoge* of Geminus and the *Hypotheses* of Ptolemy were for the Greeks; belonging to this category—to cite only writings translated into European languages and edited—are the *de Imaginatioe Sphaerae* of Thebit (or Thābit) ibn Qurrah († A. D. 901), the compendium of Alfraganus or al-Farghānī († after 861), and the compendium of al-Jaghūmī († 1344-45);⁴ (b) systematic treatises corresponding in type to the *Almagest*, but more perfect—e.g., the unedited work of al-Bīrūnī cited above; the Latin translation of the *Almagest* of Geber (or Jābir) ibn Aflah, printed at Nürnberg, 1534, would belong to this category if it had not omitted all the mathematical and astronomical tables; (c) treatises of spherical astronomy for the use of calculators and observers; these are called *zīj* (plur. *zījāt*, *azyā*, *ziyājah*); they presuppose a knowledge of the general principles of cosmography and consist essentially of tables for calculation, illustrations of the use of the tables, and indications as to the manner of solving problems of spherical astronomy (for the most part without demonstration); the only treatise of this kind published and translated is that of al-Battāni;⁵ of the Persian treatise of Ulūgh Beg only the prolegomena (explaining the use of the tables) and the stellar catalogue have been edited and translated; (d) writings on special subjects—e.g., stellar catalogues, treatises on instruments, etc.

¹ *Prolegomena*, bk. vi. ch. xvi. (tr. de Slane, iii. 145 f.).

² *Comm. de Caelo*, bk. ii. ch. 57 (*Aristotelis Opera omnia cum Averrois Cordubensis commentariis*, Venice, 1562, vol. v. fol. 136r.-v.).

³ According to the indexes of the chapters given in the catalogues of the Arabic MSS in Oxford and Berlin.

⁴ *Sullākā Hawānānāyā*, the course of astronomy of Barhebraeus, ed. and tr. F. Nau (*Le Livre de l'ascension de l'esprit sur la forme du ciel et de la terre*, 2 pts., Paris, 1899-1900), although written (in 1279) in Syriac by a Christian bishop, belongs to this category.

⁵ To which is to be added the Latin translation, made in the 12th cent. by Athelhard of Bath, of Maslamah al-Maʿjirī's recension of the tables of al-Huwarizmi, ed. with an excellent German commentary by H. Suter, 1914.

3. Relation to Islām.—Muhammadan religious ritual bases some of its prescriptions on elements of an astronomical character. The hours within which each of the five daily ritual prayers is valid depend on the latitude of the place and on the epoch of the solar year; further, the legal time for the night prayer is between the end of the evening and the beginning of the morning twilight. The ritual prayer is not valid unless the face is turned in the direction of Mecca; hence the necessity of solving the astronomical-geographical problem of the azimuth of Mecca. The beginning and the end of the month assigned to the fast are determined not by the civil calendar, but by the actual appearance of the new moon; and the beginning of the daily fast is given by the morning twilight. Finally, special ritual prayers are prescribed at eclipses of the sun and moon, for which it is well to be prepared in time. All this presupposes a certain degree of astronomical knowledge; and, although the majority of theologians and jurists are not content with pure calculation for the appearance of the new moon, but require the actual sight of the phenomenon, it is evident that the religious precept must be a real stimulus to scientific study. This explains also why the Muhammadans have undertaken so much research into the complex phenomena of the twilight and of the conditions of visibility of the new moon—phenomena which were almost entirely neglected by the Greek astronomers. On the other hand, many passages of the Qur'an set forth the benefits which God has vouchsafed to men by means of celestial bodies and motions; at least they invite reflexion on the goodness and providence of God. Astronomy thus becomes an ally of religion.

4. Sources.—(a) *Arabian*.—A first element of an exclusively practical character is due to the Arabs before Islām. Like all other peoples who dwell in hot countries and are compelled to prefer night to day for travelling, the Bedawin made use of the stars for guiding their wanderings and for calculating (approximately) the hours of the night; they were thus familiar with the principal appearances of Venus and of Mercury, the places of the rising and setting of the more brilliant stars, and above all the annual course of the moon determined by noting its position in relation to 28 successive groups of stars called for this reason *manāzil al-qamar*, 'lunar stations.' Further, among the sedentary agricultural tribes, the seasons and many meteorological provisions (especially those for rain) were strictly connected with the annual rising of certain fixed stars¹ or else with the cosmic setting of the lunar stations. Hence, even in the 16th and 17th centuries, Arabic writers on astronomy still occupied themselves with the lunar mansions² and their *anōd*, or cosmic settings.

(b) *Indian*.—The Muhammadans owe the first scientific elements of astronomy to India. In 154 A.H. (A.D. 771),³ there came to Baghdād an Indian embassy one learned member of which introduced to the Arabs the *Brāhmasphuṭasiddhānta*, composed in Sanskrit in A.D. 623 by Brahmagupta. From this work (which the Arabs called *as-Sīnd-hind*) Ibrāhīm ibn Ḥabīb al-Fazārī drew the elements and the methods of calculation for his astronomical tables (*zij*) adapted to the Muhammadan lunar year. Almost contemporaneously Ya'qūb ibn Ṭarīq composed his *Tarḫīb al-aflāk*, 'The Composition of the Celestial Spheres,' which was based on the elements and methods of the *Brāhmasphuṭasiddhānta* and on other data furnished by another Indian scientist (K.n.k.h.), who came to Baghdād with a second embassy in 161 A.H. (A.D. 777-778). It seems that almost at the same time there was translated into Arabic under the name *al-Arkan* the *Khaṇḍakhādya*, written about A.D. 665 by the same Brahmagupta, but containing elements different from those of his other work. Abū Ḥasan al-Ahwāzī, a contemporary of al-Fazārī and of Ya'qūb ibn Ṭarīq, probably drawing on oral teachings of learned Indians, introduced to the Arabs the planetary motions according to al-Arjabhad (a corruption of Aryabhata, the name of an Indian astronomer who wrote in A.D. 500). These Indian works had many imitators in the Muhammadan world up to the end of the first half of the 5th cent. of the Hijra (11th cent. A.D.); some

astronomers (e.g., Ḥabash, an-Nairizi, Ibn as-Samh) wrote contemporaneously books based on Indian methods and elements and books with Graeco-Arabic elements; others (e.g., Muḥammad ibn Ishāq as-Sarāḥṣī, Abū Ṭ-Wafā', al-Bīrūnī, al-Ḥāzīmī) adapted elements calculated by the Muhammadan astronomers to great artificial cycles of years constructed in imitation of those of the Indians. For one of the characteristics of the astronomical books of India is their representation of the mean motions of sun, moon, and planets by the number of their revolutions in cycles of millions of years, starting from the supposition that at the beginning of creation sun, moon, and planets were all in conjunction in a given degree of longitude (e.g., at the first point of Aries), taken as the initial point of the celestial sphere, and that at intervals of millions of years they will all be in conjunction again at the same point.¹ Further, many treatises composed by the Arabs gave the roots of the mean motions for the meridian of Uzain (corrupted later into Azin and Arin, the Sanskrit Ujjayin), supposed to be the central meridian of the inhabited earth (90° E. of the first Ptolemaic meridian). From those Indian books the Arabs also derived their first knowledge of trigonometrical sines, of course in the form employed in India, i.e. for arcs of 3° 45' and for the radius of 3438'.

(c) *Iranian*.—A few years after the introduction of Indian astronomy, and before the end of the 8th cent. A.D., there was translated into Arabic the Pahlavi work entitled *Zik i Shatro-ayār*, 'Astronomical Tables of the King,' a name which became in the Arabic version *Zij ash-Shāh* or *Zij ash-Shahriyār*. The original was certainly composed in the last years of the kingdom of the Sāsānids, since the tables were based on the epoch of Yazdagird III. (16th June, A.D. 632); its elements were derived, not from Persian observations, but from Indian books. It appears also that the roots of the mean motions were referred to the meridian of the mythical castle Kangdizh, which Persian epic legend placed in the Far East. The Arabic version met with great favour among the Muhammadans. We know that the astronomer and astrologer Mā Shā' Allāh († at the beginning of the 9th cent. A.D.) made use of it for his calculations, and that in the first half of the 9th cent. Muḥammad ibn Mūsā al-Ḥuwārizmī had deduced from it the equations of the planetary motions, whilst he had drawn the mean motions from the *as-Sīnd-hind* and other elements from Ptolemy, and that Abū Ma'shar († A.D. 836) used it for his astronomical tables. After the 9th cent. A.D. the *Zij ash-Shāh* rapidly fell into disuse; but a passage of az-Zarqālī (Arzachel) shows that towards the middle of the 11th cent. some astrologers in Spain still calculated the longitude of the fixed stars according to the tables of the Persians.

(d) *Greek*.—Last in chronological order is the influence of Greek astronomy. At the end of the 8th cent. or at the beginning of the 9th A.D. a rich patron, of the family of the Barmecids, Yahyā ibn Ḥalīd († 191 A.H. [A.D. 807]), caused the *Almagest* to be translated for the first time into Arabic. But this book, full of difficulties and obscurities, could not, at first, compete with easier and more practical works of Indian and Persian origin. It acquired influence later, when the mathematical preparation of the Muhammadans was more advanced, and when better translations appeared. In the first half of the 9th cent. also Arabic translations were made of the *Geographia*, the *Tabulae Manuales*, the *Hypotheses Planetarum*, the *Apparitiones (phaen.) Stellarum fixarum*, and the *Planisphaerium* of Ptolemy; the *Tabulae Manuales* of Theon of Alexandria; the book of Aristarchus on the magnitudes and distances of the sun and moon; the *Isagoge* of Gemini; two tractates of Autolycus; three of Theodosius; and the little work of Hypsicles on the ascensions. To the 9th cent. also probably belongs the Arabic translation of the astronomical tables of Ammonius, of which we still find traces in the 11th cent., when they were remodelled by az-Zarqālī, to pass afterwards into mediæval Latin literature under the names of Humenus, Armanus, etc. Finally, there appear to have been translated in the same century the book of the constellations of Aratus and a book on the magnitudes and distances of the celestial bodies, which, falsely attributed to Ptolemy, is known by the Arabs under the name of *Kitāb al-mansūrah*.

5. Some astronomical teachings.—We may here refer to some special points, which have an importance for the history of the general ideas of celestial phenomena. The only system received by the Muhammadan peoples was the geocentric. Aristotelian philosophy, the authority of Ptolemy, and the requirements of astrology were insurmountable obstacles to the conception of a heliocentric system, which, in any case, could not have been demonstrated by irrefutable reasons or, in the absence of telescopes, have procured any real advantage to practical astronomy. The lack of telescopes kept Muhammadan astronomers from becoming acquainted with other planets than those already known to the Greeks. The mode, too, of representing their motions is always that of the Greeks, viz. by means of combinations (sometimes very complicated) of eccentrics and epicycles; nor

¹ This Indian idea occurs also in some Arabic works which are not astronomical—e.g., Ibn Qutayba, *Liber poësis et poetarum*, ed. M. J. de Goeje, Leyden, 1904, p. 503 f.

¹ For details see Nallino, *Ibn al-Falāk*, pp. 104-140, 313-323 (for Arabic sources), 149-180 (Indian), 180-188 (Persian), and 216-229 (Greek).

² Alois Musil and Antonin Jaussen have found this usage still in vogue among the Bedawin of Moab. Eduard Glaser indicates it for the Yemen.

³ These correspond only approximately to the *nakṣatras* of the Indians.

⁴ So al-Bīrūnī. On the other hand, Ibn al-Qifṭī (a source of less authority) has 156=773.

do the modifications of certain parts of the planetary theories of Ptolemy introduced by some (e.g., Naṣīr ad-dīn and Qutb ad-dīn ash-Shīrāzī) depart much from this principle. Only among writers who are philosophers rather than astronomers do we meet with theories that supersede those of eccentrics and epicycles.¹ In any case, among them all, the Aristotelian and Ptolemaic doctrine of the circular form of celestial motions reigns supreme, for the elliptic orbit indicated by az-Zarqālī for Mercury² is merely a graphical construction on the lamina of the astrolabe, and not a theoretical representation.

(a) *Number of the spheres.*—The number of the spheres, i.e. of what in the Middle Ages in Europe were called 'heavens,' is eight in Aristotle and Ptolemy, viz. seven for the planets (including the sun and the moon) and one for the fixed stars. This number of eight is preserved by the first Arabic astronomers—e.g., al-Farghānī and al-Battānī, for whom, however, these ideal spheres, created to satisfy the requirements of physics and not those of astronomy properly so called, had no practical importance. Still the number of eight, combined with the Aristotelian theory of solid spheres in which the heavenly bodies are infixed without being able to move themselves, did not easily agree with the other teachings of the Ptolemaic system. Aristotle, who was ignorant of the motion of the precession of the equinoxes, and who consequently held that the fixed stars are really immovable, assigned to the eighth sphere the apparent diurnal motion of the celestial vault from east to west, a motion which the eighth sphere impressed also on all the others. But Ptolemy, accepting from Hipparchus the precession of the equinoxes on account of which the fixed stars have a slow and continued increase of longitude, came implicitly to attribute to the sphere of the fixed stars two motions in opposite directions—one (diurnal) from east to west, and the other from west to east. Ptolemy had no occasion to notice and correct this contradiction, which was soon perceived by the Arabic writers. The contradiction would have been easily eliminated by supposing that the fixed stars moved by the precessional motion within their own sphere, supposed accordingly to be fluid and not solid; and perhaps al-Battānī had in mind the possibility of this hypothesis when he entitled ch. li. of his book³ thus: 'Of the motion of the fixed stars, whether they move in their sphere, or whether the sphere moves with them.' Another solution of the difficulty would have been to suppose the fixed stars to be infixed in the convexity of the sphere of Saturn, itself naturally subjected, like all the planetary apogees, to the motion of the precession; then the eighth sphere, no longer containing the stars, would only have had the office of impressing the diurnal motion on the spheres below. This solution was actually given by Muhammadan writers, some of whom indeed took advantage of it for reducing the number of the spheres to seven, to conform with the seven heavens of the Qur'ān; but this was never accepted by the astronomers.⁴ Therefore, when Ibn al-Haitham († 1039) introduced into pure astronomical teaching the doctrine of the solid spheres of Aristotle, it was necessary for the physical reasons set forth above to add a ninth sphere without stars,

impressing on the other spheres diurnal motion. This ninth sphere, accepted by all the later astronomers, was called 'the universal sphere,' 'the greatest sphere,' 'the sphere of the spheres,' 'the smooth sphere' (*al-falak al-aṭlas*), 'the sphere of the zodiac,' 'the supreme sphere.' In general also the philosophers—e.g., Avicenna and Ibn Ṭufail—accept these nine spheres; Averroës,⁵ however, under the influence of Aristotle, cannot bring himself to exceed the number of eight. In the theological camp the nine spheres did not find many opponents, in spite of 'the seven heavens' mentioned in *Qur.* ii. 27; it was held that the specification of the number seven did not imply the negation of a superior number.⁶ In fact, several theologians saw in the eighth and ninth spheres respectively the 'seat' (*kursī*) and the 'throne' (*arsh*) of God mentioned in the Qur'ān.³

Doubts were not wanting, however, concerning the unity of the sphere of the fixed stars. Fahr ad-dīn ar-Rāzī⁴ informs us that Avicenna, in his book *ash-Shifā*, declared: 'Up till now it has not been clear to me whether the sphere of the fixed stars be a single sphere or be several spheres, placed one above the other.' And Fahr ad-dīn ar-Rāzī⁵ adds that the hypothesis of the single sphere for all the fixed stars rests only on the assumption of the equality of their motions, but that this equality is not at all certain. He further says that, even if the equality of the motions were a certainty, he would not deduce from it the necessity of a single sphere bearing all the stars infixed in it. In face of these criticisms, one comprehends the scepticism of Niẓām ad-dīn al-Ḥasan an-Naisābūrī: 'In conclusion, to none of the ancients or of the moderns is the number of the heavens quite certain, either by the force of reasoning or by the way of tradition.'⁶

(b) *Order of the planets.*—The order of the planets followed by almost all the Muhammadan astronomers is identical with that of Ptolemy, although they recognize, together with the Greek astronomers, the lack of absolute proofs in the case of the two inferior planets and the sun. Without telescopes they could not see the transits of Venus and Mercury across the sun or determine the parallaxes of the planets situated above the moon. Some Arabic authors believed that they had perceived transits of Venus or of Mercury across the sun; but what they really saw was solar spots.⁷ On the other hand, the postulates of astrology continued in the Muhammadan age to guarantee, from lack of scientific reasons to the contrary, the Ptolemaic series: moon, Mercury, Venus, sun, Mars, Jupiter, Saturn. Spain alone had astronomers who departed from this order. Jābir ibn Aflāḥ (c. 1140) held it more probable that Mercury and Venus were above the sun on account of their analogy to the superior planets in having epicycles and eccentrics, stations and retrogradations. Al-Bītrūjī (c. 1200), moved by physical reasons connected with his special system of planetary notions, placed the sun between Mercury and Venus.

(c) *Obliquity of the ecliptic.*—The obliquity of the ecliptic with regard to the celestial equator is one of the fundamental elements of astronomical calculation. The Greeks, from Eratosthenes (230 B.C.), had assigned to it the constant value of 23° 51' 20"; i.e., they held it to be invariable. The astonishment of the Arabic astronomers must have been great when they found by their observations an obliquity sensibly less; at first they could not decide whether the discrepancy was due to a real diminution of the obliquity or to a defect in the ancient observations. Al-Battānī leaves the ques-

tion undecided and declares that he chooses the excellent value found by himself ($23^{\circ} 35'$), 'since this was observed by us with our own eyes; the other, on the contrary, was received through the information of others.'¹ Some, less prudent, deduced the theory of libration² from the discrepancies as to the obliquity of the ecliptic combined with those relative to the precession of the equinoxes. But the continued series of observations left no doubt by the 13th cent. that the obliquity of the ecliptic was subject to a very slow regular diminution,³ which therefore came to be admitted by all the astronomers; in Europe, on the other hand, we must come down to Tycho Brahe (1546-1601) to see it affirmed in the midst of opposition which lasted through the greater part of the 17th century. The Muhammadan astronomers had no means of determining whether this diminution was continuous or periodical and within what limits it was contained.⁴ Abū 'Alī al-Ḥasan (c. 1260), who had accepted the hypothesis of az-Zarqālī as to libration, believed that the obliquity oscillated between a maximum of $23^{\circ} 53'$ and a minimum of $23^{\circ} 33'$; Fahr ad-dīn ar-Rāzī⁵ admitted a continuous diminution on account of which the ecliptic will coincide one day with the equator and then will depart from it again, so that the Tropic of Cancer will pass to the south and that of Capricorn to the north. Naṣīr ad-dīn at-Tūsī († 1274 A.D.) confined himself to setting forth the eight possible hypotheses as to the continuity or the periodicity of the diminution, without giving preference to any.

(d) *Precession of the equinoxes.*—The precession of the equinoxes, on account of which the equinoctial points retreat from east to west along the equator and cause a continuous increase in the longitude of the fixed stars (calculated precisely from the point of the vernal equinox or the first point of Aries), is one of the greatest discoveries of Hipparchus, accepted by Ptolemy. It was accepted by all the Muhammadan astronomers, who, from the first half of the 9th cent., assigned it a value much more exact than that of Ptolemy ($36''$ yearly), viz. $54'' 33'''$; later, a continued series of observations indicated other values still more approximate to the true one. There remained a question which celestial mechanics alone has been able to solve with certainty: Is the precession to be regarded as continuous, so that in many thousands of years the retreating equinoctial points will accomplish the entire circuit of the ecliptic, or is it confined within limits so as to be reduced to one oscillation, more or less great, of the equinoctial points? The first hypothesis, which is the true one, is accepted by Ptolemy; the second was followed by some Greek astrologers after the Christian era, who held that the equinoctial points, after having advanced 8° in 640 years, retreated 8° in a similar lapse of time, returning thus to the primitive point. According to them, the precession was $45''$ a year. Finally, it is necessary to note that, while some Indian writers are quite ignorant of the precession, others admit it in an oscillatory form with arcs of 54° or 48° (namely, 27° or 24° from the one part and from the other of ζ Piscium), which they imagined by gross mistakes and not for scientific reasons.

(e) *Hypothesis of libration or trepidation.*—The great majority of Muhammadan astronomers held that there was a continuous precession, rightly

attributing the discrepancies concerning its value to the imperfection of the observations of the Greeks. We know only three writers of the second half of the 9th cent. who, through Indian influence, accepted the idea of the oscillatory precession in the empirical form of the Greek astrologers mentioned above and of the Indians. On the other hand, Thābit ibn Qurrah († 901) suggested that the discrepancies in the estimate of the annual precession were due in reality to an apparent irregularity of that motion, and that they were connected with the discrepancies relative to the obliquity of the ecliptic. In an epistle which is preserved by Ibn Yūnus he says that he had up till then kept his own calculations private, because he regarded them as uncertain and only provisional. It seems that these secret papers formed the tractate which has come down to us only in two unedited Latin translations under the title *De motu octave sphaere* or *De motu accessus et recessus*.¹ In this tractate Thābit notes that, if all the known observations were exact, there would be a slackening and an acceleration in the motion of precession and in the increase and diminution of the obliquity of the ecliptic. In order to explain these apparently irregular variations, he proposes the following hypothesis:

The eighth sphere, viz. that which contains the fixed stars, has a movable ecliptic, the extremities of whose axis rotate about the equinoctial points of an ideally fixed ecliptic inclined $23^{\circ} 33'$ in respect of the equator; the complete rotation on those two small circles, having $4^{\circ} 18' 43''$ of radius, is accomplished in $417\frac{1}{2}$ lunar years. In this period the equinoctial points would seem to accomplish, with a motion not uniform, an oscillation of $21^{\circ} 30'$ ($10^{\circ} 45'$ forwards and the same backwards); in a similar time there will take place an unequal variation of the obliquity.

The hypothesis of Thābit was received in its entirety in Europe by Purbachius (1423-62) and by his commentators Reinhold and Nonius. The oscillation of the equinoctial points is called by the Arabs *ḥarakat al-iqbāl wa 'l-irbār*, 'motion of advance and of retreat,' whence the Latin name *motus accessus et recessus*; this was also called in Europe *motus octave sphaere*, in contradistinction to the motion of the ninth sphere, to which was attributed the motion of the continuous precession; finally, since the longitude of the fixed stars underwent the same oscillations of the equinoctial points, it was often called in Europe *trepidatio zizarum*. This does not seem to have had supporters among the Muhammadans of the East after the 11th century. It had greater fortune among the Muhammadans of the extreme West (Spain and Morocco). Towards 1060-70, at Toledo, az-Zarqālī, in order to make his observations agree with those of his predecessors, suggested that the poles of the ecliptic circulate about the equatorial poles, so that the equinoxes advanced by one unequal motion towards the east about $10'$ and then retreated irregularly by $20'$, accomplishing, i.e., an oscillation of $10'$ forwards and $10'$ backwards with reference to an equinoctial point ideally fixed. Every arc of $10'$ would have been passed over in 750 years, so that the complete cycle of the libration would be accomplished in 8000 years. The hypothesis of az-Zarqālī, explicitly denied by Averroës,² was accepted by al-Bīrūnī (c. 1200) in Spain and by Abū 'Alī al-Ḥasan (c. 1260) in Morocco; it also found great favour among the Jews and Spanish Christians and had an influence on the Hebrews, who, on a basis of Arabic sources, compiled about 1270 the *Tabule Alphonsine*.³

(f) *Motion of the solar apogee.*—Ptolemy (followed by all the later Greeks) says that he found the longitude of the solar apogee to be equal to that observed by Hipparchus, and consequently believes that it is immovable at $65^{\circ} 30'$, while the apogees of the five planets move with the motion of the precession. It is a merit of the Arab astronomers of the khalif al-Ma'mūn (813-833) that they recognized that the solar apogee is subject to the

¹ A suspicion arises, however, that this tractate may rather be by a grandson of Thābit, viz. Ibrāhīm ibn Sinān ibn Thābit, who wrote concerning libration (as al-Bīrūnī and Qāḍizādeh attest).

² *Metaphys.* p. 66 (Quirós, bk. iv. § 15).

³ It must be noticed that these Hebrews combined the hypothesis of Az-Zarqālī with fantastic elements; viz. they admitted a continuous precession accomplishing the circuit of 360° in 49,000 years (i.e. just about $26'' 27'''$ a year), which precession was to be always corrected on the basis of an inequality accomplishing its own period in 7000 years. They evidently wished to introduce into the hypothesis of trepidation Judaic elements—a thousand jubilee periods of 49 years and a thousand sabbatical periods of 7 years!

¹ Ed. Nallino, i. 12.

² See below, § (e).

³ This was already the opinion of Ḥāmid al-Ḥujandī, about A.D. 1000.

⁴ Only in the second half of the 18th cent. has celestial mechanics been able to establish the fact that it is a question of a very slow oscillation contained within limits of less than $2\frac{1}{2}''$.

⁵ *Mafatih al-ghaib*, i. 260, ii. 59 f.

motion of the fixed stars and of the planetary apogees, *i.e.* to the displacement of longitude due to the precession of the equinoxes. But the solar apogee has also another very small proper motion in longitude which, according to Leverrier, is only $11'46''$ yearly. This motion must have escaped the Muhammadan astronomers. The determination of the longitude of the apogee is not easy and, in times when telescopes and pendulum-clocks were lacking, could not be effected with absolute certainty in the minutes of arc; on the other hand, there was no term of comparison with ancient observations. One understands, therefore, why the majority of Muhammadan astronomers did not give to the solar apogee any other motion than that of the precession, attributing the small discrepancies to the imperfection of instruments and observations. It seems that Thābit ibn Qurrah, however, had dared to affirm the existence of a *proper* motion. Al-Bīrūnī¹ informs us that Thābit, author of a tractate on the inequality of the solar year, had determined 365 days, 6 hours, 12 minutes, 9 seconds, as being the length of the year which we call anomalistic, *i.e.* the time which the sun takes to return to its own apogee. If, then, the same Thābit (if we may rely upon a piece of information which Regiomontanus and Copernicus seem to have derived from the *De motu octavæ spheræ* cited above) determined the length of the sidereal year as 365 d., 6 h., 9 m., 12 s., it is plain that he must have attributed to the solar apogee a small proper motion added to that of the precession.² Certainly the values found by Thābit are excellent, since, according to the moderns, the anomalistic solar year is 365 d., 6 h., 13 m., 54·9 s., and the sidereal year 365 d., 6 h., 9 m., 10·7 s. It is beyond doubt that az-Zarqālī determined with great exactness ($12\frac{12}{100}$ every Julian year) the proper motion of the apogee, as distinguished from that due to the precession; and he therefore supposed that the centre of the eccentric of the sun moved over a very small circle, and by this was also settled the variation of the eccentricity of the solar orbit. Among us the proper motion of the apogee was discovered only in the 16th cent. by Kepler and Longomontanus.

(g) *Third lunar inequality.*—We need not notice other modifications of special points of Ptolemaic doctrines. It will be enough now to make a reference to a controversy carried on from 1836 to 1871 in the Academy of Sciences of Paris without any definite conclusion being arrived at, *viz.*: Is the discovery of the variation or third lunar inequality to be ascribed to Abū 'l-Wafā' († 998), as L. A. Sédillot maintained, rather than to Tycho Brahe? There would have been no reason for this dispute if that part of the *Almagest* relative to the movements of the moon had been better studied, and if the analogous discussions in the works of other Arabic astronomers had been examined with care. Carra de Vaux³ has demonstrated that the hypothetical theory of the variation was nothing else than the *πρόσνευσις* of Ptolemy, *i.e.* the difference between the true and the mean apogee of the epicycle by which difference the mean anomaly is corrected so as then to calculate the simple equation of the moon. Al-Battānī opportunely calls it 'equation of the anomaly.'⁴ It is curious to note that no one has observed that already in 1645 Bullialdus (I. Boulliau) had recognized that the *πρόσνευσις* corresponded to about half of the 'variation' of Tycho Brahe, and that consequently the

¹ *Chronology of the Ancient Nations*, Eng. tr., London, 1879, p. 61 f.

² The fact that Thābit wrote a tractate to maintain that the solar apogee does move is of no importance, since it is probably merely a confutation of the Ptolemaic immobility.

³ *L'Almagest d'Abū 'l-Wafā' al-Būzdjāni*, in *JA* viii. xix. [1892] 440-471.

tables of Ptolemy for the moon were sufficiently near to the truth.

6. *Opposition to Ptolemy.*—The many modifications of the doctrines of the *Almagest* never abandon the geometrical foundation followed by Ptolemy for the representation of the motions of the sun and planets, *viz.* a combination of eccentric circles and epicycles. This permitted the representation of celestial motions with all the exactness of which astronomical instruments were capable before the discovery of pendulum-clocks and telescopes; it was further obedient to the Aristotelian principle that celestial motions are circular only. Practical astronomy therefore did not feel the need of theories based on different geometrical principles. The difficulty arose only from a physical point of view, since the idea of numerous circular motions round an imaginary point was repugnant to the principles of Aristotelian physics. It was precisely in the name of Aristotelian natural laws that the battle began among the Arabs of Spain in the 12th cent. against the eccentrics and epicycles of Ptolemy; but their opponents were philosophers.¹

The first of these was Abū Bakr Muhammad ibn as-Sā'igh, known by the name of Ibn Bājah or Avempace († 1139), who is said to have explained the celestial motions by means of eccentrics only, rejecting the epicycles as repugnant to the physics of Aristotle; but we have no particular account of his system.² After him we find Abū Bakr ibn Tūfāil (*q.v.*; † 1185-86), famous in Europe for his *Philosophus autodidactus*, who said to al-Bīrūnī that he had found a theory of those motions quite different from that of Ptolemy rejecting both eccentrics and epicycles, and that he had promised to put it in writing. But it seems that the promise was not fulfilled. The ideas of Ibn Tūfāil probably influenced his friend Averroës (*q.v.*; † 1198), who affirms³ the physical impossibility of the geometrical hypothesis of Ptolemy. The astronomers, he continues, assign an eccentric to the moon because, since she is eclipsed now more and now less in one and the same point of the zodiac, they suppose that she traverses the cone of shade at different distances with regard to the earth. 'But this may happen also on account of the diversity of her position, if we imagine that the poles of the lunar sphere move around the poles of another sphere. If God shall prolong our life, we will investigate the astronomy of the time of Aristotle, since this seems not to contradict physics; it consists of motions which Aristotle calls *laulab* [*i.e.* spirals]. I believe that this motion consists in this, that the poles of one sphere move about the poles of another; since then the motion [resulting] is according to a line *leulebia* [*i.e.* spiral], just so is the motion of the sun [combined] with the diurnal motion [of the celestial sphere]. Perchance it is possible by means of such a motion to represent the inequalities which take place in the planetary motions.'

In his commentary on the *Metaphysic*, xii. 47,⁴ Averroës does not succeed in forming a clear idea of the system of Eudoxus from the scanty allusions of Aristotle and from the commentary of Alexander of Aphrodisias, which is very defective in this part, it not being clear in what manner the 'motus gyrativi'⁵ arise from two contrary motions, unless two different poles be supposed.⁶ He observes that by this hypothesis one could explain all the appearances of the planets: 'et iste motus, ut mathematici Hispanie dicunt, existit in orbe stellato, et vocant ipsum motum processus et reversionis.'⁷

Although Averroës did not complete his exposition,⁸ he had guessed a notable part of the hypothesis of Eudoxus (*c.* 409-356 B.C.), which was for the first time reconstructed by G. Schiaparelli in 1875. Averroës, like Eudoxus, allows only spheres concentric with the earth; he admits that the line *laulabi* may be the apparent result of two contrary circular motions—one of the sphere of the planets, and the other, in an opposite direction, of another sphere whose axis is inclined in respect of the axis of the first sphere; finally, the line *laulabi* corresponds to the *ἰστροπέδη* of Eudoxus, in the form of ∞ , which, according to the Greek geometers, belongs to the category of spiral lines (*σπείραι*), and, according to modern geometers, would

¹ Cf. L. Gauthier, 'Une Réforme du système astronomique de Ptolémée tentée par les philosophes arabes du xii^e siècle,' in *JA* x. xiv. [1909] 488-510; but this article is insufficient from a mathematical-astronomic point of view.

² See Maimonides, *Le Guide des égarés*, ed. and tr. S. Munk, Paris, 1856-66, ii. 185 f.

³ *Comm. de Cælo*, ii. 35 (*Aristotelis Opera omnia cum Averroës Cordubensis commentariis*, Venice, 1562, v. fol. 118v.-119r.).

⁴ Ed. cit. viii. fol. 331v.-332r.

⁵ Thus the Latin translator in the commentary on the *Metaphysic* renders the Arabic adjective *laulabi* 'spiral, in the form of a spiral or of a screw.'

⁶ And, in fact, this was the hypothesis of Eudoxus.

⁷ *I.e.* the motion of the libration of the fixed stars in the hypothesis of the Spaniard az-Zarqālī (see above, § 5, (c)).

⁸ Cf. also ed. cit. viii. fol. 329v. (on *Metaphys.* xii. 45).

be a lemniscate described on a spherical superficies instead of on a plane. There naturally occur in the hypothesis of Eudoxus some special conditions, of which Averroës does not seem to have thought; one does not understand, then, how the Arabian philosopher thought to save himself from the greatest objection which could be made to the system of concentric spheres, viz. that by making the distance of the celestial bodies from the earth always equal it did not permit of an explanation of the variation of the diameters of the sun and moon.

Another friend and disciple of Ibn Tufail, al-Bīrūjī (a native of Pedroche to the north of Cordova), attempted a complete system as a substitute for the geometrical hypothesis of Ptolemy,² by placing the data of observation of the *Almagest* in agreement with the peripatetic philosophy. He says that, moved by discourses of Ibn Tufail to meditate on this question, he had arrived at new theories by a kind of divine revelation. He admits with Ptolemy the nine spheres concentric with the earth; on the other hand, he denies the eccentrics and the epicycles. He finds it to be contrary to natural order that, while the ninth sphere impresses on all the others the diurnal motion of rotation from east to west, the spheres below the ninth should have besides a motion of their own in an opposite direction. In order to remove this contradiction, he conceives a whimsical theory which betrays the inexperience of the author in the field of practical astronomy.

According to him, the movements of the planets and of the fixed stars in longitude take place in reality from east to west, like the diurnal motion of the rotation of the heavens; those movements which astronomers have judged to be from west to east are simply illusory appearances due to the progressive diminution of the angular velocity of the spheres, according as a gradual approach is made from the ninth sphere to the earth.³ The ninth sphere accomplishes the 360° of circumference in 24 hours and communicates this motion to the spheres below; but the impulse grows weaker from sphere to sphere. That of the fixed stars, which is immediately under the ninth, accomplishes in 24 hours something less than 360°; and this little retardation brings it about that after 36,000 years⁴ it has accomplished a whole circuit less than the ninth sphere and appears to be moving very slowly in a direction contrary to it. Under the sphere of the fixed stars comes that of Saturn, considerably slower; it accomplishes in the space of about 30 years⁵ a whole circuit less than the ninth sphere. Thus Jupiter loses a whole circuit in 12 years; Mars in two; Venus, the sun, and Mercury in one; and the moon in a little more than 27 days. This, then, is the reason why all the spheres under the ninth appear to move in a direction contrary to it.

For physical reasons, therefore, al-Bīrūjī believes that the sphere of Venus is to be placed above the sun and that of Mercury below it. There remain to be explained the inequalities of the motions of the sun, moon, and planets. He says that he drew inspiration for this from constructions analogous to that by which az-Zarqālī had imagined the motion of the libration of the fixed stars. While az-Zarqālī made the poles of the ecliptic rotate parallel with the plane of the equator, al-Bīrūjī, in the case of the planets, made the poles of the planetary spheres move on inclined planes round the poles of the equator or of the ecliptic; from this it results that the planets describe lines *lulubine*, i.e. spiral, on a spherical superficies. Thus are also explained the stations and retrogradations of the planets. For this part, therefore, we have the partial resuscitation of the hypothesis of Eudoxus. The ideas of al-Bīrūjī were accepted by a fair number of Christians and Jews in Spain and Provence; and they had also an echo in Italy in the 16th century.

7. **Celestial physics.**—As is said above,⁶ celestial physics, according to Muhammadan and Greek writers, lies outside the field of astronomy; its problems are discussed in books of metaphysics, of physics in an Aristotelian sense, and of theology, or at least in special works, of which the greater part are now either lost or unedited.

Like Ptolemy, the most ancient Arabic astronomers neglect to define the idea of the celestial spheres and limit themselves to considering them in the mathematical aspect of ideal circles representing the movements of the heavenly bodies.

¹ Alpetragius of our mediæval writers.

² Of the book of al-Bīrūjī there has been published only an obscure Latin tr. (Venice, 1531) made from a Hebrew version. The Latin tr. made in 1217 at Toledo by Michaël Scotus is unedited, as is also the Arabic text.

³ This idea was already maintained by the *Ihwan as-Safa'* about the middle of the 10th cent. (see their *Rasa'il*, Bombay, 1905-06 A.H., II. 22-26) and by Fahr ad-din ar-Razi, *Mafatih al-Ghaib*, Cairo, 1303 A.H., II. 60 f. (comm. on *Qur.* II. 159) and vi. 117 f. (on *Qur.* XXI. 34). But they admit Ptolemy's eccentrics and epicycles.

⁴ This is the period of time in which, according to Ptolemy, the fixed stars accomplish the circumference, proceeding towards the east.

⁵ The duration of the heliocentric sidereal revolution of Saturn is a little less than 29½ years; it is, in the Ptolemaic hypothesis, the revolution of the centre of the epicycle of Saturn in the zodiac.

⁶ See § I.

The Aristotelian conception of solid spheres was introduced for the first time¹ into a purely astronomical treatise by Ibn al-Haitham; and he, in his unedited compendium of astronomy, gives the definition which was accepted afterwards by all the other writers of elementary treatises: 'A celestial sphere (*fulak*, plur. *aflak*) is a body completely spherical, bounded by two parallel spherical superficies having the same centre.'² In this, as he himself says, he drew his inspiration from the *Hypotheses Planetarum* of Ptolemy; in fact, as we see from a passage of Nasir ad-din at-Tusi, he followed the *Hypotheses* also in expounding how the celestial motions can be represented, and also by supposing simple equatorial zones of those complete spheres, so that the spheres of the epicycles become, as it were, tambourines (*duff*) rotating on their own axes, and the other spheres like armils.³ This second form of representation was soon abandoned, as contrary to the principles of natural philosophy.

Muhammadan writers agree with Aristotle in holding that the spheres and the celestial bodies are a simple unique substance, different from the four elements of the sublunar world, and forming a fifth element. The solidity also of the spheres, by reason of which the stars remain infixed within them, and by which the stars are carried round, is accepted by almost all,⁴ except a few theologians who, to support a strictly literal meaning of a passage of the Qur'an,⁵ maintain that the stars move within the spheres like fish swimming in water. The ideas of the majority of writers after the 4th cent. of the Hijra are those set forth in the dogmatic theology of al-Baidāwī († 1286) as follows:

'The spheres are transparent; since if they were coloured, our eyes could not possibly see that which is within them. They are neither hot nor cold; since otherwise the heat and cold would dominate in the elements of the sublunar world on account of their contiguity to it. They are neither light nor heavy; since otherwise in their nature there would be a tendency to rectilinear motion.⁶ They are neither moist nor dry; otherwise the facility or difficulty of taking certain forms or of attaching themselves would be manifested in rectilinear motion. They are not capable of quantitative motion; since, if the convexity of the external superficies were to increase, it would be necessary that there should be a void above it, which is absurd; and the same is to be said regarding concavity, since if this were to increase it would be necessary that one sphere should enter into another or that between the two there should be a void.'⁷

So also it is proved by Aristotelian reasonings that the motion of the spheres must be circular.

The greater number of Muhammadan philosophers accept the peripatetic doctrine that the spheres and the stars are living beings, rational, operating by their own will; that the spheres have souls which exist in their bodies as our souls in our bodies; and that, as our bodies move under the impulse of our souls towards the ends we have in view, so also do the spheres, which have as their end the serving of God. This doctrine is for the most part repudiated by the theologians: al-Ghazālī († 1111) does not deny the possibility of it, but he affirms that we are incapable of knowing it; on the other hand, Ibn Hazm († 1064), Ibn Qayyim

¹ This follows from the preface itself of Ibn al-Haitham and from the attestation of Muḥammad al-Akfāni as-Sahāwī, *Irshād al-qāsi*, p. 85.

² Only the spheres of the epicycles are full, i.e. are true globes.

³ These two forms of hypothesis are always found side by side for every planet, in bk. II. of the *Hypotheses*, published for the first time (1907) in German according to the Arabic version which takes the place of the lost Greek text (in Ptolemy, *Opera astronomica minora*, ed. Heiberg, p. 113 ff.).

⁴ The ancient Arab astronomers—e.g., al-Battāni (i. 124)—leave the question uncertain.

⁵ xxi. 34.

⁶ According to the Aristotelian theory (*de Cælo*, i. 8 f.), heavy bodies tend in a straight line towards the centre of the world, light bodies tend to withdraw in a straight line from the centre.

⁷ *Mejāl al-anwār*, Constantinople, 1305 A.H., p. 262.

al-Jauziyyah († 1350), and many others absolutely deny life and intelligence to the heavenly bodies. The philosophers of the peripatetic school and several theologians (*e.g.*, al-Baiḥāwī) hold that the movers of the celestial souls and consequently of the spheres are pure intelligences. Concerning their origin al-Fārābī, Avicenna, and their followers maintain a Neo-Platonic emanatory theory: from the first principle emanates the first intelligence, and from this are derived all the nine spheres by means of successive triads always composed of intelligence, soul, and body, until one arrives at the final or active intelligence from which is derived all the material of the sublunar world. This theory is vigorously opposed by al-Ghazālī and the other theologians.

The question of the marks on the moon is either neglected or only hinted at in the works hitherto published. The idea that the moon had valleys and mountains like the earth—an idea set forth by several Syriac writers—did not harmonize with the Aristotelian conception of the nature of the heavenly bodies and so could not be accepted by Muhammadan writers.

Observation of the solar spots is almost impossible to the naked eye; Fāḥr ad-dīn ar-Rāzī, however, explicitly affirms: 'There are those who believe that there exist on the surface of the sun spots, in the same manner as there are marks on the surface of the moon.'¹ These spots were actually seen on some occasions, but were erroneously believed to be transits of Mercury and Venus across the sun.

The comets and the other meteors (in an Aristotelian sense) were the subjects of observations and of numerous monographs. But, judging from the little that we know about them, Muhammadan writers followed in this matter the theories set forth by Aristotle in his books on meteorology.²

8. Conclusion.—The importance of Muhammadan astronomy in the history of science has been variously judged; sometimes Muhammadan astronomers have received excessive praise, sometimes unjust criticism, as if they had done nothing but preserve and transmit to Europe Greek science, improving it only in minor details. This harsh verdict is due not only to very imperfect knowledge of the Arabic writings on astronomy (of which the greater part is still unedited), but also to the fact that no account has been taken of the special conditions of astronomy in the glorious period of Muhammadan culture. The system invented by the Greek geometricians, and completed by Ptolemy, for representing all the celestial motions had mathematically all the precision that could be desired or attained by the use of the best instruments; it produced no sensible discrepancy between theory and the result of observation. The elliptic orbits of Kepler would not have given the theory greater perfection than it received from the complicated system of eccentrics and epicycles; the latter indeed had the advantage of preserving the Pythagorean and Aristotelian principle, which denied any but circular movement in the heavens. One must not forget that even in the heliocentric system of Copernicus the motions of the planets were still explained by means of combinations of epicycles—combinations which were in several cases less perfect than those employed by the Ptolemaic astronomy. To change the method of geometrical representation would therefore have been whimsical—a mathematical trick, which no datum of observation would have justified; and, in fact, those Arabs who wished to eliminate the

eccentrics and the epicycles¹ were philosophers rather than astronomers, and they propounded their hypotheses from data based only on Aristotelian physics.

It is thus easy to understand how it was that, *e.g.*, the astronomers of the khalif al-Ma'mūn and their successors saw no necessity for drawing from their observations of the movement of Venus² the final conclusion that Venus revolved round the sun. From the point of view of such phenomena as could be observed without telescopes, this second hypothesis had no higher value than that which made Venus revolve round the earth. In a word, celestial appearances gave no cause to shake the foundations of the geocentric system, which agreed very well with every religious notion, and which was supported by the authority of both Aristotle and Ptolemy, reinforced by a very potent element in Hellenistic and mediæval culture, *viz.* astrology. Giovanni Schiaparelli, in one of his monographs on Greek astronomy,³ has set forth clearly the decisive influence which astrology, brought into Greece by the Chaldæan Berosus (3rd cent. B.C.) and consequently received with great favour by the Stoics and Neo-Pythagoreans, had in the abandonment of the heliocentric system of Aristarchus. Astrological doctrine, based on the immobility of the earth in the centre of the world, was irreconcilable with any system which made the earth revolve round the sun or round any other body; astrology was thus a very powerful additional obstacle to the abandonment of the geocentric idea. Further, we must not forget that it was only in the 17th cent. that European physics reached clear proofs of the diurnal rotation of the earth and justified elliptic orbits and the heliocentric system, and that the really irrefutable argument for the revolution of the earth round the sun was furnished only in 1728 by the discovery of the aberration of the fixed stars.

An essential condition of all astronomical progress is to have at disposal a long series of methodical observations; and in this matter Muhammadan astronomers were obliged to begin, so to say, from the foundation. Ptolemy was the last Greek observer; but not even all the observations which he says he made are true. In several cases of capital importance—*e.g.*, regarding the obliquity of the ecliptic and the longitude of the solar apogee—he gave as agreeing with his own observations data found about 270 years before his time by Hipparchus, thus causing certain elements to be believed constant which are really variable. In other cases—*e.g.*, regarding the precession of the equinoxes—his observations are very rough. Theon of Alexandria (4th cent. A.D.) and Proclus (5th cent.) do no more than accept Ptolemy's elements, in some ways aggravating his errors; accordingly, during the seven centuries from Ptolemy to the first flourishing of Arabo-Muhammadan astronomy, we have not even one observation which is of use to the science. The first task, therefore, of the Arabic astronomers was to revise all the Ptolemaic elements of the celestial motions; it was a time not to form new theories but to collect the indispensable elements of fact by means of continuous observations more accurate than those of the Greeks. This task was accomplished by the Muhammadan astronomers in a marvellous manner;

¹ See above, § 6.

² They found (contrary to Ptolemy) that Venus has the same longitude of apogee, the same eccentricity, and the same equation of centre as the sun; and so the true longitude of the centre of the epicycle of Venus is always equal to the true longitude of the sun. This was the same as to suppose that the orbit of Venus is an epicycle whose centre is always the true place of the sun and runs over the solar orbit; in other words, it was equivalent to making Venus a satellite of the sun.

³ *Origine del sistema planetario eliocentrico presso i Greci*, Milan, 1898, § 55.

¹ *Mafatih al-ghaib*, i. 259, on *Qur.* ii. 27.

² On falling stars see present writer's art. in *Rivista degli Studi Orientali*, viii. [1920] 375-388.

indeed, we must come down to the time of Tycho Brahe (1546–1601) to find observers and observations comparable to those of the Muhammadan Middle Ages. Further, by founding trigonometry in a modern sense and developing it to a high degree they furnished astronomical science with an excellent instrument for its work.

The influence of Muhammadan astronomy in Europe is so far-reaching that to treat of it at length would be to give the history of some centuries of European astronomy. From the 12th cent. to the end of the 15th the compendiums used in the schools were translated from Arabic or were based on Arabic writings; the astronomical tables and the processes of calculation were derived from Arabic works, among which must be classed (from the point of view not of their language but of their contents) the celebrated tables of Alfonso which were still used by many in the 16th century. Spherical trigonometry in Europe started from Arabic treatises; the famous Regiomontanus himself (1436–76) borrows more than appears on the surface from al-Battānī. Through the influence of these Arabic sources the ancient Latin technical terminology was greatly modified, and not only do Arabic astronomical terms enter into European languages, but Latin words acquire new significations by imitation of corresponding Arabic words. The words 'degree,' 'minute,' 'equation' (in its astronomical sense), 'equation of the centre,' 'argument' (of a table), and some others, owe their technical signification to ridiculously literal translations of Arabic writings. We cannot enumerate all that European astronomy owes to Muhammadan observers; it will be enough to recall that they rendered inestimable services even to writers of the 17th cent.—e.g., Halley—precisely because they offered the only certain means of checking elements determinable only by a comparison with observations separated by long intervals of time. The books of Regiomontanus, Purbachius, Copernicus, Tycho Brahe, Riccioli, etc., cite the observations which were known to them of their Oriental predecessors. The theory and practice of instruments in Europe has also Arabic sources. Finally, we must not forget the influence exercised by the Arabs in the way of example. They infused into the Christians and Jews of Spain a passion for continued observations and an idea of the perfectibility of astronomical science; from Spain this passion and idea spread through the rest of Europe, preparing the way for modern astronomy.

The conditions of the Byzantine mediæval world were not favourable to the development of the sciences. Nevertheless, Muhammadan culture, which left many traces in Byzantine astrology, had also its part in astronomical studies. In 1323 an anonymous Greek introduced the Persian astronomical tables of Shams ad-din al-Buhārī (Σάμψ Μπουχαρής), which were at once widely used; in 1346 George Chrysococcus made a new redaction of them, preserving at the same time many Arabic-Persian technical terms; and finally, about 1361, Theodore Meliteniotes reproduced these methods and these Persian tables in the third and last book of his *Ἀστρονομικὴ Τριβιβλος*, after having set forth in the first and second books the methods and the tables according to Ptolemy and Theon of Alexandria. Thus there was created at Byzantium also a new astronomical terminology different from that of the classic Greek; and sometimes even Greek proper names appeared transformed by their passage through Arabic-Persian sources, as *Θαούρης* in place of *Θέων*.

LITERATURE.—There is no satisfactory exposition of the astronomy of the Muhammadan peoples in the Middle Ages; the general histories of astronomy—e.g., those of F. Hofer, J. H. von Mädler, R. Wolf (the best of all), and Arthur Berry—are inadequate, antiquated, and often erroneous. J. E. J.

Delambre, *Hist. de l'Astronomie du moyen âge*, Paris, 1819, pp. 1–211, and 513–539, is not a history but an analysis (of very unequal value) of various works of Muhammadan authors; the part devoted to the unedited book of Ibn Yūnus (pp. 76–156) is especially noteworthy, but it has the usual defect of Delambre—instead of the analyzed processes of the author, it substitutes a series of formulæ found by Delambre himself. Useful, but to be used with great caution, is L. A. Sébillot, *Méthodes pour servir à l'hist. comparée des sciences mathématiques chez les Grecs et les Orientaux*, 2 vols., Paris, 1845–49; see also his *Mémoires sur les instruments astronomiques des Arabes*, do. 1841 (*MAIBL, Savants étrangers*, i.). The present writer's Arabic book quoted above, p. 90^a, n. 1, concerns only the earliest period (summary of H. Suter, in *Bibliotheca Mathematica*, iii. xii. [1912] 277–282). Many historical notices concerning the development of astronomical theories are to be found in the present writer's commentary on al-Battānī, *Opus astronomicum*, 3 vols., Milan, 1899–1907; short notices are to be found here and there in E. Wiedemann, 'Beiträge zur Geschichte der Naturwissenschaften,' nos. iii.–xxxviii. (in the *Sitzungsberichte der physikal.-medizinischen Societät in Erlangen*, 1904–1914) and in other small pamphlets by the same author. For biographical and bibliographical notices concerning individual writers see the excellent book of H. Suter, *Die Mathematiker und Astronomen der Araber und ihre Werke*, Leipzig, 1900, and 'Nachträge und Berichtigungen zu Die Math. und Astron.,' in *Abhandl. zur Gesch. der mathem. Wissenschaften*, iv. [1902] 157–185. For edd. and tr. of original texts see above, ii. 2.

CARLO ALFONSO NALLINO.

SUN, MOON, AND STARS (Teutonic and Balto-Slavic).—I. *TEUTONIC*.—I. Archæological evidence.—The world-wide symbol of the sun-wheel occurs in the earliest Scandinavian rock-markings. Rude representations of horses and ships, which may have solar significance, are also found. In 1902 a curious object, apparently connected with the sun-cult, was discovered near Trundholm in Sweden. It is a representation of a disk, having gilding on one side and spiral ornamentation on the other, with a horse in front of it, both horse and disk being drawn on a waggon.

2. Solar myths.—Sun and moon, day and night, summer and winter, are personified in the poems of the older Edda. The Valkyrie Sigdrifa invokes Day and the sons of Day, Night and her kinswoman.¹ Various passages from *Grimmsmål*, *Vafþrúðnismál*, and *Völuspá* are summarized by Snorri:²

'Night, who was of Jotun race, married Delling, who was of Aesir race, and their son was named Day.' 'Then Allfather took Night and her son Day and set them up in heaven and gave them two steeds and two chariots and they were to drive round the earth every twenty-four hours.' The earth is bedewed by the foam which falls each morning from the bit of Hirinfaxi, the horse of Night. Day's steed is called Skinfaxi and he lights up the whole world with his mane. 'Then said Gangleri: "Who steers the course of the sun and of the moon?" Mundilfari had a son Mani and a daughter Sol, whom the gods set up in heaven. They let Sol drive the steeds which drew the chariot of that sun which the gods made to light the world, from the sparks which flew out of Muspellheim [i.e. the world of fire and heat]. . . . These steeds are called All-Swift and Early-Awake, but under the withers of the horses, the gods set two wind-bellows to cool them, but in some old records that is called "isarnkol" [i.e. iron-coolness]. Mani steers the course of the Moon and rules over waxing and waning.'

The belief in the chariot and horses of the sun is very wide-spread; in Scandinavia, judging by the archæological evidence, it must have existed in very early times. We may have a reference to the same idea in Tacitus:

'Beyond the Suiones is another sea, sluggish and almost stagnant, by which the whole globe is imagined to be girt about and enclosed, from this circumstance that the last light of the setting sun continues so vivid till its rising as to obscure the stars. Popular belief adds, that the sound of his emerging from the ocean is also heard, and the forms of horses and the rays streaming from his head are beheld.'³

Like most other primitive people, the Scandinavians were struck by the phenomena of the eclipses, which they thought were caused by wolves.

'He who pursues her [i.e. the sun] is called Skoll; he frightens her and he will catch her; but he who is called Hati

¹ *Sigrdrifumál*, 2. ² *Gylfaginning*, x.–xii.

³ *Germ.* 45. Unfortunately the text is uncertain; some editors read *deorum* for *equorum* in the last sentence.

Hróðvitnison leaps in front of her, and he will catch the moon, and so it must be.¹ 'Skoll is the name of the wolf, who pursues the gleaming goddess to Ironwood. Another called Hati, son of Hróðvitni, goes before the fair bride of heaven.'²

Sun and moon will be involved in the final world-catastrophe.

'Then said Gangleri: "Of what race are these wolves [*i.e.* Skoll and Hati]?" Hár said: ". . . The old giantess rears the sons of many Jotuns and all in the form of wolves, and it is said that of the race of these wolves, there shall come one nightier than all, called Moon-Swallower and he . . . in demon's form shall seize the moon. . . . He shall fill himself with the bodies of doomed men, he shall stain the god's abode with red blood; the sunshine shall be black, and all the weather treacherous during the following summer."³

'Whence comes a sun, in the smooth sky,
When Fenrir [*i.e.* a monstrous wolf] has overtaken this one,
One daughter alone, shall the Elf-beam [*i.e.* the sun] bear,
Before Fenrir overtakes her.
The maiden shall ride on the mother's paths
After the Powers have perished.'³

3. Sun-worship.—Our knowledge of the religious practices of the Teutons is very meagre, and it is difficult to say how far the stories told in the two Eddas formed part of a living religion, even among the Scandinavians. We have, however, various references to the sun-cult from other sources. Procopius⁴ describes how in the island of Thule [*i.e.* Scandinavia] the sun does not appear for 40 days at the winter solstice. At the end of this period messengers are sent up into the mountains to watch for the rising sun. They send word to the people below that the sun will shine upon them in five days: thereupon begins 'the greatest feast of the inhabitants of Thule.'

The positive side of Cæsar's well-known description of Teutonic religion⁵ is probably true. The Teutons may well have acknowledged as gods such things as are 'objects of sight and by whose power they are apparently benefited, the sun, moon, fire,' although these were not their only deities. Observances in connexion with the sun and moon are forbidden in Christian sermons and penitentiaries. St. Eligius (588-659) tells his hearers that no Christian person 'calls sun or moon lords.' In the 11th cent. the *Decrees* of Burchard of Worms mention pagan traditions:

'Id est ut elementa coleres, id est lunam aut solem, aut stellarum cursum, novam lunam, aut defectum lunae, aut tuis clamoribus aut auxilio splendorem ejus restaurare valeres.'⁶

From Canute's Anglo-Saxon Laws⁷ we learn that 'heathenship is to honour heathen gods, and sun or moon, . . . etc.' We have perhaps a trace of sun-worship in *Landnámabók*:

'Thorkell Moon, the law speaker, was of the best conversation of any heathen man in Iceland. . . . He had himself carried out into the rays of the sun in his death-sickness and commended himself to that god which had made the sun.'⁸

We know little of Anglo-Saxon paganism. Bede, however, mentions a goddess Eostur, in whose honour April was called 'Eosturmonath.'⁹ The word 'Eostur' is identical with the Latin, Greek, Sanskrit, and Lithuanian names for the goddess of the dawn, or *Morgenröthe*, probably the same being who is referred to in the Lithuanian and Lettish folk-songs as the daughter of the sun.

Throughout Teutonic territory the first and second days of the week are named after the sun and moon. Sunna is mentioned with Wodan and Fráa in the Mersberg charm. Sol is counted as one of the *asynjur*.¹⁰

It is noteworthy that Snorri (see above) distinguishes between the physical sun and moon and the beings who rule over them and guide their movements. This distinction has been partly preserved in the Old Norse language, where the word *tungl* (A.S. *tungol*, Goth. *tuggls*, 'a star')

denotes the actual moon, and Máni the supernatural being who directs his course. The same idea seems to underlie many of the Lithuanian and Lettish folk-songs.

II. LETTISH, LITHUANIAN, AND OLD PRUSSIAN. — I. Mythology. — Our chief knowledge of the solar mythology of the Baltic peoples is derived from Lettish and Lithuanian folk-songs, the most significant of which have been translated and analyzed by W. Mannhardt.¹ In these poems the changes which pass over the face of the sky, especially at dawn and sunset, are viewed as a drama, the chief actors being sun, moon, the daughter of the sun, the sons of God, Perkun, the thunder deity, 'God' and 'dear Maria'—the last two being as frankly pagan as the rest. Often, of course, the poems are confused and inconsistent, and it must be remembered that the terms 'sun,' 'moon,' etc., sometimes stand for the presiding deity, sometimes for the actual sun, etc., personified:

'The Sun, in the apple garden,
Weeps bitterly.
The golden apple hath fallen
From the apple tree.'²

(Here there is a clear distinction between the deity and the physical sun.)

'The Sun dances over the silver mountain,
Silver shoes she hath on her feet.'³

(In this case sun and sun-goddess appear to be one and the same.)

'God,' who was at war with the sun for three nights and three days, is evidently a sky-deity. The sky itself is described as a 'great water' or a mountain:

'The Sun with two gold horses
Rides up the rocky mountain,
Never heated, never weary,
Never resting on the way.'

(In this and in other songs we get the wide-spread myth of the horses of the sun.)

2. The sun.—The sun is called in many of the songs 'daughter of God,' in Lettish sources *saules-maat*, 'mother of the sun.' She is married to the moon, who is, however, an unfaithful husband.

'It happened in the spring-time
That sun and moon did wed,
But the sun rose up early
And from her the moon fled.
The morning star was loved then
By the lone wandering moon,
Who with a sword was smitten
In deep wrath by Perkun.'⁴

The children of the sun and moon are the stars, who are called orphans, because they appear only at night after their mother, the sun, has abandoned them.

3. The sons of God.—The morning and the evening stars play an important part in the folk-songs, sometimes as a single being, sometimes in dual form. In Lithuanian sources they are called Auszrine and Wakarine⁵ and are described as the handmaids of the sun.

"Dear sun, daughter of God,
Who kindles your fire in the morning?
Who spreads your bed in the evening?" . . .
'Auszrine kindles the fire.
Wakarine spreads the bed.'⁶

In Lettish songs the morning and the evening stars are called the 'sons of God'—an epithet exactly equivalent to the Greek Dioskouroi. Like the Dioskouroi and the Ásvins of Indian mythology, the Lettish sons of God are connected with horses:

'Hither rode the dear sons of God
With steeds dripping with sweat.'⁷
'Folks say the moon has no steeds of his own.
The morning star and the evening star
They are the steeds of the moon.'⁸

⁸ *Ib.*

4. The daughter of the sun.—A favourite theme of the Lettish folk-songs is the wooing of the daughter of the sun by the son of God, the sun providing the dowry, often most unwillingly.

'Why are grey steeds standing
By the house-door of the sun?
They are the grey steeds of the son of God
Who woos the daughter of the sun.
The son of God stretches out his hand
Over the great water
To the daughter of the sun.
The sun cries bitterly
Standing on the mountain.
Why should she not weep?
She sorrows for the little maiden,
She sorrows for the dowry,
For the chest which is laden
With gold and silver gifts.'

This is a good example of a sunrise or sunset myth. The daughter of the sun is the red glow which is in the sky when the planet Venus appears, but soon afterwards melts into darkness or the full light of day. The 'dowry' seems to be the rays of the sun which light up the edges of the clouds and the tops of trees and mountains.

'The sun prepareth the dowry herself, gilding the edge of the forest of pines.'²

The daughter of the sun is almost certainly identical with the goddess mentioned by Lascius.³ 'Auscā dea est radiorum solis, vel occumbentis vel supra horizontem ascendens.'⁴

5. Dear Maria.—Mannhardt considers that the name Maria has been substituted for that of various pagan deities, but it is also possible that she stands for a particular goddess, perhaps the Perkuna tete (i.e. the aunt of Perkun) mentioned by Lascius: 'Perkuna tete is the mother of thunder and lightning; who receives into a bath the weary and dusty sun, and sends her out again next day washed and shining.'⁵ Maria also presides over a bath-chamber:

'Behind the mountains smoke is rising.
Who is it hath kindled fire?
Dear Maria heats the bathroom
Where bathe the little orphan maidens [i.e. stars].'⁶
¹ I ran down into the valley, into the bath-chamber of dear Maria.'⁷

According to Prætorius,⁸ the Nadravians worshipped a star-god Szeiwegsdukks, who is evidently the Snaixtix worshipped by the Sudavians in Samland and equated with Sol in the *Constit. Synod. Evangel.* of 1530. Lucas David⁹ calls Snaixtix the god of light and mentions him as one of the four deities who were invoked at agricultural festivals.¹⁰ This deity seems to have been worshipped in both male and female form: 'They more commonly called this godhead Szeiwegsdunka, a star-goddess, whom they consider the bride of the sky and through whose power the morning and evening stars are guided.'¹¹ Is this perhaps 'the maiden who weaves star-coverings,' mentioned in one of the folk-songs, and also the goddess whose place has been taken by dear Maria, and who was also known as the aunt of the thunder-god? The underlying idea may be that she is a goddess of fire, light, and heat.¹²

6. Cult.—We know little of the sun-cult of the Baltic peoples, although we know from Peter von Dusburg¹³ and Erasmus Stella¹⁴ that sun, moon, and stars were worshipped as important deities.

Prætorius¹ tells us that Bretkius (a historian of the 16th cent.) had observed that the Nadravians did honour to their gods by worshipping the different phases of the moon at various stages of their agricultural work.

In the course of his missionary journeys among the Lithuanians Jerome of Prague met with a people who worshipped the sun and who had a strange cult of a huge iron hammer. The priests justified this cult by telling Jerome that formerly the sun had been invisible for many months because a king had imprisoned it in a tower. 'The signs of the zodiac brought help to the sun, and broke the tower with the huge hammer, and restored the liberated sun to men, and therefore that which had been the instrument by which mortals had received light was worthy of veneration.'² According to Rendel Harris, the signs of the zodiac here stand for the Heavenly Twins or 'Sons of God': 'These and similar cases all arise out of the same theme, that the Sun (or the daughter of the Sun) has been carried off, or swallowed or imprisoned, and must be recovered.'³ They use the hammer, the weapon of the thunder-god, because sacred twins are universally considered as children of the sky or thunder-god. In one of the Lettish songs they are described as 'workmen of Perkun.'

SUN-DANCE.—See PHALLISM, ix. 823.

SUNDAY.—i. History of Sunday before the Christian era.—Only three times in the NT is there any reference to a religious observance of Sunday. St. Paul urged his converts at Corinth to put aside money for charity every Sunday (1 Co 16²). Shortly after writing this he preached at a service held at Troas, which is mentioned as if it were a regular institution (Ac 20⁷). Thirty years later, perhaps, the author of the Apocalypse wrote: 'I was in the Spirit on the Lord's day' (Rev 1¹⁰). Though not quite conclusive, the evidence makes it probable that the observance of Sunday began among St. Paul's churches, which were predominantly Gentile. Now we cannot suppose that Gentile Christians, who were taught by St. Paul to protest against having the Sabbath imposed upon them, would yet accept from the Jews a whole system of reckoning time by weeks. It is important, therefore, to inquire how far the week was recognized in the Græco-Roman world independently of the Jews.

The week originated in Babylon, where it was invented for astrological reasons, but came to be used as a civil division of time. At first each month began with a fresh week, so that there were two or three odd days at the end. This was too inconvenient to last; and the weeks, emancipated from the month, ran on in an unbroken series. The gradual diffusion of Babylonian astrology carried a knowledge of the week into W. Asia, then into Egypt, and later still into E. Europe. The Israelites, when they invaded Canaan, found it established there and adopted it, as they did many other elements of Amorite culture; but the emphasis laid upon the Sabbath was their own.

In considering the recognition of the week in Europe it will be convenient to trace the evidence backwards. We may begin with Dio Cassius. Writing soon after A.D. 230, he says:

'The dedication of the days to the seven planets originated in Egypt, but has spread over all the world in comparatively

¹ *Deliciae Prussiae*, p. 18.

² *Aeneas Sylvius*, in *ib.* iv. 289.

³ *Boanerges*, p. 334.

recent times. The ancient Greeks, at any rate, knew nothing of it: but now it is established not only among all other peoples but even among the Romans, who already regard it as more or less a national tradition.¹

In the middle of the 2nd cent. Justin Martyr, writing for heathen readers, speaks of Saturday and Sunday (*τὴν Κρονικήν, τὴν Ἡλίου ἡμέραν*) as if they were familiar names to all.² Near the end of the 1st cent. Josephus boasts:

¹ 'Nor is there any city of the Greeks, nor any barbarian city, nor any nation, where our custom of resting on the seventh day has not reached.'³

That, no doubt, is an exaggeration; but it would have been meaningless unless division of time into weeks had been so familiar that any one might know which day was a Saturday. The belief that such was the case in the 1st cent. is supported by a picture which was found at Herculaneum, and therefore painted before A.D. 79. It contains the heads of the seven planetary deities in the order of their days—Saturn, Apollo, Diana, Mars, Mercury, Jupiter, Venus. Numerous references in Latin literature assure us that the Jewish Sabbath was well known as early as the Christian era. But only those are to our purpose which imply familiarity with the week. Such are the passages in Tibullus,⁴ Ovid,⁵ and Martial,⁶ which mention the observance of Sabbaths by Romans. But more remarkable is the fact that Horace,⁷ writing about 35 B.C., could represent an ordinary superstitious mother as making a vow for next Thursday (*Jovis dies*) and could describe how he himself attempted to escape from a bore by pleading that it was a special Saturday.⁸ Neither the vow nor the plea would be intelligible without the week as a familiar background.

2. Sunday in the primitive Church.—It was therefore not only the Jewish proselytes among St. Paul's converts, but all his Greek and Roman disciples, who reckoned their time by weeks and therefore found a weekly day of worship natural. To such, again, as were Jews by race it seemed actually part of the order of nature. That is why, we may well suppose, St. Paul's protests against the observance of the Sabbath or of any fixed days⁹ were but partially successful. The Sabbath, indeed, was given up by the churches which he founded. But, as a concession to his converts' habit of mind, another day of the week was chosen for worship. There could be no question what the choice should be, for the Lord's resurrection had given the first day of the week an unquestionable pre-eminence.

The name of this day which was current in the Roman Empire was 'the day of the sun' (*ἡ Ἡλίου ἡμέρα, dies solis*). The Jews, who avoided all use of heathen terms for either days or months, called it the first day of the week (*μία Σαββάτων*), and the earliest Christians followed their example. But a mere number was felt to lack distinction, and very soon an appropriate name was found, which contrasted alike with Sabbath and Sunday. The first day of the month, at least in Asia Minor, was usually called the 'Emperor's Day' (*Σεβαστή*).¹⁰ Now the early Christians, partly by way of challenge, applied to their Lord many of the official terms which were consecrated to the emperor, the lord of the earth. So it was probably not without reference to the term *Σεβαστή* that they entitled the first day of the week *Κυριακή*, 'the Lord's Day.' So apt a name was rapidly established. The author of the Apocalypse, writing about A.D. 90, uses it without explanation. To Ignatius¹¹ (c. A.D. 110) it

was a matter of course and a basis for argument. When the empire became Christian, the name entirely displaced 'the day of the sun' for all who spoke Greek or Latin. *Κυριακή* remains to this day in Greek; and in the Romance languages we find derivatives of *dies Dominica*—Dimanche, Domenica, and so on. But the Northern peoples, who in accepting the week from the heathen Romans had named the days after the corresponding Northern divinities, were more conservative. In England Sunday (A.S. *Sunnan Dæg*), in Germany *Sonntag*, in Sweden *Söndag*, have resisted all attempts to substitute either Lord's Day or Sabbath.

3. Observance in the Church before A.D. 321.—The records tell us very little about the manner in which Sunday was observed during the first three centuries, except that it was the day on which Christians assembled for worship. After St. Paul, who is quoted above, our first witness is the younger Pliny. His famous letter, written to the emperor Trajan in A.D. 104, tells how the Christians in his province of Bithynia held a service early in the morning 'on a fixed day' (*stato die*) and a common meal late in the evening.¹ Ignatius (A.D. 110) insists upon the contrast between the Lord's Day and the Sabbath.² A little later the *Teaching of the Apostles* ordains:

Κατὰ κυριακὴν δὲ Κυρίου συναχθέντες κλάσατε ἄρτον καὶ εὐχαριστήσατε προσεβόλοισι καὶ ἀλλήλοις τὰ παραπτώματα ὑμῶν, ὅπως καθαρά ἡ ψυχὴ ὑμῶν ᾖ.³

A simple service, before or after the day's work, was the only observance possible for a community most of whose members occupied very humble stations, while many were slaves. As the Christians advanced in numbers and in social position, they were able to command the time for a long service. Justin Martyr, writing about A.D. 170, describes one which must have occupied at least two hours; for it includes readings from the Bible, sermon, prayers, and Eucharist.⁴ And, since Melito, bishop of Sardis, just about the same time published a treatise *On the Lord's Day*, we may conclude that the services were being systematized.⁵ How important they were considered is partly shown by Tertullian's attack upon cowardly bishops, who excused themselves for fleeing from persecution on the ground that in such times they could not assemble a congregation or celebrate the Sunday rites: 'Sed quomodo colligemus, inquis, quomodo Dominica sollempnia celebrabimus?'⁶ From that time onward the position of Sunday as a holy day was unquestioned; and we need trace its history no further.

Just at that point we find the first suggestion of a Sunday holiday. Two sentences of Tertullian are worth quoting, both written while he was still a Catholic. In Sunday worship, he says, Christians avoid every trace of gloom, and even put aside business which might interfere with prayer ('differentes etiam negotia, ne quem diabolo locum demus').⁷ And, when he tells the Christians that they have more festivals in the year than the heathen, he implies that Sunday, like a Roman festival, is more or less a holiday: 'Si quid et carni indulgentium est, habes, non dicam tuos dies tantum, sed et plures. Nam ethnicis semel annuus dies quisque festus est, tibi octavus quisque dies.'⁸

It is to be observed that he compares Sunday with heathen festivals rather than with the Sabbath. So long as Jewish Christianity remained a power, or the hostility of Jews a thing to be feared, Gentile Christians were anxious to repudiate any connexion between the Sabbath and Sunday. The feeling was obviously strong when Ignatius wrote *μηκέτι σαββαρίζετε ἀλλὰ κατὰ κυριακὴν ζώετε*,⁹ and when the author of the *Epistle of Barnabas* described Sunday as *ἄλλου κόσμου ἀρχή*.¹⁰ Justin Martyr shows its influence when he derives the sanctity of Sunday from the creation and the Resurrection. Although Jewish Christianity disappeared from the West before the end of the 2nd cent., there is plenty of evidence that some of its traditions persisted in the Eastern Church for two hundred

years more. The *Apostolic Constitutions*,¹ e.g., recognized a parallel observance of the Sabbath and Sunday. And the Council of Laodicea (363), while condemning a Judaizing observance of the Sabbath, marked it as a festival and a day of worship. Different as was the East from the West, they were in constant communication; and the maintenance of the Sabbath in the East was a reason for keeping Sunday clear of Sabbatarianism in the West. Egypt, intermediate between East and West, was Western in its observance of Sunday. Accordingly Clement of Alexandria (c. 200) says that the Lord's Day is celebrated by putting away evil thoughts and acquiring true knowledge;² and Origen (c. 240) apologizes for the common observance of Sunday as a concession to the feelings of the weaker brethren. They, 'being either unable or unwilling to keep every day in this manner, require some sensible memorials to prevent spiritual things from passing altogether away from their minds.'³

A hundred years later Athanasius wrote to much the same effect: 'We keep no Sabbath day (but) we keep the Lord's Day as a memorial of the beginning of the second new creation.'⁴

St. Jerome follows in the same line. He tells how his party of recluses at Bethlehem attended Church services on Sunday, but otherwise pursued their usual occupations.⁵ St. Augustine, while insisting upon the festal character of Sunday—'Dies tamen Dominicus non Judaicis sed Christianis resurrectione Domini declaratus est, et ex illo habere coepit festivitatem suam'⁶—pronounces that the Fourth Commandment is in no literal sense binding upon Christians. His words seem framed to exclude the idea of any transference of obligation from the Sabbath to Sunday.

4. **Movement in favour of a day of rest.**—While the leaders of the Church gave no sanction to the idea that Sunday was the heir of the Sabbath, that idea was all the time gaining power among the mass of the Christian people in the West. Several causes combined to favour its growth. As the passage quoted above from Tertullian indicates, the numerous heathen festivals constantly suggested that a holy day should be a day of rest. Familiarity with the OT, whose authority was unchallenged, insensibly turned men's thoughts in the direction of Sabbatarianism. Increasing leisure and power enabled many Christians to command a day of rest. Greater stress was laid, as time went on, upon the duty of attendance at the Church services, which in many cases involved the abandonment of regular work. How steadily popular opinion was moving in the direction of a Sunday holiday may be inferred from a resolution passed in 305 by the Council of Illiberis in Spain, making the observance of the Lord's Day compulsory and ordaining that failure to attend the services shall be punished with excommunication. The Sabbatarian movement, therefore, like that for the worship of the saints, came from below. Theologians long resisted it, but at last yielded, and sought for reasons to justify a practice which the people had adopted. Among these we do not usually find either the duty of observing the Fourth Commandment in the spirit or the social need (recognized in Deuteronomy) of a day for rest and recreation. The reasons alleged are of a mystical and symbolical character, such as would naturally suggest themselves to theologians in difficulties. And yet the very contrasts which they draw between the Sabbath and the Lord's Day show the influence of the popular pressure, and prepare the way for the identification of the two which was to come in the 9th century.

St. Ambrose, e.g., describes how the first day has succeeded to the dignity which formerly belonged to the seventh: 'Ubi enim Dominica dies coepit praecellere, qua Dominus resurrexit; Sabbatum, quod primum erat, secundum haberi coepit a primo. *Prima enim requies cessavit, secunda successit.*'⁷ St. Chrysostom (c. 390) goes further. Commenting on 1 Co 16¹, he says that the first day of the week was well chosen for acts of charity, ὅτι καὶ ἀνεῖν ἔχει καὶ πόρων ἀρέλειαν. He thus actually carries back the Sunday rest into the year 57. And, when he writes about Ro 14⁵, he asserts that 'esteemeth every day alike' has reference only to fasting. The reason of so strange a misconception is doubtless that he regards the observance of Sunday as a matter of course. Although, therefore, he generally contrasts Sunday and Sabbath in the manner of his time, it is not surprising to find him once coming very near to the

later Sabbatarian view. In the 10th *Homily* on Gn 1 he writes: 'God from the first teaches us symbolically to set apart one whole day in the week and devote it to spiritual activities.'

Examples might be given from other writers. But these are enough to indicate the double process which was going on. While the official position of the Church was hostile to Sabbatarianism, the writers could not altogether resist the influence of popular opinion which was steadily moving towards it.

5. **Constantine's decree of A.D. 321.**—Parallel to the Christian movement in favour of a Sunday rest there seems to have been another, which was quite independent. The matter is obscure, and we must rely in part upon conjecture. As the social and industrial organization of the empire advanced under the Pax Romana, the sporadic festivals of the ancient calendar became more and more inconvenient. The efficiency of labour depends largely upon recreation; but holidays at irregular intervals are not effectual for recreation, and interfere sadly with organization. We can imagine that the heathen often reflected upon the contrast, to which Tertullian points, between the regular weekly festival of the Christians and their own uncertain celebrations; and that they wished that they could exchange their inconvenient holidays for a regular rest on 'the day of the sun.' Some such process of thought in the popular mind is required to explain the readiness with which the whole world, heathen as well as Christian, accepted Constantine's famous decree. Though he was doubtless influenced mainly by the wishes of his Christian supporters, it was not as 'the Lord's Day' but as 'the venerable day of the sun' that he described the new public holiday:

'Omnes iudices urbanaeque plebes et cunctarum artium officia venerabili die Solis quiescant. Ruri tamen positi agrorum culturae libere licentereq; inserviant, quoniam frequenter eventit ut non aptius alio die frumenta sulcis aut vineae scrobus mandentur, ne occasione momenti pereat commoditas coelesti provisione concessa.'¹

There has been much speculation about Constantine's motives. Eusebius would persuade us that they were wholly religious,² others that social and political considerations determined his action; but we have not sufficient evidence to decide the question. One thing is certain. The edict of A.D. 321 marks an epoch in the history of Sunday. It was the parent of a double series of legal enactments and conciliar decrees which exercised a great influence—both for good and for evil—upon the life of all Europe during many centuries.

6. **Later imperial decrees.**—With regard to the imperial decrees, it is important to remember that they affected an ever-decreasing area. The laws of Theodosius the Great, which forbade all litigation and the spectacles of the theatre and the circus on the 'dies Solis quem Dominicus rite dixerunt majores' (386), affected mankind from Spain to Mesopotamia. But its reiteration by Leo and Anthemius (469) was addressed only to Turkey, Greece, Asia Minor, Syria, and Egypt. The chief importance of those later decrees is that, enshrined in Justinian's Code, they set up a standard for the new nations which gradually rose out of the flood of barbarian invasion.

7. **Decrees of Church Councils (300-600).**—On the other hand, the decrees of Church Councils had an immediate influence not only in the areas which they represented but also to some extent throughout the former Roman Empire, for the Church maintained a large degree of unity. It is therefore worth while to record not only how the Council of Laodicea (363), ordering men to work on the Sabbath, badē them τὴν Κυριακὴν προτιμῶντες, εἰ γε δύναιντο, σχολάζειν ὡς χριστιανοί, but also how the Council of Orleans (538), while protesting

against an excessive Sabbatarianism, forbade all field work under pain of censure; and the Council of Macon (585) laid down that the Lord's Day 'is the day of perpetual rest, which is suggested to us by the type of the seventh day in the law and the prophets,' and ordered a complete cessation of all kinds of business. How far the movement had gone by the end of the 6th cent. is shown by a letter of Gregory the Great¹ (pope 590-604) protesting against the prohibition of baths on Sunday.

8. **Sabbatarian movement (600-800).**—It was a right instinct which led the people to demand, and emperors and councils to grant, that Sunday should be a day of rest as well as of worship. Up to the end of the 6th cent. the resultant changes in law and custom, in spite of some extravagances, were on the whole beneficial. But in the darkness of the next two centuries other influences came into play. The ceaseless wars and disorders which lowered the standard of civilization both in the Eastern Empire and in Western Europe threw all initiative into the hands of military or ecclesiastical rulers. Changes were no longer made in response to the people's demand, but were imposed upon them by rulers who were guided not by a sense of practical need but by monkish theory. Thus an edict² of Clotaire III. (c. 660) forbids servile labour on Sunday.

'Quia hoc lex prohibet et sacra scriptura in omnibus contradicit.'

Among the laws of Ine, king of Wessex (c. 690), we find the following:

'If a "theowman" work on Sunday by his lord's command, let him be free; and let the lord pay xxx shillings as "wite." But if the "theow" work without his knowledge, let him suffer in his hide, or in "hide-gild." But if a freeman work on that day without his lord's command, let him forfeit his freedom, or sixty shillings: and be a priest doubly liable.'³

9. The Christian Sabbath from 800 to 1500.—

(a) *Decrees of rulers and councils.*—Though the decrees of the 7th and 8th centuries were obviously part of a Sabbatarian movement, the term 'Sabbath' was not applied to Sunday until Aleuin had written:

'Cujus observationem mos Christianus ad diem dominicum competentius transtulit.'⁴

Under his inspiration the new feeling, long fluid in society, was crystallized in Charlemagne's decree of A.D. 789, which forbade all ordinary labour on Sunday as a breach of the Fourth Commandment. In particular it forbade agricultural labour, which Constantine had expressly permitted, and the holding of markets, which Constantine had appointed in order to encourage country people to attend the church services: 'Provisione pietatis suae nundinas die solis perpeti anno constituit.'⁵ From that time onward the identification of Sunday with the Sabbath was taken for granted, and from that principle deductions of increasing severity were drawn by princes and ecclesiastics.

Among the decrees which were issued by princes for their own dominions we may mention that of the emperor Leo (c. 900) which forbade agricultural work in the Eastern Empire, and that of Edgar the Peaceable (A.D. 953) which extended the Lord's Day from 3 p.m. on Saturday to Monday's dawn. More interesting, because of wider influence, are the pronouncements of leading churchmen. In the 12th cent., e.g., Bernard of Clairvaux maintained that the Fourth Commandment required the Sabbatical observance not only of Sundays but also of holy days. In the 13th cent. Thomas Aquinas lent his immense authority to the same principle: 'Sabbatum . . . mutatur in diem dominicam . . . Similiter alius solennitatis veteris legis novae solennitates succedunt.'⁶ In the 15th cent. Tostatus, bishop of Avila, a learned canonist, laid down the law of the Christian Sabbath with a fullness of detail which rivals that of the

Pharisees. And the precepts of the learned were enforced and illustrated for the multitude by stories of miraculous judgments—ranging from toothache to sudden death—which had fallen upon those who profaned Sunday or Saint's Day by labour.¹

For five hundred years after Charlemagne Church Councils were much occupied with questions of Sunday observance. The following examples may perhaps be sufficient for the purpose of illustration:

A.D. 829—The Council of Paris re-enacts the prohibition of ploughing, marketing, and law business on Sunday.²

853—A Synod at Rome forbids markets and field labour.³

1009—A Council at Hexham (? Eingthamense) forbids markets, fairs, hunting, and ordinary labour.⁴

1031—The Council of Bourges forbids travelling, except in cases of necessity or charity.⁴

1050—The Council of Coyac (in Spain) forbids all 'servile work' and all travelling.⁴

1212—The Council of Pamiers commands all parishioners to hear *the whole* of the mass and preaching.⁴

1244—The Synod of Lyons found it necessary to limit the number of holy days, whose increase was causing various abuses.⁵

1322—The Synod of Valladolid ordained 'quod nullus in diebus Dominicis et Festivis agros colere audeat, aut manualia artificia exercere praesumat, nisi urgente necessitate, vel evidentis pietatis causa.'⁴

(b) *How Sunday was observed.*—What was the effect of all these exhortations? The constant reiteration of the same orders is general evidence that they had not been obeyed. But particular evidence is not lacking. In 1226, e.g., the prior of Walsingham, who held a market on Saturday and Sunday, granted half the profits to Sir William de Clare in exchange for other rights.⁶ And the records tell not only of journeys which emperors and kings made on Sunday, but also of three emperors who were crowned in St. Peter's at Rome on that day, causing thereby an immense amount of labour.⁷ Sunday, therefore, was not generally observed with anything like the strictness which Church authorities enjoined. Yet it was to a large extent observed as a holiday and a day of worship. How were the hours of leisure spent? In all the decrees of Councils and pronouncements of individuals, down to the 15th cent., there is no prohibition of any recreation except dancing, the singing of ribald songs, theatrical performances, and races in the circus.⁸ The last two prohibitions of the emperor Leo soon became needless, for theatre and circus ceased to exist. So from 900 till the Reformation there was practically no limit set to the amusements of the people on Sunday. What use was made of that liberty we may infer partly from the decrees of Councils in the 16th cent. and partly from the Puritan reaction which soon began in Protestant countries.

10. The Roman Catholic Sunday in the 16th century.—

The Council of Cologne⁹ (1536) decrees: 'Cupimus his diebus prohiberi nundinas, claudi cauponas, vitari comissiones, ebrietates, sumptus, lites, lusus improbos, choreas plenas insanis, colloquia prava, cantilenas turpes, brevitur omnem luxum.'

The Council of Milan (1573) complains that Sunday is commonly profaned by markets, open shops, hawking, dicing, sports, conjuring, and theatrical performances. The Council of Rheims (1583) decrees:

'Nemo lusibus et choreis det operam. Venditiones quarumcunque rerum, his exceptis quae ad divinum cultum et victum necessarium pertinent, nundinae publicae, mercatus et auctiones, ne fiant diebus festis. Ludos etiam theatrales, etiam praetexta consuetudinis, prohibemus.'

The Council of Narbonne (1609) protests against the profanation of Sunday by dancing, singing,

hunting, hawking, markets, public feasts, and revelling, and allows none but travellers to be served in the inns.

These quotations prove that the Counter-Reformation led the authorities of the countries which remained Roman Catholic to recognize a duty with regard not only to Sunday labour but also to Sunday recreations. They seriously endeavoured to check the licence which had been allowed for many ages and had doubtless increased with the advance of material prosperity in the 14th and 15th centuries. It is difficult to estimate how far they succeeded in reforming the manners of the people. Peter Heylin, sub-dean of Westminster, whose *History of the Sabbath* is the most valuable book on the subject, is an important witness, for he travelled on the Continent very soon after the close of the 16th century. He sums up his impressions in these words:

'Nor is their discipline so severe as their Canons neither. So that the Lord's Day there, for ought I could observe, when I was amongst them, is solemnised after the same manner as with us in England: repairing to the Church, both at Masse and Vespers, riding abroad or walking forth to take the ayre, or otherwise to refresh themselves, and following their honest pleasures, at such leisure times as are not destinate to the public meetings: the people not being barred from travelling about their lawfull business, as occasion is, so they reserve sometime for their devotions in the publike.'¹

But Heylin, as an advocate, looks only on the fair side; and undoubtedly (as the decrees of the Councils imply) there were many regions in which Sunday was spoiled both by needless labours and by the coarsest amusements.

II. The Protestant Sunday in the 16th century.—The Reformers of the 16th cent. were in a difficult position, for, although they regarded both Gn 2 and Ex 20 as historical, they could not rest the institution of Sunday on either of the traditional grounds. They could not identify it with the Jewish Sabbath; nor could they admit that an ecclesiastical rule of observance, however venerable, was of unchangeable validity. Yet both feeling and reason urged them to maintain its obligation. Luther, Calvin, and the various catechisms and confessions put forward much the same view—to this effect:

The Fourth Commandment was abrogated by the New Testament: and ideally there should be no distinction between days. But human nature requires a day of rest from labour: the soul demands leisure for joint worship: therefore a day must be fixed for all. We cannot do better than follow the tradition which sets apart the first day of the week.²

Sound as that argument was, it had an unfortunate effect upon the minds of a generation who had been trained to rest upon absolute law and were not ready to accept reason in its place. To a vast number of Protestants Sunday appeared to have lost its authority; and there was a decided slackening of its observance. Heylin thus describes the state of things in the latter part of the century:

'There was no restraint on Sundays in the afternoone, from any kind of servile work, or daily labours; but that men might and did apply themselves to their severall businesses, as on other days. As for the greater townes, there is scarce any of them, wherein there are not Faires and Markets (Kirk Masses, as they used to call them) upon the Sunday: and those as much frequented in the afternoone as were the Churches in the forenoone. . . . So that in generall the Lord's day is no otherwise observed with them . . . than an half holiday is with us. . . . For recreations, last of all, there is no question to be made, but that where working is permitted, and most kinde of businesse, a man may lawfully enjoy himselfe and his honest pleasures; and without danger of offence pursue those pastimes by which the mind may be refreshed and the spirits quickened.'³

This is true, he says, of Holland, Belgium, Switzerland, France, and Germany, and part of Poland.

In England, where religious changes were far

³ II. 6, § 9.

less violent, the observance of Sunday in the reigns of Henry VIII. and Elizabeth was considerably stricter.

Both *The Institution of a Christian Man* (1537) and the queen's *Injunctions* (1558) lay down excellent principles. And yet one of the *Homilies*, published in 1563, sorrowfully confesses: 'The Lord was more dishonoured and the Devill better served on Sunday than upon all the dayes in the weeke besides.' King James's proclamation of 7th May 1603 is a significant confirmation of this complaint: 'Having been informed that there had been in former times a great neglect in keeping the Sabbath day,' he ordains 'that no Bearebaiting, Bull-baiting, Enterludes, common Playes, or other like disordered or unlawful Exercises or Pastimes be frequented, kept, or used at any time hereafter upon any Sabbath day.' And this was not because James was accustomed to great strictness in Scotland, where up to 1600 observance was on the whole less precise than in England. The early Calvinists were not Sabbatarians, and John Knox himself played bowls on Sunday.

12. The 17th and 18th centuries.—(a) *England.*—Till the reign of James I., as we have seen, England and Scotland kept pace with the movements on the Continent. But throughout the 17th cent. our island was the scene of a dramatic struggle which had no parallel elsewhere. The extreme Protestant type of mind has a natural affinity to the OT, and the Calvinists and other Puritan sects early felt the attraction. By a process somewhat like that which took place in the 5th and 6th centuries, they turned towards the Jewish Sabbath, and their steps were hastened by repulsion from the scandals of the 16th cent. Sunday. The movement, of which the early stages are obscure, came to a head in the publication of a remarkable book.

Nicholas Bownd, a Suffolk clergyman, in his *Sabbatum Veteris et Novi Testamenti, or the True Doctrine of the Sabbath* (1595), boldly and crudely claimed for Sunday the authority and the observances of the Jewish Sabbath and maintained that they should be enforced by the State. The book had an immense vogue. It was translated and circulated on the Continent, where it exercised much influence. In England, accepted as an inspiration by some and as a challenge by others, it gave rise to a literary controversy which lasted for a hundred years. The first reply to it was James I.'s *Book of Sports*¹ (1618), which proclaimed liberty for the people to enjoy their traditional pastimes on Sunday except bull- and bear-baiting. This was followed by the Sunday Observance Act (1625), which forbade men to go outside their own parishes in search of amusement on Sunday. The *Book of Sports* was republished by Charles I. in 1633, with a special admonition to justices of the peace: 'Look to it, both that all disorders there may be prevented and punished, and that all neighbourhood and freedom, with manlike and lawfull exercises, be used.'

In 1635 Francis White, bishop of Ely, published an official defence of this view; and in 1638 Heylin supported it with *The History of the Sabbath*, a book which shows much ability and learning. The controversy was continued, and 120 books on the subject were published in the next hundred years. Other weapons were used besides the pen. In 1643 Parliament ordered the *Book of Sports* to be burned by the hangman and imposed the Puritan Sabbath upon the ever-increasing area which their troops commanded. In 1648 they formally adopted the *Westminster Confession* and the *Longer* and the *Shorter Catechisms*. One quotation from the last-named must suffice.

'Q. 60. How is the Sabbath to be sanctified?—A. The Sabbath is to be sanctified by a holy resting all that day, even from such worldly employments and recreations as are lawfull on other days; and spending the whole time in the public and private exercises of God's worship, except so much as is to be taken up in the works of necessity and mercy.'

By successive enactments (1644, 1650, 1656) the same Parliament proscribed every kind of Sunday recreation, even 'vainly and profanely' walking for pleasure. At the Restoration the pendulum swung the other way. The court, the cavaliers, and the High Church clergy led the way in a violent reaction; and the return of the Prayer-book service on Sunday morning was accompanied by trading, open theatres, and ostentatious frivolity

¹ The full title of this work is *The Kings Majesties Declaration to his Subjects concerning Lawfull Sports to be Used*, London, 1618.

in the afternoon and evening. To what lengths the court went may be learned from Macaulay's description of Charles II.'s last Sunday night. There were many protests; and the battle of the books continued, Bishop Pearson, John Owen, and Richard Baxter being among the combatants. In 1677 a compromise was effected. The Sunday Observance Act regulated trade, labour, and travelling in a reasonable way, making ample allowance for 'works of necessity.' At the same time the Sunday Observance Act of 1625 was revived and came to be recognized as the standard by which amusements were to be regulated. Both acts were observed with varying degrees of strictness at different times and in different places. But it is no little tribute to their reasonableness that both remained in force until the year 1871, though they were modified in some details; e.g., in 1699 forty watermen were allowed to ply on the Thames, in 1710 coaches and chairs received permission to stand for hire, and in 1794 bakers to sell bread at certain hours. From the Revolution to the death of Queen Anne a higher standard prevailed, both of attendance at church and of obedience to the law. Under the Georges, though no change was made in the law, and though the same literary controversy continued, there was a steady decline in both respects. About 1780 the Evangelical Revival, following the movement led by the Wesleys, produced a considerable change in opinion and observance. How much need there was for improvement may be inferred from three actions of Bishop Porteous, who was a leader of the new school. He supported the institution of Sunday Schools, which began in 1780 and soon spread over the country. He persuaded the Prince of Wales to transfer the meetings of his rowdy 'Sunday Club' to a week day. And he drew up the Sunday Observance Act of 1781, which enacts that any place of public entertainment or debate where a charge is made for admission may be deemed a disorderly house. Passed in order to check bear-baiting and infidel propaganda, this act has been used of late to impede Sunday concerts and lectures to working-men.¹ For many years it was undoubtedly of great value, helping to restore the credit of Sunday in the public eye. But, when the rapid growth of large towns, due to the industrial revolution, presented new problems, this law combined with the restrictions of travelling to cause mischief. The mass of the industrial population, cooped up in towns which were almost destitute of churches, had no meeting-place but the street or the public-house. This evil became serious in the latter part of the 18th cent., but its full development was not seen till the 19th.

(b) *Scotland*.—Scotland very early in the 17th cent. adopted the theory of the 'Christian Sabbath' and applied it to social life with the ruthless logic which is characteristic of Calvinism. The *Westminster Confession* was adopted by the General Assembly of the Kirk of Scotland in 1647, before Parliament had passed it; and it has remained the formal standard of faith to the present day. So long as it was enforced by public opinion—i.e. till about 1870—the Scottish Sunday was observed with amazing rigour. Not only were ordinary recreations disallowed; a ban was put even upon books and music, except such as were recognized as religious in the narrow sense. No recreation remained but whisky-drinking, and a great part of the drunkenness which is still common in Scotland may be traced to an unwise Sabbatarianism. In parts of the Highlands and the Islands the old rigour remains; but in the greater part of

the country, as will be explained below, the last fifty years have witnessed a great change.

(c) *America*.—The American colonies differed in their practice. The more southerly States, such as Pennsylvania and Virginia, were inclined to English views of Sunday. The New England States, founded by Puritans, kept very close to the Scottish standard; but their coast towns were influenced by English practice, and their Western border by the practical necessities imposed by danger from their Indian neighbours.

(d) *Protestant Europe*.—Nicholas Bownd's book was translated into several Continental languages and exercised a considerable influence. In Holland and Switzerland a strong Sabbatarian party grew up; and in Protestant Germany his doctrine found rigorous advocates. But on the whole the Sabbatarians failed; and the observance of Sunday, especially in Germany, fell much below the standard in England. Sunday labour was very common, and Sunday amusements were very coarse.

(e) *Roman Catholic Europe*.—In Roman Catholic countries, during the same centuries, Sunday was so much eclipsed by the Saints' Days that it ceased to be observed with any kind of strictness. While the Saints' Days were real holidays, labour on Sunday was the rule rather than the exception. Till near the end of the 18th cent. the priesthood were powerful enough to secure a general attendance at mass; but the rest of the day was usually given to ordinary occupations. If in Spain Sunday was more a day of rest than in France or Italy, this was because it was the day set apart for bull-fights.

13. *From the French Revolution to 1848*.—The French Revolution marks an epoch in the history of Sunday observance. Its new calendar, with a week of ten days, though ephemeral and rather absurd, was a practical challenge to tradition, whose effects were permanent. The questions which it raised frightened some men into reaction, but excited others to free speculation. And it gave prominence to one fact, which no Government could afford to ignore for long. In every country there was an increasing number of citizens who did not acknowledge the Christian sanctions for Sunday, for whom, therefore, any rules for Sunday observance must rest on social rather than religious grounds. The recognition of this fact gradually affected the administration of the existing laws; and perhaps it may account for the complete absence of legislation between 1780 and 1850. In England the repulsion caused by the Revolution combined with the Evangelical Revival to render Sunday observance much stricter. The laws of 1677 and 1781 were rather rigidly enforced, and public opinion (among the minority who had votes for Parliament) was on the whole Sabbatarian. For the middle class and for all the people in country districts the movement was largely beneficial. The churches were filled; the sense of duty was strengthened; and habits of reflexion were induced. On the other hand, for the growing multitudes in the great towns the restrictions imposed by law became ever more cruel. Neglected by the Church, they had few places of worship and little will to enter them. They wanted means of getting into the country and opportunities of reasonable recreation in the town; but these were denied them, and nothing was left but the public-house. It was not till about 1850 that their needs were recognized. The active controversy which was carried on about Sunday concerned only the reasons for observing it. Several distinguished writers took part in the discussion, but they did little more than reproduce the well-worn arguments of the 17th cent. on either side.

¹ The present writer was threatened with prosecution in 1897 for lecturing to a Sunday Society in Bristol.

In France, though Napoleon re-established the Church, the hold of Sunday upon the public mind could not be restored. It remained to a large extent a day of trade and of labour, as well as of social amusement. In Spain and Italy there was no striking change. In Germany, which had been penetrated with French ideas, there was a marked decline. If we may judge by the books which were published there between 1780 and 1848, public opinion was averse to strictness based on religious grounds and not yet alive to the social reasons in favour of a day of rest. Sunday observance therefore, resting mainly upon tradition, naturally failed to maintain its hold.

The United States continued the division of opinion which had existed among the colonies of N. America. New England and the Western States, which were gradually peopled by emigrants from New England, remained Sabbatarian, while the Southern States, led by the Quakers of Pennsylvania, generally adopted the more liberal view. Between 1820 and 1850 many books were published on both sides, but no legislation resulted.

14. From 1848 to 1914.—From 1848, the 'year of revolution,' we may date a new phase of the Sunday controversy. Suddenly the masses of the people, especially in manufacturing towns, acquired a new consciousness and began to be regarded with a new interest. The consequences were not long in making themselves felt. Hitherto it may be said that the churches and the legislatures had, on the whole, worked in harmony. Since 1848 there has been a gradual divergence. For, while the churches were slow to admit the possibility of change, the legislatures, more and more influenced by popular opinion, tended to favour relaxations which were supposed to be required by new social conditions. At the same time an agitation began in some countries in favour of limiting the Sunday labour which vast numbers felt to be oppressive. These two elements were mixed in very different proportions in different countries.

(a) *England.*—In England, where Sunday labour was already severely limited, the main question was that of relaxation. In 1851 a lively controversy arose about two points. Should railway travelling be allowed on Sunday? And should the new Crystal Palace be open to the public on Sunday afternoon? The instances could not have been better chosen, for their discussion involved all the main principles which were at stake. Twenty years passed before any legislative result came of the debate. In 1871 an Act was passed requiring the consent in writing of the chief officer of a police district, or of two magistrates, before a prosecution for Sunday trading could be instituted under the Act of 1677. Since then the Sunday Observance Act has been a dead letter. And an Act of 1875 has very much limited the application of the Act of 1781. That did not end the debate. In 1875 the Sunday League was formed to advocate the opening of museums and picture galleries and other means of rational recreation on Sundays. In spite of several societies started in opposition, the Sunday League has gradually effected a great and beneficial change.

But the real crux of the situation is connected with travelling. Nothing has done so much to alter the habits of the people as the rapid increase in means of communication. The railway, the steamer, the tramcar, and the motor-car have successively helped to empty the towns on Sunday. They have answered a real need; for the strain of modern life has created a new craving for fresh air and change of scene, which finds satisfaction in the week-end habit of the richer folk and in the excursion train for the poorer. The desire for such recreation is natural and wholesome. At the same time it is responsible for two serious evils. (1) Those who spend Sunday away from home rarely devote any part of it to worship, and those who remain at home feel themselves thereby excused from attendance at church. Consequently the number of those who enter any place of worship on Sunday forms an increasingly small percentage of the population. (2) Every added facility for travel

on Sunday involves additional labour on the part of a large class of workers. The railways, the tramways, the restaurants, the bands, and the news agencies are so heavily tasked on Sunday that few of their employees enjoy anything like a day of rest.

Intent upon claiming what they considered their right to recreation and convenience, the mass of the people did not see what was involved in its satisfaction. Shops were increasingly opened, trains ran in ever-increasing numbers, and a large number of subsidiary industries were obliged to join the movement. Then contractors who were in a hurry took to Sunday work; and there was a real danger that the industrial population might lose their day of rest. About the beginning of the 20th cent. the trade unions and other bodies began to realize the danger; shop-assistants began to protest; and so a check was imposed upon the movement. In the first year (1914-15) of the Great War it seemed as if the national necessity might obliterate Sunday rest. Munition factories and many others were opened on Sunday, and double pay was offered for work on that day. But the result was uniformly a diminished output. Many of those who worked on Sunday for double pay spent the extra money in drink on Monday and Tuesday; and such as conscientiously toiled all seven days did so with rapidly failing energy. After two years Sunday work was generally abandoned; and it may be hoped that the nation has taken the lesson to heart.

(b) *The Continent.*—On the Continent during the latter half of the 19th cent. the same causes produced even more marked effects. In the eighties and nineties a stranger could hardly tell from the aspect of the towns whether the day was Sunday or not. But at last even the 'anti-clerical' Governments, which had looked on complacently at a change which diminished religious observance, became aware that it was causing immense social mischief; while on behalf of the overstrained workers urgent claims were made for a legal day of rest. Between the years 1895 and 1910 laws were passed, in almost every country of Europe, which were intended to secure a weekly holiday for every working-man.¹ Even in France, where the secularist influences were strongest, it was judged necessary to insist upon Sunday as the normal day of rest, all substitutes in special cases being regarded as exceptional. The general effect of this movement was a marked change in the aspect of the towns. In the year 1913 no factories were working on Sundays, and few shops were opened. Thus in a large measure Sunday observance has been restored, but with a difference. It is now popularly regarded, not primarily as a response to the religious need of worship, still less as obedience to a divine command, but as the condition of wholesome life for the labouring man.

15. *The present state of the question.*—The foregoing narrative should help us to discern the principles upon which Sunday observance ought to be based, and perhaps to determine the proper mode of observance, and the means by which it may rightly be enforced or encouraged.

Why is Sunday to be observed? It is easier for us to answer this question than it was for the theologians of the 17th and 18th centuries, and that for two reasons. Recent investigations into early Church history, of which the results are summarized above, have removed some prejudices which hampered our ancestors. We now know how gradually the observance of Sunday developed and how late was the theory which connected it with the Sabbath. And the modern study of the

¹ See the return made to the House of Lords on the subject in 1911.

OT has removed a difficulty which they could never fully meet. So long as the story of the creation in Gn 1 and 2 and the account of the giving of the Law on Mt. Sinai were regarded as historical, the question had to be faced: How can a divine command, directly given to men, be abrogated? The answer for us is plain: No such commands were ever given, and the stories which record them are legends. The Sabbath was made for man; and, under the guidance of Providence, it was made by man. Sunday, in its turn, was made by man and for man. Man, therefore, is lord both of the Sabbath and of Sunday. It is from the experience of men, both as individuals and in societies, that the reasons must be drawn which determine the manner in which Sunday is to be observed.

(a) *The new reasons for observing Sunday.*—These reasons are evidently of two kinds, answering to the conditions required for bodily vigour and spiritual health. While the former may be regarded as especially the concern of the State and the latter of the Church, the mutual influences of body and mind are so considerable and so intricate that in practice it is hard to draw a line between the sphere of politics and that of religion. It is all the harder because to ancient thought the distinction was unknown, and even in modern times is largely artificial. For the Church cannot ignore the body, nor can the State disregard the interests of the spirit. But happily no sharp division is necessary. The reasons given by the Reformers¹ are of general application and may satisfy both the Churchman and the statesman. Since three hundred years of controversy have added nothing substantial to them, we may be content with restating them in a more detailed form.

The need of bodily rest at short intervals is a fact of human nature which all civilized nations have recognized by instituting public holidays. The more complex the social and industrial organization, the more important it becomes that such holidays should recur at regular intervals. The sporadic festivals of the ancient Roman calendar and the Saints' Day system of modern Italy could not be tolerated in an industrial country; for production depends upon regularity of labour and the efficiency of labour upon regularity of recreation. Constantine's decree of A.D. 321, therefore, not only conferred a benefit upon the individual and satisfied a requirement of the Church, but also solved economic and social problems which were growing very difficult. Its wisdom is proved by the fact that, in spite of occasional protests and experiments, the Sunday holiday has remained the rule of civilized countries ever since.

The well-being of the people, which is the proper object of government, demands more than mere cessation of work at sufficient intervals. The life of the citizen is incomplete, and his value to the State is small, unless he cultivates his mind, develops family affection, and enjoys social intercourse. All these functions require leisure—not merely the tired hours after a day's work, but whole days when the time can be disposed of at will. It is in days of leisure, also, that personality has the best chance of development. The State, therefore, has a responsibility, not only for appointing holidays, but also for preventing such misuse of them as may diminish their value to the citizen and to the community. On the other hand, experience proves such responsibility to be of a negative rather than a positive character. The State can remove obstacles to a right course of action, but cannot compel the individual to walk therein. If any positive commands are laid down

for the weekly holiday, they must issue from a religious authority, which appeals only to spiritual sanctions, and affects only those who acknowledge its right. The Christian Church is such an authority, and has strong reasons, besides those just mentioned, for requiring its members to observe Sunday. Putting aside the mistaken claims for Sunday, which originated in the dark ages and were so hotly urged in the 17th cent., there remain some which are undeniable. The spiritual life of the individual requires a recurrent leisure time, in which he may read or meditate, may do acts of charity, and commune with his friends, with nature, or art. It requires, also, regular opportunities of joining in common worship, without which his membership of a Church becomes unreal. The former demand might be satisfied by times of leisure peculiar to himself. But the latter involves regular holidays which are common to all. Nor can it be a matter of indifference whether these holidays fall on Sundays. The power of association and tradition is enormous: no man can escape from it, and no Church can ignore it. To substitute another day would be to waste the accumulated associations and traditions of nearly 2000 years which are concentrated on Sunday. For on the Lord's Day Jesus rose from the dead; on that day, ever since, His disciples have met for worship and mutual comfort; on that day they have joined in the feast of His love. Luther did not state the whole case when he wrote: 'Because Sunday has been appointed from the earliest times, we ought to keep to this arrangement, that all things may be done in harmony and order, and no confusion be caused by unnecessary novelties';¹ for he ignored one of the strongest impulses in human nature.

(b) *The mode of observance.*—Assuming the above reasons for the observance of Sunday, we have to consider, from the point of view of Church and State, what ought to be the manner of its observance. The action of the State in such matters, as we have indicated already, is mainly negative. It has to protect the worker against the oppression of unbroken labour, to secure for him a regular period of recreation, and to prevent other persons from interfering, whether by force or by bribery, with his reasonable use of his leisure time. That task is not so simple as might appear. Every right, when exercised, imposes a duty upon some one else. The right to food involves the Sunday labour of the milkman; the right of the public to enjoy works of art encroaches upon the leisure of the custodians; the right to fresh air and green fields compels the toil of the railwayman. These classes also have their rights, which must somehow be safeguarded. To adjust conflicting claims in the interest of the people as a whole is a work of much insight and patience; nor can it be accomplished once for all, since every enlargement in the tastes and interests of the many involves a fresh tax upon the ministrations of a few. In Britain, happily, men seem to be approaching a general agreement about the main principles of such accommodations. No man should be required or encouraged to work on Sunday except for the benefit of a large number. The railwayman, the custodian of a picture gallery, or the musician who plays in a band, is engaged in a work of charity, if he is not adding a seventh working day to his week for the sake of profit. No such plea can be made on behalf of a manager who makes profit by the performances of others, or of a tradesman who opens his shops on Sunday. A partial exception is rightly made in the case of those who supply the public with needed refreshments. But even that requires careful watching;

¹ See above, § 21.

¹ *Larger Catechism.*

and the Government has long recognized the duty of limiting the sale of intoxicants to certain hours of the day.

The action of the Church, on the other hand, is positive. It aspires to guide men in their use of the leisure which is secured to them by the State. The primary duty which it inculcates upon all is that of attendance at public worship, for which the Sunday rest was originally instituted. But it also indicates proper uses for the hours which are not spent in such attendance. In the past such guidance took the form mainly of prohibitions. We have seen that, when the prohibitions were few, the result was licence; and, when they were multiplied, Sunday became a day of gloom and boredom. Not to speak of the Scottish 'Sabbath,' which has become proverbial, the restraints were mischievous enough in England till past the middle of the 19th century. The children of pious parents might not play on Sunday except with a Noah's ark. Boys and girls might not take exercise, but sat wearily still. Their elders, limited to 'religious' books or 'sacred' music, took refuge in sleep. Much harm was done to the cause of religion by such observances, and still more by the opposition which Churchmen raised in Parliament to every proposal for allowing rational entertainments for the artisans of the great towns.

A better spirit now prevails. But, while there is little of coercion by Church authority, there is very little of positive suggestion. The time has come when the Christian Church as a whole must formulate something like a programme, instead of leaving Sunday progress to individual experiment. Some such statement of principles as the following, if issued by authority, would relieve many troubled consciences and prevent much revolt.

(1) Sunday is the day for Christians to join in worship. No man spends it well who does not habitually unite with his neighbours in praise and prayer.

(2) Sunday is a day of recreation. Recreation means different things for different people, since an essential feature of it is change. The manual labourer will rest his body; the brain worker will seek exercise; both alike will be the better for a visit to a picture-gallery, or a concert, or a talk with friends.

(3) Sunday is the festival of family life. It is the only day on which most fathers can see much of their children. Unless some hours of the day are employed in cultivating family affection, its ties will be dangerously relaxed.

(4) Sunday is the day for meditation. The average man, if he does not devote some part of Sunday to reading or thought about matters outside his daily occupations, becomes a slave to routine and no longer possesses his own soul.

(c) *How far observance can be enforced.*—By what means can the due observance of Sunday be promoted? The primitive Church punished some offenders with excommunication; the mediæval Church employed the method of penance on a large scale. Both these weapons are now out of date; and they were never of much use for promoting what is best. In proportion as her rules advance from 'thou shalt not' to 'thou shalt,' the Church is less and less able to use any kind of compulsion. She cannot, in fact, compel her members to-day; she can only persuade them through the teaching of ministers and the opinion of neighbours.

The State, on the other hand, just because its commands are nearly all prohibitions, whose object is to protect the rights and interests of the community, can and must use compulsion. Every breach of positive law can be measured and punished by fine or imprisonment. Yet the main influence is really that of public opinion; for the magistrates and police, who administer the law, will always be strict or lax according to the general feeling of the society in which they live. The best means therefore of securing a proper observance of Sunday is to educate public opinion.

LITERATURE.—Many hundreds of volumes have been written on this subject. A very good account of some 300 will be found

in Robert Cox, *The Literature of the Sabbath Question*, 2 vols., Edinburgh, 1865. A few of them are historical, but the mass are arguments for and against the obligation of the Sabbath, in which the same ideas (very few) recur over and over again. The following short list gives specimens of the writings of different countries and denominations. The English predominate, for England has produced far more books than all the other countries put together.

(i.) 13th century.—Thomas Aquinas, *Exposition of the Commandments*.

(ii.) 16th century.—Martin Luther, *Larger Catechism* and other books; John Calvin, *Institutes*, bk. ii. ch. viii.; Philip Melancthon, *The Augsburg Confession*; Thomas Cranmer, *A Confutation of Unwritten Verities*; Richard Hooker, *Ecclesiastical Polity*, v. 69-71.

(iii.) 17th century.—Nicholas Bownde, *Sabbathum Veteris et Novi Testamenti or The True Doctrine of the Sabbath*, London, 1595, 41606; King James I., *The Book of Sports*, do. 1618; Francis White, *A Treatise of the Sabbath Day*, do. 1635; Peter Heylin, *The Hist. of the Sabbath*, do. 1636; Hugo Grotius, *De Veritate Religionis Christiane*, Amsterdam, 1627, reprint, Glasgow, 1745, bk. v.; *The Westminster Confession of Faith and Catechisms*, London, 1647, 1648; John Cocceius, *Indagatio Nature Sabbati*, Leyden, 1658; Edward Stillingfleet, *Irenicum*, London, 1659; Richard Baxter, *The Divine Appointment of the Lord's Day proved*, do. 1671.

(iv.) 18th century.—Thomas Morer, *Κυριακή Ἡμέρα*, London, 1701; Jonathan Edwards, 'On the Perpetuity and Change of the Sabbath,' Sermons xiii., xiv., xv., in *Twenty Sermons on Various Subjects*, Edinburgh, 1804; Isaac Watts, *The Holiness of Times, Places and People*, London, 1733, Discourse i., 'On the Perpetuity of a Sabbath'; *An Act for preventing certain Abuses and Profanations on the Lord's Day*, 1781; *Decree of the National Convention of France appointing a new Calendar*, 1793; Beilby Porteus, *A Letter to the Clergy of the Diocese of London*, London, 1789.

(v.) 19th century.—*Report of the Lord's Day Observance Society*, 1832; 'Edinensis,' *Sunday Railway Travelling*, Edinburgh, 1847; J. A. Hessey, *Sunday: its Origin, Hist. and present Obligations (BL)*, London, 1860, 51889; *Report of a Committee of Congress (U.S.A. 1833)*; *Report of the Committee of the Legislature of New York, on the Judiciary*, 1838; E. W. Hengstenberg, *Über den Tag des Herrn*, Berlin, 1852, Eng. tr. London, 1853; François Perennès, *De l'Institution du dimanche*, Paris, 1844; P. J. Proudhon, *De la Célébration du dimanche*, do. 1848; W. F. Crafts, *The Sabbath for Man*, New York, 1885; J. Lefort, *Du Repos hebdomadaire*, etc., Paris, 1873; C. Büttner, *Die Sonntagsruhe im Gewerbebetrieb und im Handelsgewerbe*, Leipzig, 1895.

Heylin and Hessey treat the question historically and with much ability. Parts of the history are well treated in articles and special chapters: Smith's *DCA*, s.v. 'Lord's Day'; *EBrl*, s.v. 'Sunday' (deals chiefly with legislation); *PRE3*, s.v. 'Sonntagsfeier'; *HDB*, s.v. 'Lord's Day' and 'Sabbath.' There is also a good chapter (ch. vii.) in W. E. H. Lecky, *Democracy and Liberty*, 2 vols., London, 1896.

M. G. GLAZEBROOK.

SUNDAY SCHOOLS.—I. Origin.—The history of the Sunday school is not the history of religious education. The latter has always existed; the former is a modern institution. The Sunday school is a voluntary lay organization conducting religious instruction in classes on Sunday, generally but not always in church buildings, generally but not always as part of a church organization. The informal instruction that was probably given by teachers in the early Christian communities was somewhat akin to the activity of the Sunday school teacher. But the catechetical schools¹ which flourished in the post-apostolic Church were entirely different. Moreover, the regular catechizing of children, which was always the duty of the minister, albeit a duty very much neglected for many centuries, was not a precursor of the Sunday school. Indeed, if it had been thoroughly effective and well developed, there might never have been a Sunday school. The failure of the clergy thoroughly to systematize and to develop the religious education of the children made the Sunday school necessary. Thus the Scottish clergy, who were more successful in the training of children, regarded the new institution at first as altogether superfluous. The origin of the Sunday school is to be sought in the sporadic efforts of earnest men and women to supply some elementary instruction to children who were neglected by the Church. The most notable instance of such effort was that of Robert Raikes at Gloucester; the name 'Sunday school' seems first to have been attached to his

¹ See art. CATECHUMEN, CATECHUMENATE.

institution; and there was genetic connexion between Raikes's enterprise and the whole Sunday school movement that succeeded.

2. *The period of beginnings.*—(a) *Robert Raikes and the first Sunday schools.*—The national duty of universal education was not fully recognized in England until fifty years ago. In the 18th cent. education was the privilege of the well-to-do. Even the many benefactions which had been provided from time to time for the education of the poor had become almost universally devoted to the children of the middle classes. Moreover, with the development of the factory system, the children had been forced into labour at a very early age, with the result that they grew up in hopeless illiteracy. Among a number of efforts to remedy this intolerable condition the most significant was that of Robert Raikes, editor of the *Gloucester Journal*. He was a man of generous sympathies, interested in various efforts to ameliorate the lot of the unfortunate. His attention was attracted to the vicious conduct of the 'young pagans' who were employed in the factories during the week, but who were at large on Sunday, and who naturally employed their single holiday in the only rough recreation which they understood. Believing that their ignorance was responsible for their depravity, he gathered a number of them into a school and secured four women at one shilling per day to instruct them 'in reading and the Church Catechism.' The date of this simple enterprise, which was soon copied in numerous towns, is usually set at 1780. Sunday schools became so popular that attention was given to them in the *Gentleman's Magazine*, and the various letters in that once influential periodical still remain our most important source of information regarding the beginning of the movement. Wesley, in his itineracy, soon came upon Sunday schools in various places, and with line insight immediately saw their possibilities.

(b) *The Sunday school in America.*—The American churches were accustomed to hold services in the morning and afternoon. There was an 'intermission' of an hour or more, during which a simple lunch was eaten. Naturally this period was often used for the catechetical instruction of the children, for whom the somewhat solemn services provided little that was appropriate. There is no evidence that any such practice was at all common previous to the Revolution. The catechizing of children took place in the schools, in the family, and in connexion with the pastoral visits of the minister. A large proportion of the children were of course altogether neglected. The period of the Revolutionary War was not favourable to religious education, and the strong influence of France tended decidedly away from religion. In the general desire of the churches to meet this condition, they turned with interest to the new institution of the Sunday school, which had been introduced into the United States from England. It was not in America primarily (though it was to some extent) a school held on Sunday for illiterate children who could not be instructed on weekdays, but rather a school conducted by the Church for religious instruction on the day set apart for that purpose. Thus from the beginning the Sunday school in America was more closely related to the Church than it was for a long time in England. This is not to say that there was not considerable opposition in the one country as in the other from clergymen who felt the danger of the intrusion of inexpert laymen.

(c) *Sunday school organizations.*—Within a few years of the establishment of the Raikes schools organizations for propagating the institution came into existence.

William Fox, a London merchant, had had in contemplation

a large plan for the gratuitous instruction of the poor. When he learned of the Raikes scheme, it seemed to him more practical than his own more ambitious project; and he took the lead in forming, in 1785, the Society for the Establishment and Support of Sunday Schools. In 1796 was organized the Edinburgh Gratis Sabbath School Society. Others were formed in other Scottish cities. In 1810 the Hibernian Sunday School Society was organized in Dublin. These societies collected funds for the establishment of new schools, for the payment of teachers, for the purchase of Bibles, spelling-books, etc. The practice of paying teachers, although continued in a few places for many years, very soon gave way to the volunteer system, with the spread of the new institution. A number of young men who were giving their services in the Sunday schools of London felt the necessity of mutual help and conference, and organized in 1803 the Sunday School Society for this purpose. This organization became the most significant means of developing the Sunday school in Great Britain.

Organization began in America with the First-Day or Sunday School Society at Philadelphia, in 1791. It was undenominational in character and philanthropic in purpose. The visit of Albert May of London in 1811 greatly stimulated interest in Sunday school organizations. Many of them were formed in American cities. After a number of federations of these had been made, the desire for a national undenominational union resulted in the organization in 1824 of the American Sunday School Union, which has continued to do effective work to the present time.

(d) *Lessons and methods of teaching.*—The earliest Sunday school teaching was of the most primitive sort. Many schools on both sides of the Atlantic were obliged to give much of their time to the simplest lessons in reading and spelling. Religious instruction consisted of the memorizing of Scripture, hymns, and catechism, the teacher simply listening to the recitation. Soon some simple plans of lessons were prepared, with some practical appreciation of child religion. Helps to the teacher were the *Sunday School Repository*, or *Teachers' Magazine*, which began in London in 1813, and the *American Sunday School Magazine*, started in 1824.

3. *Development of the Sunday school in America.*—(a) *Denominational organizations.*—The definite adoption of the Sunday school by the Church in America is seen in the steps taken by almost all the denominations subsequent to the organization of the American Sunday School Union to supervise and extend the work within their own churches. For example, in 1827 the Sunday School Union of the Methodist Episcopal Church was organized in New York City; Baptist and Congregational organizations starting in 1825 developed into the American Baptist Publication Society in 1840, and into the Congregational Sabbath School and Publishing Society in 1868. The superior church bodies of other denominations undertook similar responsibilities.

(b) *The Sunday School as a pioneer religious agency.*—It is easy in the light of our modern educational science to criticize the poor endeavours of early religious education, but no history of the wonderful development of the Mississippi valley would be adequate which failed to recognize the social significance of the little Sunday schools that went far ahead of the organized Church into the pioneer communities.

In 1820 the American Sunday School Union established its first western headquarters at Cincinnati, and in the following year resolved at its annual convention to undertake the organization of a Sunday school in every destitute place in the Mississippi valley. Funds were raised, lay and clerical missionaries were appointed, and a notable advance was made. A single missionary in the course of a life of arduous journeying organized over 1300 new schools. As it was said of old that where ten Hebrews lived there should be a synagogue, so it came to be the expectation in America that, wherever three or four Christian families were neighbours, a Sunday school should be started, at first in the farm-house, later in the school-house or in the court-house. Very many churches of the West had their origin in the activities of a few of the laity who had begun religious work by the organization of a little Sunday school.

(c) *The International Sunday School Association.*—The convention system has been characteristic of the American movement. Neighbourhood conventions were held before 1820. Springing from the annual meeting of the American

Sunday School Union, a national convention of Sunday school workers was called in 1832. After a very successful session this body adjourned to meet the following year. Numerous state and county conventions met in the succeeding years, until in 1859 a third annual convention was called. The fourth did not meet until after the Civil War, in 1869, and by that time the noted Illinois leaders, B. F. Jacobs, Edward Eggleston, J. H. Vincent, and D. L. Moody were prominent. While this convention was not called international, there were delegates from Canada and from the British Isles. The same was true of the fifth convention of 1872, at which the uniform lessons were adopted. The movement then became definitely organized as international, with delegates from all the states and provinces of North America. An official body was gradually developed, which supervised the extension of the system to state, county, and township conventions, meeting annually and leading up to the great triennial gathering. At the eleventh convention in 1905 it was resolved to incorporate under the name 'International Sunday School Association.' This was done in 1907, headquarters being established at Chicago. A completely articulated organization exists under an executive committee, with a general secretary and a corps of superintendents over the various divisions and departments.

(d) *The development of the lesson system.*—As an improvement on mere memorizing, the 'limited lesson' system came into vogue about 1825. Two years later Albert Judson published a question-book, which supplied some notes and explanations of the selected lessons. In the same year the American Sunday School Union issued the *Union Question-Book*, which was followed annually by others covering a considerable portion of the Bible. Various schemes followed, the result partly of private enterprise, partly of denominational zeal. There was no adequate direction, and Sunday school leaders felt the need of some unity of effort. After much discussion the convention of 1872 voted to issue a uniform system of lessons for all Sunday school pupils. A lesson committee was appointed, and great enthusiasm was developed in the scheme. The co-operation of the British Sunday School Union was secured, and the lessons became practically universal. Noted writers prepared lesson-helms and commentaries; great teachers' meetings were held for the exposition of the lesson of the forthcoming Sunday, and the public press frequently devoted a column on Saturday to this purpose.

After twenty years of great external success the educational value of the uniform lesson was seriously called in question. The subject was warmly debated in conventions. At last, in 1908, the convention decided, while continuing the uniform lesson, to authorize its lesson committee to prepare a thoroughly graded course, to be used by such schools as desired it. This has since been done, and a series of text-books has been prepared by the various denominations upon the lessons thus outlined.

(e) *Teacher training.*—It has been recognized that most Sunday school teaching has been very unsatisfactory. Efforts have been made almost from the beginning to effect improvement. The institutes held since 1837 for public school teachers were a challenge to the Sunday school, which was answered by the development of conferences and institutes. The normal class of J. H. Vincent in Illinois in 1857 was a model which many followed. Courses for normal training of increasing scope have been issued, until to-day those published by the various denominational societies and prepared by educational experts are of very high grade. A

summer school has been established at Lake Geneva, Wisconsin, where instruction for professional and lay workers is carried on during the vacation season.

(f) *The Sunday School Council of Evangelical Denominations.*—The activity of the various denominations in Sunday school work has very markedly developed during the last thirty years, until there has grown up a professional body of editors and secretaries representing the more definitely Church point of view. These leaders, feeling the need of a common expression of the denominational responsibility for religious education, organized in 1910 the Sunday School Council of Evangelical Denominations. Annual meetings are held, at which important problems of educational policy and administration are discussed. The existence of such a representative body naturally raised the question of future responsibility for the making of the lessons for the Sunday school world. The lesson committee has therefore been reconstituted, and now consists of eight members selected from the international association, eight members selected by the council, and one member selected by each denomination having a lesson committee.

(g) *The emphasis on religious education.*—The last quarter of a century has been marked by a growing emphasis upon the more serious educational responsibility of the Church. This was seen in the demand for the graded curriculum. In addition to the international lessons, several very significant courses of study have been produced, notably the *Constructive Studies* of the University of Chicago Press, the *Completely Graded Series* of Scribner, and several series of various denominations. In 1903 was organized the Religious Education Association to promote the educational ideal in religion and the religious ideal in education. The Association holds annual conventions or conferences, conducts studies and surveys, publishes a magazine, gathers in its offices in Chicago all significant material on religious education, and conducts an extensive correspondence of advice and stimulus on problems in this field. Several denominations have established Boards of Religious Education, which are undertaking the supervision of the entire educational work of the Church. Leaders of great ability are being selected as secretaries. In some cases these boards are preparing new and specially graded curricula.

The numerous agencies of religious education are being co-ordinated in the more progressive churches under a professional director of religious education. He is becoming the educational minister of the Church. Some colleges and universities and most theological seminaries have established chairs of religious education, by means of which a trained professional force is being developed and scientific work in religious education is being undertaken. An extensive literature has already been produced, both technical and popular.

4. *British developments.*—(a) *The Sunday School Union.*—The parent society in London developed into a nation-wide enterprise. In 1821 there were four metropolitan auxiliaries and sixty provincial unions, besides the Sunday School Society of Ireland and the Sabbath School Union of Scotland. The reports of that year show 4000 schools with 36,000 teachers, and 500,000 scholars. In 1823 infant schools were added for children below the ordinary Sunday school age, as in 1811 Thomas Charles of Bala, the Welsh Methodist leader, had already established adult schools. The latter subsequently became known as senior classes, and in time both infant and senior branches became part of a completely organized school. The Union celebrated its jubilee in 1853 by inaugurating a fund for the erection of

a permanent building. In 1862, at the time of the International Exhibition in London, a general Sunday school convention was held, attended by delegates from all over the British Isles, as well as from the Continent, the United States, and the Colonies. British Sunday schools were accustomed to meet in the morning and in the afternoon, and the Union had prepared annually a double series of lessons. Beginning with 1874, the British Lessons Committee co-operated with the American Committee in the production of the international series of lessons.

In 1880 was celebrated the centenary of Sunday schools throughout the United Kingdom, and a great convention was held in London to which delegates came from all over the world. As a result of this enlarged interest, the Union modified its constitution so as to become thoroughly national in character, representation to the counties being extended in 1890.

During the last thirty years the Union has developed a very significant philanthropic work, including country homes for poor scholars, a home of rest for lady teachers, a children's convalescent home, etc.

(b) *Educational progress.*—In the second quarter of the 19th cent. a forward movement in the science and art of pedagogy began in Scotland. David Stow organized the Glasgow Normal School for the training of teachers. Believing that the same principles could be applied to religious education, he published in 1826 a training system. The Union published in 1837 *Popular Education, or a Normal School Manual*. In 1856 a training class was organized at Pimlico. An attempt was made in 1861 to establish a college for Sunday school teachers, but it was found more feasible to develop a system of standardizing examinations. The college was finally established in 1899, and the examination system adapted to this organization. In addition to the publication of lessons and the encouragement of teacher training, the Union has developed a considerable literature for teachers and scholars, a separate building being required for this phase of its work.

5. *World Sunday school work.*—The Sunday school spread naturally through the English-speaking world. Various efforts were made, beginning as early as 1815, to establish it on the Continent, but with slight success. The convention in London in 1862, at the earnest solicitation of Albert Woodruff, undertook a continental propaganda. Sunday schools were established in all European countries. This movement was promoted by the world's conventions which met in London in 1889, in St. Louis in 1893, in London in 1898, in Jerusalem in 1904, in Rome in 1907, in Washington in 1910, in Zürich in 1913. At Rome the World Sunday School Association was organized, with American and British sections. Missionary work in China, India, S. Africa, and Europe was assigned to the British section; in Japan, Korea, the Philippines, S. America, and in the Muslim fields to the American section. The Association reported at Zürich the world Sunday school membership as 30,015,037, with 310,057 schools, and 2,669,630 officers and teachers.

6. *Non-Protestant Sunday schools.*—The Roman Catholic Church has adapted the Sunday school to its system, though without relinquishing the control to lay leadership. In the Hebrew Reformed Synagogue the Sunday school, generally under paid teachers, has become very effective. Among the Latter-Day Saints an excellent system of religious education has been developed, including the Sunday school. The Christian Science churches have established Sunday schools especially for children.

THEODORE GERALD SOARES.

SUNNITES.—1. *Distribution.*—Islām is at present divided into two great unevenly divided sections. The Shi'ahs (*q.v.*) are found in Persia and among the masses in India; the Sunnites in the Turkish empire as it was prior to the Great War, in N. Africa, Egypt, other parts of Africa, Central Asia, Afghanistan, India, China, and the East Indies. In India the ruling class is of Sunnite faith; in the Turkish empire there are numbers of Shi'ahs of the better class who make a point of concealing their religious convictions. The Muhammadan population of the world is estimated to be about 221,000,000, and of this total it is reckoned that about 15,000,000 are Shi'ahs; the rest are Sunnis. The Ibādīs (*q.v.*) of E. Arabia and N. and E. Africa are not relatively numerous and are neither Shi'ah nor Sunnite inasmuch as they claim descent from the Khārījite¹ schism of the early Umayyad period. The Zaidites (*q.v.*) of Yemen, though of Shi'ah origin, are on terms of fellowship with the Sunnites of Arabia.

2. The term 'Sunnite' and the early attitude towards the sunnah.—The Sunnite is the follower of the *sunnah* ('form,' 'outline,' 'mode,' 'usage'), or the view and usage of the Prophet. The issue implied in the use of the term is as to how new demands of thought are to be satisfied and new situations are to be met. The party of the *sunnah* contended that, where the Qur'ān did not fully and clearly provide direction, the inquirer should seek trustworthy information as to what Muhammad had said on the subject, what his action had been with relation to it, or what he had approved in others. The *sunnah* of the Prophet would be found embodied in a tradition (*hadīth*), and it was of the highest importance that the trustworthiness of traditions should be certified. They were tested, not by their intrinsic probability or by their consistency with other reports, but solely by the reputed reliability of the succession of persons through whom they had been handed down. If the *isnād*, or chain of guarantors, had no unreliable members, the contents of a tradition were considered to furnish unimpeachable support for the opinion or course of action on behalf of which they had been cited. This mode of arriving at the *sunnah* of the Prophet opened the way to the wholesale fabrication and perversion of traditions to suit the needs of persons hard pressed for arguments on behalf of causes honest or dishonest. Abū Hanīfah († 150 A.H.) seems to have felt that tradition as a basis of support was not sufficient. Possibly, as a Persian he lacked the Arab's respect for this mode of proof and sought a more rational method, but what determined his attitude to an

¹ See art. KHAWĀRĪJ.

even greater degree was probably the notoriously untrustworthy manner in which traditions were produced. He preferred to resort directly to the Qur'ān and, where it was not explicit, to decide according to his own view of what might fairly be inferred from its teaching as bearing on the question in hand. This method of obtaining direction involved two principles which the party of the *sunnah* for a long time viewed with distrust, viz. *ra'y*, or independent personal judgment, and *qiyās*, argument from the analogy of known cases to secure direction for new cases. Both of these were thought to imply disrespect towards inspired authority. Abū Ḥanīfah went farther than this in the readiness which he showed to depart from the written authority of the Qur'ān and the direction given by the *sunnah*. Even when these gave a clear decision, or where the principle of *qiyās* gave a definite instruction, the situation might suggest a better view or a wiser course of action. To follow such a suggestion was a duty. The principle here implied is termed *istihsān*, preference, or asking for the better thing. It involves personal independent judgment (*ra'y*) to a greater degree than the employment of *qiyās* does and is still more inconsistent with the early view of the party of the *sunnah* ('Ahlu-'s-Sunnah). Mālik ibn 'Anas († 179 A.H.) lived in the atmosphere of tradition at Medina, and tradition had more weight with him than with Abū Ḥanīfah. Still, where traditions were being forged at the rate he knew and for the purposes of which he was aware, there was room for a principle of decision in legal and doctrinal questions which would protect Islām against injury through capricious or irrational judgments. Mālik, therefore, admitted the rule of *istiṣlāḥ*, the seeking of the public welfare, which might override the dictation of the Sacred Book and the *sunnah*. The strict party of the *sunnah* opposed this rule, as it had the liberal practice of Abū Ḥanīfah; both allowed too much room to *ra'y*. To men accustomed to earlier conditions, when the absence of a *sunnah* which might cover all cases left room for decision on other grounds, the mere multiplying of traditions did not afford a sufficient reason for surrendering methods of obtaining guidance which had been followed when traditions were not available. Meanwhile the uninformed masses of Islām were strongly inclined to the simpler method of appeal to external authority. *Qiyās*, *istihsān*, *istiṣlāḥ*, and *ra'y* were too human, and hence too feeble and erring. The future of Islām largely depended on whether free scholarship (*ra'y*) or authority (*sunnah*) became the ruling factor in the community, whether the need of the Muslims was to be conceived according to the view of intelligent leaders or to that of the great body of the people with its clinging to old-established ways.

3. The Mu'tazilite reaction.—The traditional and rationalistic tendencies both went on developing, and the mutual antagonism between them was intensified. The rationalistic party became recognized as a party which favoured *ra'y*, lent its approval to Greek philosophy and Christian culture, and regularly employed the Aristotelian method of arriving at truth. The earlier *khalifahs* of the Abbāsīd dynasty had been interested in these things, but they became established and officially approved under the *khalifah* al-Ma'mūn († 218 A.H.). In the last year of his reign he instituted an inquisition against the traditionalists. This inquisition (*al-Mihna*) went on for sixteen years (218-234 A.H.), and, while it lasted, the orthodox suffered severely and their leaders were often under peril of death. This period of persecution, with the strenuous controversies which it witnessed, settled the characteristic marks of the

later Sunnī belief and also brought out and sharpened the weapons by which rationalism sought to destroy the positions of the 'Ahlu-'s-Sunnah. The latter applied to their opponents the name Mu'tazilah, 'dissenters' or 'seceders.' It was a name which had been used in a favourable sense of pious ascetics or hermits, but in the late 2nd cent. A.H. it was given an unfavourable significance and came to mean heretics. On the one side were the 'Ahlu-'s-Sunnah, and opposed to them were the 'Ahlu-'r-Ra'y, the Mu'tazilah. The fundamental question for both parties was the true conception of God. Was the view held by the one party or the other a view which did justice to the unity of the Supreme Being? Was it one which adequately set forth and protected His character as a perfect Being? The Mu'tazilah, as their orthodox antagonists called them, were proud to describe themselves as the 'party of the (divine) unity and justice' ('Ahlu-'t-Tawhid wa'l-'adl). They charged the party of the *sunnah* with a contradiction of both these divine virtues.

Connected with these fundamental issues were others of sufficiently vital importance but subordinate to them. The question as to the source of authority for belief and conduct required to be solved. The party of the Qur'ān and *sunnah* insisted upon a literal conformity to these two sources, while the Mu'tazilah demanded that belief and conduct should be consistent with reason, and the method by which the rational view was to be tested was that of the Aristotelian logic. This science was known by the term *kalām* (*q.v.*), and those who relied upon it were designated Mutakalimūn—descriptions without intrinsic stigma, but acquiring in the hands of the orthodox Sunnites the unpleasant implication of heresy and heretics respectively. The Mu'tazilah nevertheless were proud to call themselves 'Ahlu-'l-'Aql, 'the party of reason,' and felt that only by reason could one reach a worthy view of God and of man's duty to Him. The Qur'ān was saved from absurd interpretations and became a real guide for reasonable beings only as it was subjected to a rational process of study. Literal acceptance of the text had led the orthodox to proclaim the dogma of the uncreated and eternal nature of the Qur'ān, and as a party in this early time they applied the dogma even to the letters and words of the book as written and to the sounds of the uttered recitation or reading. It was in the controversy regarding the uncreated nature of the Qur'ān that Ahmad ibn Ḥanbal (*q.v.*) appeared as the outstanding champion of the traditional view. When pressed by the Mu'tazilite argument to the effect that the human media and the inanimate records were obviously not unlimited in either nature or duration, his answer was that the book declared itself to be (or, rather, God in the book declared it to be) *kalām Allāh*, i.e. the word or speech of God, which was inseparably and uninterruptedly an attribute (*ṣifa*) of God. It could not be dissociated from the thought of God and the divine reason and was therefore eternal. This polemic instantly raised the question of the divine attributes (*ṣifāt*). Was the *kalām Allāh* to be conceived as an entity independent as to essence from the being or essence of God? Were all the attributes entities in this sense? On the basis of the statements of the Qur'ān the party of the *sunnah* persistently argued for the affirmative. The Mu'tazilah charged them with giving God a partner (*shirk*). It was polytheism to assert that there were other eternal entities beside God. The Qur'ān text should not be interpreted in such a sense as to violate the unity of God and 'associate' other beings with Him. It should be explained in an allegorical sense (*ta'wīd*) where the literal sense would involve irreverence or what was irrational. The orthodox rejoinder relentlessly attacked the presumptuous setting up of *ra'y* over the *kalām Allāh*. It surely was the greater sin that the creature should venture to set aside the plain words which God had spoken because to him they seemed absurd. The ambiguity of the terms used in the controversy made agreement between the two parties impossible. 'Word of God' meant one thing for Ahmad ibn Ḥanbal and a very different thing for his persecuting inquisitors. For him to claim that his Qur'ān was uncreated, and for them to reply that their Qur'ān was created, must necessarily have left each where he was before the argument. The *sunnah* party suffered much ridicule at the hands of their opponents because of their readiness to accept all the anthropomorphisms of the Qur'ān as precise descriptions of fact. They boldly taught that God sat on a throne, possessed sight, smell, hearing, etc., though they grew more cautious as the controversy wore on and pressed for verbal acceptance of the Qur'ān teachings, with a consent to leave questions as to how such things could be with God Himself to make plain later or not to make plain as He chose. It was to be an acceptance 'without seeing how' (*bīnā kar'ifa*, or, contracted, *balkar'ifa*). Connected with this subject of the anthropomorphic attributes and acts of God in the Qur'ān is that of the possibility of actually seeing God, as the Qur'ān declares. If the saints see God, it is implied that the anthropomorphic view is literally true; if it is not true, they do not see Him.

One more element in the Mu'tazilite controversy

remains to be noticed. The party of the *sunnah* held the characteristic Arab view that the will of Allāh was the all-determining source of change and activity in the world. The 'party of 'aql' allowed to man the capacity to initiate action and placed upon him the responsibility for his choice. Because of their attitude on this special point, the Mu'tazilah are classed as Qadarites (believers in free will). Their argument attacked the orthodox, particularly on the ground that they held man responsible for his acts and nevertheless denied that he was free. Freedom he might seem to have, but it was only illusory; in reality his acts were created by God, without whom nothing happened. This orthodox contention the Mu'tazilah repudiated as involving injustice to man and also as implying an insulting impeachment of God's justice.

4. Re-establishment of orthodoxy.—The Mu'tazilite controversy was summarily terminated by the *khalifah* al-Mutawakkil in 234 A.H. He reversed the liberal policy of his predecessors, declared the doctrines that they had championed to be offences against the State, and proclaimed the orthodox views to represent the official opinions which alone would be tolerated in Islām. This official endorsement of the 'Ahlu-'s-Sunnah has been maintained in Islām down to the present. The dogmatic beliefs of the persecuted orthodox are held by both Sunnites and Shi'ahs, and the Sunni khalifate has regularly stood sponsor for them. There is no doubt that the Mu'tazilite *khalifahs* of the Mihna period represented a relatively small minority in the Muslim world of their time and that al-Mutawakkil was wise not to continue his support of their views in the face of an adverse popular sentiment. Tradition and Qur'an retained their hold upon the masses, to whom their directness and their clear mandatory accent appealed as mere reflective opinion could hardly hope to do. The great body of Islām ranged itself behind the orthodox *khalifahs*, and the Mu'tazilah tend to disappear little by little. The free-thinking teachers notwithstanding give the traditional theologians a great deal of trouble, in spite of the smallness of their numbers. It was easy to make a system based on literal interpretations appear ridiculous when attacked by means of keen dialectic, and the orthodox tenacity and insistence did not prevent their partisans from feeling an awkward discomfort when they were forced to evade rather than answer the attacks made upon them. It will be readily understood that the man who enabled them to inflict genuine defeat upon their opponents, Abū'l-Hasan al-Ash'arī (*q.v.*), would seem to the orthodox to be almost a prophet when he arrived.

5. Abū'l-Hasan al-Ash'arī.—Al-Ash'arī had been long trained in the views and arguments of the Mutakallims, and there is some plausibility in the legend which represents him as using their method against his own teacher al-Jubbā'ī to the discomfort of the latter. He had apparently come to see that the Aristotelian logic was valuable, not for the discovery of truth, but for making explicit the significance of propositions which were taken for granted and for the confutation of false arguments. It became clear to him that religion could not be built securely upon *kalām*, a formal science. The foundation must be in revelation through inspired men and media, through prophets and sacred writings. Feeling that, in spite of their poor logic, the party of the *sunnah* had founded Islām upon the true basis, that tradition was a genuinely trustworthy means of communicating revealed guidance from age to age, and that the consensus of the Muslim community (*ijmā'*) expressed through its leaders was more reliable than

the judgment of the individual Mutakallim, al-Ash'arī returned to the orthodox faith which he seems to have inherited from his forbears in the first instance. He came back converted through his own employment of *kalām* against itself, and naturally he made use of the weapon from that time (300 A.H.) forward to disprove the views of the Mu'tazilah and to develop into a system the orthodox doctrine.

6. The principle of consensus.—The principle of consensus operated more largely from the days of al-Ash'arī onward. It was Ash-Sha'fī (†204 A.H.) who first made extensive use of it in his teaching and was prepared to accept it as a guide where the Qur'an and *sunnah* failed to afford direction. His preference for *ijmā'* was approved only with reserve by the rigid Hanbalite orthodoxy of the 3rd century. Al-Bukhārī's strictness in the criticism of *hadiths* and his refusal to give an opinion on the human utterance of the Qur'an are possibly alike based upon an employment of the *ijmā'*. The principle has a bearing upon the division of Islām into Sunnites and Shi'ahs. In the days of the early Ash'arite school this division, which is based, not upon dogmatic differences of a genuine religious character, but upon a divergent view of the khalifate, had not yet taken place, and the *ijmā'* embraced the whole Muslim community. When the division came, it was recognized that the 'Ahlu-'s-Sunnah lay beyond the boundaries of the Persian empire as organized under the Safawids (A.D. 1502), and that *ijmā'* had a sense and a binding force in Sunnite Islām which it did not have in Persia. The Persian Muslims readily accord the name Sunnis to their rivals and accept Shi'ah as a proper term by which to describe themselves. *Ijmā'* is especially a Sunnite principle and has guided the leading movements and changes of Sunnite Islām during many centuries. There is no need of its use among the Shi'ahs, where appeal is made to the inspired authority of the *imāms* as it is voiced through their *mujtahids*.

In spite of the fact that the Hanbalite school, so powerful in the 3rd cent. of Islām, is now almost a negligible quantity, al-Ash'arī, the founder of the Sunnite theological system, was an ardent Hanbalite after his conversion and died in that faith (320 A.H.). It is necessary to say, however, that the views which are now held by all the Sunnite schools are the founder's views as somewhat liberalized by the Ash'arite school after his death. There is evidence to show that the cast-iron system into which the great teacher came back at the time of his conversion from Mu'tazilism was modified through the very *kalām* influence which he brought with him. It was probably al-Ash'arī's thought to employ *kalām* for purely apologetic purposes, but his followers gave much more scope to the principle of the consensus than he seems to have thought of. The 'Six Correct Books' of traditions (*Kitābu Sittah*), of which the two great *Saḥīḥs* of al-Bukhārī and Muslim are the most essential authorities, contain the only generally accepted evidence as to the *sunnah*, but in the application of the *sunnah* the principle of the *ijmā'*, used in accordance with the scholastic method introduced by al-Ash'arī, has made it possible to leave far behind the strict views of law held by the triumphant Hanbalite school of the 3rd Muslim century. That kind of unchanging orthodoxy would not have preserved the unity of Islām as it has been preserved among the Sunnites. Modern Hanbalites are the consistent successors of the early Hanbalite school before al-Ash'arī, but they exert little influence. Sunnite Islām is an Islām to which the liberal views of the Hanafites and the moderate views of the Mālikites and Shāfi'ites have had less and less difficulty in adjusting themselves as time has passed, so that in opinion and practice unity and even a large measure of uniformity have come to prevail. The Hanbalite domination of the Sunni sect became at once impossible with the admission of the *kalām* method and the broader understanding of the *ijmā'*. The schools differ, as they have always differed, in the extent to which they recognize certain liberal principles and attitudes of mind. Analogy (*qiyās*) and judgment according to personal opinion (*ra'y*), and, in special relations, *istihsān*, or preference for a better view) play a large part in the administration of Hanafite law, a less important part among the N. African Mālikites, and a small part in the Shāfi'ite communities of Islām. But the difference is within the region of *fiqh* and not within that of dogmatic opinion.

7. Triumph of Ash'arite theology.—The process of liberalizing the orthodox system of al-Ash'arī must have been somewhat rapid in the century

following his death. Towards the end of the 4th cent. A.H. there seems to have been a disposition to allow *kalām* to run riot in Baghdād, where we read of theologians who were willing to argue questions without reference to the traditional authorities of Islām. Even in the West the great thinkers, excluding Ibn Ḥazm (*q.v.*) as almost a sole exception, gave themselves more and more to a philosophical account of religion and at the same time realized painfully that they had parted company with accepted orthodox views. Men like Ibn Ṭufail and Averroës (*qq.v.*) in the late 6th cent. A.H. have one system for the masses and another teaching for the instructed few. Nevertheless one may say that, in spite of excesses, the Ash'arite school had definitely imposed its views and method upon the Muslim world before the end of the 11th cent. of our Christian era. The liberty of thought which al-Ash'ari had secured for Islām had developed by that time a controversial intellectualism which left no place for intuition or mysticism in religion, and orthodoxy was in serious danger of losing the sympathy of the masses. A new emphasis was called for in order to supply a corrective to the general rationalism which prevailed.

8. Al-Ghazālī.¹—Al-Ghazālī († 505 A.H.) was by nature an intensely religious man to whom the truth was the greatest of all possessions. It was for him life's supreme concern to solve the problem of Ultimate Reality in such a way as to be satisfied that he enjoyed contact, response, and fellowship with it. He was convinced that what he sought could not be given by an acceptance of truth on mere external authority, a point to which, in spite of his dependence upon *kalām*, al-Ash'ari still held. He saw that the Mutakallimūn could proceed to their conclusions only as they took for granted certain propositions which they did not prove, and that, when they had said all, the seeker had in possession only a system of logical inferences and not at all an experience of the ultimately real. Not because it was a last resort or because he was in despair of finding anything better, al-Ghazālī turned to Ṣūfism. He made a full and sympathetic trial of the Ṣūfī discipline, after having tried other ways, and was convinced that the Ṣūfīs (*q.v.*) had solved the problem of the soul's quest. Man craved a satisfying revelation and a satisfying communion with God; he received both through faithful conformity to the Ṣūfī ideal and persistent openness to receive higher communications. Al-Ghazālī was a moderate Ṣūfī who was ready to give due weight to reason within its own limits, and who recognized the ethical and religious duties of the common life. His pre-eminent gifts and virtues—for he was one of the finest characters as well as one of the greatest minds which Islām has produced—have made his solution of the religious problem exceedingly influential down to our own day. Ṣūfism became a power far beyond the borders of the dervish organizations; the extreme dependence upon rationalism was checked; the emotional factors in human nature were provided for with due regard to ethical and religious conduct. Probably no teacher since the days of the Prophet has afforded to Muslims a better illustration of the possibilities of their own faith. Sunnites generally admit a great indebtedness to him, and his works are standard texts in the training of orthodox theologians (*'ulamā*).

9. Sunnites and Shi'ahs.—The distinction between Shi'ahs and Sunnis has its roots in the dispute between the 'Alids and Umayyads in the years which followed the *khalīfah* 'Uthmān's assassination (35 A.H.). In its origin it has nothing to do with the religion founded by Muhammad,

but rather is occupied with the political question of the succession to the leadership of the Muslim community. At first the 'Alids on their side claimed that they were the legitimate *khalīfahs* because they were descended from the Prophet's daughter Fātimah and his cousin and intimate companion, 'Alī. The Umayyads on their part claimed a nomination by the choice of the Muslims themselves and as a further title claimed kinship with the Prophet as being of the Hāshimite family. Later the 'Alids stood for the claims of descent against all claims of right to office because of the popular choice. This difference still marks off the Shi'ah political theory from that held among the Sunnites.

(a) *Theory of the khalīfate.*—There is, moreover, an old standing difference between the Sunnites and Shi'ahs as to the functions of the *khalīfah*. Among the Sunnites the *khalīfah* is a political ruler essentially, while from the first the 'Alid party regarded the Prophet's successor as a religious guide and therefore preferred to designate him as the *imām* of the Muslim community. It was assumed that his physical descent from the Prophet secured to him not merely divine rights, but also a divine endowment of grace and wisdom. No such assumption was held by the Sunnites with relation to their *khalīfahs*. They were chosen from among the believers and could claim no supernatural qualifications. Their authority was conferred by the Muslim community and carried with it no implication of pre-eminent saintliness or infallibility. The Sunnite attitude towards the *khalīfahs* differs greatly from that of the Shi'ahs towards the *imāms*. The personal qualities and public influence of the *khalīfahs* have been largely determinative of the respect shown to them. Among the Shi'ahs the office hallows the occupant, and the *imāms* are regarded with the deepest religious veneration. The Sunnite *khalīfahs* by law are required to be of the Prophet's tribe, the Quraish; the *imāms* were chosen from the still more narrow circle of the Prophet's immediate family.

Since the twelfth *imām*, Muhammad ibn al-Ḥasan, disappeared in the middle of the 3rd cent. A.H., the line of visible *imāms* has been suspended, but there has never been a legal reason why the Sunni khalīfate should be interrupted, as it has always been possible for the Muslim community to find an eligible candidate and to nominate him, provided circumstances did not interpose a physical hindrance. The *sultāns* of Turkey have assumed to be the *khalīfahs* of the Prophet and have taken to themselves the exclusive title pertaining to that office, Emir al-Mu'minīn, 'Commander of the Faithful', since the time of the Ottoman conquest of Egypt in A.D. 1517. As they are not of Arab race, let alone of Quraishite lineage, there is no basis in law for the Ottoman claim. The first *sultān* (Selim I.) to assume the title justified his act on the ground of a surrender of his rights on the part of the last 'Abbāsīd *khalīfah*, al-Mutawakkil II., who at the time of the conquest of Egypt was attached to the court of the Mamluk *sultāns* and was recognized by them as the spiritual head of Islām. The Ottoman *sultāns* have retained in their own persons the dual authority temporal and spiritual which the Mamluks had divided, and the principle of the consensus seems to have permitted the *'ulamā* to legalize the departure from the law of the khalīfate as settled by the *sunnah*. They have accepted the transfer of the 'Abbāsīd rights to *Sultān Selim* as giving a title, and have regarded it as fortified by other considerations, viz. the Ottoman conquest of Muslim domain, the control of the sacred cities, and the possession of relics of the Prophet. The *sultān* has made a concession to traditional sentiment in constituting the chief *muftī* in Constantinople as *shaykh ul-Islām*, or highest spiritual authority over all believers. This functionary, nevertheless, derives his power from the *sultān* who appoints him, though it is to be admitted that the choice of the *'ulamā* practically settles the appointment. All questions affecting Islām are considered by the *shaykh ul-Islām*, and are subject to his decision as promulgated by a *fatwā* issuing from him. The other conditions recognized by Sunnite authorities as binding in the election of a *khalīfah* are that he shall be of adult years, of sane mind, of free condition, a man versed in the learning of Islām, and a capable administrator who will rule justly. In contrast to the Shi'ahs, the Sunni doctors have always recognized Abū Bakr, 'Umar, and 'Uthmān, the first successors of the Prophet, as genuine *khalīfahs* (*al-Khalafā ar-rāshidūn*) together with the fourth *khalīfah* 'Alī, who of course is allowed to be a legiti-

¹ Cf. art. ETHICS AND MORALITY (Muslim), § 7.

mate successor by the Shi'ah sect also. For 'Ali and his successors in the imamate the Sunnis have much respect on account of their reputation for either piety or learning, though they do not admit the Shi'ah claim of supernatural gifts or divine rights as belonging to them.

(b) *Enmity between Sunnites and Shi'ahs.*—The intense hatred between Sunnis and Shi'ahs as distinct sects dates from the time when the Shi'ahs were constituted a separate political organization by the foundation of the Safawid empire of Persia in A.D. 1502. The fault in this mutual bitter feeling is greater on the Shi'ah side than on that of the Sunnites, but the treatment of Persian pilgrims to Mecca has been an enduring irritation, and in earlier times the military aggression of the Turkish *sultāns* gave occasion for resentment in Persia. As has been pointed out above, there are many individual Muslims of Shi'ah connexion in the Turkish empire, and, either because of an acquired indifference or oftener because of their practice of *taqīyah* (concealment of faith), they suffer no personal inconvenience at the hands of their Sunnite neighbours. The proposal of Nādir Shah in the 18th cent., that a reunion of Islām be brought about by admitting the Shi'ahs to fellowship with the Sunnis as a fifth orthodox school, was prompted by the world-ambition of that ruler and was met by vigorous and successful opposition on the part of the Persian *mujtahids* and *mullahs*.

(c) *Position as to the sunnah.*—The difference between the Sunnites and the Shi'ahs does not consist in the acknowledgment of the *sunnah* of the Prophet by the former and its denial by the latter. The title of the Sunnis to have the oldest and the most thoroughly tested body of traditions is not questioned, but the Shi'ahs also have their *sunnah*, whose authorities are the acknowledged *hadīth* collections of the sect. Resting upon these recognized standards, the Shi'ah teachers claim that they alone have the genuine *sunnah*, while the Sunnite version, they allege, has been perverted so as to furnish arguments against the claims of 'Ali and his sons to the succession of the Prophet. The corruption of the *sunnah* for any such purpose by the Sunnites is exceedingly unlikely, while the evidence of the manipulation of traditions by the Shi'ahs to support their own side is considered to be fairly clear. In the interpretation and adaptation of the *sunnah* to new relations the Sunnites are guided by the consensus (*ijmā'*) and analogy (*qiyās*), while the Shi'ahs claim to be alone rightly guided in their following of the *sunnah*, inasmuch as they have enjoyed the infallible instruction of the *imāms* either in person or since the line has been suspended by the inerrant communication of their word and will through the *mujtahids*. According to the *sunnah* view, there can be no *mujtahids* in Islām since the death of the last great orthodox founder in the 3rd cent. A.H. The term as employed in Sunni circles is limited to the great *imāms* of the earlier centuries who founded the four orthodox schools and laid on indisputable foundations the theology and law of Islām. Since their day no teacher's opinions have justified themselves as a permanent basis for faith and life.

10. *Changes in Sunnite Islām.*—In theory Sunnite Islām is tied up to the Ash'arite system, and because of that it is thought to be fated to intellectual stagnation. The facts show that from the time of al-Ash'arī himself there was some modification of the founder's positions, and with the contribution made by al-Ghazālī one may say that the modification amounts to a materially altered view-point and the introduction of a new and revolutionary emphasis which laid stress upon intuitive and emotional factors in religious experience. The necessities of the historical situation have repeatedly rendered nugatory the theoretical requirements of Sunnite orthodoxy. Where

Muslims live under Christian governments, as in India, the law of the khālifate has to yield place to the obligations of political loyalty, the duty imposed by the *jihād* is in most cases unfulfilled, and the *zakāt* must be modified, especially as to the authority to whom it is to be turned over and the mode and purpose of its distribution. With the universal recognition of saint-worship and the cult of relics, the dogma of the unity of God and the law against idolatry (*shirk*) are violated, and the sufficiency of the canonical authorities, the Qur'an and *sunnah*, is called in question. It may be recalled that one fruit of the modern liberal movement in India is the rise of the Ahmadiyah sect, whose founder, Mirza Ghulam Ahmad († 1908), recognized the logic of facts in the position of the Indian Muslims and declared that the duty of the *jihād* was not binding any longer. The practical effect of the Ṣūfī teaching when fully developed is a pantheism which is in contradiction with the hard, clear-cut monotheism of the Ash'arite theology. It is a pantheism leading to a loosening of the positive bonds of conduct which the orthodox teaching imposes. The righteousness of the Ṣūfī may become extravagantly mechanical and violently anti-social, so much so that public regulation may be called for, as is the case in Egypt. Enough has been said to show that Sunnite Islām, however immobile it may be in theory, has admitted into its system under the compulsion of facts vastly important modifications, some of which have seemed to contain unrevealed potentialities of disintegration.

11. *Detailed differences between Sunnites and Shi'ahs.*—A few points in which Sunnites and Shi'ahs differ require to be mentioned.

(a) The Sunnites do not accord to 'Ali and his sons the degree of veneration which the feast of Muharram implies. This holds true even if the Sunnite Muslims of India do not scruple to participate in the ceremonies of the feast along with their Shi'ah neighbours. (b) There is some confusion of the orthodox feast of the 'Ashūra, which falls on the tenth day of Muharram, with the Shi'ah feast, which extends from the first to the tenth day of that month. The motive of the respective feasts is, however, entirely different. The 'Ashūra commemorates the completion of creation by the creating of Adam and Eve on the tenth day of Muharram, while the tenth day of the Shi'ah ceremonies is simply the crowning day of the whole Muharram feast, pointing in particular to the Kerbelā massacre which is supposed to have taken place on that day. (c) Generally speaking, the ritual of ordinary worship differs only in the non-essential points. The mode of purification before the *ṣalāt* with the Sunnites includes the washing of the arm upwards to the elbow, while with the Shi'ahs the process is reversed. In the washing of the feet the Sunnite ritual literally washes; the Shi'ah merely rubs or wipes the feet. (d) To perform the *ḥajj* by proxy is not permitted by the Sunnis, while it is not uncommon among their rivals. This permission, if granted, would violate the cardinal Sunni requirement that a Muslim must perform the *ḥajj* at least once during his lifetime. (e) More far-reaching in its social effects is the permission given by the Shi'ah law to contract *mut'a* marriages. These temporary unions, for a price agreed upon and under conditions of legal contract, are forbidden by the Sunnite codes. (f) The Sunnite recognition of the principle of *taqīyah* is limited to cases of extreme personal danger when it is at most permitted to dissemble one's religious convictions in order to preserve one's life. The Shi'ahs do not view *taqīyah* as limited to situations of personal risk, and, where it applies, they do not merely permit a resort to *taqīyah*, but strongly recommend the employment of it. Especially where the interests of religion may be supposed to be in jeopardy, the Muslim of Shi'ah faith will feel the use of *taqīyah* to be a moral obligation.

In all that has been said in the foregoing description of the Sunnite position and practice regard has been had to only those matters which fall within the canon law (*shari'ah*). It must be kept in mind that in all Muslim countries, whether Sunnite or Shi'ite, there is another authority which has its constituted rights and its organized administration, viz. the customary law (*'urf* or *'adah*). This differs according to the established conventions of different places. It is not a distinctive feature of the Sunnites and need not be more fully treated in this article.

The power of the *'ulama'* among the Sunnis is

very great, though as a class they are not viewed with the superstitious veneration or even fear which the Persian Shī'ah shows to many of the *mullahs*, to all the *mujtahids*, and to the large class of *sayyids* who are to be found in Shi'ite regions. The influence of the 'ulamā has been conserved by their learning, which, though narrowly restricted to Muslim theology and law, is often comprehensive within those limits. This learning is constantly on call in the service of the Muslim community. Their influence, moreover, has been much greater than it might have been owing to a certain measure of accommodation which has made large room for such a phenomenon as the Ṣūfī movement—a movement whose elements of wonder and emotionalism have proved to the satisfaction of the masses that Islām was still a medium of supernatural power and divine life. Along with this they have admitted to the curriculum of theological studies in all the leading schools the works of the great mystics, particularly those of the master, al-Ghazālī. The tacit or explicit approval of the cult of saints, endowed as it is by public funds, may be an anomaly, but for the orthodox leaders it also is an instrument of power. More potent than any other factor is the fact that the consensus (*ijmā'*) is realized only through the 'ulamā and that no cause has been so effective in bringing about change of policy and the initiation of new lines of action as the voice of the 'ulamā declaring the mind of the universal Muslim community. The *ijmā'* is being prepared by the training which the candidates for the learned calling receive, whether it be in the Azhar University at Cairo, in the schools of Constantinople and India, or in the ancient seats of learning like Bokhāra. It is a long mechanical process aiming at fixing rigidly the positions of traditional orthodoxy in the thoughts and sympathies of the student and cultivating in him a fanatical devotion to the authority of the past, especially of the primitive age of the faith. It is natural that, when his opportunity to lead comes, he should adjust himself as an obedient part of the whole traditional system.

W. M. PATTON.

SUPERNATURALISM.—Supernaturalism is the mental attitude that has the supernatural for its object. The term is used by anthropologists¹ to express the fact that primitive magic and primitive religion alike rest on a belief in supernatural powers. In such a context it is convenient to have a word such as 'supernatural' that may be equated now with 'magical' and now with 'divine.'² For the savage respects the human magician 'on account of his continual intercourse with the supernatural world,'³ and, on the other hand, must be allowed 'to possess a rudimentary notion of certain

supernatural beings who may be fittingly called gods, though not in the full sense in which we use the word.'⁴ Frazer, indeed, assumes a general tendency among savages to claim 'powers which we should now call supernatural,'⁵ on the ground that 'a savage hardly conceives the distinction commonly drawn by more advanced peoples between the natural and the supernatural.'⁶ F. B. Jevons, on the other hand, warns us against 'the error of imagining that there was a time when man did not distinguish between the natural and the supernatural. This error may take the form of saying either that to primitive man nothing was supernatural or that everything was supernatural.' He goes on to say:

'Primitive man took to himself the credit of his successful attempts to work the mechanism of nature for his own advantage, but when the machinery did not work he ascribed the fault to some overruling supernatural power.'⁷

The objection of E. Durkheim, that to recognize breaches in a habitual order does not amount to the recognition of breaches in an order conceived as necessary after the manner of modern science,⁸ is surely somewhat hypercritical in such a context. An objection of another kind, since it does not dispute the facts, but merely regards convenience of terminology, is that of J. H. Leuba,⁹ who in naming the belief in supernatural power would call attention to the power rather than to the supernatural quality attaching to it, and hence would substitute for 'supernaturalism' the term 'dynamism,' originally used by A. van Gennep⁷ to describe the 'impersonalist' theory of *mana* as contrasted with the 'personalist' theory of animism. Now there is much to be said for the view that the positive content of supernaturalism receives its fullest conceptual expression in terms of the *mana* type.⁸ But the mental attitude in question has its negative side as well as the positive side connoted by *mana*, since it is called forth by the frustration of reasonable expectation; so that, as Jevons says, 'where the natural ended, the supernatural began.'⁹ Again, this mental attitude is not so predominantly intellectual that it can be suitably designated by means of any mere concept that it generates. For the rest, anthropological terminology is, happily, in a somewhat fluid condition, and may be varied without impropriety in response to the needs of different theoretical purposes. It will suffice here to give a brief account of the chief aspects of the mental attitude under consideration.

1. Emotional aspect.—The emotional constituents of the magico-religious sentiment have been subjected to psychological analysis with results that show it to be, even in its simplest forms, exceedingly complex. 'Awe' is perhaps the word in our language that expresses its many-sided nature most fully, and awe is defined by W. McDougall as 'a tertiary compound of fear, wonder, and negative self-feeling.'¹⁰ Round the object provided by the supernatural, fear, admiration, and submissiveness in varying degrees are organized into a mood, whether, in addition, that object be on the whole hated or loved, and consequently take rank as a manifestation of evil or of good supernatural power. Thus the sentiment is excited equally by magic and religion, the sorcerer, like the god, being 'surrounded by a halo of mystery and an atmosphere of awe.'¹¹ To appreciate the

³ *Ib.* p. 357.

emotional attitude of primitive man towards a universe which, beyond the narrow circle of the daily routine, is almost wholly unknown, yet felt to be pregnant with immeasurable possibilities of weal or woe, one should take stock one by one of the more baffling and startling elements in his experience, as is done, *e.g.*, by W. D. Wallis in his paper 'The Element of Fear [better 'Awe'] in Religion.'¹ Confined by his ignorance to the immediate here and now, the savage attributes mystic powers alike to the stranger at a distance and to those of his own race that are dead and gone. Nor does the familiar present remain unvisited by portents. The sky above him is disturbed by thunderstorm, eclipse, shooting stars, the aurora; earth and sea about him have their haunted pools, their fantastic rocks. Then living nature teems with wonders—trees and herbs, reptiles and fishes, birds and quadrupeds, that look strange or behave unaccountably. Moreover, man is mysterious to himself, with his visions, his seizures, the power of his eye and gesture, his sheer impressiveness, ranging from the majesty of kings to the gruesomeness of witches. For the rest, life is full of accidents and coincidences. Altogether, the savage world provides plenty of scope for that interplay of primary emotions of which awe is the outcome. Be it noted, however, that the essence of supernaturalism does not consist in bare feeling, but attains to expression through every aspect of the mental life at once.²

2. Intellectual aspect.—Since supernaturalism has a negative as well as a positive side, embodying a cautious doubt of the unknown combined with an effort to read a meaning into it, primitive thought needs a twofold set of concepts. Negatively the supernatural is *tabu*, positively it is *mana*.³ Among savages, of course, such notions have not been built up into any systematic theory; nor is it possible to say at what stage of mental evolution they first came into use, though perhaps it would be hard to point to any primitive people that lacks them entirely. Moreover, since the supernatural implies evil power as well as good, ministering to the purposes of the sorcerer no less than to those of the priest, it is to be expected that *mana* will sometimes split up into two notions that stand antithetically for the good and bad kinds of supernatural power.⁴ Finally, it cannot be said that rudimentary thought is altogether without an idea corresponding to that of the natural or normal. It seems highly doubtful whether we can credit the savage with a belief in what we call the uniformity of nature, as some have sought to do;⁵ indeed, historically, the modern concept of 'nature' would seem to have descended from *mana*, its wonder-working quality having been shed by the way.⁶ But in the Polynesian *noa*, the non-sacred, common, or permitted,⁷ we have the counterpart, as in the Latin *profanus*, of 'nature' so far as it stands not for mechanism but for routine. We must not, however, look for definiteness in primitive categories, since they are never subjected abstractly and as ideas to reflective examination, but merely embody such more or less arbitrary associations as custom suggests and sanctions.

3. Practical aspect.—Seeing, then, that the savage may be said to live out his ideas rather than to

think them out, it is in the sphere of his actual practice as regulated by social use and wont that we are likely to meet with the clearest indications of his mental tendencies. Primitive supernaturalism will declare itself primarily in a group of traditional activities through which the appropriate feelings and thoughts find their satisfaction. The question, then, is how far there is a distinctive province of behaviour corresponding to the interest in the supernatural. Now, there can be no doubt that among some peoples of low culture the cleavage between the secular and the magico-religious sides of the social life is made 'as with a hatchet.'⁸ Thus we are told of the Central Australian:

'From the moment of his initiation . . . his life is sharply marked out into two parts. He has first of all what we may speak of as the ordinary life, common to all the men and women, and associated with the procuring of food and the performance of corroborees, the peaceful monotony of this part of his life being broken every now and again by the excitement of a fight. On the other hand, he has what gradually becomes of greater and greater importance to him, and that is the portion of his life devoted to matters of a sacred or secret nature. As he grows older he takes an increasing share in these, until finally this side of his life occupies by far the greater part of his thoughts.'¹

B. Malinowski, however, referring to this passage, raises a doubt whether such a bipartition of activities is a universal feature of primitive society. He instances Veddas and Melanesians, among whom religious and secular interests and pursuits seem to shade into each other without perceptible break.² But, when Durkheim states³ that 'the division of things into sacred and profane lies at the base of all religious organization,' he can hardly be intending to affirm that a religious organization worthy of the name is to be found among all mankind. It is surely enough if the generalization hold good in the typical case. Moreover, this theory of the 'two worlds' of the sacred and the profane, though convenient in certain contexts—as, *e.g.*, to explain those 'rites of passage' whereby a man during initiation, or a woman at child-birth, enters a condition of *tabu* and passes out again into ordinary life⁴—need not be pressed too hard, seeing that sacredness is to some extent relative, so that, *e.g.*, a man may be *tabu* to strangers without being so to his friends.⁵ All that need be assumed here is that certain activities tend to be organized about the interest in the supernatural as embodied in a specific tissue of feelings and beliefs. The magico-religious life is unlimited in its claim on human endeavour, and in its ulterior effects on human welfare may be well-nigh all-pervasive. But the mental attitude that it demands cannot be continuously maintained. Whenever the tension is relaxed, 'nature,' in the shape of the effortless rule of habit, is busy making good the strain.

R. R. MARETT.

SUPERSTITION.—I. Signification and use of the term.—The word 'superstition' is used both in a concrete and in an abstract sense. We group together as superstitions a number of beliefs, habits, and fancies, tribal and individual, which we regard as not being founded on reasonable conceptions of the world and of human life, necessities, and obligations. The general or abstract term 'superstition' signifies the disposition to attribute occurrences to preternatural or occult influences, and to direct conduct with a view to avoiding mischief or obtaining advantages which such influences are supposed to produce. The precise connexion between the etymology of the word and its ordinary signification is not easy to trace. The prefix *super* seems to imply some excess, and this excess may generally be conceived as an exaggeration of a reasonable belief in some supernatural agents or agencies, with a readiness

to accept unverified statements as to spiritual or magical interference in the material world. The origin of the most potent and widely spread superstitions has already been discussed under various headings.¹ It seems therefore more suitable here to consider superstition as an abstract quality, and to regard it in its psychological and historical aspects.

Two points may be noted for the purpose of clearing the ground: (1) the intensely subjective way in which the word is commonly used. No man is ready to acknowledge himself as superstitious, but almost every one is ready to recognize superstition in another. We find that men of a particular race, culture, and tone of mind brand as superstitious the religious or ceremonial observances of an alien people, while charging such people with incredulity if they are unready to receive new doctrines equally superstitious from their own standpoint. 'What is religion to you is superstition to me,' and *vice versa*, is a tacit assumption against which we must be on our guard. (2) Superstition need not be in any way connected with mysticism (*q.v.*). True, the mystic who regards all things and persons as owing what reality they have to a divine and supernatural life or element is likely to have a strong desire to find traces of the spiritual and eternal manifested in or through the form of the material and temporal. But the reasonable mystic, by very reason of his belief in the spiritual nature of ultimate reality, is the less liable to give credence to fanciful and grotesque intimations from a spirit world. Plato, the greatest of mystics, was eminently sane and reasonable. If the same cannot be said of all the Neo-Platonists, the reason must be that some of them were less mystical because more material than he.² Some confusion, however, may arise from the circumstance that many minds (especially of a saintly or of a poetic order) attach a symbolic meaning to certain material phenomena or ceremonial acts without any excessive regard for their intrinsic value. Hence we have the interesting fact that, in the higher religions of an advanced race, we may have what seems to be identity in attachment to doctrine and ritual with far-reaching differences in fundamental religious conceptions. Hence the warnings of religious teachers, on the one hand against the sudden demolition of 'superstitions' which have, for the uneducated, been valuable from their association with religious thought and feeling, and on the other against the confusion of symbol and reality, which tends to materialize and crystallize popular religion.

The superstitious mind, then, is one that is not educated to discern the character of evidence, or that has not patience to suspend judgment in the presence of unfamiliar phenomena. If it is objected that some very powerful and (in some directions) well trained intellects have coincided with a superstitious bias, these exceptions would seem due to a want of mental balance.

2. **Historical aspects.**—Turning from the individual to society and to historical progress, we may say that, roughly speaking, superstition declines as the view of the universe becomes more scientific. True, the birth of many—perhaps of all—sciences is attended by crude hypotheses which lend themselves to strange vagaries of thought. This is specially evident in the pseudo-science of alchemy, whence emerged the science of chemistry.³ Even the earliest efforts of Ionic thought were not without such vagaries, yet the Greek philosophers had in them the root of the matter—a whole-hearted desire after truth. Therefore they progressed, and their progress belonged to the Western world.

When, in May, 585 B.C., in the midst of a battle between Lydians and Medes, there occurred 'the first eclipse of which European science foretold when it should betide,' the date was to have 'a deeper interest for Europe than the warfare. . . . Thales of Miletus, the father of Greek, and thereby of European, philosophy and science, had studied astronomy in Egypt; and he was able to warn the Ionians that before such a year had passed—his lore could not tell the day or the hour—the sun would be darkened.'⁴

This does not, of course, imply that the Greeks had already become, or were ever to become, what we should call a scientific people. But to bring so uncanny an occurrence as a darkening of the sun within the range of calculable events was to cut the ground beneath many superstitions. Yet

¹ See esp. artt. MAGIC, CHARMS AND AMULETS, DREAMS AND SLEEP, EVIL EYE, MYTHOLOGY, PRODIGES AND PORTENTS.

² See art. NEO-PLATONISM.

³ See M. M. Pattison Muir, *The Story of Alchemy and the Beginnings of Chemistry*, London, 1902, also artt. ALCHEMY.

⁴ J. B. Bury, *A Hist. of Greece*, London, 1900, ch. vi., sect. 1.

Greek religion and Greek life abounded with superstitions. The religion of the Olympians was bound up with beliefs about the gods which Plato would have excluded from his ideal city, and the old-world ritual which survived in popular ceremonies was yet more favourable to unreasonable fancies and actions. The Athenians were doubtless the most intellectual of the Greeks, yet their persecutions for impiety show both a low standard of religious liberty and a high standard (if the expression may be used) of respect for ancestral religion. Anaxagoras, Pericles, Euripides, above all Socrates, suffered at the hands of their countrymen. True, their cause prevailed in so far that in the next century speculation was more free and scepticism had scope; and, after all, the moderation centred in the maxim *μηδὲν ἄγαν* seems to have checked any tendency to persecution like that of the Middle Ages and later. Nicias was, in spite of his popularity, blamed by posterity for delaying the retreat of the Athenians before Syracuse on account of an eclipse of the moon. But the point against him, most probably, was not that he was too ill-educated to know the cause of lunar eclipses (since most Athenians would then have been in his company), but that he preferred the almost certain event of annihilation for his army to the exceedingly doubtful risk of supernatural punishment if he neglected the state of the heavens.

Yet, by a kind of paradox, scepticism seems to have overshot the mark, and, by denying the possibility of all certainty, to have opened the way, for people who *must* believe something, to all manner of superstitious habits and practices.¹ The interchange of religious ideas, the foundation and migration of religious societies, and the general disintegration which followed the conquests of Alexander and the advance of Rome meant, to many individuals in many places, a remarkable development and enlightenment of the religious consciousness; but it also meant a recrudescence of Oriental and barbarous superstition. This is found even among the late philosophical sects, notably the Neo-Pythagorean.²

As might naturally be expected, in societies comprising men of culture considerably above the rank and file of their contemporaries, we have, from the ancient pagan world, emphatic protests against the mischief wrought by superstition. Chief among these is the great poem of Lucretius (*q.v.*), who sees in superstition, or in popular religion, the most potent source of human ill. The same missionary spirit pervades the treatise of Plutarch *περὶ Δεσποδαιμονίας*, in which he holds up to contempt the figure of the man who lives in perpetual fear of having, by some trivial action, offended supernatural powers. There is, however, this great difference between the two: that, whereas Lucretius would dispense with the gods altogether, Plutarch (*q.v.*) holds to a faith in the divine beneficence and to the propriety of observing ancestral rites. The most eloquent part of his essay is that in which he shows the absurdity of stigmatizing as blasphemous those who deny the existence of the gods, while tolerating those who spread evil notions as to their malignity and vindictiveness. The same contrast may be noticed in assailants of superstition at various periods: the uncompromising enthusiast would sweep away all religious beliefs and institutions, though he may, like Lucretius, entertain conceptions of the universe which may fairly be regarded as religious. The conservative reformer, however anxious to remove causes of distress and aberration due to mistaken theology, may cling to old habits of piety, and reinterpret ancient traditions in accordance with liberty of thought.

3. **Superstition and Aberglaube.**—It may be noted that the kinds of superstition opposed by moral reformers are generally those which arise from baseless terrors. There are, of course, other manifestations of the superstitious spirit of a comparatively innocuous kind, such as belief in fairies, superstitions concerning the weather, lucky and unlucky days, and the like. And there is a mass of what may be regarded as superstition about the accretions to almost every system of positive religion, which on the one hand changes it very

¹ This 'overshooting of the mark' by the sceptics is suggested by E. Hevan, *Stoics and Sceptics*, London, 1913.

² See art. NEO-PYTHAGOREANISM.

conspicuously from its original form, and on the other hand may bring it within the reach of minds unaccustomed to deal with abstract ideas. These accretions are sometimes, in order to avoid the unpleasant connotation of 'superstition,' called by the German name of *Aberglaube*. They consist both of ritual and of dogma, and are hardly ever entirely to be distinguished from the necessary appurtenances of the religion with which they are associated.

The Middle Ages are generally regarded as pre-eminently a time of superstition. The judgment is probably justifiable, though there were as many hard-headed and constructive thinkers at most epochs of the Middle Ages as there have been earlier or later. But apart from the mixture of races and consequent multiplication of superstitions in the declining Empire, with the deficiency of mental culture in the leaders of the barbarian races, there was a great force arising to control speculation—that of ecclesiastical authority. This, however, must be considered on two sides. The worst kinds of superstitions, or at least the most conspicuous kinds, especially in Eastern Europe, were distinctly discouraged by the Church—soothsaying, necromancy, charms, and the like. And there can be little doubt that many of the heresies crushed out by the mediæval Church were accompanied by superstitious vagaries. Still, the fact is patent that the suppression of free thought, especially as directed to Church doctrine and ritual, must have tended to the growth of *δεισιδαιμονία* in Plutarch's sense. Of course, when we speak of the suppression of free thought, we do not necessarily mean that a very large number of persons suffered from not being allowed to think freely. Probably the number who thus suffered was comparatively very small. But many more must have lived in perpetual fear of the unseen. The terrors of the Judgment Day and of the world to come are very familiar objects of mediæval art, and it is difficult for us to see how far they were practically mitigated by the harmonious setting forth of the more comforting and spiritual elements in Christianity, with which they were, perhaps not quite consistently, associated.

The Renaissance and the Reformation are commonly regarded as having given the death-blow to superstition—so far, at least, as their influence extended. It is certain, however, that the indiscriminate cult of antiquity, which in some sections of society accompanied the Renaissance, contained or encouraged superstitious fancies and observances of a novel kind. And as to the Reformation even in Protestant countries, practically a good deal of *Aberglaube* formed part of the newly established doctrines and usages, and the sway of spiritual authority was by no means removed. The great movement towards mental and spiritual emancipation is generally taken as beginning in the 18th century.¹ It is to be noted that the battle waged on behalf of human reason was not confined to the world of thought and opinion. Political institutions, social divisions, industrial methods, and moral conventions were to be submitted to the test of right reason, and, if they failed, to be extirpated forthwith. The bitterness with which the contest was carried on, and which reached its culminating point in the excesses of the French Revolution, was partly due to the belief that superstitious practices had been maintained chiefly by those who profited by them—from the medicine-men of a savage tribe to the officers of an established church or a hereditary monarchy. Although there is, of course, some ground for such a supposition, as a partial explanation of the evil in question, its wholesale acceptance shows a very deficient com-

prehension of human nature. Without intelligible reasons, man is always desirous of knowing more than he can know about the spiritual world, and he will more readily submit to authority which has a traditional, if not actually a divine, sanction. And the exact nature of the government and institutions which right reason would commend has, of course, been very differently conceived by socialists or revolutionists of various types. Still, the general recognition that all beliefs and practices ought to have some rational justification was a great point gradually gained. It does not, of course, imply that nothing should be believed without strict logical proof, or that no institution should be maintained that does not evidently serve some useful object. But it does embody the Stoic principle that life should be according to nature and according to reason, and thus it tends to eliminate most of what is injurious either in superstitions with regard to religion or in tame acquiescence in existing governments.¹

4. Influence of education.—The great agency making for the reduction of superstition during this century and the last is popular education. True, our elementary education can hardly as yet be called scientific, and what passes for scientific education may, after all, be superficial and narrow. But all sound teaching, at the present day, may be said to produce something like a scientific view of man and his environment—a view perfectly compatible with belief in the spiritual significance of life and even in a possible communion with non-material beings, but inconsistent with fanciful and trivial interpretations of natural phenomena as determined by præternatural agency.

If there should ever be a recrudescence of superstition in this generation or the next, it would probably be due, not to a defect in the scientific faculty, but to the expectations lately raised within the bounds of scientific investigation. Experts in psychology, especially those who have devoted themselves to what is technically called psychical research (*q.v.*), have, to many sane and scientific minds, proved the possibility of telepathy, thought-transference, and other processes which, fifty years ago, would certainly have been set down as superstitious. More than this, some persons of scientific mind and education believe that they have actually established and conducted a means of communication between living and dead.² When the persons engaged in these investigations are careful and scientific, we are inclined to accept their evidence, as we should on any other point of expert investigation. But in this field the 'media' used are of such uncertain character, the conditions and possibilities of communication so deeply veiled in obscurity, the desire to attain to fellowship with the departed so intense, that it is as well to approach all such problems with the most suspicious caution. There may be, as has often been said, a 'superstitious fear of superstition.' But, while suspending judgment on the result of the inquiries of experts, the non-expert may be in danger of falling into a superstitious habit of mind such as tends to upset entirely the mental balance.

LITERATURE.—For primitive superstitions see the works mentioned in the art. here cited, esp. J. G. Frazer, *GP*, London, 12 vols., 1911-15; E. B. Tylor, *PC*, 2 vols., do. 1903. For the philosophy and history of the question see the various histories of philosophy and W. E. H. Lecky, *Hist. of Rationalism*, new ed., 2 vols., London, 1887; A. W. Benn, *Hist. of English Rationalism in the Nineteenth Century*, 2 vols., do. 1906; J. Masson, *Lucretius, Epicurean and Poet*, do. 1907; Plutarch, *Moralia*, including *de Superstitione*, tr. into very vigorous English by Philemon Holland, do. 1603; Matthew Arnold, *Literature and Dogma*, do. 1873, chs. on '*Aberglaube invading*' and '*Aberglaube re-invading*.'

SUPRALAPSARIANISM.—The term supralapsarianism is used in Calvinistic theology, in contrast with sub- or infra-lapsarianism, to denote a view of the divine decrees in which, for the manifestation of His glory, God is held to destine a certain portion of mankind to eternal life, and another portion to destruction, regarding both simply as creatures, and antecedently to any consideration of the Fall and sin. It is not meant that this purpose is actually carried out without regard to character or condition; but, in the order of decrees, it is first determined who are to be embraced in the one class, and who in the other; then the means are appointed—including creation, the Fall, sin, redemption—by which the end in each case is to be attained. So harsh a view of the divine procedure has always been in the highest degree repellent to Christian minds; accordingly, the great majority of Calvinists have shrunk from it, and contented themselves with the milder sublapsarian view, which affirms an election of God from the mass of mankind, regarded as already fallen.

On its historical side, the question is raised whether Calvin himself is to be classed as a supralapsarian or a sublapsarian. Some incline to the former view, but the truth seems to be that, when Calvin wrote, the question had not distinctly emerged, and the emphasis which he continually lays on election as a choice of some from a sinful mass, and on reprobation as grounded on the sinner's own evil, fairly warrants the more usual opinion that his doctrine inclined more to sublapsarianism.¹ On the other hand, Beza, Calvin's successor, Gomar, the colleague and opponent of Arminius in Holland, Twisse, the prolocutor of the Westminster Assembly, and a few others,² were conspicuous for their advocacy of supralapsarianism; and the Remonstrants, in the Arminian controversy, naturally sought to fasten this view on all Calvinists. It is really, however, an extreme opinion, and the bulk of Calvinists, as already said, have wisely kept themselves aloof from it. Turretin, *e.g.*, ably states and defends the sublapsarian position in his *Institutio*.³ The Synod of Dort, in its decision, framed its canons on sublapsarian lines.⁴ The *Westminster Confession* leans, in certain of its clauses, to the stronger view of Archbishop Ussher (author of the Irish Articles), and of a few members of the Assembly, but the tone of the debates in that body sufficiently shows that the prevailing opinion was sublapsarian, and the Confessional statement, taken as a whole, is of this character. The stronger view has, indeed, no symbolical sanction.

Cunningham, in his discussion of the subject,⁵ claims that the controversy is one 'of no great intrinsic importance,' but this can hardly be allowed.

* A doctrine of this kind, which bids us think of beings not yet conceived of as even created (therefore only as *possibles*)—not to say as sinful—set apart for eternal blessedness or misery, and of the fall and redemption as simply means for effecting that purpose, is one which no plea of logical consistency will ever get the human mind to accept, and which is bound to provoke revolt against the whole system with which it is associated.⁶

It cannot even be conceded, though it has often been contended, that this is the most logical form of the predestinarian doctrine. The end, it is argued, comes necessarily first in order of thought; then the means are devised which are to accomplish it. In the case of moral destiny, we are disposed to say, this is the precise inversion of the fact. There can be no legitimate consigning of a moral being to wrath, save as he is in some way viewed as deserving of that wrath; even in order of thought, therefore, the consideration of moral state must precede the sentence of rejection. If the reply is made that the sin itself is viewed in Calvinism as foreordained, this is doubtless true, but only in the sense in which every event in life is foreordained, viz. by God's decreeing to admit it into His providential plan and to overrule it for the ends of His wisdom. It is a totally different

thing to affirm that sin is ordained as a means to the destruction of a being already foreordained to wrath prior to consideration of his sin.

It need only be added that the whole subject assumes a different aspect when fuller justice is done to the Scriptural idea of election as aiming, not at exclusion, but at subsequent wider inclusion.¹

SVETĀMBARAS.—I. Origin and history.—'We,' said a Svetāmbara once to the present writer, 'are the Catholics amongst the Jains; the Digambaras represent the Puritans'; and that does roughly sum up the difference between the two great sects of the Jains.²

Even during the lifetime of Mahāvīra,³ two parties probably existed, for the great Jain hero seems to have formed his community by uniting two different orders of mendicants, the Sthāvira kalpa and the Jina kalpa. The Sthāvira kalpa wore clothes, but one section of the Jina kalpa did not, going about like Mahāvīra himself, clad only in the four quarters of the sky. This outward and visible difference was symbolic of the differing types of men in the community, and only a strong statesman could have held the two parties together; under any great strain the cleavage was bound to become permanent.

According to the Sthānakavāsī Svetāmbara tradition, the first crisis arose through a great famine that occurred in the reign of Chandragupta (? 310 B.C.), when 12,000 Jain monks went to S. India under Bhadrabāhu in search of food. These, being the young and vigorous members of the order, were able to carry out their rule in its entirety and so went unclad, whilst the other members of the community, who remained at home under Sthūlabhadra, amounting also, the legend says, to 12,000, were allowed (owing perhaps to age and infirmity) to wear clothes, no matter to which of the two parties they had originally belonged. When Bhadrabāhu returned home after the famine, although he became once more head of an undivided community, he was never able to insist on nakedness as a rule of even a section of the community. The second cause of schism also arose during this famine—at least according to the Sthānakavāsī Svetāmbara tradition; for it was then, during his leader Bhadrabāhu's absence, that the second in command, Sthūlabhadra, called a council at Pāṭaliputra to collect the sacred books. The council were able to produce only eleven *Āṅga*, but Sthūlabhadra himself supplied the missing twelfth *Āṅga*. Bhadrabāhu on his return was annoyed to find that this council had been held in his absence, and not unnaturally, though irritably, declared that the twelfth *Āṅga* was hopelessly lost. It only remained now for a leader to be found for the malcontents to hive off, and (if the legend be true) irritability had much to do with that leader's decisive action. About forty years after the great famine (according to Tapāgachchha Svetāmbara tradition, about A.D. 142; according to Sthānakavāsī, A.D. 83; and according to Hoernle, A.D. 79 or 80) the reins of government fell into the weaker hands of a man called Vajrasena, and the community finally divided. The Svetāmbara quote

the following legend to account for the actual cleavage :

A monk named Śivabhūti had been given a most beautiful blanket by the king in whose service he had been at the time of his initiation. His spiritual preceptor warned him that it was becoming a snare to him and advised him to give it away ; this he refused to do, so his preceptor took the extreme step of tearing up the blanket in its owner's absence. Śivabhūti, when he discovered what had happened, was so angry that he declared that, if he could not have the one possession which he valued, he would keep nothing at all, but would wander in entire nakedness like the Lord Mahāvira himself ; and he then and there started a new sect, that of the naked Digambara.

This very human legend which the Śvetāmbara (the 'White-clothed') tell of their unclothed rivals not only accounts for their nakedness, but also goes on to explain another difference between the two sects ; for, when Śivabhūti's sister wanted to join his order, seeing that it was impracticable for a woman to go about nude, he roundly told her that it was impossible for a woman to become a nun, or to obtain *mokṣa* (*g.v.*) without rebirth as a man, and thus laid down for all time a distinctive tenet of the Digambara. Important as these legends are, it must be remembered that they are quoted only as illustrative of the Jain point of view, for their confirmation is sadly to seek, and the legends connecting Chandragupta with the faith are essentially open to suspicion.

2. *Distinctive tenets and practices.*—We are on firmer ground when we notice the main differences between the two sects at the present day. We are already prepared for the fact that the Śvetāmbara list of sacred books is not accepted by the Digambara, and that, since they hold that no woman can attain *mokṣa*, the Digambara will not admit the Śvetāmbara tradition that Mallinātha (the nineteenth *tīrthāṅkara*) was a woman. But the two sects differ very considerably about the life-story of Mahāvira.

The Śvetāmbara say that their great saint married and enjoyed life to the full before entering an order, and that, even when he at last decided to do so, he waited till his parents' death, and until he had gained his brother's consent, lest he should grieve any one before receiving initiation, which he obtained in his thirtieth year. The more austere Digambara tradition, however, is that their founder never married ; and, having no hesitation about hurting any one's feelings, renounced the world at the mature age of eight. Even the prenatal stories differ, for the Śvetāmbara believe that Mahāvira's mother had fourteen wonderful dreams ; the Digambara say that she had sixteen ; while the legend of the removal of the embryo of Mahāvira from Devānandā to Trīśālā is a Śvetāmbara one.

The lists of the heads of the community since Śivabhūti of course differ also. The Śvetāmbara generally arrange their philosophy in nine categories ; the Digambara arrange very much the same philosophy under seven heads. One point of divergence on which they lay great stress is that, according to the Śvetāmbara, a *tīrthāṅkara* needs food to support him until he dies ; while the Digambara believe that, once a *tīrthāṅkara* has attained omniscience, he has no further need of meals.

There are also differences in actual practice. A Śvetāmbara ascetic may keep a loin-cloth, a shoulder-cloth, and a blanket to wear. Indeed, including these and his brush, mouth-cloth, and wooden vessels, he is allowed to retain fourteen possessions in this world, whereas a Digambara is absolutely nude and, though provided with a brush and peacock's feathers, has to live entirely in the jungle. The Śvetāmbara laymen complain that their ascetics interfere too much in their conferences ; this complaint is, of course, never brought against a Digambara ascetic, whose lack of clothing interns him for life in the wilderness.

There are also different rules about begging for the ascetics of the two orders, and the Digambara ascetics have no *upāsarā*. Again, the Śvetāmbara idols have glass eyes inserted in the marble, wear

a loin-cloth, and are bedecked with jewels, whereas the austere Digambara idols are nude and are represented as being dead to the world, with eyes cast down. There is naturally therefore a difference in the installation ceremonies of their idols. The ordinary worship differs also. The Śvetāmbara, when performing the eightfold worship, offer flowers and fresh fruit to their idols, and so on great festivals do the Visapanthi Digambara ; but the Terāpanthi Digambara never offer flowers or fresh fruit ; in their stead they use cloves, dry coco-nut, sugar, and rice.¹

There is another very interesting difference. A Digambara Jain has no private idol in his own house, but, if a Śvetāmbara is a wealthy man and lives far from a temple, he may have his own private chapel. This chapel is separate from the house and can be entered only by persons in a state of ceremonial purity. In the chapel, if he can afford it, he may have a *pratīmā* (an image of any one of the twenty-four *tīrthāṅkara* that an astrologer selects for him), or he may have a *siddha cakra* (a tray on which are depicted the leading points of the Jain faith).¹ The householder offers the eightfold worship to the *pratīmā*, but only washes and wipes the *siddha cakra* and marks it with sandal-wood paste. An instructed Śvetāmbara would never ask a boon even of the idol in his own house : he would only stir himself up to future efforts by meditating on it. But if, as often happens, an uninstructed Śvetāmbara does ask a gift, his prayer would be answered not by the *tīrthāṅkara* (who as a matter of fact does not even hear it) but by the *yakṣa* in attendance on the *tīrthāṅkara*.

3. *Śvetāmbara sects.*—The main division of Śvetāmbara Jains is into Sthānakavāsī and Derāvāsī. The Sthānakavāsī are a non-idol-worshipping sect, which arose about A.D. 1474.² Excepting on the crucial point of idol-worship, they do not differ much from other Śvetāmbara Jains.

At the present time the chief sects among idol-worshipping (Derāvāsī) Śvetāmbara are the Tapāgachchha (whose ascetics use red alms-bowls, and whose laymen in their devotions first confess their sins of walking and later their sins of trading), the Kharataragachchha (whose ascetics use black alms-bowls, and whose laity first confess their sins of trading and later their sins of walking), and the Añchalagachchha and the Pāyachandagachchha, whose divergences are very slight.

It must be remembered that these are only spiritual distinctions and do not interfere with the freedom of marriage between different sects. The chief castes among the Jains are Osavāla, Porāvāda, Śrīmālī and Śrī Śrīmālā, which are each divided into two sections, Dasā and Visā. It is impossible for members of these different castes to intermarry : thus an Osavāla Kharatarā could marry an Osavāla Sthānakavāsī, for, though the sect differs, the caste is the same, but a Dasā Osavāla could never marry a Visā Osavāla, and still less could any Porāvāda marry any Osavāla. It is interesting to notice, however, that any Jain could dine with any other Jain, Śvetāmbara or Digambara, whether Osavāla or Śrīmālī ; but they would not interline with any Brāhman convert to Jainism.

LITERATURE.—Through the kindness of Jain friends the writer was given an opportunity of translating this art. to the leading Tapāgachchha Śvetāmbara Sadhu in Rajkot in his *apāsara*, when the principal Sthānakavāsī Jain *paṇḍits* were also present ; the art. has thus had the advantage of criticisms and suggestions from both parties at first hand. See also A. F. R. Hoernle, *Annual Address to the Asiatic Society of Bengal*, in *J.A.S.B.*, Calcutta, 1898 ; Mrs. Sielclair Stevenson, *Notes on Modern Jainism*, Oxford, 1910, and *The Heart of Jainism*, do. 1915.

SWAHILIS.—See ZANZIBAR.

SWAN-MAIDENS.—The beautiful and poetic myth of swan-maidens is of early origin and, in varying forms, of very wide diffusion. The central idea of the myth is that certain beings, half-mortal, half-supernatural, have the power of metamorphosis into bird-form; connected with this are two secondary ideas: (1) that this power is dependent on the possession of a magic attribute, which was generally a bodily covering, such as a feather coat, robe, or veil, but sometimes merely a ring or chain; (2) that either this being, when in human form, or her captor is subject to a tabu of some kind. There are so many variations on these themes that it is impossible to do more than refer briefly to some of the most significant versions.

1. In **Oriental folk-lore.**—Oriental folk-lore furnishes many instances of bird-maiden stories. In Indian tradition we find the very early myth of Urvaśi embedded like a jewel in the dull ritual of the *Satapatha-Bṛāhmaṇa*.

The *apsara*, or nymph, Urvaśi loves one of the lunar race of kings, Purūravas; in wedding him she stipulates that she must never look upon him naked. By a trick played by the *gandharvas*, supernatural beings who desire the return of their former playmate, the promise is broken and Urvaśi vanishes. Purūravas, seeking her, finds her and her companions swimming on a lotus-lake in the shape of water-birds. They 'appear to him,' i.e. assume human form, but in response to his pleading Urvaśi replies: 'I have passed away like the first of dawns. . . . I am like the wind, difficult to catch.' Finally, however, she relents, and the couple are re-united.

In the *Vikramurvaśi* of the poet Kālidāsa, a drama based upon this story, the bird-myth has almost disappeared, except for Urvaśi's power of flying and for the constant references to swans throughout act iv. Her change into human form depends merely upon the laying aside of a veil, in itself probably a stage convention for invisibility; the marital tabu, which Lang² characterizes as a relic of 'a traditional Aryan law of nuptial etiquette,' assumes a quite different form.³

The myth re-appears in one of the finest tales of the *Thousand and One Nights*, that of Hasan of Bassorah.

Hasan is enjoying the hospitality of a family of princesses; when obliged to leave him, they enjoin him not to open a certain door. He disobeys, and finds a fair pavilion and a bathing-pool, to which come flying from the desert ten birds, one among which was pre-eminent for beauty. Each bird, as it alighted, 'rent open its neck-skin with its claws, and issued out of it, and lo, it was but a garment of feathers.' After their departure Hasan, who has become deeply enamoured of the fairest bird-maiden, confesses his disobedience to his hostess, and is told that this damsel is 'the daughter of the sovran of the Jans. He hath an army of women, smiters with swords, and lungers with lances, . . . and the plumed skins wherewith they fly are the handiwork of enchanters.' Hasan is advised to steal the feather dress and never again to let it come into the owner's hands; he does so, but after three years the wife by a ruse secures the dress, buttons it on, and flies away. Hasan tracks his wife to the islands of Wāk-Wāk, inhabited by the warrior women, and recovers her.⁴

The story of Janshāh⁵ is a slighter tale that begins similarly; but the bird-maidens are only three in number, and are 'as doves, eagle-sized.' The husband's device to secure the feather coat is to place it in a chest, leaden-bound, which is built into the foundations of the palace; but in vain, for the lady traces it by scent and digs it out.⁶

The Wāk-Wāk islands of the former tale have been identified with various Melanesian islands;⁷ it is not surprising, therefore, to find the tale of Hasan re-appearing in the Celebes in a modern form, which Tylor quotes in connexion with the heaven-

plant myth.¹ Tatar versions of the myth are signalized as being the only ones to represent the bird-maiden as a malignant being, half-vampire, half-fury;² in the Tatar poem quoted by J. G. Frazer³ to illustrate the external soul belief, the hero wrestles with the evil swan-woman for 'moons and years.'

2. In **classical tradition.**—Classical tradition does not seem to have preserved any swan-maiden tale in a complete form, but that the main idea was a familiar one is evident from the Ceynus myths, the bird-transformation of the comrades of Diomedes, the story of Leda, and the symbolic connexion of swans with Apollo, with the Muses, and with Aphrodite.⁴ Modern Greek folk-lore represents the Nereids as flying maidens, similar in many points to swan-maidens.⁵

3. **Slavic.**—Slavic folk-lore bears frequent testimony to the myth. The South Slavs were naturally more influenced by late Greek and by Oriental tradition, and the Bulgarian *samodivas*, and the Serbian *vilas*, like the Greek Nereids, resemble the swan-maidens; e.g., the *vilas* are associated with water and have the power of flying.⁶

The Polish fairy-tale of the prince and the twelve geese-princesses shows that the myth in its simplest form was known to the Western Slavs.⁷ The most important Russian example is the tale of 'Sweet Mikāilo Ivānovitch the Rover' and Mārya the white swan; this begins in fairly conventional style, although without the feather dress, but later it diverges considerably, for Mārya dies, is magically revived, and finally forsakes her husband for another love.⁸

4. **Celtic.**—Old Celtic tradition has two beautiful and elaborate swan-maiden tales, as well as an episode in the story of Etain, wife of Eochaid, who is carried off by the hero-god Mider in the form of a swan.⁹

The story of the 'Children of Lér,' one of 'the three most sorrowful tales of Erin,' is an example, with Christian 'overlay,' of that variant of the myth in which the swan shape is enforced by malignant magic. The four royal children, metamorphosed for 900 years, retain their powers of human reasoning and speech, and have the gift of singing 'plaintive music at which the men of the world would sleep, and there shall be no music of the world its equal.'¹⁰

This power of song is turned to account in the Christian episode which concludes the tale.¹¹ 'The Dream of Oengus' conforms more closely to the regular swan-maiden type, so much so that J. A. MacCulloch¹² dismisses it as of no mythological or religious value; its artistic value, however, is very great.

The god Oengus is smitten with love for a dream-maiden, the original of whom proves to be Caer, a princess who spends every alternate year in the form of a swan. Oengus, having once seen her in mortal form, succeeds in discerning her in swan-guise from among her 150 companions 'with their silvery chains and golden caps around their heads.' He woos and wins her, and flies off with her, himself also metamorphosed, and their singing is of such beauty as to lull to sleep all its hearers for three days and three nights.¹³

5. **Teutonic.**—The Teutonic races bear the distinction of having developed the swan-maiden myth most elaborately, and of having enriched it by connecting it with other supernatural ideas. Traces of the symbolic importance of swans are found in the primitive myths of the life and death

⁶ Contrast with this Hartland's idea (p. 308) that the swan-maiden must always employ an intermediary to obtain her robe.

⁷ E. W. Lane, *The Thousand and One Nights*, London, 1838-41, iii. 523, note 32.

both of the world and of individuals; thus the two swans, the progenitors of all the swan-kind, that float on the Urtharbrunnr of the old Norse cosmogony,¹ may be contrasted with the swan that lived, according to Finnish mytl, on the river of Tuoni or Death.² In later folk-tale we find a swan living on a hidden lake, which maintains the world in equipoise by carrying a ring in its beak; when it drops it, the end of the world will come.³ Popular saying still remembers the bird as one of omen and angury;⁴ in Rügen, swans, not storks, are the bringers of new-born children,⁵ while, on the other hand, the sight of a swan in flight may betoken death,⁶ and swans are often leaders of the spirit-host.⁷ The ideas of animal shape-changing and of the external soul favoured the development of the swan-maiden myth in folk-lore. The Scandinavian North, as one of the chief haunts in Europe of the wild swan, showed itself especially alive to the beauty and significance inherent in the myth; Grimm,⁸ influenced perhaps by the legends of the 'goose-footed woman,' 'la reine pédanque,' and 'Berthe aux grands pieds,' thinks that the goose supplanted the swan in legend, but this seems hardly proved. The power of flying and the possession of a feather coat were attributes of many gods in the Norse pantheon. The swan-maiden of the Scandinavians appears to have been merged into the Norns on the one hand and the Valkyries on the other, who themselves often have traits in common. The connexion of swans with angury and with the Urtharbrunnr, the home of the Norns, prepares us for the former aspect; the power of 'riding through the air' possessed by the Valkyries prepares us for the latter; and we have already seen the bird-maidens as warrior-maidens in the story of Hasan of Bassorah.

The swan-maidens of the *Nibelungenlied* are Norns also; as swan-maidens they appear to Hagene 'like birds,' and they fall into his power when he takes their garments, but they are also 'wise women,' and one gives him prophetic warning.⁹ The maidens of the *Völundarkvitha*¹⁰ are conventional swan-maidens with their 'swan-coats,' but they are also Valkyries, for they appear helmeted. Again, the hero Helgi is helped in battle by Kára, a rebirth of the Valkyrie Svava, who hovers singing above him.¹¹ Fridlevus II., king of Denmark, is given helpful warning before a battle by the song of three swans.¹² After this it is not surprising to find also traces of a connexion between swan-maidens and the *fylogja*, or female guardian-spirit; thus the *fylogja* of a beautiful woman appears as a swan.¹³

6. The swan-knight.—The swan-knight seems to have been monopolized and localized by Teutonic mythology, although there are traces of the idea in classical legend, as in the Cynus myth already mentioned,¹⁴ and although the Teutonic myth appears to have fused with Celtic Arthurian legend. The popularity of the charming tale of Helyas, knight of the swan, and supposed ancestor of Godfrey of Bouillon, is attested by the numerous versions of it in various languages.

In the popular German fairy-tale the enchanted brothers owe their restoration to human form, not to the prowess of their brother, as in Helyas, but to the devotion of a sister. Of the other swan-knights of Brabant, the link with the Graal legends has brought Lohengrin, son of Parsival, most into prominence

and popularity. The fact that the swan-hero arrives from an unknown land in a skiff, and departs in the same way, has led Grimm¹ to trace the beginning of the Teutonic swan-knight myth to Seyld and Scaf, semi-divine founders of the Danish race, of whom a similar tale is told, although the connexion with the bird-myth is very obscure.

7. Interpretations.—The interpretations of the swan-myths have been various; the earlier school of mythologists saw in them nature-myths, the swan-maiden being the white cloud, her captor the storm-spirit.² Others have explained the swan-maiden, who is subject to mysterious prohibitions and who in the end is almost always lost to her captor, and the swan-knight, who must not reveal his name or place of origin, as denizens of the world of the dead or of the islands of the blessed.³ A more prosaic view takes into account merely the totemistic aspect which the myth shows in common with all animal shape-changing tales, points to the swan-maidens and swan-knights as founders of clans, and compares them with such figures as Mélusine of Lusignan.⁴ The most modern theory brings the tabu into prominence, to the overshadowing of other aspects, and adduces the wide evidence now forthcoming of marital tabus among primitive peoples;⁵ thus a curious piece of corroborative evidence on the symbolic connexion between swans and women has been found in the rites enforced on secluded girls among American Indian tribes.⁶ Fortunately for the appeal of the myth, none of these theories has power to detract from, but all serve only to enhance, its elusive and poetic beauty.

LITERATURE.—J. Grimm, *Teutonic Mythology*, tr. J. S. Stallybrass, London, 1882-88, i. 426-430; W. Mannhardt, *Germanische Mythen*, Berlin, 1858, p. 340 ff.; E. H. SWAT OR UDYANA.—This is a famous principality in Independent Eastern Afghanistan, between the latter country and Kashmir, to the south of Chitral and the Pamirs. It receives the name of Swät from the river of that name (the Svastu, in Sanskrit), which joins the Kabul branch of the Indus above Peshâwar. Its literary name of Udyâna (in Prakrit, Ujjâna) is ascribed to its 'garden or park-like' appearance; for it is an exceptionally richly cultivated and well-watered beautiful Alpine valley. Through this Indo-Scythian country Alexander descended for his invasion of India, crossing, it is generally supposed, the Malakand Pass, which is on the main route to the Indian plains; but Swät is best known for its fame as an ancient centre of Buddhism. It is still thickly covered with the ruins of Buddhist monuments and temples, richly decorated with some of the finest sculptures of the Greco-Buddhist or so-called Gandhâra (*q.v.*) type of art. These sculptured friezes and terra-cottas date chiefly between the 2nd and 5th centuries A.D.; and a collection of several hundreds was made by the present writer during the Chitral expedition of 1895 and is now preserved in the Calcutta and Peshâwar museums.⁷ The Chinese Buddhist pilgrim Fa Hian, who visited the country c. A.D.

400, says: 'The religion of Buddha is very flourishing . . . in all there are 500 monasteries, they belong to the Little Vehicle (*Hina-yāna*) without exception.'¹ But, when Hiuen Tsiang visited the land c. A.D. 630, he found that nearly all the convents, some 1400 in number with formerly 18,000 priests, were 'waste and desolate.'² It is a striking commentary on Fa Hian's reference to the exclusive prevalence of the 'Little Vehicle' form of Buddhism that as a fact all the sculptural remains are of the 'Great Vehicle' (*Mahā-yāna*).

It was regarded by Fa Hian as the most northerly province of India, and the food and clothing of the people were the same as in India, and this is still the case—the people dress in white. The dimensions of the Swāt country, as described by Hiuen Tsiang at 5090 *li* (about 833 miles) in circuit, show that it in those days evidently included, in addition to the valley of Swāt, also the Chitral and Dard adjoining countries and the mountains on the right bank of the Indus, even beyond the great bend of the river to the south.

It was the native country of Padma-saṃbhava (*q.v.*), the founder of Lāmaism in Tibet; and the notorious prevalence of Saivite magical rites in the manuals ascribed to that saint in the Tibetan is somewhat in keeping with the old reputation of this country for sorcery. Hiuen Tsiang, in his visit to this land about a century before Padma-saṃbhava's period, writes: 'The science of magical formulas is become a regular professional business with them (the men of Swāt or Udyāna).'³

The belief in serpent-dragons of rivers and springs was especially prevalent here. It was at the source of the Swāt river that was located the legendary water-dragon or serpent Apalāla, whose conversion by Buddha is a favourite motive in Buddhist art, both north and south. Hiuen Tsiang refers especially to the 'white water' issuing from this spring, as also does al-Birūnī about the 11th cent. A.D.,⁴ which would doubtless be snow-water rather than glacial, yet it suggests that the river-name Svastu may have originally been derived from *sveta*, or *sveta*, 'white,' which approximates the modern name of that river, 'Swāt.' Confirmation of this ancient water-serpent worship was found by the present writer in a Kharoṣṭhī inscription upon a great boulder at a spring of which the record reads from a rubbing taken by the present writer: 'By the son of Dati, the Thera (Buddhist monk) Nora, a tank was caused to be made for the worship of All Serpents (in) the year 113.'⁵ This date, from the paleographic details, is placed about 65 B.C.

SWEARING.—See OATH, PROFANITY.

SWEAT, SWEAT-HOUSE.—Sweat, a colourless fluid containing about 2 per cent of solid matter, is a secretion of the sebaceous glands. Its chief function is to regulate the heat discharge of the human body. It is connected with some curious and interesting religious and magical customs in various parts of the world.

1. Sweat in magic.—Primitive man regards sweat, like blood, saliva, hair, and nail-parings, as a medium both for setting sorcery in motion against an enemy and for working the more harm-

less forms of magic. Codrington says that among the Melanesians the belief prevails that a leaf with which a man has wiped the perspiration from his face may be employed to work mischief against him.¹ A like belief is found among the Negroes of N. America.² Some of the natives of N.E. New Guinea take elaborate precautions to prevent a drop of their sweat from being made use of by a sorcerer; on leaving a camping-place, they stab the ground all over with their spears.³ Some of the most curious uses to which this exudation of the human body has been put are illustrated by a group of customs connected with love magic.

A cake, an apple, or a sweetmeat impregnated with the sweat of the giver is a powerful philtre throughout the greater part of northern and central Europe, from Cairn Gorm to the Carpathians.⁴ A Hungarian girl steals meal and honey at Christmas-time, bakes a cake, takes it to bed with her for one night, and then bestows it on a youth whom she wishes to fall in love with her.⁵ W. R. Paton says that in three *Ναποκάνορες* (confessors' manuals) of the Orthodox Church, which are, he believes, less than three centuries old, 'women are accused of rubbing dough on their bodies, and giving it to eat to men in whom they wish to arouse satanic love.'⁶

The victim of such love magic can, however, have recourse to a counter-charm of the same character. 'It was narrated that if a man who, under the influence of a philtre, was forced to love against his will, would put on a new pair of shoes, and wear them out by walking in them, and then drink wine out of the right shoe, where it could mingle with the perspiration already there, he would promptly be cured of his love, and hate take its place.'⁷

A similar idea underlies the superstition prevalent among the Negroes and Indians of N. America, and also in Belgium, that, if the owner of a dog wishes to make the animal faithful to him, he should give it some bread which has been soaked in his sweat.⁸ In the island of Tutu, in the Torres Straits, men drink the sweat of renowned warriors to acquire courage.⁹

The mythology of ancient Egypt seems to have ascribed a sacramental virtue to the sweat of Osiris. In the pyramid libation-formulae the libations appear to be his sweat; and in the ritual of Amon the incense appears to be crystallized drops of it.¹⁰ A song quoted by A. Erman speaks of the Nile as the sweat of Osiris' hands.¹¹ The Negroes of Jamaica identified a man's luck with the perspiration of his hands, and believed that, if the latter were wiped away, the former would disappear.¹²

2. The sweat-house.—The ceremonial use of vapour baths is a custom of great antiquity and wide geographical distribution, being found both in N. America and in N. Europe. In the former continent it was probably known to every tribe north of Mexico, though along the north-west coast it has been superseded by sea-bathing.

The type of the ordinary sweat-house seems to have been everywhere the same. Willow rods or other plant stems were stuck into the ground and bent or fastened with withes into a hemispherical or oblong frame-work, which generally was large enough to accommodate several persons. A hole was dug conveniently near the door into which stones, usually heated outside, were dropped by means of forked sticks. These were sprinkled with water to generate steam. A temporary cover of blankets or skins made the enclosure tight.¹³

In each tribe there were certain prescribed rules for the construction of the sweat-house. In some cases, however, the communal ceremonial chamber was used for this purpose. Sometimes it was used as a kind of men's club like the Pueblo *kiva*,

women being permitted to enter it for certain ceremonial purposes, but not for sweating. Among certain tribes on the Pacific coast women were not even permitted to gather wood for the holy fire to be kindled in the sweat-house. In California, where sweating always had a religious significance, some of the tribes used the sweat-house as a sleeping-place for adult males. Half-an-hour was usually spent in the sweat-house, and then the bather plunged into a stream, if there was one at hand.

¹ Among the Eskimo, hot air was used in place of steam and in Zuni, and probably in the Pueblos generally, hot stones near the body furnished the heat.¹

Some tribes lit the fire in the sweat-house in autumn and kept it alive till spring. Bancroft says of the Northern Californians:

'A fire is built in the centre [of the sweat-house] in early fall and kept alive till the following spring, as much attention being given to it as ever was paid to the sacred fires of Hestia.'²

Sweating in N. America was practised for three purposes: (1) *religious*—such as purification and the propitiation of spirits, preparation for war, and on arrival at puberty, when it was usually attended by scarification and mutilation; (2) *therapeutic*—prescribed by a shaman, who stood outside and invoked the spirits believed to cause the disease (among the Plains Indians shamans who officiated at these ceremonies had usually to pass through the sweat-house themselves for purposes of purification); (3) *social and hygienic*—a number of persons would enter a sweat-house for the purpose of enjoying the luxury of a bath (among certain tribes this became an almost daily practice, and was perhaps a degeneration).

The sweat-bath is also used by the Eskimos of Bering Strait, among whom the men and boys indulge in it about once a week, or once in every ten days during winter, but with this people it does not appear to possess a religious significance.³

Among many tribes the sweat-house had its own guardian spirit or *manitu* (*q.v.*).

Among the Lillooets of British Columbia 'men who had the spirit of the sweat-house for their guardian spirit made a sweat-house of elk-skin supported on wands, and inside it they placed four large stones, which were heated to make the steam for the bath.'⁴

It was believed among the Algonquins that a man when in the sweat-house might acquire *manitu*. A Fox Indian, relating his experiences during a sweat-bath, once said:

'Often one will cut one's self only through the skin. It is done to open up many passages for the manitou to pass into the body. The manitou comes from the place of its abode in the stone. It comes roused by the heat of the fire, and proceeds out of the stone when the water is sprinkled on it. It comes out in the steam, and in the steam it enters the body wherever it finds entrance. It moves up and down, and all over and inside the body, driving out everything that inflicts pain. Before the manitou returns to the stone, it imparts some of its nature to the body. That is why one feels so well after having been in the sweat-lodge.'⁵

Among the Thompson Indians of British Columbia, when a boy reached the age of puberty, he went through certain ceremonies to obtain a guardian spirit.

In the sweat-bath 'he prayed to the spirit of sweat-bathing under the title of "Sweat-bathing Grandfather Chief," begging that he might be strong, brave and agile, lucky, a good hunter, a skilful fisherman, and so forth.'⁶

The Ojibwa (*q.v.*), an Algonquin tribe, had a secret society called the 'Midé'wiwin,' or society of the shamans. For four days before initiation into it a candidate would purify himself in the sweat-bath.

¹ In all ceremonies, prophetic or medico-magical, great reliance is placed on the vapor-bath. . . . It is entered with

sacred feelings, and is deemed a great means of purification. Secret arts are here often disclosed between *Medais* [shamans] of high power, which could not be imparted in other places, or positions, believed to be less subject to the influence of sanctifying power.¹

When we turn to the Old World, we find a striking resemblance to the American customs in Herodotus's description² of the use of the sweat-bath among the Scythians as a means of purification, after mourning. The construction of the sweat-house was, however, simpler than in America. Three sticks were stuck in the ground, leaning towards each other, and around them pieces of felt were tightly stretched. A dish containing red-hot stones was placed inside. Hemp seed was then thrown on to the stones. A close parallel to this custom was found among the Delaware Indians, and is described by Tylor:

'At their festival in honour of the Fire-god with his twelve attendant manitus, inside of the house a small oven-hut was set up, consisting of twelve poles tied together at the top and covered with blankets, high enough for a man to stand nearly upright within it. After the feast this oven was heated with twelve red-hot stones, and twelve men crept inside. An old man threw twelve pipefuls of tobacco on these stones, and when the patients had borne to the utmost the heat and suffocating smoke, they were taken out, generally falling in a swoon.'³

The sweat-bath, as used among the peasantry of Great Russia, possesses the nature of a ceremonial purification even at the present day. It is taken weekly on Saturday afternoons, and all kinds of pollution must be avoided till after the service on Sunday morning.⁴ Among the northern Finns, for the *savna*, or sweat-bath, a log-hut is used. The bath is frequently taken *en famille*.⁵ With this people, however, and also with the Lapps, who make use of the sweat-bath on Saturdays before putting on their clean clothes, it appears to be an entirely secular institution.⁶ Vapour baths were in use among the Celtic tribes, and the sweat-house was in general use in Ireland down to the 18th,⁷ and even survived into the 19th century. It was of beehive shape and was covered with clay. It was especially resorted to as a cure for rheumatism.⁸

Vapour baths were used by the Greeks and Romans; details for their construction are given by Vitruvius.⁹ The sweat-bath, which in England has been misnamed the 'Turkish bath,' being in reality of Russian origin, was introduced into this country by David Urquhart, M.P. (1805-77).

3. *Origin and distribution.*—The presence of the sweat-bath both in N. Europe and in N. America at once raises the question whether it has originated independently in each of these continents, or whether it has reached them from a common centre of distribution. It is essentially a northern institution, and one belonging to the Mongoloid branch of the human family. M. A. Czaplicka suggests that the Slavs of Great Russia probably borrowed it from the Finns of the Middle Volga. There are many unsolved problems connected with the ethnology of the Scythians, but there appears to have existed among them a Finno-Ugrian element from which most likely the sweat-hut was derived. We should naturally expect to find the sweat-hut in N. Asia, whose inhabitants form an ethnological bridge uniting the Mongoloid peoples of Europe and N. America. We are,

however, disappointed in this expectation, since among the aborigines of N. Siberia it is not indigenous, but is in use only among those tribes which, like the Yakuts, have derived many elements in their culture from the Russians. We seem, then, to be led to the conclusion that the sweat-bath originated independently in both Europe and America, or else that it originated in a more southerly latitude than N. Siberia. The vapour-bath appears to be one of those institutions which were originally indulged in for hygienic purposes, but afterwards, owing to their beneficial results, came to be connected in the mind of primitive man with mysterious unseen powers, and hence were used in connexion with religious rites. Now, however, the sweat-bath seems to be regaining its former secular character.

LITERATURE.—This is given in the footnotes.

H. J. T. JOHNSON.

SWEATING.—See ECONOMICS.

SWEDENBORG. — 1. *Life and works.* — Emanuel Swedenborg was born in Stockholm on 29th Jan. 1688. He was the second son of Jesper Swedberg, bishop of Skara and previously professor in the University of Upsala. The family was ennobled by Queen Ulrica Eleonora in 1719, when the patronymic of Swedberg was changed into the name of Swedenborg.

Little is known of Swedenborg's childhood. After completing his studies at Upsala in 1709, he started on an extended foreign tour, and he was in England in 1711, 'studying Newton daily and very anxious to see and hear him.'¹ We gather from one of his letters to his brother-in-law, Dr. Ericus Benzelius, that mathematics and astronomy absorbed at that time most of his interest. He wrote of his conversations with Flamsteed, Halley, and other well-known men of science, but his copious references to the works of Dryden, Spenser, Milton, Shakespeare, and others show that his scientific studies did not prevent him from becoming acquainted with the best English literature. Swedenborg spent nearly two years in London and Oxford. He afterwards visited Holland, France, and Germany, working all the time at a number of inventions. One of them was 'the plan of a certain ship which with its men was to go under the surface of the sea and do great damage to the fleet of the enemy.'² Another of his inventions was a magazine air-gun to discharge 60 or 70 shots in succession without reloading. He also devised a flying machine, but the great Swedish engineer, Christopher Polhem, expressed the opinion that, with respect to flying by artificial means, it was about the same thing as trying to make a *perpetuum mobile* or to make gold!

In 1716 Swedenborg was appointed by King Charles XII. extraordinary assessor at the Royal Board of Mines, an appointment which caused him to decline the offer of a professorship of astronomy in the University of Upsala. As the eldest son of his family, Swedenborg had a seat in the House of Nobles of the Swedish Parliament, but his interest in science, always greater than in politics, led him in 1721 to go abroad to study the mines and manufactures of other lands. It was during this journey that he published a treatise on physics and chemistry, at Amsterdam, a second edition of his *New Method of finding the Longitude*, at Leipzig, and *Miscellaneous Observations on Geology and Mineralogy*. But the work which won for Swedenborg a European reputation was his *Opera Philosophica et Mineralia* in 3 vols., with numerous copperplates, published at Dresden and Leipzig in 1734 at the expense of his patron, the Duke of Brunswick. In the first volume of that work, the *Principia*, Swedenborg gives an elaborate theory of the origin of the visible universe and propounds his nebular hypothesis. This theory has been often attributed to Kant and Laplace as the original authors, but Swedenborg's theory appeared in the *Principia* in 1734, while Kant's *Natural History of the Heavens* was published in 1755, and Laplace's *Système du Monde* in 1796, as has been shown by Arrhenius in his introduction to the Latin reprint of Swedenborg's *Cosmologia*. Soon after appeared the *Economy of the Animal Kingdom* (1740-41) and *The Animal Kingdom* (1744-45), in which are given the results of Swedenborg's extensive labours in anatomy and physiology. In 1745 his *Worship and Love of God* was published. This work marks the surprising transition of its author's mind from plain scientific and philosophical reasoning to what is generally considered a form of religious mysticism, but what the author himself would have described as spiritual perception. A great change had come over him. His mind, as he himself says, had been opened to enable him to hear and see things of the other life.

Swedenborg gives the year 1743 as the date of the opening of his spiritual sight, but it was in April 1745, according to his

own statement, that he was fully admitted to intercourse with angels and spirits, not by any process analogous to what is usually termed spiritism (*q.v.*), but by speaking with them directly, while remaining normally conscious of everything about him on earth. He was quite aware of the scepticism with which such a mental state would be received, when made known to the world, and he anticipated it in his first theological work in these words: 'I am well aware that many persons will insist that it is impossible for any one to converse with spirits and angels during his life-time in the body; many will say that such intercourse must be mere fancy; some, that I have invented such relations in order to gain credit; whilst others will make other objections. For all these, however, I care not, since I have seen, heard and felt.'

In 1747 Swedenborg resigned his position on the Royal Board of Mines and devoted himself to the new work to which he believed himself to have been divinely called. His vast work, the *Arcana Coelestia*, was completed in 8 vols. in 1756. Then followed, among others, *The Earths in the Universe* (1755), *The New Jerusalem and its Heavenly Doctrine* (1758), *Heaven and Hell* (1758), perhaps the best known of all his books, *On the Intercourse between the Soul and the Body* (1769), *Divine Love and Wisdom* (1763), *Divine Providence* (1764), *The Apocalypse Revealed* (1766), *Conjugal Love* (1768), the first theological work to which Swedenborg's name is attached, and lastly *The True Christian Religion* (1771).

It is interesting, and in a sense very significant, to find that, while Swedenborg was fully occupied with the publication of so many theological works, he yet found time and freedom of mind to attend to mundane affairs. In 1763 he wrote several papers on scientific subjects in the *Transactions of the Royal Academy of Sciences of Stockholm*, and in 1766 he republished at Amsterdam his *New Method of finding the Longitude of Places on Land and Sea*. Count Höpken has stated that 'the most solid and best written memoirs at the Diet of 1761 on matters of finance were presented by Swedenborg.'²

The last political document bearing his signature is an address to the Diet entitled 'Frank Views concerning the Maintenance of the Country and the Preservation of its Freedom,' in which he utters a warning against the revival of an absolute monarchy.

On Christmas Eve, 1771, while in London, he had a stroke of apoplexy and was visited by the minister of the Swedish Church, E. Ferelius. He never completely recovered, and he died on 29th March 1772 in the eighty-fifth year of his age at his residence in Great Bath Street, Coldbath Fields, London. He was buried in the Swedish Church. In 1905 the Swedish Government, having made arrangements for the transfer of Swedenborg's remains to his native country, sent the frigate *Fulgia* to England to bring them home, and in due time they were deposited in the Cathedral of Upsala, close to the resting-place of Linneus.

2. Doctrines.—The philosophical and theological doctrines professed by Swedenborg may be conveniently considered under three heads—God, the world, and man.

(a) *God.*—He has nowhere given any formal arguments to prove the existence of God. He starts at once from the conviction that 'all the principles of human reason unite and, as it were, concentrate in this, that there is one God, the Creator of the Universe.' Two principles constitute the essence of God—love and wisdom. His infinity comprehends both immensity and eternity, His immensity having relation to space and His eternity to time. But God with respect to the created world is 'in space without space, and in time without time.' God is life, and all life is from Him. Life itself is uncreatable, but it can be communicated, lent, as it were, to finite beings. God is one absolutely in essence and in person. The Lord Jesus Christ is God, indeed, but He is not another divine person. He is Jahweh manifested in the finite garment of humanity. Yet in Him is a divine Trinity of love, wisdom, and power—the three essentials of His divine nature. Thus the Lord alone ought to be loved supremely and worshipped as our Heavenly Father. 'To see Him is to see the Father (Jn 12⁴⁵ 149).'

In a sense Swedenborg admits that God, in His essence, is unknowable, but he believes that there is a form of anthropomorphism which is not only permissible in speaking of God, but necessary, because it conveys a profound truth about Him. He asserts that our thinking in human symbols would be baseless and misleading if God Himself were not divinely human. Hence his startling postulate, 'God is a man.' Of course, he does not

¹ R. L. Tafel, *Documents concerning the Life and Character of Swedenborg*, 3 vols., London, 1875-77, i. 200-314 (Swedenborg's first letter from England to Benzelius, Oct. 1710).

² Tafel, ii. 408.

mean that God is a man in a physical sense. His real meaning is simply that, if we think at all about God, we must do so by means of symbols derived from our highest human experience. But, if these symbols do not correspond, in an infinite Reality, to what they represent, as finite symbols, to us, then all these conceptions are not merely imperfect and inadequate, but actually false. We are then obliged to conclude that there is a fundamental antinomy in the constitution of the human mind, so that the Power from whom it proceeds has so constructed it that it must think about that Power, and think about it falsely. Surely, Swedenborg considers, what the human mind *must* think should be, at least, an approximate symbol or representation of a fact. If we doubt this, the grounds upon which we believe any philosophical, ethical, or spiritual truth are undermined.

Thus, to think of God as a divine man would simply mean, for Swedenborg, to think of Him as being infinite love and wisdom, as He is apprehended by us by means of symbols derived from the highest of human faculties, the intellect and the will—those faculties by which we are made 'in the image of God.' But Swedenborg seems also to have discerned some profound connexion between this conception of God as a divine man in His essential nature and the rational interpretation of a possible incarnation in time. In reading Swedenborg it must always be remembered that there is an idealism, quite his own, at the basis of his philosophical views and consequently of his theology. This enables one to understand much that lies hidden behind his realistic language when he deals with spiritual matters for which our human vocabularies have only weak and inadequate expressions.

(b) *The world.*—This should be particularly remembered in his treatment of the creation of the world. Swedenborg has attempted to correlate two apparently irreconcilable ideas—the idea of a personal God distinct from the universe, and the idea of an immanent Creator. He has done it by means of his doctrine of 'discrete degrees.' He holds that there are substances of many orders composing the universe. The primary, self-existent substance is the infinite God from whom all finite substances originate. But those substances are related to each other in an order constituted by degrees named 'discrete degrees' in distinction from 'continuous degrees,' because they are plans of existence entirely separate from each other and incapable of being resolved one into another. A continuous degree is merely a variation of being or quality on its own plane, as from heavier to lighter, or from denser to rarer. It is only a question of more or less. Discrete degrees, on the other hand, are never of the same forms or qualities of being, and, moreover, they involve the relation of cause and effect. Hence Swedenborg says: 'Nothing, so far as I am aware, has hitherto been known of discrete degrees but only of continuous degrees; yet without a knowledge of both kinds of degrees nothing of cause can be truly known,' for 'seeing from effects alone is seeing from fallacies.'¹ He means that fallacies arise, not from a failure to distinguish between cause and effect, as, e.g., between matter and spirit, but from the fact of regarding them as differing by continuous degrees only and not by discrete degrees. For thus cause is never lifted above the plane of effect, nor spirit above the plane of matter.

It is maintained therefore that in everything of which anything can be predicated there are what are called end, cause, and effect, and these three are to each other according to discrete degrees. In creation the natural or material world is the

effect, of which the spiritual world is the cause, and God is the end. The first act of creation, not in time but in order, is the putting forth by the Divine of a finite emanation of love and wisdom from Himself. This is conceived as a spiritual sun of incomparable splendour, a manifestation so intense that the finite mind could not bear its ardour, were it not tempered by intermediate stages. Thus, successive discrete degrees, separated not in space but in the quality of their spiritual constitution, produce the higher and the lower heavens; other discrete degrees subsist in the angelic forms according to their receptibility of love and wisdom.

Similarly, the affections and thoughts which constitute the life of men are not, as it seems to us, self-generated, but pass into their minds out of the spiritual world, in a clearer or more obscure manner, always according to discrete degrees and in the order of cause and effect. In the world of matter a different law operates. Matter is derived not directly from spirit, but from the natural sun, which, according to Swedenborg, is not only the centre and support of our solar system, but also the proximate cause of its existence. From the activity of this primal sun are ultimately produced, by discrete degrees, the atmospheres and matter itself out of which the physical world is formed. The material substances, conceived as inert in themselves, are nevertheless capable of being acted upon by spiritual forces. But there is nothing of God in them as the ultimate of creation, since their life has ended in no-life, and love and wisdom have ended in forms of motion. Of course, this does not mean that God is not present in this ultimate of creation.

This doctrine is intended to exclude the incomprehensible idea of a creation *ex nihilo*, whilst it is meant also to provide against a pantheistic interpretation of the universe. It inevitably presents the difficulties which are inseparable from any theory of emanation.

(c) *Man.*—The theology of Swedenborg, as it deals with man, his nature, and his destiny, cannot be understood apart from his view (or, as he would insist, apart from the doctrine that he was divinely commissioned to make known to the modern world) of the real meaning of God's Word as we have it in the letter of Holy Scripture. More than 150 years ago Swedenborg had foreseen the difficulties and objections which criticism might bring forward as an argument against a belief in a divine revelation. 'It is in the mouth of all,' he says, 'that the Word is from God, is divinely inspired and therefore holy. But yet it has been unknown hitherto where within it its Divinity resides. The man who worships Nature instead of God may easily fall into error concerning the Word, and say within himself when he is reading it: "What is this? Is this divine? Can God who has infinite wisdom speak thus?"'² Yet Swedenborg never lost his faith in a divine revelation, and one of the principal objects of his theology is to show that the difficulties which create so serious a stumbling-block in many minds are due to the fact that they are looking in the Bible for what its letter does not and cannot explicitly manifest. He affirms that the Word contains throughout a spiritual meaning which alone gives the true and full sense of God's revelation to man.

Philo, Origen, Clement of Alexandria, and others have attempted to discover a spiritual sense in the Bible, but Swedenborg's conception proceeds on entirely different lines. For him the Word is the divine truth itself as it exists in God. It is the very form of God, and the medium of communication and conjunction with Him for the

¹ *Divine Love and Wisdom*, no. 127f.

² *True Christian Religion*, no. 187.

angels in the heavens and for men upon earth. But truth in this divine form is utterly incomprehensible to any finite mind. To render it at least partly intelligible, it must descend through the discrete degrees already described, and assume successively lower and lower forms of expression adapted to the comprehension of the various grades of finite intelligence. On earth it presents itself to us as the letter of our Bible, or rather as the original texts from which that letter has come to us.

How then are those texts written? They are written in pure 'correspondences,' *i.e.* in symbols derived from nature. Every natural object is conceived to be the effect, and therefore the expression, of spiritual causes. Those effects 'correspond' to those causes; hence their capacity, when properly understood, to reveal the spiritual meaning contained in them.

The first result of this principle is that man is thus enabled to know the true canon of the sacred Scriptures. Those books which are so written as to present a correspondential spiritual meaning are really 'the Word.' The other books possess devotional and even doctrinal value, but they are not 'the Word.' Guided by this fact, Swedenborg declares that the only books of the Word in the Bible are, in the OT, the Pentateuch, Joshua, Judges, 1 and 2 Samuel, 1 and 2 Kings, the Psalms, and the Prophets from Isaiah to Malachi; in the NT, the four Gospels and Revelation. The Epistles form therefore no part of what Swedenborg strictly calls 'the Word.' But he valued them highly, and he frequently quotes them.

In the letter, as we have it, Swedenborg recognizes a human element manifested in the language and feelings of the writers of the various books of the Bible; it is only the spiritual sense that is entirely and solely divine. Hence many of the difficulties raised by the higher criticism would be no difficulties for him; *e.g.*, instead of a creation in six days in the book of Genesis, he reads there the earliest condition of man and the gradual development of his psychological constitution; his growth in a knowledge of good and truth, of love and faith, and of divine things; and finally his introduction to a celestial perception of divine truth itself. It is a conception of the regeneration of man, called to reach his spiritual destiny through knowledge, trial, faith, and love, and Swedenborg sees that such a conception has a sublime meaning for us which it could not have had for the men who lived when the letter was written. It would have been an unintelligible revelation for most of them. Therefore the full meaning of the letter as contained in the spiritual sense was not given to them. There is, according to Swedenborg, a grave spiritual danger in the premature disclosure to any mind of divine Truth.¹

But what is man? He is, says Swedenborg, made to be at the same time in the spiritual world and in the natural world. He is not life, but a recipient of life from God. And God grants man a sense that the life which he feels within himself is his own, in order that he may live as of himself. In every man's soul there is an inmost or supreme degree into which the divine of the Lord proximately flows; hence it is that man can receive intelligence and wisdom and speak from reason, and from this also comes the fact that his soul is endowed with immortality.

The will rather than the understanding constitutes the man. Swedenborg rejects the idea of angels having been created as such to people the heavens. All spirits, he believes, whether in heaven or in hell, are from the human race. He

also holds that there is no personal Devil or Satan, but that that name signifies the whole society of evil spirits.

The life of man cannot be changed after death, for the spirit of man is such as his love is, and infernal love cannot be changed into heavenly love, 'because they are opposite.'

The problem of evil, as presented by Swedenborg, is explained by the freedom with which God has endowed man, and it is because God 'who changeth not' will not withdraw that gift that man's love remains what it was even after death. If he has deliberately made evil his good and good his evil, then he is his own hell, and does not desire heaven. He could find no ease there, and would long for his congenial surroundings and associates. He is not sent to hell; he goes there of himself, and would be happy there, if an evil soul could find permanent happiness anywhere. But he inevitably meets with sufferings and punishments, inflicted not by God or His agents, but chiefly by the evil spirits his associates. What happens under our eyes here upon earth continues in hell. For evil breeds evil always and everywhere. This conception is sad, but certainly drawn from life.

Are then those sufferings eternal? It is difficult to interpret definitely the teaching of Swedenborg on that point. How far 'those sufferings may be mitigated,' says Howard Spalding, 'we are not told, but a careful study of all that Swedenborg has said on the subject suggests that they may be so greatly modified as to cease to be acutely felt.'¹ It is remarkable that, according to Swedenborg, there is no absolute destruction of evil even in heaven, for nothing which has formed part of the spiritual nature of man can ever be annihilated. Spirits therefore—yea, angelic spirits—carry with them into heaven the perverted organic forms in which their evils resided. They are even permitted to experience from time to time a sense of their evils, but not uselessly, for by those alternations of state spirits are kept in continual spiritual progress. Thus the regeneration of man, begun on earth, continues to eternity.

Of heaven we are told that God Himself is heaven, and that His presence to each human spirit brings heaven into him, but always in a degree which depends on a certain faculty of reception acquired on earth by man's conscientious endeavour to make what he truly believes the rule of his life.²

There has been a tendency, more or less defined, to class Swedenborg among the mystics, but this seems to be due to an imperfect understanding of his system. His conception of life in heaven should suffice to show how little he has in common with mysticism past or present.

• The fulfilment of God's purpose in creating the world is a fundamental doctrine in Swedenborg's theology. That purpose, we are told, was, by making man in His own image and endowing him with the faculties of freedom and rationality, to prepare him for that conjunction with God which constitutes the angelic heaven. In this sense, the creation means infinite love seeking by love to cause love to arise freely between the Creator and His rational creature. But the misuse of rationality and freedom has led to evil being chosen and loved instead of good; hence sin, whose effect is the weakening of true freedom, and the obscuring of that interior light within us which is rationality. Then it is that the love which had created man has also come to save him. By His incarnation the Lord did not come to reconcile His Father

¹ *The Kingdom of Heaven as seen by Swedenborg*, p. 4 f.

² For full details see especially Swedenborg's *Heaven and Hell*.

¹ See *Arc. Cælest.* no. 339s.

to man, for God in Christ, as Swedenborg says, is the one only God who is love itself and does not need to be reconciled to His creature. It is man who needs to be reconciled to God. The Lord came and, as to His human nature, was born, lived, suffered, and died 'for us,' not 'instead of us.' He came to enable man to do that which, through sin, he had almost lost all power of doing, namely, to shun evil and to do the Lord's will in a life of righteousness and true holiness. Moreover, God 'became flesh,' not only to effect this work of redemption, but also that He might visibly manifest His infinite love for man, and thereby give to him for ever a definite object of intelligent faith, worship, and love. Man is said to be saved by the blood of Christ, in this sense, that His blood is the symbol of divine truth, and the shedding of His blood is the symbol of the imparting of His spirit of truth, the Holy Spirit. The Atonement, for Swedenborg, is thus really an at-one-ment, the reconciliation of man to God by the love and power of God. It was accomplished by the Lord taking upon Himself man's nature, enslaved by sin, from the Blessed Virgin Mary, sustaining in His own person the assaults and temptations of the powers of darkness, and gradually subduing them. For this work the Lord laid down His life, *i.e.* the life in Him of all that was not in perfect agreement with the infinite perfections of His indwelling divinity. When this was done, 'consummated,' the Lord Jesus Christ was no longer, even as to His human nature, the Son of Mary. He was the 'only begotten Son of God,' the perfect manifestation of the infinite, invisible Father. This process, called glorification, was completed after His resurrection, when the Lord 'put off' from the infirm human nature all its hereditary tendencies to evil and sin, and 'put on' from the Father the divine humanity subsisting in the essential divinity within Him. This is the supreme type of man's own regeneration by which, having put off hereditary tendencies to evil and his actual sins, he puts on from the Lord, in the degree that he has thus put off evil, a new regenerated and spiritual humanity, a spiritual mind. No real regeneration can be attained except in accordance with the principle that a 'saving faith' is 'a faith which worketh by love.' Salvation by 'faith alone' is rejected and condemned by Swedenborg in innumerable passages in his works.

It is important in connexion with this subject to understand his idea of 'the Church.' The essential Church for him is constituted by a genuine love of goodness and truth and by the spiritual relation established with the Lord in the minds of men. The true Church is therefore invisible, but, so far as it is a true Church, it can never pass away. This, however, does not exclude the possibility of the disclosure by the Lord of further truths called for by new conditions in the world of human thought and experience, and needed to establish a higher level of spiritual life. Nor does it exclude the possibility of the loss or the corruption of truths previously held, rendering necessary the institution of a specific 'New Church' in order to restore what has been lost, and to incorporate new truths which the Church in the past was not ready to receive. The assertion, therefore, made by the disciples of Swedenborg that a 'New Church' has been instituted, involves, as they would insist, no disparagement of the former Christian Church 'so far as it is really the Lord's.' The members of the 'New Church' at the present time consider it an entire misconception to imagine that Swedenborg is the founder of a 'New Church.' He himself always repudiated any such pretension. He considered himself a mere instrument through

whom new truths needed in the Church were communicated to the world. His chief point always is, however, that 'the Church is one thing and religion is another.' The Church is called a Church from doctrine; religion is called religion from a life according to doctrine. Hence his well-known saying: 'All religion is related to life, and the life of religion is to do Good.'

SWINE.—The swine plays a prominent part in many ancient and modern religions. The word 'pig' is unlucky to the Scottish fisherman, and on hearing it he will feel for the nails in his boots and mutter 'Cauld iron.'¹ The inhabitants of certain villages on the north-east coast of Scotland consider the words 'sow,' 'pig,' and 'swine' very unlucky; should any one be so unwise as to utter these words while the line is being baited, the line will surely be lost. The Galelareese, having noticed that, whilst men suffer from it, caused by treading on the fallen fruit of the *aren* palm-tree, the wild boar, which is fond of the fruit and runs freely among it, is not liable to such a disease, argue that the fruit treats the pig as a real friend, and, if one by grunting can impress the fruit that he is a pig, it will treat him in the same way.² The pig was offered by the Romans and Greeks as an expiatory sacrifice. Cato advises that, before thinning a grove, the Roman farmer should offer a pig to the god or goddess of the place.³ The grain distributed as prizes in the Eleusinian games in Greece was grown on the Rarian plain near Eleusis; this plain was so sacred that no dead body was allowed to touch it, and, whenever a defilement occurred, a pig was offered as a sacrifice. The Caribs abstained from pig's flesh because, like most primitive races, they believed that the physical and mental qualities of the human being depend largely upon the food which he eats; therefore, if they were to eat the flesh of pigs, they would have small eyes like those of a pig. Similarly Zulu girls abstain from eating pig's flesh because they fear that by eating it they might gradually come to resemble the ugly pig in appearance. But there are other reasons why primitive man abstained from pork. The Kai of N.E. New Guinea find that pigs are the worst enemies of the crops; therefore, if a field-labourer were to eat pork, the dead pig in his stomach would attract the living pig into the field.⁴ Swine's flesh was forbidden to all the Semites except the Babylonians, but it is an open question whether this was because the animal was holy or because it was unclean.⁵ As early as the time of Hammurabi pork was a highly valued food among the Babylonians and frequently formed part of the temple offering. the inspection of pigs various omens were derived, and in the official lists special provision is even made for the temple pigs. The heathen Harranians sacrificed swine's flesh once a year and ate the flesh.¹ By the Syrians the swine was regarded as sacrosanct, and it was specially sacred to Aphrodite.² To the Greeks the attitude of the Jews towards swine was difficult to understand.³ In Is 65^a 66^b.¹⁷ we are told that some of the Jews used to meet secretly to eat swine's flesh; it has been suggested therefore that 'the swine was revered rather than abhorred by the Israelites,'⁴ and that it was not eaten because it was divine. To the Egyptians the pig was very loathsome.⁵ Swineherds were forbidden to enter a temple and even had to marry among themselves. If a man even touched a pig, he immediately stepped into a river to wash off the taint. Pig's milk caused leprosy. These prohibitions prove that the Egyptians originally regarded the pig as sacred, for the belief that the eating of a sacred animal produces leprosy and that the effect caused by touching a sacred object is removed by washing was current among many ancient tribes and religions.⁶ Later, however, the pig began to be looked upon with horror and was regarded as the Egyptian devil and the embodiment of Set or Typhon and enemy of Osiris. Typhon, in the form of a pig, injured the eye of Horus, who burned him and ordained that a pig was to be sacrificed, seeing that Ra, the sun-god, had declared the pig to be an abominable beast. We find in various religions that the animal sacrificed to a god because he is the god's enemy was originally the god himself. Now, we read that Typhon was hunting a boar when he discovered and mangled the body of Osiris, and that for this reason pigs were sacrificed once a year. It has therefore been suggested that originally the pig was a god, and that he was no other than Osiris.⁷ We have already seen that the Kai of New Guinea abstain from pork because they regard the pig as the enemy of the crops, so that we can understand why the Egyptians should have identified their corn-god Osiris or his enemy Typhon with a wild boar. It might also be noted that pigs were sacrificed to Osiris on the very day on which he is recorded by tradition to have been killed. Further, the pig was sacred to the corn-goddess Demeter and was often associated with her. In art she is represented as accompanied by a pig.⁸ At the Thesmophoria it was customary to throw pigs into some sacred vaults, which are described as the 'caves of Demeter and Persephone.'⁹ It seems that the pigs were intended to represent Persephone and her descent into the lower world. An ancient legend tells that, when Pluto carried off Persephone, Eubuleus, a swineherd, was herding his swine near the spot, and his herd were engulfed in the cave into which Pluto and Persephone had vanished. The Thesmophoria has analogies in the folk-customs of N. Europe. In certain districts of Conrland the pig is the corn-spirit, whose power of

fertility lies in his tail; therefore, when barley is sown for the first time in the year, the sower sticks a pig's tail into the field, believing that the ears of corn will grow as long as the tail.¹ The idea that the pig is an embodiment of the corn-spirit can further be seen from the Scandinavian custom of 'Yule boar.' This is a loaf prepared from the last sheaf in the form of a pig. It is usually prepared at Christmas and kept till sowing-time, when it is given to the plough-horses in the hope that it will be the means of securing a good harvest.² In this connexion it is of interest to note that Ball finds a philological connexion between Tammuz, the Assyrian god of the under world and of vegetation, and the Chinese and Turkish words for pig. He also cites the evidence of classical writers³ that 'the Jews did not use swine's flesh because it was sacred inasmuch as by turning up the earth with its snout it taught men the art of ploughing.'⁴ In some parts of White Russia it is believed that the bones of a pig preserve the corn from hail, whilst in other places the ribs are thrown into the seed-bag among the flax-seed because they cause the flax to grow well and tall. The Alfoors of Minahassa in N. Celebes believe that a pig's blood causes inspiration, and at one of their festivals the priest drinks a pig's blood and thereupon is able to prophesy as to how the rice-crop will turn out.⁵ The inhabitants of Car Nicobar rub themselves over with pig's blood in order to cleanse themselves of any devils of which they may be possessed.⁶ In the same way the Greeks cleansed a homicide by sprinkling him with pig's blood and beating him with a laurel bough. The Karens of Burma believe that a bad harvest is caused by adultery, and, in order to atone for this, those detected in adultery must buy a pig, scrape out furrows in the ground with each foot, and then fill them with the pig's blood.⁷ Some Yabim believe that after death their souls will be turned into swine, and they therefore abstain from swine-flesh lest they should thus be eating the souls of their relatives. The people of Tamara (off the coast of New Guinea) also abstain from pork because the souls of the dead transmigrate into the bodies of pigs. The worshippers of Adonis did not eat pork because their god had been killed by a boar. It has been suggested that the cry '*Hyes Attis!*', raised by the worshippers of Attis, meant 'Pig Attis!'⁸ In Fiji a huge pig is presented to those who are initiated into manhood. At Maewo, in Aurora, one of the New Hebrides, fifty days after the death of a wealthy man pigs are killed, and the point of the liver of each pig is cut off. The brother of the deceased goes to the forest and calls out the dead man's name, saying 'This is for thee to eat,' the idea being that, if pigs are not killed for the benefit of the dead man, his ghost has not proper existence.⁹ It should be noted also that the pig is very often represented by a cowry-shell. Malinowski, in an

account of the natives of Malu Island, off the coast of New Guinea,¹ says that at one of their feasts the natives erect a gallows and ornament it with a white shell called *moto* (the so-called white cowry, *Ovulum ovum*). This shows that they are about to offer pigs for sacrifice, and the number of pigs to be sacrificed is always the same as the number of shells. The association of this shell

with pigs is important when it is remembered that cowries are widely known as pig-shells. This fact, and also the passionate tendencies of swine, would be the most plausible explanation of the abhorrence with which they have always been, and still are, regarded in the East.

SYMBOLISM.

Christian (J. GAMBLE), p. 134.

Greek and Roman (P. GARDNER), p. 139.

Hindu (A. S. GEDEEN), p. 141.

SYMBOLISM (Christian).—It is proposed in this article to indicate the more important of the emblems and personifications in which Christian belief has found spontaneous expression. The literary images which deserve to be called symbolical, but which have not embodied themselves in pictorial or material shapes, are excluded from view. An attempt will be made, however, to connect the emblems which call for notice with the language of the New Testament.

When the subject is thus defined, the field to be surveyed is at once seen to admit of a clear division. The first four or five Christian centuries separate themselves for our purpose markedly from the centuries which follow. For the symbolism of the earlier period we have the definite and varied testimony offered by the sepulchral paintings and inscriptions of the Roman catacombs. With the light thus obtainable we are able to see the hopes with which the Christians of Rome during this formative period followed their dead into the unseen world and connected the life that now is with that to which they believed it to be the portal.

Burial in the catacombs and the symbolism to which it gave rise practically ceased before the middle of the 5th century. From that time onwards new images and ideas crowd in upon us, created by the popular imagination in response to the Church's teaching and worship, to legends of the saints, animal fables, and spiritual plays and moralities. Many of these images do not succeed in finding an emblematic expression, but those which do create a symbolism far exceeding that of the previous period in amplitude. We shall give our chief attention to the earlier period, and briefly indicate the later emblems which, either from their permanence or from their inherent significance, seem especially to claim notice.

A review of the entire field brings one decisive feature of the symbolism into prominence. The emblems will all be found to point onwards to a life beyond the tomb. The symbolism is created by a hope or, it may be, a fear whose fulfilment is not expected within the limits of our present existence. The justification of this 'other-worldliness' may readily be found in our records of the life of Christ. His ministry began with the announcement, 'The kingdom of God is at hand,' and was throughout a prophecy of good things to come (Mk 1¹⁵). Some of His disciples may at first have believed that they would see these good things before they 'tasted' death (9^a). The mere lapse of time was enough to stamp such expectation with the mark of illusion. Every year it became more clear that the realization of the promised kingdom must needs be a slow and gradual process. In another respect also the desired consummation underwent a change. The earth ceased to be regarded, as perhaps it had at first been, as the

Jewish (I. ABRAHAMS), p. 143.

Muslim (D. S. MARGOLIOUTH), p. 145.

Semitic (M. H. FARBRIDGE), p. 146.

scene of fruition. The liveliest hope cannot resist the accumulating contradictions of continuous experience. Year by year it became less likely that the kingdom could ever be localized or assume any material shape. The Crucifixion and its sequel had lifted the thoughts of the disciples from the earth and carried them into that heaven which had now become the Master's home. To this heaven they transferred their 'treasure' (Mt 6¹⁹), less perhaps from deliberate apostasy than from the reluctant acceptance of undeniable experience, and to it their hearts ascended. Death thus re-assumed its normal character, and what lay beyond it became an object of anxious thought or fervent longing. These thoughts and longings form the central motives of Christian symbolism. The blessedness hoped for after death, the means by which it may be reached, and the character of Him who procured and guarantees it—these will be found to be the subjects round which the Christian emblems of all periods gather. From the beginning hope has been the dominant Christian characteristic. The scene of fulfilment and the mode of realization may have shifted. Hope itself has remained.

The symbolism of the catacombs embodies the hopes of future blessedness entertained by those who used these burying-places up to the time when such subterranean burial ceased. Thus the roses, or flowery meadows and shrubs, which appear on so many tombs represent paradise. Its entrance is sometimes indicated by a curtain which is in process of being drawn aside. The Good Shepherd who appears on tomb after tomb may with greatest probability be here regarded as the Lord and Protector of the dead. It is they whom He gathers round Him in the heavenly fields. One of their number is the sheep He carries on His shoulders. The fish, one of the two articles of food with which the thousands were fed (Jn 6¹⁻¹⁴), represents the mystical union with Christ, and its fruit incorruptibility (*ἀφθαρσία*). The vine points to the heavenly feast, or to its earthly pledge—the Eucharist. The dove, sipping water from the basin or jar, is the soul refreshing itself from the water of life (Rev 22¹). The palms symbolize either the palms borne by the blessed (7^b) or the wreaths or crowns of those who have been victorious in the race of life (1 Co 9²⁵, 2 Ti 4⁸). The anchor indicates the hope of He 6¹⁹ which enters in 'within the veil.' The ship and lighthouse typify the dangerous voyage across the ocean of life to the haven of safety. The stag is that of Ps 42¹, and represents the soul's thirst for God.

The paintings of the catacombs have been fully described by two recent writers. Wilpert, in his *Malereien der Katakomben Roms*, has classified the paintings, reproducing all that are important and giving his interpretations of their symbolism. Von Sybel, in his *Christliche Antike*, has reviewed the subject on the ground provided by his predecessor's labours. He also reproduces many of the paintings and states his own conclusions in a lucid style and with much wealth of learning.

The symbolism of the later centuries has the

¹ *Trans. and Proc. Royal Soc. S. Australia*, xxxix. [1915] 404f.

same general character. As sin and misery increase on the earth, fear plays a larger part in the Church's symbolism. The torments of the lost become more conspicuous than the joys of the blessed. A final judgment of all mankind displaces the earlier individual judgment and assumes truly terrifying aspects. The figure of Christ becomes more stern and awful, and, as it does so, the person of the Virgin Mother takes His place as Protector and Advocate.¹ She is invested with steadily-growing dignity and is separated more and more from human infirmity. The Church becomes a figure of regal authority. In what has been said² to be 'perhaps the finest mediæval personification'—the sculpture on Strassburg Cathedral—she appears as a royal lady, with the crown upon her head and the banner of victory and the chalice in her hand. Elsewhere Christ is seen crowning her from the Cross, or she receives His blood in her chalice. Thus, whether in earlier or in later art, the symbolism alike points beyond the tomb.

We may now proceed to deal in greater detail with the separate symbols. They will be found to gather, for the most part, round two central subjects: (1) Christ, regarded as the author of eternal life, and (2) the heavenly state.

1. *The author of eternal life.*—Christ is represented in all our Gospels as the giver of eternal life to those who accept and follow Him. The synoptists amply confirm His declaration in the Fourth Gospel: 'He that heareth my word, and believeth him that sent me, hath eternal life, and cometh not into judgement, but hath passed out of death into life' (Jn 5²⁴; cf. Mt 10²⁸, 39 19²⁹, Lk 9²⁴, 26, etc.). There can be no doubt that, whatever the Kingdom of God may have meant to the first Jewish disciples, it represented an inseparable association with Christ, here and hereafter, as Master and Saviour. To the Gentile world Christ, we may safely say, appeared as, above all else, a deliverer from the power of death. He had taken flesh that 'through death he might . . . deliver all them who through fear of death were all their lifetime subject to bondage' (He 2¹⁴). He had 'abolished death, and brought life and incorruption to light through the gospel' (2 Ti 1¹⁰). These and similar passages were probably understood by the earliest believers much as they are by ordinary Christians to-day. They were taken to mean that the faithful disciple would find Christ waiting for him, when death was past, and that Christ would then lead him into a better and happier existence than he had hitherto known, better and happier because it was nearer to God. Christians generally would not perplex themselves then, any more than they do now, with questions regarding the precise nature or locality of this future existence. The 'eternal life' which in the Fourth Gospel is the equivalent of Messianic blessedness was probably understood by the great majority of readers as a life in which the disciple would 'see' God, and which would not come to an end as earthly life does. Far as this is from exhausting the meaning of the word 'eternal,' it is difficult to suppose that the word can ever have conveyed, or does even now convey, to the ordinary Christian more than this simple interpretation. Of this better life, to be known hereafter, Christ had given a foretaste or prophecy during His earthly ministry. The blind then received their sight, the lame walked, the lepers were cleansed, the deaf heard, the dead were raised, and the poor had good tidings preached to them (Mt 11⁵). It is this power of God to save from death and harm that finds expression in the paintings of the catacombs. Christ appears as the son of God foretold by prophetic voices.

¹ See art. 'Mary,' in *HDB*.
Schulze art. 'Simmbilder,' in *PRE³* xviii. 392.

His ministry has been heralded by many previous displays of God's saving power. He has actually shown Himself to be the raiser of the dead, the restorer of the blind, and the healer of the sick. He waits for His disciples beyond death to lead them into the heavenly pastures. Such are the subjects and implications of the symbolism.

(a) *OT types.*—Scenes from the OT which were especially held to typify this deliverance recur with great frequency on the tombs. These are the salvation of Isaac, when he was about to be slain in sacrifice by Abraham, the salvation of Noah in the Ark, the restoration of Job to his former prosperity (Job 42¹⁰⁻¹²), the rescue of Jonah from the jaws of the sea-monster, and the preservation of the three Hebrew youths in the flaming furnace. Some features in the symbolism of these paintings deserve particularly to be noted. In the representations of Abraham's contemplated sacrifice it is the rescue of Isaac from death that the painter desires to symbolize. This is plain from the attitude in which Isaac is represented when the design of the picture permits. He appears with extended arms—a posture of prayer or adoration of which more is said below. This is also the attitude of Noah as he stands in the Ark, and of the three children in the furnace. There is no suggestion in the paintings of the theological meanings afterwards found in Abraham's projected sacrifice. It may also be observed that the Deity is represented here, as generally or often in the earliest Christian art, by an outstretched hand. No attempt is made to delineate His features. There are no representations of the Trinity such as we find afterwards. Of all Biblical types Jonah has been the most frequently chosen by these painters. He forms the subject of 129 separate pictures which have come to light. It is to be observed that he does not here appear as a type of the resurrection of Christ, as he does in Mt 12⁴⁰. Nor is it the repentance of the Ninevites at his preaching (Mt 12⁴¹) that the painters wish to symbolize. He is represented as an example of God's saving power. Sometimes he forms the subject of three or four connected pictures. We first see him standing on the deck of the vessel and about to be cast into the sea. We then see the monster vomiting him out towards the land. He next appears resting under the gourd, which takes the form of an arbour like those in paradise. There may be a fourth picture where he reclines in an attitude of dejection, his head resting on his hand.¹

(b) *The sacred infancy.*—The divine childhood is depicted on a number of tombs. One of the most beautiful paintings in the catacombs² is the picture in the Priscilla cemetery of the Christ-child on His mother's breast. The mother bends slightly forward as if to suckle the child. The child's hand is spread out over the mother's breast, but the face, with wonderful eyes, is half turned towards the spectator. Above the heads of mother and child two stars are indicated in an oblique direction. To the left stands a man in mantle and sandals who has in his left hand a written roll and with his right points to the star above. This figure probably represents, not Joseph (who, as far as is known, does not appear in early Christian art), but a prophet, either Isaiah, who pointed to the light of the Messianic age (60¹⁻⁶), or Balaam (Nu 24¹⁷, Rev 22¹⁶), who told of the star to arise out of Jacob. If this identification be correct, it is, as von Sybel says,³ 'one more evidence that at least the earlier Catacomb painting was in no sense historical, but entirely symbolical art.' The picture belongs to the beginning of the 2nd century.

Another incident of the sacred infancy frequently

¹ Von Sybel, p. 216 ff.

² *Ib.* p. 247.

³ *Ib.* p. 249.

depicted is the visit of the Magi. They are generally represented as three in number, although the painter may be led by the exigencies of space to increase them to four or reduce them to two.

The definite determination of their number as three, their designation as kings, the ascription to them of proper names (Kaspar, Melchior, Balthasar), the differentiation of their ages—to this legendary web antiquity only contributed the first threads. Its elaboration was the work of the Middle Ages.¹

The Annunciation (Lk 1^{26f.}) forms the subject of two paintings, one belonging to the end of the 2nd and the other to the 3rd century.² Mary is seated. The angel, in the form of a man, makes the announcement standing, as a visitor who has just entered the house. The relative postures of the two figures can be explained without the supposition of an intention to claim for Mary a higher dignity than for the angel. The two paintings may presuppose, but cannot be held to go beyond, the Gospel narratives.

On the other hand, Mary's perpetual virginity finds constant expression in mediæval art. The OT provides many images of inviolability which are applied to Mary. She is the 'fons signatus,' the 'hortus conclusus,' and the 'turris' of the Song of Solomon (4¹⁵ 4¹² 4⁴). The christianized *Physiologus*—a mediæval bestiary or book of animals, real and fabulous, with allegorical explanations³—supplied the legend of the unicorn, a fabulous animal which could be tamed only by being caught in the lap of a pure virgin. Ezk 4² provided the symbol of the barred door, Jg 6³⁷ that of Gideon's fleece watered by the dew from heaven. The number and variety of these symbols show the value assigned to the doctrine of Mary's perpetual virginity by the mediæval Church.⁴

(c) *The Divine Healer*.—The Gospel miracles, of which there are numerous representations in the catacombs, are evidences of God's desire to release humanity from its plagues. In the heavenly city of the Apocalypse there was to be neither sorrow nor death (Rev 21⁴). To this divine purpose the healings of Christ bore emphatic witness. His ministry was a short-lived anticipation of the Messianic Age (Mt 11^{4f.}). The beneficent power, then displayed in a few instances, would hereafter be seen in the fullness of its strength. It is an evidence of the authority rapidly acquired by the Fourth Gospel that the miracle most frequently represented in the catacombs is the raising of Lazarus (50 examples have been discovered). We remember how both the sisters greet the Saviour with the words, 'If thou hadst been here, my brother had not died' (Jn 11²¹⁻³²). We are intended to regard the presence of Christ as incompatible with death, or at least with its bereaving power. Other healings which may with certainty be identified are that of the paralytic (Mk 2^{1f.} and ||), where the man appears walking with his bed on his shoulder, and that of the blind man, where we see Christ touching with His finger the man's closed eyes. Another unmistakable scene is the cure of the issue of blood (Mk 5²⁵ and ||). The woman comes behind the Saviour as He walks with two disciples, and kneels that she may touch the hem of His robe. Other paintings have no distinctive features which would justify certain identification.

(d) *The Cross*.—The absence from the earlier catacombs of what has now become the distinctive Christian emblem is full of significance. The use of the cross as a separate symbol appears to date from the campaign of Constantine against Maxentius (A.D. 312), when Constantine put the cross upon the shields of his soldiers. Previous to this date we find the cross mentioned in one inscription

¹ Von Sybel, p. 250.

² Wilpert, p. 202; von Sybel, p. 252.

³ See Cahier and Martin, *Mélanges d'archéologie*, Paris, 1847-56, 'Curiosités mystérieuses,' ch. vii. pp. 107-117.

⁴ Schulze, *PRE* xviii. 392.

in the catacombs, and appearing doubtfully in two ceiling-paintings. Both inscription and paintings belong to the 2nd century. The monogram of

Christ  (e.g., $\epsilon\nu$ , $\delta\omicron\upsilon\lambda\omicron\varsigma$ ) appears

in inscriptions of which some may possibly be anterior to Constantine, but its general use dates from the reign of this emperor. It has accordingly become customary to regard both the cross and the monogram as indicating a date not earlier than the 4th century. It should also be observed that the only known reference to the Passion in the catacombs previous to the 4th cent. is what is believed to be a representation of the crowning with thorns in the Pretextatus cemetery.¹ The absence of any symbol of the Passion from the earlier tombs may readily be accounted for by the fact that their paintings were intended to display, not death, but the victory over death. Even when the cross does begin to appear, it seems to be introduced, not for its own sake, but as a support for the rose-leaves which gather round it. It thus becomes a beautified or transfigured cross. We are reminded of the symbolism of the Passion-narrative in the Fourth Gospel, where we see Christ reigning with sovereign authority from the Cross, and the majesty of the Divine Sufferer shining through the indignities which strive in vain to obscure it. The foliage-crosses of the catacombs—concealed or 'dissimulated' crosses—have indeed been traced to the supposed desire of the Christians to avoid observation. Apart, however, from the fact that such crosses do not begin to appear until the 4th cent., it is difficult to believe that the other emblems which do appear would not have clearly indicated these vaults as Christian burying-places. It seems more natural to suppose that the transfiguration of the Cross effected by St. Paul's theology required much reflexion before it could find emblematic expression. The Cross was at first a stumbling-block (Gal 5¹¹) and only slowly became a symbol of glory (6¹⁴).²

It will thus have been observed that the earliest representations of the Passion were avowed symbols, suggesting, but not depicting, the sacrifice of the God-man. Realism becomes more pronounced as we travel down the centuries. The crucifix—an inevitable development of the cross—does not appear in churches till after the 7th century.³ The implements of the Passion (hammer, claws, etc.) become independent emblems towards the end of the Middle Ages, when indulgences began to be attached to their veneration. The lamb with blood streaming from its breast, and carrying the cross or a banner upon which the cross was depicted, became a favourite symbol on the portals of Latin churches. The pelican (taken from the *Physiologus*), who tears open its breast to feed its young, was used to represent the sacrificial death of Christ.⁴

(e) *The Good Shepherd*.—The favourite symbol of Christ among those who constructed and used the catacombs was that of the Good Shepherd. This image takes here the place of the crucifix in later art. It appears in two different forms in the Gospels. In Lk 15³⁻⁷ the shepherd is seen bringing home on his shoulders, 'rejoicing,' a sheep that has been lost. In Jn 10¹⁻¹⁷ the shepherd leads his sheep to and from the pastures and protects them

¹ Wilpert, p. 226; von Sybel, p. 292.

² For the three forms of the cross in later symbolism—

decussata, or St. Andrew's cross, ; commissa, Tau or

Egyptian cross, ; and inmissa, —see art. Cross.

³ See *DCA*, s.v. 'Crucifix.'

⁴ Schulze, *PRE* xviii. 392.

from the wolf, even at the price of his own life. It is added by Christ in a subsequent verse (v. 27¹): 'My sheep hear my voice, and I know them, and they follow me: and I give unto them eternal life; and they shall never perish, and no one shall snatch them out of my hand.' Both representations are of frequent occurrence on the tombs. We see the shepherd pasturing his flock, and carrying upon his shoulders a sheep, whose legs he clasps sometimes with one and sometimes with both hands. There seems to be little doubt that this favourite symbol, like the others in the catacombs, is intended to transport the mind beyond death. The painters wished to indicate the power of Christ over death. Those who died, no less than those who lived, were under His protection, 'the sheep of his pasture.' Thus, where a landscape is indicated in the paintings it is invariably that of the garden or park which typifies paradise. The image, so understood, would appear to have passed into the early burial prayers of both the Greek and the Latin liturgies.¹ Thus, when A. P. Stanley² points to the frequent image of the Good Shepherd as an evidence of the joyousness of early Christian feeling, we must remember that the sheep in these pictures are in all probability those who have passed from the vicissitudes of the world into the safe haven of eternal rest.

A brief reference may here be made to the emblems which early Christian art adopted from Greek and Roman mythology. We cannot measure the precise significance which these emblems possessed for the Christians who used or looked at them. They may have been little more than the current decorations of the period; or they may have had a distinct didactic purpose, and been intended to suggest that Christ was the reality to which the heathen mythology pointed in unconscious and hesitating prophecy. So Eros and Psyche appear in many of the catacomb paintings, and in five different pictures where we should have expected the Good Shepherd we find Orpheus with his lyre.

(f) *The Judge of the dead.*—In some paintings Christ is seen seated upon a raised platform, plainly in the character of Judge. In one of these² we see a male figure in the posture of an *orans* between two taller forms, who point to him as if they were his introducers or sponsors. In the background upon a raised pedestal is Christ, who stretches His open right hand over the head of the middle figure, while in His left He holds a roll. In Wilpert's opinion, the middle figure represents one of the dead who has already stood before the judgment-seat of Christ, while the two other figures represent his advocates.

These representations of judgment convey some important suggestions. The face of Christ in the picture described above is grave without being stern. It must be remembered that no authentic likeness of Christ appears to have been preserved by His disciples. The varieties given to His face and figure from the earliest times put this beyond reasonable doubt. Ireneus⁴ shows that no trustworthy portrait existed in his day. To the same effect are the words of Augustine.⁵ The disciples were thus left to their own insight and skill to depict His likeness. The painters of the catacombs seem to have given Him the typical male head of their time. This type was during the first two centuries a beardless face with the hair closely cut. It was followed in the 3rd cent. by a face, still beardless, but surrounded by long hair falling upon the forehead and down the back. A still later type was a bearded face framed in flowing or

¹ Von Sybel, p. 242; *ap.* Muratori, *Liturgia Romana Vetus*, Naples, 1760, i. 751: 'We pray God faithfully that He may grant [to the departed] that, redeemed from death, released from his sins, reconciled to the Father, brought home on the shoulders of the good Shepherd, he may enjoy the society of the blessed.'

² *Christian Institutions*, London, 1831, ch. xiii., 'The Roman Catacombs.'

⁴ *Contra Hæc.* i. 25. 6. ⁵ *De Trin.* vii. 41.

curling locks. If the painters were guided by the prevalent fashions of wearing the hair and beard, it is obvious that we cannot infer much from the apparently increasing seriousness of the countenance.¹ The growth of asceticism in subsequent ages had a marked influence. The early effort after beauty was abandoned. Manly beauty was associated in the mind of the monastic Church only with barbarian soldiers. The words of Is 53², 'There is no beauty that we should desire him,' shaped the artist's conceptions. The figure of Christ in the Church of Galla Placidia in Ravenna (c. A.D. 450), when compared with the portrait to be seen in the Church of Apollinaris in the same city, painted about a century later, shows the transition from the earlier ideal, shaped by the love of beauty, to the ascetic or melancholy conceptions of later art.²

These representations seem also to make it plain that the judgment symbolized was individual and thought of as taking place immediately after death. The departed appears at once before the judgment-seat of Christ (2 Co 5³). The approving sentence of the Judge is the signal for his immediate entrance into paradise. Thus in one painting³ we see two figures, one on either side, drawing back a curtain to admit into paradise one of the departed, who stands in the centre in the posture of an *orans*. In another painting two of the blessed move eagerly forward to welcome a new arrival, who advances in the same attitude of devotion. We find no representation in the catacombs of a general judgment of mankind. Nor do the paintings, as archeologists of all schools agree, give any indication of belief in an 'intermediate state' or a period between death and judgment. All those who die in Christ are conceived as passing at once from their death-beds into heaven.⁴

When we pass into the subsequent centuries, death and judgment assume terrifying shapes. The destructive power of death is symbolized by a man who weeds the garden of life or fells its trees, or (after Rev 6⁹) as a rider with drawn bow, above all as an emaciated old man who finally reaches the form of a skeleton with scythe and hour-glass. 'The dance of death' appears to have originated in the plague known as 'the Black Death.' It quickly gained a wide popularity, which it retained far beyond the Middle Ages. The soul, leaving the body, was regularly represented as a little human figure, naked and sexless, emerging from the mouth. In pictures of the Last Judgment popular imaginations of hell took the place of the earlier representations of paradise. Hell was symbolized by the open throat of a monster (after the leviathan of Job 41), into which men and women, masters and servants, priests and people, were thrust. Devils in every shape did their work of derision and torture under the supervision of the prince of hell. To him the popular imagination transferred everything it knew of monsters, and thus there arose the being of many shapes and names with goat's horns, cloven hoof, bat's wings, and a tail. He even took the form of a blackbird, and, as such, flew into the mouth of Judas at the Last Supper, and whispered into the ear of Pilate as he sat in judgment. Popular humour may well have had its share in shaping these fancies.⁵

2. *The heavenly state.*—St. Paul represents Christ as the second Adam, who undid the consequences of the first Adam's transgression (Ro 5). By the early Christians heaven was pictured as a restored Eden. The word 'paradise' appears to

¹ Von Sybel, p. 281; Wilpert, p. 106; E. von Dobschütz, 'Christusbilder,' in *TU*, new ser., iii. [1899].

³ Wilpert, p. 467; von Sybel, p. 267.

⁴ Wilpert, p. 430; von Sybel, p. 273.

⁵ Schulze, *PRE³* xviii. 393.

have been originally Persian and to have been introduced into Greek literature by Xenophon.¹ The Greeks seem to have passed it on to the Hebrews. It appears in the OT only in writings subsequent to the Greek period (Ec 2⁵, Ca 4¹³, Neh 2⁵), and bore the meaning of a park with trees, shrubs, and grass, and tenanted by wild animals, such as surrounded the residences of eastern potentates. Such parks were commonly enclosed by a wall or trellis-shaped fence. Trees, shrubs, flowers, and the trellised fencing in the catacomb paintings are invariably symbols of paradise.²

On the threshold we meet with the figures known as *orantes*. These are forms, male or female—the latter are much more numerous than the former—standing with arms either fully extended or bent at the elbows, and with opened hands. The *orantes* give rise to questions which are still in debate. Whom, in the first place, are these figures intended to represent? Against the supposition that they are either likenesses of the departed or intended to represent their souls³ we have to place the fact that a female *orans* often appears painted on the tomb of a man, and also to remember that the paintings appear to have been sometimes executed before the tombs were filled. It seems therefore most natural to regard the *orantes* as ideal figures, poetic representations of the blessed dead. Again, what is the meaning of the outstretched arms and open hands? Are we to understand the attitude as one of prayer or one of adoration? And, if it be prayer that is symbolized, for what do the supplicants pray? The answers to these questions are not unaffected by dogmatic interests. According to the opinion of Wilpert, the *orantes* are praying for the salvation of their friends who still remain upon the earth. In some of the inscriptions we find the survivors asking for the prayers of the departed.⁴ On the other hand, we meet with the attitude in some cases where it unquestionably symbolizes adoration, or at least the prayer in which entreaty loses itself in submission. Thus in the OT scenes of deliverance from death the rescued appear often in the attitude of *orantes*. So Noah stands in the Ark, and Daniel among the lions, and so the three children appear in the furnace. Yet in each of these cases the deliverance has already been granted. If anything is asked for, it can only be the continuance of something begun. So the new inmates of paradise seem to stand in an attitude of wondering recognition. In the highest Christian prayer entreaty ceases because the human will is one with the divine. The lifting up of the hands was a Jewish as well as a Christian practice (Is 14⁵, 1 Ti 2⁸).

3. The heavenly feast.—The Christians who buried their dead in the catacombs had two sacraments, both of which are frequently symbolized in the paintings. In baptism the believer was admitted among the number of the elect. He became a 'saint' in the original sense of that word. On the tombs we find representations both of the baptism of Christ by His forerunner and of the Church's baptism. There are also three pictures of a fisherman, seated on the bank and drawing a fish out of the water with his hook. The figure may point to baptism and to the words of Jesus addressed to the disciples: 'Come ye after me, and I will make you fishers of men' (Mt 4¹⁹ and ||). If this be so, it would supply an additional reason for the adoption of the fish as a Christian symbol.

In the Eucharist the believer partook of the bread which came down from heaven, and of which he who ate would not die (Jn 6⁵⁰). In it he had the prophecy of the heavenly feast. When Jesus took leave of His disciples, He told them of the new wine which He would drink with them in the Kingdom of God (Lk 22¹⁸). The Crucifixion shattered for a brief interval the hope raised by the prophetic words. Despondency gave way to renewed confidence when it became clear that God had not 'allowed His Holy One to see corruption.' So 'day by day, continuing stedfastly with one accord in the temple, and breaking bread at home, they [the disciples] did take their food with gladness and singleness of heart' (Ac 2⁴⁶). It is no longer possible to mark the steps by which this early 'breaking of bread' passed into the Church's Eucharist. It is enough to recognize that what afterwards became the ecclesiastical rite originally formed part of the corporate feast of the Christian society. If the presence of the heavenly Christ was, as we can well believe, more vividly realized during these feasts than at any other time, the disciples would naturally associate them with the peace or joy which awaited them hereafter. The fellowship of the earthly feast would provide the mould for their anticipations of future happiness. They might recall the

Biblical assurances: 'Blessed is he that shall eat bread in the kingdom of God' (Lk 14¹⁵), 'Blessed are they which are bidden to the marriage supper of the Lamb' (Rev 19⁹), 'To him that overcometh, to him will I give to eat of the tree of life, which is in the Paradise of God' (2⁷). It is profitless to dwell upon the inconsistency of picturing spiritual happiness by an image which appeals only to man's bodily appetites. For in the 'new world' which, whether it be peopled by corporeal or incorporeal beings, is in any case to be the scene of fruition every earthly image, the most attenuated equally with the most material, becomes obsolete. An instrument intended for a region surrounded by an atmosphere is useless when the atmosphere is transcended. Thus the most spiritually-minded Christians, restricted by limitations from which they cannot escape, may well continue, as they do, to associate heaven with the 'shout of them that triumph, the song of them that feast.' In the catacomb paintings heavenly happiness is frequently represented by the image of festal joy. The scene of the feast is marked, by the customary indications, as paradise. The guests are to be seen, generally if not always, behind the roll which is the recognized symbol for the cushions used at feasts. Often attendants appear carrying a dish or holding a flagon or wine-cup. In one series of four pictures these attendants take the form of two female figures who are designated by inscriptions as 'Irene' and 'Agape.' They are appealed to by the guests to supply warm water or to mix the wine ('Irene, da calda'; 'Agape, misce nobis'). One of the figures seems thus to symbolize the peace of heaven, and the other the love from which the Christian love-feast derived its name, and which was one of St. Paul's three abiding things.¹ The food indicated in these pictures consists invariably of bread and fish. Sometimes a number of baskets, filled with small round loaves, appear either in front of the cushion-roll or on either side of it. The miraculous feeding of the thousands was plainly the model in the painter's mind. This miracle, connected by St. John (6⁵⁵) with the 'bread of life,' was an anticipation of the heavenly feast. Similarly prophetic was the Church's Eucharist, which in some of the paintings seems to be expressly depicted and made a symbol of its heavenly antitype. It need only be added that the fish, from its presence in the miracle, as well perhaps as for the reason given above, appears to have established itself as a symbol for a Christian disciple, long before the acrostic was discovered: *ΙΧΘΥΣ = Ἰησοῦς χριστὸς θεοῦ υἱὸς σωτήρ*.

It will appear from the foregoing summary that, while Christian symbolism points persistently onwards towards an ideal world, conceived as lying beyond death, the hope thus expressed is sustained by experiences which are prized for their own sake, and also as earnest of things yet to come. Eternal life, the ultimate blessing of the Fourth Gospel, is there represented as both present and future. So the Messianic kingdom of the earlier evangelists was yet to come, while it was also 'within' or 'among' the disciples who walked with Jesus and saw God in Him. The Church which continued His ministry in the ages that followed was likewise a prophet of what was yet to be, and also a teacher of men amidst the dangers and obligations of actual life. Thus in the Middle Ages, while the three theological virtues (faith, hope, charity) appear repeatedly on church porches, pulpits, and monuments, the cardinal virtues (prudence, justice, fortitude, temperance) also assume their symbolic shapes. The Church is a teacher of common-place morality, while at the same time she must bear witness to truths whose validity cannot be demonstrated by everyday experience. The Christians who built the catacombs tell us in many inscriptions of the central hope with which they consigned their dead to the tomb. Their desire was that the departed might 'see God' ('Vivat in Deo,' 'Vives in aeternum,' 'Denm videre cupiens vidit'). Such is the hope, vague and yet real, changing but steadfast, which has created the Christian symbols of the past, and may be trusted to fashion new ones as the human heart becomes more proficient in the interpretation of its own language.

SYMBOLISM (Greek and Roman).—A symbol is a visible or audible sign or emblem of some thought, emotion, or experience, interpreting what can be really grasped only by the mind and imagination by something which enters into the field of observation.

So far as Greek and Roman religion are concerned, we need speak only of two kinds of symbols—symbolic representation by means of actions or words and symbolic representation in art.

Religion, taking its rise in experience and belief, tends, as it becomes less literal and less insistent, to give rise to symbolism; and this is true also of that lower kind of religion which is called magic. When primitive men thought that by certain actions and words they could compel spiritual powers to do their bidding, or when they thought that the painting of animal forms on the walls of their caves gave them power over the animals depicted, they had not yet reached the stage of symbolism, but had taken the first steps towards it; when they poured water on the ground to produce rain, they thought that there was an actual causal connexion between the ritual act and the fall of rain. But just as, when religious belief decays, the feelings which gave rise to it often find scope in the field of poetry, so, when actual belief in the power of sympathetic magic grows less, the actions and ceremonies to which it led are often continued in symbolism.

I. GREEK.—**1. In local cults.**—The local cults of Greece, which went on at a lower level, and in a more conservative key, than the religion of poetry and of philosophy, preserved a great deal of symbolism. Even in Athens the great festivals embodied such traces of primitive religion. At the Brauronian festival young girls, impersonating bears, danced a bear-dance in honour of Artemis. At the Diasia the priest who struck down the sacrificial ox was accused of murder and in turn accused his instrument, the axe, which was condemned and solemnly cast into the sea. In the worship of the dead flowers and fruits gradually took the place of the more serious offerings of an earlier time. With the dead were buried, not, as in primitive times, real armour and ornaments, but only symbolical offerings, money of gold-leaf, animals of terra-cotta, and the like. Sometimes these objects were only depicted in relief on the tombstone. The terrible human sacrifices once brought to the sterner deities were commuted into sacrifices of animals, sometimes clad in human fashion, or mere images of human beings. Naturally it was in the mysteries, where the survivals of primitive religion were most rife, that symbolism was most prominent. Mere ceremonial ablutions took the place of actual immersions as a ceremony of purification. The sacred meal which the deity shared with his votaries became a mere ceremonial tasting of some special food. At Eleusis, in the great mysteries, the votaries emptied two vessels filled with water, turning to east and west and repeating the sacred formula *θε, κibe* ('Sky pour rain; earth bear grain'), which was directed to earth and sky, and was evidently a survival of an ancient magical formula for the production of rain.

The suppliant who visited the cave and oracle of Trophonius at Lebadeia, before he went into the presence of the hero, drank from two springs, that of oblivion and that of memory, to signify that he was to forget the past and to remember the revelation which was to come to him. Originally, in all probability, the water of these springs was supposed to have some actual effect on the votary, as had the spring in the cave of the Clarian Apollo at Colophon on the priest who drank of it before

soothsaying. But in the time of Pausanias¹ the action had become merely ritual and symbolical.

The sacred marriage was common to several cults in Greece. When the notion of the deity was somewhat crude, women were shut into the temple, to stand in the same sexual relation to him in which, according to tradition, Cassandra stood to Apollo. But, as time went on, such dedication became only symbolical, the place of the victim being sometimes taken by the wife of the priest.

As the mystery religions spread and their outlines hardened, a new element came in, which was destined to take further development in Christianity—the element of authority. Symbolic rites were practised, not on the ground of mere tradition, but by ordination of the recognized hierophants of each cultus, who claimed a divine communication. This element, however, scarcely belonged to the earlier religions view of either Greeks or Romans, among whom authority in religion was scarcely recognized apart from tradition. Cults had an open field and freely competed one with another, except those with which the safety of the State was supposed to be connected.

It seems that almost all ritual which does not appeal to the intelligence is in character symbolical. And the notable feature in symbolic ritual is that, since it appeals mainly to the emotions, it may be interpreted or understood in a great variety of ways. At the mysteries of Eleusis, *e.g.*, some of the votaries might regard the whole proceedings as a sort of spell to cause fertility; some might be genuine worshippers of the great goddesses Demeter and Persephone; some might, like Cicero, find in the ritual a promise and pledge of a life beyond the grave. Everything depended on the religious outlook, the exalted or materialist beliefs of the votary himself.

¹ Aristotle, says Synesius,² is of opinion 'that the initiated learned nothing precisely; but that they received impressions, were put into a suitable frame of mind.'

Thus symbolic ritual has a great attraction for persons of emotional temperament, while it is distasteful to those of strongly developed intelligence, who like definite views. Compared with clear doctrine, it is like music compared with painting. It was by no means well suited to the minds of the more cultivated Greeks.

2. In art.—In early Greek art symbolism appears in two forms: in representing by some simple figure an idea such as a quality or attribute of one of the deities and in representing the whole of anything by depicting some characteristic part of it.

A few symbols of the deities seem to have been taken over by the Greeks from the pre-historic peoples whom they displaced in Crete and Hellas. Such is the double-edged axe, which is found in the palace of Cnossus in Crete in the third millennium B.C. in scenes of cultus, and which belongs to a male or female deity of the people. This axe became among the Greeks a symbol of Dionysus. The snake also appears as an attribute of a goddess of Crete frequently represented, and later was inherited by the Greek Erinyes. But most of the symbols of the gods of the Greek pantheon seem to be more immediately derived from the art of the nations of Syria and Mesopotamia. Most of these symbols were displaced by growing anthropomorphism. This statement requires some explanation. On early bronzes and terra-cottas found on Greek sites, dating from the 7th or 6th cent., the goddess Artemis is figured as winged and holding in her two hands lions, panthers, or swans. On the chest of Cypselus, a

¹ IX. xxxix.

² Aristotle, *Frag.*, ed. E. Heitz, Leipzig, 1869, p. 40.

7th cent. work preserved at Olympia, Pausanias¹ saw such a figure, which surprised him by its strangeness. It was strictly symbolical; the wings were not for flight, but only to typify swiftness, the lions were added to show the power of the goddess over animals, whose mistress (*πόρνια*) she was. We can trace this representation step by step through Greek art and see how in maturer times the swiftness of the deity was indicated by her stature and slimmness of build, her power over animals by the stag or dog who accompanied her. A similar transformation takes place in the case of Zeus. On early coins of Elis an eagle appears as a substitute for the god; later he bears the eagle in his hand. Later still, as in the great statue of Pheidias, a golden eagle was an adornment of the sceptre of Zeus. Thus, as time went on, merely outward symbols tended to disappear or at all events to become unimportant; and the meaning which they had conveyed was expressed in the type of the deity. Certain symbols, however, held their ground. The thunderbolt of Zeus, indicating him as the lord of storms (*Zeús vértios*), is usual in the 5th century. To express this feature in the type of the deity would not be easy. The bow, as symbol of the rays of the sun-god,² is usual in the hand of Apollo in archaic representations; later the lyre is far more usual. Even wings do not altogether disappear, but they mostly lose their merely symbolic character and are used for flight, as in the case of Victory and Eros, an innovation ascribed to the sculptor Archemus of Chios (c. 570 B.C.). The god Hermes, even in late art, carries wings on his cap or his heels—a survival of archaic symbolism.

Coins furnish us with many examples of symbols belonging to the deities. In the 7th and 6th centuries the obverse of electrum and silver coins usually presents some very simple symbolical device—a griffin at Teos and Abdera, a thunderbolt at Olympia, a wolf at Argos, an owl at Athens; and then, after the archaic period, this type is usually banished to the reverse of the coin, and in its place we have the head of the deity to whom the type belongs. It must, however, be observed that, when numismatists speak of a symbol on a coin, they use the word in a technical sense, to indicate not a symbolical type, but one of those small and subsidiary devices often placed in the field of a coin by magistrates who were responsible for its issue—a device probably often taken from the private signet of such magistrates.

Another phase of symbolism is found when in artistic representation a part is taken to stand for the whole. This often appears on Greek vases and reliefs. Pausanias³ observes that, in the painting representing Hades by Polygnotus at Delphi, the grove of Persephone is represented by one tree. So on vases a temple or a house is often represented by a single column, a river by a swimming fish, a sea-shore by a shell, and so forth. It is probable that this was how the scenes in tragedies were represented on the background of the stage. It is really a sort of shorthand, and altogether parallel to the process by which in Egypt and elsewhere picture-writing came into being.

Symbolical or allegorical impersonations are to be found in Greek art at all periods, though more often in archaic art and that of Hellenistic times than in the greatest period. On the chest of Cypselus, in the 7th cent., we are told by Pausanias⁴ that Night was figured, carrying two boys, one white and one black, who represented Sleep and Death respectively. Justice as a beautiful figure

scourged Injustice, who had the form of an ugly woman. Fate, with teeth and claws like a wild beast, claimed Polynices as a victim. Even in the great age we have such figures as Virtue, Nemesis, Opportunity (*Καίρως*). But it is in the Hellenistic age, in the great cities of the East, that symbolic personalities most abound. In the celebrated procession of Ptolemy II. of Egypt¹ we have figures of the Year and the Seasons; in that of Antiochus IV. of Syria² we find statues of Night, Day, Earth, Heaven, Morning, and Noon. On the coins of Alexandria under the Romans we find a remarkable set of fanciful figures—Euthenia (Prosperity), Kratesis (Dominion), and the like.

The great Ionian cities of Asia Minor appear on monuments of the Roman age in the persons of the legendary Amazons whom they claimed as their foundresses.³ Smyrna on coins carries a double-axe and has a prow of a ship at her feet; Cyme holds a dolphin and a trident; Teos, a city renowned for vines, carries the thyrsus of Dionysus; Ephesus carries poppies and ears of corn, and so forth. In each case the attributes embody the situation or the produce of the city. In a noted Pompeian painting⁴ we have well-characterized impersonations of Europe, Asia, and Africa. The list might be almost indefinitely lengthened.

Symbolism in Greece, in the great period, often takes fine poetic forms, as when the sun-god in his chariot on the pediment of the Parthenon represents the East in the morning, or boys plunging into the sea represent the setting stars on a fine vase in the British Museum.⁵ In the same age rivers are represented by man-headed bulls, as on the coins of Gela and Catania in Sicily; nymphs have cows' horns; Alexander the Great appears on the money of his general Lysimachus with the ram's horn of Ammon.

But, in spite of such examples as these, there is a broad line of distinction between the use of symbolism in Oriental art—the art of Babylon, Assyria, Egypt, and India—and the use in Greek art. Oriental art is content with adding symbols to the human forms of deities, without caring for their beauty or appropriateness. In Egypt and Babylon we find human bodies joined to the heads of all kinds of animals—lion, bull, jackal, hawk, and so on. And Indian figures of deities represent them with several heads, many arms (each holding some attribute), necklaces of skulls, and the like. Oriental art tries to represent in this way qualities and attributes which sculpture or painting could not otherwise portray—elements of mysticism, mythological tales, or sometimes the ideas of pantheistic religion. Greek art avoids monstrous forms as a rule, though it inherits a few specially suitable for artistic development, such as the Centaur. And it does not attempt to portray, in sculpture or in painting, anything which lies outside the scope of those arts. Exquisite in form and clear in meaning, its creations do not carry us beyond sense and intellect, do not appeal to the mystical tendencies of men. Thus Greek symbolism has no wide limits.

II. ROMAN.—I. In cult and law.—In Roman religious ceremonies the symbol held a large place. This was natural, as in quite the early times of the republic there was an invasion of Greek religion and Greek deities, which caused the old rustic religion of the Roman people to survive only in the form of ritual, the meaning of which was in a great degree obscured. Hence the State cultus of Rome was divorced alike from belief and from morality, and, so long as the magistrates performed

⁴ v. xviii.

exactly the ceremonies handed down by their ancestors, it mattered little what meaning they attached to those ceremonies or what beliefs they held in religion. The emperor, whether he were a Trajan or a Nero, was always *pontifex maximus* and represented to the gods the State in its religious capacity. Hence the Romans were extremely careful as to the way in which they wore the toga or the cap called *apex*, as to their exact position in relation to the points of the compass, and as to the attitude in which they stood when they were sacrificing. All these details had no doubt some meaning in their origin; but not only are we unable usually to discover what it was, but even the Romans did not know: they blindly followed the tradition, with an uneasy feeling that, unless they did so, some great calamity would overtake the State. Most of these ritual customs were probably derived from the Etruscans, a people at a low level of culture, but exact in all matters of a religion which seems scarcely to have risen above the level of magic.

When an official conducted a sacrifice, he sprinkled the victim with wine and threw over it salt meal; then he made a ritual motion symbolical of slaying it, but the actual butchering was done by attendants.¹ Like the Greeks, the Romans contrived to put in the place of human sacrifices the mere offering of substitutes and symbols.²

When the Greek deities migrated to Rome, they took with them their recognized symbols; and the native gods, who were largely identified with the immigrants, also adopted these outward signs of inward powers. Thus in art Greek customs went on, as in fact the artists were usually Greek. So we have on Roman monuments the symbolism of Ephesus and Alexandria. Allegorical and symbolical figures, such as Pudicitia, Ubertas, Annona, appear abundantly on the Roman coins; but they can have had but little serious worship. In short, while symbolism is of importance in relation to Roman cultus, it is unimportant in earlier Roman art, requiring a concrete poetical imagination of which the Romans were destitute.

There was a good deal of symbolism or symbolical ritual in the customs of Roman law; e.g., if a man purchased a slave, he laid hands on him (*mancipatio*) in the presence of witnesses and weighed out at the same time to the seller a piece of money which was accepted as a symbol of the price, *quasi pretii loco*, as Gaius says.³ We need not be surprised that much symbolism made its way into Christianity in Rome, since it had become a recognized part of the routine of daily life.

2. In art.—In the time of the Roman dominion, as the religion of Mithras and other mystery cults spread from east to west through Europe, the range and power of symbolism increased. We may especially trace on tombstones of the period of the empire, alike in Italy, Gaul, and other regions, a growth of religious symbols mainly having reference to the life beyond the tomb, which was taking an ever larger place in men's thoughts and hopes. Some of the mythological scenes which the Greeks had depicted on tombs, from mere artistic and decorative motives, seem to have been re-interpreted in a more mystic fashion. Such were the rapes of women and the combats of men; and more especially scenes from the lives of Heracles and Orpheus and other heroic persons who had won immortality by great deeds, or had descended into Hades and returned. Some ordinary figures of earlier art—the griffin, the lion, the bull, the cock—became connected with the hope of immortality. The Mithraic shrines of northern Europe contain

reliefs in which symbolism seems to run wild, though we know so little about Mithraism that our interpretation of such reliefs is usually conjectural. On this subject the works of Franz Cumont are authoritative. It is impossible here to discuss the question of the symbolism on later pagan tombs. A good account of it will be found in Mrs. Arthur Strong's *Apotheosis and After Life* (1915). This writer, however, goes too far in interpreting almost all the scenes and figures on such tombs in reference to the future life. It is obvious that, unless we keep in restraint the tendency to read mystic meanings into painted and sculptured scenes, we may drift back into the fancy world of Creuzer, who traced the influence of the mysteries everywhere on Greek vases and Roman reliefs. We are on safer ground in speaking of contemporary Christian art, because here we have a literature for comparison.

In the early Christian art¹ of the catacombs and of sarcophagi there is even an increase of symbolism, as compared with contemporary pagan works. This is natural, because the Christians commonly adopted pagan types, only giving them a fresh meaning; e.g., the peacock, which in Greek art belonged to Hera, became to Christians a symbol of the resurrection, probably because the flesh of the peacock was supposed not to decay. Orpheus became an emblem or symbol of Christ. The fish, the sheep, the vine, all acquired a new Christian signification. Probably in many cases the meaning would not be realized by the pagan artist who was called in; and it was safer that the knowledge should be confined to the society. This symbolism is apt to degenerate into something like shorthand: a man carrying a couch refers to the miracle of the healing of the paralytic man; a cock beside Peter to his denial of his Master, and so forth.

The use of symbols in the later Neo-Platonic philosophy is so closely connected with their use in Christianity that it need not be here treated. See art. NEO-PLATONISM.

LITERATURE.—There is no recent work which deals methodically with Greek symbolism. Roman symbolism is treated in Mrs. Arthur Strong, *Apotheosis and After Life*, London, 1915. P. GARDNER.

SYMBOLISM (Hindu).—Of all religions of the East, the home of type and imagery, Hinduism makes the most use of symbols. It has formally declared the ultimate truth to be unknowable and indefinable. In all its scheme of practice and teaching it seeks to make definite approach to the reality by suggestive type or symbol—an approach that can never find its goal, but can only draw nearer and nearer, as it points successively, like the ancient Greek philosophers, to the symbol or likeness which most fully and faithfully reflects the true, and embodies the largest part of a reality which in its entirety is inconceivable by the human mind and inexpressible in the language of men. The symbol is the necessary and helpful intermediary between the inadequate capacity of the mind of the would-be worshipper and the incommunicable nature and fullness of the Unknown whom he adores. A complete and adequate description therefore of the Hindu use of type and symbol would require an almost complete exposition of Hindu belief in its many varieties and ramifications. Whether in creed or in practice, the symbolic in Hinduism is not far from being co-extensive with the religion itself. Of this the literature of Hinduism and its systems of doctrine are sufficient illustration. All, however, that is practicable within the limits of an article is to indicate the motive or motives that more or less consciously and avowedly have prompted the use of the symbol, to set forth in the briefest possible

¹ G. Wissowa, *Religion und Kultus der Römer*, Munich, 1902, p. 352.

² *Ib.* p. 355.

³ i. 119.

¹ Cf. art. SYMBOLISM (Christian).

manner its historical relations in the religious scheme and cult, to define its necessary limits, and to select for illustration and comment a few of the more important types which have occupied a considerable place in the belief and profession of the adherents of the faith. A mere enumeration of the symbols employed would be a large and probably impossible task.

1. Use and purpose of symbols.—The use and purpose of the symbol is twofold: (1) to set forth in visible or audible likeness what cannot be really or fully expressed to the physical eye or ear, or even clearly conceived by the limited faculties of the human mind. All language is in the last resort symbolic, and religious language in an especial degree, for it endeavours to present a mystery, a reality too deep for words. The Hindu faith had at its service a language of the utmost delicacy and flexibility, with a vigorous and fertile growth and an almost unlimited vocabulary, and found itself in a world of tropical luxuriance, with a tropical wealth of beauty and suggestiveness. It was not to be wondered at that it became profuse in type and symbol and laid under contribution all the facts and phenomena of nature to serve its religious and priestly ends. All the great gods had their resemblances, animal or material forms, in which they presented themselves embodied to human sight, which served to recall to the worshipper the deity, whose mind and character they more or less inadequately reflected. Other more rare and refined symbols were representative of qualities or attributes, as the lotus, the emblem of spotless purity preserved under the most unfriendly conditions. All idols, totems, fetiches are symbols. The wise man does not worship the symbol, the shape in clay or wood or stone, but is thereby reminded of the invisible substance or reality which they each represent.

(2) The image or symbol serves the purpose also of providing in material and suitable form a convenient object of reverence, to meet the religious need of those whose minds, through darkness and ignorance, are unable to grasp the conception of an unseen formless deity. Such men, if left without a visible object to which their reverence and fear may attach themselves, will wander in a maze of doubt, disquiet, and unbelief. It is better that they should worship erroneously, worship a thing, than that they should not worship at all. There is much that might be urged in favour of the Hindu view that regards the worship of the external symbol as a stepping-stone to higher, clearer forms of belief; it is a view unacknowledged perhaps but not unknown to other faiths. And in Hinduism, whatever may be said of or claimed by the wise and instructed thinker, the *pūjā* of the multitude to the image of the god is reverent and sincere. In some respects also and within definite limits the Indian contention has justified itself that the symbol has proved a signpost and a guide to better, higher thoughts and to a truer worship of Him whom no form can express or language describe.

2. The most important types.—(a) The most important symbols are those of the *Brahman*, the undefinable and unknowable origin and source of all. Of the *Brahman* only signs and types can be employed, for the primeval source and sustainer of the universe is beyond and above thought or word. His names or titles are symbolic: *hiraṇyagarbha*, the golden germ, that was in the beginning; *svayambhūt*, the self-existent one; *visvakarman*, the artificer of all things; and many others. The authors of the *Upaniṣads* especially attempt to set forth in symbolic terms the being and nature of that which in the last resort they are obliged to confess is beyond knowledge. *Prāṇu*, the breath,

or *vāyu*, the wind, is a frequently recurring type; and it seems to have been felt that by its mysterious and elusive character the *prāṇu* was peculiarly fitted to represent that which in its essence eludes comprehension. The breath, *prāṇu*, is *Brahman*.¹ A similar type is the *ākāśa*, the all-pervading and all-surrounding ether, 'omnipresent and unchanging in the heart.'² *Manas* also, the mind or will, is with the *ākāśa* a symbolic form or type under which the *Brahman* is to be meditated on or worshipped.³ The mystical syllable *Om*, the most widely venerated syllable in the world, is the highest *Brahman*, and its utterance with understanding of its significance secures the accomplishment of every wish.⁴ *Om* is also a symbol of the Hindu triad, *Brahmā*, *Viṣṇu*, and *Śiva*, and each of the three sounds of which the word is composed represents one of these deities. To the Buddhists also the word is a symbol of much significance, forming part of the sacred six-syllabled formula which every Buddhist cherishes in his memory and makes a constant part of his invocation and prayer.

A more comprehensive and suggestive symbol of the *Brahman* is given in the compound *sachchid-ānanda*, a kind of triple representation in three several modes or aspects, as *sat*, 'being,' *chit*, 'thought,' and *ānanda*, 'bliss.'⁵ This more refined and abstract symbolizing represents a later phase of speculative thought and marks a forward step in the progress of philosophic insight. As a type or symbol it is less inadequate than the sun in the heavens (*āditya*),⁶ the material *ākāśa*, the golden *puruṣa* in the eye,⁷ or even than *manas*, or the significant name *ātman* itself. In its further course, moreover, speculative thought denied that even in *sachchidānanda* any positive implication concerning the *Brahman* did or could reside. The *Brahman* transcended all symbols and assertions, comprehended both being and not-being (*sat*, *asat*), thought and not-thought (*chit*, *achit*), bliss and its contrary (*ānanda*, *anānanda*), or rather he was above and beyond all, the unsearchable and unknown.

(b) Each of the great gods has an animal or material form or object which represents him to the eyes of men, by which he is symbolically known. The more popular gods have many symbols. The 'vehicles' of the gods are practically symbols of their presence and power—the goose of *Brahmā*; *Garuḍa*, the monstrous eagle of *Viṣṇu*; the bull (*Nandi*) of *Śiva*; the fabulous sea-monster (*makara*) of *Varuṇa*, who is then depicted as a white man and is described as *makarāśva*, 'he whose steed is the *makara*,' riding, with the head and fore-legs of an antelope and the body and tail of a fish; the peacock of *Kārtikeya*, the god of war; the monkey of *Hanumān*; the deer of *Vāyu*; the elephant *Airavata* of *Indra*, produced with other sacred and marvellous objects at the churning of the ocean; the buffalo and dogs of *Yama*; and many others. Of the well-known Hindu triad *Brahmā* hardly possesses any emblem or type except his sacred goose—an indication of how little the first member of the triad attracted to himself the thought and worship of the Hindu. Of the popular *Viṣṇu* there were many symbols, some of which are always represented on the images or pictures of the god. The most frequent and characteristic is perhaps the *chakra*, or discus;

⁷ *Taitt.* ii. viii. 5; *Chhānd.* i. vi. 8.

the club and conch-shell also which he carries are indicative of his authority and power. The auspicious mark (*śrīvatsa*) usually represented on the breast of the god, in form like a curl of hair, and the three-pronged or trident-like mark made with white or coloured earths on the foreheads of his worshippers are symbolic, the latter of devotion to the service of the deity. The sacred *tulasī* plant in the courtyard of the dwelling is the mark of the deity's presence and protection, and in it centres the worship especially of the women of the household. The *sālagrāma* also, the sacred ammonite-stone, is another mystical and well-known symbol.

The symbolic types or presentations of the rival deity, Śiva, who in almost equal degree with Viṣṇu holds the affection and regard of the Indian peoples, were equally numerous. The most important are the bull Nandi, on which he rides, and the *linga*, or phallus. Every Śaivite temple has its sacred bull, who roams the courtyards and streets unmolested and receives practically divine honours. The *linga* is the commonest emblem of the god, and the stones, great or small, which represent him have this form or are roughly shaped to it. Two of these stones are said to bear a pre-eminent holy character: that at Benares, where Śiva is worshipped as Viśveśvara, *παντοκράτωρ*, the lord of all; and the idol in the temple at Somnath, destroyed by Mahmud of Ghazni in his iconoclastic raid into India. The trident also is borne by Śiva, a type of government and authority; and the crescent moon depicted on his forehead has a special significance, recalling the sovereignty which was assigned to him when the moon was recovered from the depths of the ocean.

Similarly the wives of the great gods have each their symbols—the trident and skull of Kālī, the lotus of Sarasvatī, wife of Brahmā, and also of Lakṣmī, wife of Viṣṇu.

In a late writing the Gāyatrī is said to represent the triad of gods, Brahmā, Viṣṇu, and Śiva, and also the three Vedas.

(c) Under sacred trees in the vicinity of Indian villages will often be found the images or symbols of the *grāmadevatā*, the village divinities who watch over its interests and care for the inhabitants; and in the village fields the clay or pottery steeds of Aiyānar (*q.v.*), the tutelary deity of the fields, on which he rides by night to pursue and rout the demoniac powers.

(d) There are symbols also of a more general import, which are not always easy to classify. The *pinda*, or ball of cooked rice, used at the commemorative services for deceased relatives and offered to the *pitrs*, represents symbolically the share which the departed still have in the family life. The most important and widely recognized symbol of this character is probably the sacred footprint, which typifies both the presence and the authority of the god. In the courtyard or vicinity of many, perhaps most, Hindu temples there is the print of a foot on the ground, often of large size, with sacred symbols engraved on the sole, which differ according to the deity commemorated. To these there is sometimes a legend attached, which gives its supposed history and describes the occasion on which it was impressed. The well-known footprint on Adam's Peak in Ceylon is believed by Śaivites to be that of Śiva. By Buddhists also the numerous footprints of the Buddha are regarded with reverence.

(e) In many parts of India the symbols of the sun and moon and the planets may be seen. The two first are represented by a disk or crescent respectively, made of metal. The signs of the planets in their order are as follows: of Budha, or Mercury, a bow; of Śukra, or Venus, a square; of Mangala, or Mars, a triangle; of Vṛhaspati, or

Jupiter, a lotus; of Śani, or Saturn, an iron scimitar or sword; of Rāhu, a *makara*; and of Ketu, a snake. The last two symbols are usually of iron; the square of Śukra is silver or silvered, and the bow of Budha is gilt.

(f) Hindu coins and seals also bore symbols, which were very numerous and diversified. Besides figures of gods and goddesses, the commonest emblems were the trident, denoting empire; the elephant or bull, power; the umbrella, royal dignity and right; the crescent, a lunar dynasty; a thunderbolt, spear, or other weapon, armed might. Others also with these were indicative of the authority or claims of the sovereign by whom they were designed.

Dubois, *Hindu Manners, Customs, and Ceremonies*, Eng. tr.³, Oxford, 1906.

A. S. GEDEN.

SYMBOLISM (Jewish).—Symbolic actions as well as symbolic ideas occur in the Hebrew Bible frequently. The prophets often made use of symbolic ideas—*e.g.*, the basket of fruit in Am 8¹, the vineyard in Is 5³⁻⁷, the almond-trees in Jer 1¹¹, the dry bones in Ezk 37¹⁻¹⁴, and the various figures in Zechariah. Equally frequent are symbolic actions—*e.g.*, the rending of mantles (1 S 15²⁷, 1 K 11³⁰), the discharge of arrows from a bow (2 K 13¹⁶⁻¹⁹), the casting of shoes (Ps 60³, Jos 5¹⁵, Ru 4⁷). The former type easily merges into the parable, the latter into charms; possibly we should say that they emerge from these literary and magical arts. Symbols, in any case, have frequent historical connexion with primitive culture, though they tend to transcend their origin under the transforming influence of higher conceptions. Most important, therefore, for the present article is the association of symbolic ideas with religious ceremonial. Prominently the Sabbath is described as a symbol, *ōth*;¹ similarly with the rite of circumcision (Gn 17¹¹), the phylacteries (Dt 6⁸), the Passover (Ex 13³), natural phenomena such as the rainbow (Gn 9¹²; cf. Gn 1¹⁴ in the Rabbinical commentaries).

It was accordingly easy for later Judaism to apply symbolic meanings to many of the Biblical institutions. Philo, throughout his works, elaborates such interpretations, but the method is much older. Thus in the *Letter of Aristaeus* (which can scarcely be later than the 2nd cent. B.C. and may well belong to a century earlier) the enactments as to the animals lawful for food are explained symbolically.² But by Philo's age symbolical interpretation had so fully developed that the Alexandrian allegorist felt impelled to rebuke those of his brethren who neglected the ceremonial acts because they regarded them merely as symbols of ideal things.³ Though this is a real danger to a ceremonial religion, on the other side it can gain appreciably by idealizing institutions the original significance of which is outworn or unknown. Ancient rites may have been derived from primitive tabus, and yet they have retained permanent acceptance by the process of symbolization. In a remarkable letter Maimonides (*q.v.*) dealt with certain acts of worship, such as prostration (as practised by Muhammadans in the 12th century). Probably such acts were derived from olden customs of exposing parts of the body, but, contends Maimonides,⁴ they no longer mean anything

¹ See art. SABBATH (Jewish).

² §§ 139-106.

of the kind and have become symbols of humility. Present values do not entirely depend on past origins. A similar principle might undoubtedly be very widely applied to the history of religious ceremonial, which often becomes ennobled by the newer ideas read into it by progressive ages. And, conversely, when an institution is lost (as with the Biblical sacrifices), the whole system may be retrospectively idealized by symbolical adaptation. When, after the destruction of the Temple, prayer and charity and fasting perforce displaced sacrifice, the latter shared in the moralizing process. But the relation went deeper. Fasting *was* sacrifice: the loss of bodily tissue corresponded (in the Rabbinic conception) to the offering of a sacrificial animal on the altar.¹ The table at which the ordinary meals were eaten became a veritable altar,² and the partaking of food was in the Jewish home associated with a variety of customs, derived in large part from the same range of symbolism. It has often been claimed, moreover, that the dietary laws, besides being included in the law of holiness, or rather because of that inclusion, were a training in control of the appetites and restraint of desires.³ Maimonides also offers a utilitarian view, that the forbidden food was unwholesome;⁴ thus showing that, though the utilitarian and the symbolical interpretations are in a sense rival theories, they may be syncretized by a skilful moralist.⁵

Another aspect of the same phenomenon is presented by symbolic survivals. Acts which were once literal are retained as rites. Many current Jewish marriage customs are of this nature. The bridal canopy, so picturesque a feature of a Jewish wedding, was originally the marriage chamber. Then the Scriptural application of the marital state to the relation of God to Israel led to symbolic results, among them the appointment of a bridegroom of the Law on the feast of Rejoicing at the end of Tabernacles.⁶ It is not quite clear why a glass is broken at Jewish weddings; it is probably a *memento mori*.⁷ Funeral customs are also marked by symbolic survivals. Some of these are Kabbalistic in origin, and it is not always easy to discriminate the symbolical from the superstitious.⁸ So, too, with such ceremonies as *tashlikh*.⁹ Many symbolical customs arose in memory of the destruction of the Temple. Historical associations are also responsible for many a symbolic rite. Draping the synagogues in black on the fast of the 9th of Ab is an instance in point. The *shofar*, or ram's horn, was thus connected with events and anticipations, with Sinai in the past and the Messianic age in the future. According to Séadiah, the *shofar* symbolized ten ideas: (1) creation, (2) repentance, (3) revelation, (4) prophecy, (5) destruction of the Temple, (6) the binding of Isaac, (7) imminence of danger, (8) day of judgment, (9) restoration of Israel, and (10) resurrection. In this manner many rites were saved from becoming obsolete. The phylacteries worn on the head typify service of the mind; on the hand, service of the body. The former represents the

recognition of the Godhead, the latter restraint of lust.¹

Jewish symbolism is also illustrated in ecclesiastical art, and in colours. Thus the blue thread on the fringes (Nu 15³⁸) is the colour of the sea, the sky, the divine throne of glory.² The symbolism of art was more thoroughgoing. The Crown of the Law is a frequent ornament on mantles of the scrolls, and so is the Shield of David.³ On ancient Jewish coins, too, symbols were employed; so also with tombs.

The prevalent custom now is to avoid sepulchral emblems. This accords with the oldest rule, for the *siyyun* of the Talmud was only a mark warning wayfarers against incurring ritual impurity by contact with the tomb. Yet the action of Simon, who carved panoplies and (possibly) ships on the pyramidal tombs at Modin (1 Mac 13²⁹), can scarcely have been isolated. Outside Palestine the Jews of the first centuries of the Christian era certainly adopted the Greek habit of inscriptions and introduced symbols, such as an oil vessel, the seven-branched candlestick (symbolical of the soul [Pr 20²⁷]), the ram's horn (Messianic), and an ear of corn (type of the resurrection). These emblems are parallel to those on the Maccabean coins and to those favoured by Jews in the late mediæval period. At that late date symbols appear descriptive of the dead, as out-stretched palms as in act of benediction (for priest), ewer as in act of bathing (Levite), a harp for a musician, a crown for a goldsmith, and so forth. In the 18th cent. Jews, like their Christian neighbours, used symbolical signs for houses and businesses. Thus the Rothschild family still exemplifies the custom in its name ('Red Shield'). Ornamental coats-of-arms are found on tombs in the oldest Jewish burial-ground of the Sephardic Jews in London. Such customs are no longer in vogue. There has been a growth, however, of symbolism in synagogue decoration in the form of glass windows mostly without human or animal figures.

In the Talmud a good deal of legal symbolism was taken over from ancient Biblical as well as from Roman law.⁴ Some of this is still retained.

Returning to the more religious aspect of the subject, we may say in general that in the Midrash symbolism is the soul of Jewish ceremonial. Many particulars of the sacrificial system, the ritual of the Temple, synagogue, and home, are treated in this manner. Take, e.g., the rites of Tabernacles—the bearing of palm-branch, citron, myrtle, and willows of the brook (Lv 23⁴⁰). The palm is the spine, the citron the heart, the myrtle the eye, the willow the mouth, so that, in the synagogue liturgy, the citron atones for heart sins, the palm for stiff-necked pride, the willow for foul speech, the myrtle for lusts of the eye. In another version the old homilists⁵ explain the 'four kinds' as symbolizing four types of character. The citron has both scent and taste, so there are men who study and perform; the palm-date has taste but no scent, so there are men who study but do not perform; the myrtle has scent but no taste, so there are men who perform but not on the basis of study; the willow has neither scent nor taste, so there are men who neither study the law nor perform good deeds. The Holy One did not destroy these, but bade all be united into one bundle, the better elements atoning for the less

ABRAHAMS.

SYMBOLISM (Muslim).—The Islāmic languages appear to have no exact equivalent for 'symbol.' When it signifies a badge indicative of office, party, or community, the nearest would be *shī'ār*, or in certain cases *ghiyār*; where what is meant by it is a veiled expression for an idea, the Arabic rendering would be *kināyah*.

Islām as a religious system has nothing corresponding to the Christian cross. Muhammad seems to have adopted the Roman eagle as the standard for his armies,¹ but the flag of the later (Abbasid) khalifahs was 'like any other, only black in colour with the legend in white, "Muhammad is the Apostle of God."² Those borne by various factions and regiments differed in colour and at times in the wording of the legend; thus the Abbasid colour was black, the Alawid green, the Umayyad white; the flag of the Zanji pretender of the year 255 A.H. was a strip of silk with a Qur'anic legend in red and green;³ in the processions of the sultans of Tunis white, red, yellow, and green flags were carried; those of the different tribes differed in legend;⁴ the flags of the different divisions of the Ottoman army were red, yellow, green, white, red and white, green and white.⁵ The Muhammadan colour in India is green,⁶ which by an ordinance of the Mamluk Sultan Sha'ban of 773 A.H. on the turban indicates descent from the Prophet.⁷

There is no more common error than the supposition that the crescent (or rather crescent and star) is an Islāmic symbol, and even approved writers on Oriental subjects are apt to fall into it.⁸ It was certainly in pre-Turkish times sometimes used as an ornament on the minarets of mosques;⁹ and on flags—e.g., that of the Fātimids of Egypt, accompanied by a lion of red and yellow satin,¹⁰ and that of the Almohads (A.D. 1159)¹¹—and on the sedan-chair of a Zanjid princess.¹² As such the crescent had been employed on the Roman senatorial shoe—a practice for which Plutarch¹³ offers a variety of reasons. The current view of its adoption by the Turks is well presented by F. T. Elworthy:

'Hera, under her old moon-name, Iō, had a celebrated temple on the site of Byzantium, said to have been founded by her daughter Keroëssa, "the horned."¹⁴ The crescent, which was in all antiquity and throughout the Middle Ages the symbol of Byzantium, and which is now the symbol of the Turkish Empire, is a direct inheritance from Byzantium's mythical

foundress Keroëssa, the daughter of the moon goddess Iō-Hera.¹⁵

Keroëssa, supposed to have been not the foundress, but the mother of the founder, of Byzantium, seems to have been an inference from the Golden Horn and so to have no place in this inquiry. Further, it seems correct to say that the crescent and star figure, though rarely, on coins of Byzantium, but as one of numerous ornaments,² and that no ancient author mentions any connexion between this emblem and the city. The *signa Constantinopoleos*, according to A. Geofræus,³ who asserts that the Turks 'neque insigniis utuntur neque coronis,' were quite different. The earliest mention of it in English literature is said to be in the *Arte of English Poesie* by G. Puttenham (1589),⁴ who ascribes its introduction to the sultan Selim I. (1512–20), with the notion of increase and brightness, though it has been observed⁵ that the crescent is not that of the new but that of the waning moon, while rising in its wake is the morning star of hope; from Puttenham's time the antithesis between it and the cross has been common in English and French literature. F. Sansovino,⁶ however, supposes it to have been the ancient emblem of Bosnia, adopted by Muhammad II. when that country was conquered in 1463. This is declared to be an error by Zinkeisen,⁷ who speaks of a golden crescent inherited from the Seljuks, and displayed on all the flags and standards of viziers, beglerbegs, etc., appearing on the earliest flags of the Janissaries. With von Hammer Purgstall⁸ it is a silver crescent which, with the two-pointed sword of 'Umar, gleamed on the blood-red flag of the earliest Janissaries; in the authority to which he refers⁹ the Janissaries' flag displays the sword without the crescent; what appears on the flag of the cavalry is evidently a horseshoe rather than a crescent, with no star. It is worth noticing that the Seljuk chronicler Ibn Bibi¹⁰ compares the shoe of the sultan 'Ala-addin's horse to a crescent and its nails to stars; whence the symbol may originally belong to cavalry regiments. Its occurrence, however, on certain Byzantine coins is remarkable, and seems to have some connexion with its later employment by the Turks, who have not often introduced it on coins.

The symbols of royalty in use at the Islāmic courts were similar to those found elsewhere. In Umayyad times the khalifah on accession received a rod, a signet, and a scroll.¹¹ The rod was doubtless the Prophet's; in Abbasid times a new khalifah received not only the Prophet's signet, which was a silver ring with a bezel of Chinese iron with the legend 'Muhammad is the Prophet of God,' but that of his predecessor, with a ruby inscribed with the khalifah's name.¹² The Abbasid khalifah also wore a crown,¹³ against Arab usage;¹⁴ and indeed the etiquette of their court was closely modelled on that of the Sasanians, as appears from the recently published handbook of it by Jahiz of Basrah.¹⁵ A crown was worn by the Fātimids of

Egypt also.¹ In their processions there were borne a rod, a special sword (said to have been made of meteorite), an inkpot, a lance, a target (said to have belonged to the Prophet's uncle *Ḥamzah*), a horse-shoe-shaped ruby,² and a canopy or umbrella. The last of these was a common emblem of royalty, and figures, *e.g.*, at Indian courts,³ where the sovereign in the 16th cent. was attired 'in a white *qaba*, made like a shirt tied with strings on the one side, and a little cloth on his head coloured oftentimes with red or yellow.'⁴ The *qaba* appears in the attire of the Buwaihid Mu'izz al-Daulah (10th cent.),⁵ and, with a black robe, a belt, and a sword, it formed the distinguishing dress of a vizier.⁶ Apparently the belt symbolized some sort of subordination, as an Indian prince to whom Yamin al-Daulah gave a robe of honour had to be compelled to put on this portion of it.⁷

Homage to a newly-appointed sovereign was (at any rate in early times) indicated by a shake of the hand, the meaning of which is shown by the term employed to be agreement over a bargain. In later times homage was indicated by kissing the ground before the ruler; this practice, originally alien to Islāmic ideas, had become familiar before the end of the 4th Islāmic century.⁸ To a newly-appointed vizier (or emir) food was sent in the 4th cent. from the khalifah's table,⁹ probably signifying that he had become a member of the royal household. The practice of offering such a person fragrant herbs¹⁰ is said to have been a purely Persian or Dailemite rite, the sense of which is not clear.

Owing to Islāmic objection to the limner's art, symbolism is very scanty in its architecture, and where found appears to be borrowed. The great mosque of Cordova exhibited in the carvings of its lattices the peculiar form of the Indian cross, the meaning of which is unknown, whereas 'the resting of the walls, originally painted scarlet, is typical of flame, and, brought from Persia, symbolized the faith of the Ghebers, worshippers of fire.'¹¹ Probably in such cases the Muslim worshippers and spectators were quite ignorant of the signification. The same is likely to be true of the ornaments to be found on other works of art, such as pottery and textiles. Certain creatures are indeed habitually associated with particular ideas, chiefly on etymological grounds—*e.g.*, the raven with parting—but there is little scope for their employment in art. The symbolism of magical or quasi-magical rites in use in some communities (*e.g.*, the figures representing either a double hand or the spathe of the male palm, indicative of fertility, painted in Tunis on the walls of the house where there is to be a wedding)¹² is probably not Islāmic.

The practices of Islāmic ritual are tralatitious, though taken from many different communities; their symbolic interpretation is therefore conjectural, and is the subject of considerable speculation. Several pages are devoted by the mystic Ibn 'Arabi to the meaning of the postures of prayer (*ṣalāt*):

'The raising of the hands implies that whatever was therein has fallen away; it is as though the Almighty, when He commanded this, said, "When thou standest before Me, stand as a

poor mendicant, who owns nothing; fling away everything that thou possessest, and stand empty-handed, setting it behind thee; for I am in front of thee." Moreover since the hands are the seat of power, by raising his hands he confesses that the power is God's, not his own; he who raises them to the chest is thinking that God is in front of him; he who raises them to his ears is thinking that God is above him. Sitting in prayer is the attitude of the slave before his master, an attitude which he may not adopt without the master's leave,' etc.¹

Similar speculations on the meaning of the ceremonies of the pilgrimage are to be found in the work of Ghazālī;² the special garments worn by the pilgrim, *e.g.*, are to remind him of the grave-clothes wherein he will meet his Maker.

Besides explaining much of the Qur'ān as elaborate symbolism the Ṣūfis (*q.v.*) developed a system of their own, or rather a number of systems; and there are numerous collections of odes in Arabic and Persian which, ostensibly dealing with love and wine, are traditionally interpreted as dealing with the doctrines of pantheism. Illustrations of the style will be found in the commentary of H. Wilberforce Clarke on his translation of the *Divān* of Hāfiz,³ where we are told that 'breeze' signifies the means whereby union with the Desired One is attained, 'bell' signifies the angel of death, 'dark night' the world, 'wave' the excess of divine knowledge, etc., whereas in some cases the same term is variously explained; thus 'narcissus' may signify the growth of the world, the pure existence of God, the vision of God, or inward results of joy in respect of deeds. These interpretations are not always very convincing; but in some works of the kind the symbolism is either interpreted by the author himself or is sufficiently clear or conventional to leave no doubt of the meaning; an example is to be found in the *Masnavi* of Jalāl al-Din Rūmī.⁴

The employment of symbolic acts, either to emphasize language or in lieu of it, is common with Oriental peoples, but not specially Islāmic. The same parable has a tendency to do duty through many centuries. Ibn al-Athir records (A.H. 442) how, when an Arab tribe proposed to take Kairawan, they selected as their commander a man who offered to pursue the following plan: taking a carpet, he unfolded it, and then said to the others, 'Which of you can get to the middle of this carpet without treading upon it?' They declared it to be impossible. He showed them that the carpet had to be rolled up from the edge, meaning that the country had gradually to be conquered and secured. According to W. G. Palgrave, Ibrahim Pasha obtained the command of an expedition against Nejd eight centuries after by solving the problem of the carpet.⁵

LITERATURE.—See the works quoted in the footnotes.

D. S. MARGOLIOUTH.

SYMBOLISM (Semitic).—The extent to which symbolism exists in OT literature is very doubtful. In the case of the Babylonians and Assyrians, however, our knowledge is much more definite and is obtained chiefly from a study of cylinder-seals, the Babylonian boundary-stones, and the monoliths of Assyrian kings. On the Babylonian *kudurrus*, or boundary-stones, the emblems of the gods are grouped together, and in one case the name of the god with whom the emblem is associated is inscribed by the side, thus giving us definite data on which to base our investigations.

The Hebrew word for symbol, *ōth*, is most probably connected with the root *āwā*, 'to describe with a mark,' and with Assy. *ittu*. Some scholars have suggested a connexion between Assy. *ittu* and Heb. *יָתִיב*.⁶

1. **The symbolism of religious life.**—The Temple as the centre of the religious life of ancient Israel should be treated first. Solomon's temple was specifically built in order that it might contain the ark, the symbol of the presence of the deity. In the second Temple, the adytum being empty, the presence of the deity was symbolized by the continuance of the altar service, the Day of Atonement ritual, and the shewbread. Among the Semites the god was symbolically represented as a nobleman dwelling in his palace, and W. M. Flinders Petrie¹ has shown that the features and routine of Egyptian temples were similar to those of large households. First came the small chamber symbolizing the mysterious dwelling of the deity himself. The larger hall in front of this could be compared to the audience-chamber where human kings receive their subjects, whilst the larger space in front of the building was primarily a meeting-place for the people. The division of the Temple into a Holy Place and Holy of Holies was also symbolical and corresponded to the heavens and the highest heaven (עֲלֵיוֹן and עֲלֵיוֹן הַשָּׁמַיִם [I K 827]), whilst the entrance may have symbolized the earth, Jahweh's footstool (Is 66¹). Why was the Temple built on a mountain? This really brings us to another question. Was there any connexion between the idea which represented Jahweh's home on a mountain and the 'high places' referred to in the OT? From the standpoint of the Deuteronomic historian, the high places were legitimate places of worship until the building of the Temple at Jerusalem. It is to be noted also that the high places are said to have been built on hills, and it has therefore been suggested² that they were artificial mounds taking the place of natural high places such as the summits of hills and mountains. The explanation of this symbolism can be learned from Babylonia. One of the most noticeable characteristics of the Babylonian temples was their enormous size. In Gn 11³⁴ we read that the people meet together in the land of Shinar and decide to build a city and a tower that shall reach up to heaven. To the Babylonians a temple was above all a 'high place,' and there is a symbolic reason to account for this conception. Jensen³ has shown that the Babylonians regarded the earth as a huge mountain. In fact the earth was actually called E-Kur, 'mountain house.' Later they began to identify one particular part of the earth—a mountain peak preferably—as the dwelling of the god, so that the temples which were built later were known as 'mountain houses.' The height of the temple thus symbolized the mountain which had formed the original home of the deity.⁴ The same idea can be seen by sketching the history of Mt. Zion. The sanctuary on the mountain existed before the settlement of the Hebrews. Just as His people dispossess the early settlers of Canaan, so Jahweh dispossesses the god of Zion. Mt. Zion is now regarded as His home and He therefore reveals Himself to His people from the mountain (Ex 19¹¹). We can thus see the symbolic idea which suggested the *ziggurats* in Babylonia, the high places in Canaan, and the sacred temple mount in Israel.

The very names 'ark of Jahweh,' 'ark of God,' suggest that the ark contained an object which in some manner symbolized the God of Israel. In the Assyrian temples a statue of the god took the place of the ark in the Holy of Holies, and

it has therefore been suggested that the ark with the cherubim over it was a symbol of Jahweh. The custom of carrying about an ark as a symbol of the deity has its parallel in other Semitic religions. In Babylonia the gods were carried about in ships in solemn procession, and in Egypt the arks with their images were placed in boats. Renan¹ actually derives the Hebrew ark from the Egyptian ark-boat, but there is not sufficient evidence to warrant such a suggestion.

Cheyne² thinks that the symbolic meaning of the brazen serpent can be learned from Babylonia. He thinks that the brazen oxen in I K 7²⁵ were copies of the oxen which stood in Babylonian temples as symbols of Marduk. I. Benzinger³ has suggested that there was a serpent-clan among the Israelite tribes and that *Nehushtan* may have been its sacred symbol (Gn 49¹⁷). The two pillars Jachin and Boaz which stood in front of the porch of the Temple were probably symbolical. The temple of Melkarth at Tyre and also the temple at Hierapolis had two similar pillars in front of them, and, as these were symbols of the deity and Solomon's temple was constructed on the same principle, it has been suggested that Jachin and Boaz were symbols of Jahweh. It is possible that the brazen lavers and the sea of the Temple symbolized the clouds. As to the sea and oxen, W. H. Kusters⁴ finds here a symbolic trace of the Babylonian myth of the struggle of Marduk and Tiamat—the sea representing Tiamat and the oxen Marduk. Seeing that the Babylonian creation-myth determined the form of the Israelitish cosmogony, this view has received general support, although there is no direct reference to it in the OT. H. P. Smith⁵ suggests that the twelve oxen were symbols of the twelve constellations and that the sea was a symbol of the great celestial reservoir from which the earth is watered. The ornamental figures on the smaller lavers he also regards as symbolical. The bull was sacred to Jahweh, the lion was sacred to Astarte, whilst the palm-tree is represented with a symbolic meaning in Phœnician art. The ornamentation therefore suggested a syncretistic purpose in building the Temple.

Although there is not the slightest reference in the OT to any symbolic meaning of the tabernacle, scholars, both ancient and modern, have suggested that both in its structure and in its appurtenances it symbolized various religious truths. The Heb. דְּבַר, 'dwelling,' expressed the idea that God dwelt among His people; אָהֳל מוֹעֵד, 'tent of meeting,' represented the idea that God met His people there; whilst the name אָהֳל עֵדוּת, 'tent of the testimony,' constantly called to mind that the decalogue inscribed on the tables of the ark bore witness to the covenant between Jahweh and His people. But there are other ideas symbolized by the tabernacle. The innermost chamber, the Holy of Holies, was the dwelling-place of the deity Himself. This could be entered by the high-priest alone, and only once a year—on the Day of Atonement. In this chamber everything was made of gold and decorated with beautifully-made fabrics, whilst the vestments of the high-priest were conspicuous by their gorgeous finery. This gave expression to the thought that God's most holy minister and His chief abode should be adorned with becoming dignity and splendour. On the other hand, in the Holy Place, which could be entered by the priesthood only, the furniture was of gold, whilst the outer pillars, which were taken, no doubt, as belonging to the court, were made of brass. The court, which was for the people, had

only brass. The covering for the Holy of Holies was made of costly materials with figured cherubim; the curtain at the door of the Holy Place was without cherubim, and that at the court was simply made of white linen. We can thus see how the costliness of the adornments of the different apartments symbolized their sacredness; the more sacred a chamber was, the more sumptuously was it adorned.

¹ Together the curtains are designed to form the earthly, and, with the aid of the attendant cherubim to symbolize the heavenly, dwelling-place of the God of Israel.¹

The sacrificial system of the Hebrews symbolized self-surrender and devotion to the will of God, the need of forgiveness, and the blessing of divine fellowship. The peace-offering with its communion-feast showed the idea of fellowship between God and man; the *tamid*, or continual offering, symbolized Israel's pledge of unbroken service to Jahweh; whilst the sin-offering with its sprinkling of blood showed that one of the conditions of cleansing oneself from sin was to place oneself submissively before God. The care taken in the preparation of the aromatic compounds of the incense suggests a symbolic meaning. From Ps 141² it appears that incense was regarded as a spiritual symbol of prayer. Bähr regards the shewbread as a symbol of the fact that Jahweh was ever present with His people and was the giver of their daily bread. Circumcision was a tribal badge and showed that the patient had been admitted a member of the tribe, whilst the Sabbath symbolized the completion of the work of creation. In Ex 31¹³ it is actually described as an everlasting symbol (*nik*) between Jahweh and Israel. The long hair worn by the Nazirite symbolized his consecration for some special service. In ancient religions the offering of one's hair, like the offering of one's blood, symbolized the making of a covenant between the worshipper and his god. The frontlets, or *tōtāphōth* (Ex 13¹⁵), were badges worn upon the forehead and arm to show that the worshipper belonged to a certain religious community, and as a worshipper of the national deity was subject to His help and protection.² Fire occurs as a symbol of the divine presence (Ex 20¹⁸ 3² etc.). It was also regarded as a purifying agent (Is 48¹⁰), and to pass through fire was therefore a symbol of purification. Would not this explain why sacrifices were burned before they could be accepted by God? Water was another source of symbolical purification. Ablutions were so common among the Hebrews that it is difficult to distinguish washings performed for the sake of the body and those with a symbolical significance. Anointing³ denoted the consecration of a person or even of an inanimate object (such as the tabernacle and its appurtenances or the stone at Bethel). In Ps 92¹⁰ it is referred to as a symbol of prosperity and joy, and the cessation of the practice was therefore a symbol of mourning (2 S 12²⁰). The word *ashērāh*, which appears very often as a name for Astarte (1 K 18¹⁹, 2 K 21⁷ etc.), came to be used as a name for the symbol of the goddess⁴ (Dt 7⁵, Ex 34¹³ etc.). The *hammanīm* were most probably symbols of the sun-god, who is called in Phœnician inscriptions *ḥm*,⁵ whilst the *maṣṣēbhōth* were symbols expressing gratitude for a

⁵ A. Bloch, *Phœn. Glossar*, Berlin, 1890, p. 22.

divine revelation (Gn 28²² 31¹³ etc.). As to bull symbolism, it most probably originated among the Hebrews themselves (and was not borrowed from the Egyptians, as hitherto supposed). The Hebrews being an agricultural race, it was natural that they should look upon the bull as a symbol of strength and power. The bulls on the lavers of Solomon's temple may have been due to the influence of Phœnician workmen, for among the Phœnicians Baal was regarded as a bull. The horns of the altar are represented by some scholars as symbols of ancient bull-worship. The *ziggurats*, or temple towers, of Babylonia consisted usually of three, four, or seven stones, no doubt on account of the symbolic sacredness attached to these numbers. The quadrilateral shape of the *ziggurats*, with the four corners towards the four cardinal points, symbolized the four quarters over which the Babylonian kings held dominion. The lions (symbols of Nergal) and the bulls (symbols of En-lil) which stood at the entrances of Assyrian temples probably symbolized the means which the gods had at their disposal for punishing man. The names of the temples symbolized the character of the gods to whom they were dedicated. Nabu's temple was known as E-pad-kalama-suma, 'the house of him who gives the sceptre of the world'—no doubt suggested by the staff which formed the symbol of Nabu. Sin's temple at Haran was called 'the house of joy,' and that of Shamash was known as 'the house of the universal judge.' The basin of the temple known as *apsu* represented the domain of Ea, the water-god. The *ziggurats* and the basin thus became 'living symbols of current cosmological conceptions.'¹

We may now turn to the symbols of the gods themselves.² The symbol of Ramman, the storm- and thunder-god, was a lightning fork, whilst an axe represented the destruction which storm and thunder bring in their wake. His nature as a solar deity was also symbolized by a bull. Sin had a crescent, either by itself or with a disk. Since the moon at certain phases suggested the appearance of a horn, he was represented as an old man with a flowing beard, and wearing a cap on which were the horns of the moon. The horn was thus regarded as his crown and came to symbolize his power. This explains why the Assyrian kings adorned themselves with a horned crown as a symbol of divinity.³ Anu symbolized 'the abstract principle of which heaven and earth are emanations.'⁴ Such expressions as 'light of heaven and earth,' by which Ninib was known, symbolized his beneficent character as a solar deity. But the fiery rays of the sun might also be destructive, and he was therefore represented also under the form of a lion. Ea's symbol consisted of a ram's head which projected from a frame. This symbol occurs on the Bavian relief and the Esarladdon stele. But on boundary-stones his symbol is usually an animal with the head of an antelope and the lower part of a fish. As the water-god of Babylonia, fountains were sacred to him, and he was regarded as the giver of fertility. He was the Oannes of Berossus—half man, half fish—who came out of the water to instruct the people. The symbol of a fish was therefore suggested either by the idea of fertility or by the fact that he was god of the water. Nabu, as scribe of the gods, was symbolically represented as carrying the tablets of fate and recording the decision of the gods upon them.

¹ M. Jastrow, *The Religion of Babylonia and Assyria*, Boston, 1898, p. 653.

² These symbols can be studied most conveniently from the *Mémoires de la déléation en Perse*.

³ In OT the horn was a symbol of power and its exaltation signified victory (1 K 22¹¹, Jer 43²⁵ etc.).

⁴ Jensen, p. 274.

The staff by which he is represented symbolizes either the stylus of a writer or a ruler's sceptre. The solar god Marduk symbolized the sun of spring which brings about the growth of vegetation and the revival of nature. As a warrior-god his symbol is a spear, and as a storm-god he is represented by a horned dragon. Sometimes he is represented by the symbol of a dog, and in a lexicographical tablet¹ there is a reference to four dogs of Marduk. As the goddess of love and the symbol of creation Ishtar was represented by a female figure with her breasts exposed and a child on her left arm sucking her breast. She symbolized every feminine phenomenon of the Babylonian pantheon. She was the mother of the gods and the mother-goddess, and was therefore prayed to in hymns as 'helper and heavenly mid-wife.' As goddess of the passions she was represented on seal-cylinders as nude, with the distinctively feminine parts particularly emphasized. In the astrological system she was identified with Venus and regarded as a symbol of light. Sometimes her symbol is a star² of various shapes.

Nergal, who symbolized the hot sun of mid-summer, was represented by a lion; Nusku, the fire-god, by a lamp; and Nirusu by an eagle. Hommel³ connects the name Bau with *bohu* of Gn 1, and suggests that the goddess was a symbol of the watery depths of the universe. On one of the inscriptions of Nabu-pal-iddin Shamash is represented as seated in his shrine; before him is a table resting on a wheel, and attached to the wheel are cords held by two male figures which direct its course. These figures represent the messengers of Shamash, Malik and Bunene, who occupy the position of chariot-drivers. The sun's movement across the heavens, which is here symbolized by the wheel, was thought of as a drive⁴ (cf. Ps 19⁶). On seal-cylinders his beneficent character is symbolized by the manner in which he pours forth streams of water from jars placed on his shoulders. But the most common symbol of Shamash is a sun-disk.

The chief symbol of Ashur was a standard which consisted of a pole surrounded by a disk enclosed within two wings. Above the disk was the figure of a warrior shooting an arrow. The terra-cotta images of Bel found at Nippur⁵ represent him as an old man with a flowing beard, a real 'father' of the gods. He personified the various forces of nature whose seat and sphere of action is the inhabited world. Together with Anu and Ea, therefore, he symbolized the eternal laws of the universe.

2. The symbolism of common life.—A Hebrew slave who refused to take advantage of the liberty open to him after seven years' service had one of his ears bored with an awl and pinned to the door to show that he was in future to be devoted to the service of that house⁶ (Ex 21⁶). Elevation to a position of superiority was symbolized by placing a crown on the head (2 S 1¹⁰, 2 K 11¹² etc.). The worshipper spread out his hands in prayer to show that he desired to obtain divine mercy and help (Ex 9²⁹, 33, 1 K 8²² etc.). Washing of the hands was a symbol of innocence. In Dt 21⁶ the heifer's neck was broken to show that the murderer deserved the punishment, whilst the elders of the

city by washing their hands showed that they were free from the guilt. Hostility towards a person is shown by gaping with the mouth (Ps 35²¹, Job 16¹⁹ etc.); ill-feeling by clapping the hands (Ezk 6¹¹ 21¹⁷ 22¹³), or by spitting in the face (Nu 12¹⁴, Dt 25⁹); and anger by gnashing the teeth (Ps 35¹⁶, Job 16⁹, La 2¹⁶ etc.). The key of the door was probably looked upon as a symbol of authority, and to place it upon a man's shoulder showed that he was appointed steward (Is 22²²). Covering a woman with one's mantle signified the intention of acting as her protector (Ezk 16⁸). The father of a new-born child acknowledged it as his offspring by placing it upon his knees (Job 3¹²). In a Babylonian poem describing the wickedness wrought by the evil spirits they are said to snatch the child from the knees of a man. The use of salt as a condiment and the piquancy which it gives to insipid articles of diet caused it to be regarded as a symbol of life. An abundance of salt has the effect of preventing the growth of vegetation, and therefore the ploughing of a city with salt denoted that it was condemned to eternal destruction (Jg 9⁴⁵). It was a mark of reverence to cast off the shoes on approaching a sacred person or place (Ex 3⁵, Jos 5¹⁵). To appear barefoot was a sign of great emotion or of mourning (2 S 15³⁰, Is 20² etc.), and to draw off the shoes meant to give up a legal right (Ru 4⁷). The taking of an oath was symbolized by placing the hand under the thigh of the adjurer (Gn 24² 47²⁹), or by lifting up the hand towards heaven¹ (Gn 14²²). As kissing was a means by which parts of the body of different persons came into contact, it was naturally a symbol of affection and reverence (Gn 27²⁶, Ex 18⁷, Ru 1⁹ etc.). Various symbolisms were used in mourning.² Sackcloth was worn to show that the mourner's grief for the departed was so great that he was ready to give up all the pleasures and conveniences of life (Gn 37³⁴, 2 S 3³¹). The tearing of one's garment denoted that the mourner's dearest friend had been torn from him (Gn 37²⁹ 44¹³ etc.). The mourner went about barefoot and bareheaded (2 S 15³⁰, Ezk 24¹⁷), sat in ashes and sprinkled ashes upon his head (Jer 6²⁶, La 3¹⁶ etc.), and practised various mutilations of the body (Jer 16⁶ etc.). Shaving the head (as among the Arabs at the present time) was also a sign of mourning. The making of a covenant was symbolized by the person who gave the pledge passing between the parts of an animal cut into pieces, and thus showing that he was ready to be similarly treated if he failed to keep his promise (Gn 15⁹ etc.).

Light represented to the Orientals the highest human good. The most joyful emotions and pleasing sensations are described under imagery derived from light (1 K 11³⁶, Ps 97¹¹ etc.). It was only natural that there should follow a transition from corporeal to spiritual things, so that light came to typify true religion and the happiness which it brings. Sin, wickedness, chaos, were represented by darkness. The lion was a symbol of strength (Jl 1⁶). Kneeling was a mark of homage to a superior, and is therefore referred to as an attitude of worship (2 Ch 6¹³, 1 K 8⁵⁴).

In Babylonia it was customary for the suitor to present gifts to the girl's parents. According to some scholars, this symbolized the purchase of the bride—a practice which existed in earlier times. Various symbolisms were connected with the marriage ceremony, but their meaning is obscure. The officiating ministers bound sandals on the feet of the newly-wedded pair,³ gave them a leather

girdle, and fastened it to a pouch of silver and gold. The first of these ceremonies may have symbolized the marriage-contract between them. We are told in the Code that, if a maid behaves insolently towards her mistress, the latter may put an *abuttu* on her and reduce her to slavery. The adoptive parent may do the same with a disobedient son. What the *abuttu* was is unknown. Jensen has suggested that it was some kind of incised mark which acted as a symbol of the person's position (cf. the mark on Cain's forehead [Gn 4¹⁵]). The repayment of a debt or the dissolution of a partnership was symbolized by the breaking of a tablet. Mutilation is often referred to as a punishment for crime, and the form of mutilation was symbolical of the offence itself. For striking a father the hand was cut off; for ingratitude evidenced by speech the tongue was cut out; as a punishment for unlawful curiosity the eye was torn out; and as a mark of disobedience the ear was often cut off. The cutting short of the hair was a mark of degradation. The city walls were regarded as a symbol of shelter.¹ Swearing by the gods and the king was a means of sanctioning an agreement. When a contract was made, both parties and witnesses added their names to it. And this was authenticated by impressing their seals or making a nail-mark. The Code states explicitly that a woman was not a wife without 'bonds.' This was a marriage-contract which symbolized an official acknowledgment of the union. An artisan symbolized his adoption of a child by teaching him a trade. The penalty of breaking a contract was the payment of two or more white horses to the god. The exact meaning of this symbolism is unknown, but white no doubt suggested purification and innocence. In Babylonian magic there was a symbolical tying and loosening of knots according as the sorcerer wished to strangle his victim or to release him from any demon by which he had been captured. If a magician wished to rid himself of an object, he would burn or torture an image of it, believing that the victim would meet with the same fate as his image. By 'seizing the hands of Bel,' the Assyrian kings legitimized their claim to the Babylonian throne.

3. The symbolism of numbers and colours.—It is doubtful whether the Hebrews used numerical symbols in OT times. On the Moabite Stone and the Siloam inscription the numbers given are invariably in words. But this does not exclude the possibility that numerical symbols, which were employed by the Babylonians and Egyptians, were also used by the Israelites. In S. Arabian and Phœnician inscriptions also the numbers are partly written and partly indicated by figures. The numbers most commonly used with a symbolical meaning are three, four, and seven.²

White symbolized purity and innocence. It represented light, which impressed the Hebrew mind not only by its brilliance and beauty, but by its divine symbolism and profound moral connotation (Lv 16⁴⁻³², Dn 7⁹, Ps 104²). As black absorbs all colours and thus buries the light, it symbolized death, humiliation, mourning (Mal 3¹⁴, La 4⁸ etc.). Blue, representing the colour of an unclouded sky, symbolized revelation (Ex 24¹⁰). It was the first of the colours used for the curtains of the sanctuary, and the Israelites were commanded to have a ribbon of blue fringe on the edge of their garments in order to remind them of Jahweh (Nu 15^{38f.}). Red, as the colour of blood, repre-

sented bloodshed, war, guilt (Zec 6²). Purple was the distinguishing mark of royalty, representing dignity and honour (Est 8¹⁵, Jg 8²⁶), whilst green, as the colour of plants—growths to which people look forward in winter—symbolized hope and resurrection.¹ It was also the symbolic colour of the moon.²

4. Special symbolisms in OT.—Ahijah tore his garments into twelve pieces in order to show that the kingdom of Israel would be similarly divided (1 K 11²⁰⁻²³). One of the sons of the prophets asked his comrade to smite him, and by his wound thus showed the punishment that Ahab had deserved (20³⁵). Zedekiah, a false prophet, put on horns in order to show that Ahab would push the Syrians as with horns of iron (22¹¹).

In considering the special symbolical actions of the prophetic books, we are confronted with very great difficulty. For scholars are divided in their views as to whether these actions were actually performed in their literal sense or were merely conceived as symbolic visions in the minds of the prophets. It seems almost certain that there are a number of such actions which could not have been performed literally. It is impossible, however, for the present writer to discuss in this brief article the category to which each of these many prophetic symbolisms belongs. But a brief discussion of some of these from the books of Jeremiah and Ezekiel may give some indication as to the difficulties in arriving at a definite decision. In Jer 13¹⁻¹¹ Jahweh tells the prophet to go to the Euphrates and hide his linen girdle in a rock. After a while he is told to remove the girdle, and he then finds it to be marred. The lesson is that, just as a girdle from its nature clings to a person, so Israel is closely united to Jahweh.

Now, on the one hand, it may seem unlikely that Jeremiah should have undertaken a journey from Jerusalem to Babylon—a distance of about 200 miles—in order to bring out this point to the people. But it is possible that the journey *was* actually performed. (1) We know that the prophet was absent from Jerusalem during part of Jehoiakim's reign, and, as we have no account of his whereabouts during this period, it is possible that he made the journey to Babylon then. (2) In Jer 39¹¹, we are told that Nebuchadrezzar behaved in a most friendly way towards him on the capture of Jerusalem. This can be explained by the suggestion that king and prophet had met previously, and that it was on the occasion of the prophet's visit to Babylon. In Ezk 4⁵ we are told that the prophet lay upon his side for 390 days. How can this be taken literally? Did any person actually count the number of days? In 4¹² we are told that Ezekiel used human excrement for fuel in baking some barley cakes. Surely it cannot reasonably be suggested that the prophet would have inconvenienced himself by going to such extremes merely in order to bring home to the people some divine message which he could very well have preached in a much more suitable manner. There are some scholars, chief of whom is A. Klostermann, who argue that these symbolical actions *were* performed. The dumbness of Ezekiel (3²⁴⁻²⁷), they suggest, was due to a temporary loss of speech, and they explain similar performances by somewhat similar suggestions. Against this it may be argued that the prophet here refers to his keeping silent from delivering any prophetic message rather than actual speechlessness. Again, the fact that the prophet had to remain at home, in order to carry out the divine command, suggests

¹ The Code says that, if a father repudiates his son, 'he shall leave house and yard.' 'Yard' simply means 'enclosure' and may refer to the city walls, as a symbol of shelter (C. H. W. Johns, *Bab. and Assyr. Laws, Contracts, and Letters*, Edinburgh, 1904, p. 42).

² Cf. art. NUMBERS (Semitic).

¹ Hammurabi says that he 'bedecked the grave of Malkat with green,' the colour of resurrection (introduction to his Code of Laws).

² Jeremias, i. 110.

that it was not loss of speech but an injunction to refrain from reproving his co-religionists any more. The present writer is therefore inclined to agree with R. Smend, A. Kuenen, and E. Hühn in regarding many of the symbolismisms of Ezekiel as being merely symbolical visions in the mind of the prophet and as not having been performed externally.

LITERATURE.—Very little indeed has been written by modern scholars on OT symbolism. Among the older works the most important is C. Bähr, *Symbolik des mosaischen Cultus*, 2 vols., Heidelberg, 1837-39. For discussion of prophetic symbolism by modern scholars see F. Giesebrecht, *Die Berufsbegabung der alttest. Propheten*, Göttingen, 1897; F. E. König, 'Zur Deutung der symbolischen Handlungen des Propheten Hesekiel,' in *NKZ* iii. [1892]; E. Hühn, *Die Messianischen Weissagungen*, 2 vols., Tübingen, 1899; W. Nowack, *Die kleinen Propheten*, Göttingen, 1897, p. 29; F. Delitzsch, *Iris: Studies in Colour and Talks about Flowers*, Eng. tr., Edinburgh, 1889.

For a study of Babylonian symbolism see W. J. Hinke, *A New Boundary Stone of Nebuchadnezzar I. from Nippur*, Philadelphia, 1907; W. H. Ward, *The Seal Cylinders of Western Asia*, Washington, 1910; P. Jensen, *Die Kosmologie der Babylonier*, Strassburg, 1890; K. Frank, *Bilder und Symbole der babylonisch-assyrischen Götter*, Leipzig, 1906; J. de Morgan, *Mémoires de la dévotion en Perse*, Paris, 1900-05, vii. 137-153; F. Hommel, 'Ursprung des Tierkreises,' in *Aufsätze und Abhandlungen*, Munich, 1900, ii. 236-268.

MAURICE H. FARBRIDGE.

SYMBOLO-FIDEISM.—Symbolo-fideism¹ is the name given to the theology taught in the second half of the 19th cent. at the Protestant Faculty of Paris by Professors Auguste Sabatier and Eugène Ménégoz, and disseminated since by a large number of their pupils and disciples. It has also been called the theology of the Paris school.

As its name indicates, this theology has two aspects: (a) symbolism, which deals with religion more particularly from the point of view of its form, and (b) fideism, which deals with it from the point of view of its content. Sabatier devoted himself specially to the former and Ménégoz to the latter aspect. But the two conceptions are inseparable and interdependent. Together they form a theology with a distinct character of its own.

The basis of symbolism is the psychological observation that the essence of things escapes us, and that we know only their manifestations in the form of images, figures, and symbols. We cannot, e.g., know what God is in Himself. We know Him only by the more or less anthropomorphic representation which we form of Him in our thought. This we express by the terms 'Father,' 'Lord,' 'Master,' 'Captain,' 'Sovereign,' 'King,' or by emblems bringing out one or other of His attributes—e.g., Lion, Rock, Banner, Fire. These symbols are without doubt the expression of a living reality, but the conformation of our brain is such that it cannot grasp that reality naked; our mind can apprehend it only when it presents itself in the garment of a more or less sensuous representation. This observation holds good in regard to all religious data, and is borne out in the most subtle dogmatic systems. The task of the theologian is to lay bare the eternal truth from under its contingent manifestations and its historical formulæ; moreover, these formulæ are subject to the laws of historical evolution.

As regards the Deity, it is the name 'Father,' habitually used by Jesus Christ, that best suits the religious man's conception of the Supreme Being—perfect, just, merciful, eternal, all-embracing; a Spirit both transcendent and immanent, on whom man feels himself absolutely dependent, while at the same time conscious of liberty and responsibility before Him. On the ideas of liberty and responsibility depend those of sin and penalty, which in turn suggest those of pardon and salvation. A lively conviction that we are created for life and not for death, for happiness and not for

suffering, rouses us to aspirations after salvation. We desire life, happy life, eternal life. The whole idea of salvation is summed up in these words.

How are we to attain this life, this salvation? Conscience replies: By the pardon of our sins. But how is pardon to be obtained? It is with this vital question that fideism is concerned. The term 'fideism' (Lat. *fides*, 'faith') was employed in the religious sense for the first time by Ménégoz in his *Réflexions sur l'Evangile du salut*.¹ Its meaning is most concisely indicated in the phrase: 'We are saved by faith, independently of beliefs.'

The distinction between faith and beliefs is one of the fundamental premisses of fideism. By faith is meant the movement of the self towards God—a movement which implies forsaking sin, repentance. The man who repents and gives his heart to God is saved, whatever his beliefs may be. This statement is opposed to the old orthodoxy, which made adherence to certain official dogmas a condition of salvation. Fideism declares that a man is saved by faith alone ('*sola fide*'). At the same time, it recognizes the value of doctrines. Doctrines are dynamic ideas which make for good when true, and for evil when false. Fideists regard them therefore as pedagogic instruments of the first order. It is for this reason that they attach so much importance to the pursuit of truth and oppose so resolutely doctrines which they consider erroneous. It is only through a great and regrettable misunderstanding that their opponents reproach them with indifference to doctrine; and it is also false to assert, as has been done, that fideists fail to appreciate the intellectual factor in religious faith. Faith, according to their teaching, is an activity of the self in its unity, and therefore must comprise all the elements of the soul's faculties—thought, feeling, and will. But the essential factor in salvation is the inward movement towards God, not intellectual adherence to some doctrinal tenet. Fideists reject the doctrine of salvation by beliefs without thereby denying the spiritual influence of beliefs, as the Reformers rejected the doctrine of salvation by works, while maintaining that good works are obligatory on Christians.

In a general way, and as a result of historical, critical, exegetical, and philosophical studies, fideists have departed from orthodox theology and returned to the simple doctrine of salvation as taught by Jesus Christ, according to their interpretation, to the multitudes in His preaching of the gospel; hence their emphasis on repentance and on consecration of the soul to God as conditions of salvation.

As regards the idea of salvation, they find it in the symbolic interpretation of the primitive Christian conception of the Kingdom of God. This idea has for them two aspects: (1) the entrance of believers at death into celestial happiness, and (2) the gradual establishment of the Kingdom of Justice and Peace on the earth. These two ideas combined constitute in their eyes the Kingdom of Heaven.

The name 'Symbolo-fideism,' which expresses the union of symbolism and fideism, gained currency from two articles by Eugène Ménégoz, signed T. P. ('Théologie protestant') in the *Eglise Libre* (1894, nos. 31 and 33). Auguste Sabatier accepted this title (*Esquisse*, p. 456). It passed into Holland with the thesis by J. Riemens entitled *Het Symbolo-fideisme: Beschrijving en kritische Beschouwing* (Rotterdam, 1900), and into Germany with Gustav Lasch's *Die Theologie der Pariser Schule: Charakteristik und Kritik des Symbolo-fideismus* (Berlin, 1901).

Symbolo-fideism has given rise to numerous controversies, an echo of which is found in current

¹ In recent years the word 'fideism' has frequently been used alone.

¹ Paris, 1879, § 44.

religious journals and theological reviews. Its adversaries have also published a number of polemical pamphlets. These are referred to in the writings mentioned below.

LITERATURE.—The two principal works of Auguste Sabatier on the subject are the *Esquisse d'une philosophie de la religion d'après la psychologie et l'histoire*, Paris, 1897 (several times re-edited), Eng. tr., London, 1897, and *Les Religions d'autorité et la religion de l'esprit*, Paris, 1904 (published from MS, after the death of the author), Eng. tr., London, 1904. The writings of E. Ménégoz are collected in *Publications diverses sur le jûdisme et son application à l'enseignement chrétien traditionnel*, 5 vols., Paris, 1900-20. The reader will find in these works references to other works of the same authors. See also Hector Haldimann, *Le Fidélisme; Etude critique de la doctrine du 'Satur par la foi, indépendamment des croyances'*, Paris, 1907; E. Ménégoz, *Religion and Theology*, London, 1908; *Le Satur par la foi, indépendamment des croyances; Anthologie du fidélisme*, by the Comité des publications religieuses libérales de Genève, Geneva and Paris, 1913; A. Delcourt, *Le Fidélisme: La notion intégrale du satur et l'essence de l'Evangile*, Paris, 1914. A. Thiébaud has given an objective and critical exposition of fideism in the *Journal religieux des Eglises indépendantes de la Suisse romande*, 1917, nos. 23-26.

EUGÈNE MÈNÉGOZ.

SYMPATHY.—Sympathy, as the etymology denotes, is 'feeling with' others. Two persons feeling alike do not, however, make a true sympathetic couple unless the feeling of one has partly caused or is reinforcing the feeling of the other. The perfection of mutual sympathy is reached when similar feelings originate spontaneously in the two and reinforce each other. Any relation, however, in which there is a mutual reinforcement of feeling, however originated, is one of mutual sympathy.

1. Emotional contagion.—The primary fact in sympathy is that the feeling of one person can, on occasion, cause similar feeling in another. In its primitive manifestations this occurs without reflective consciousness of the feeling, and certainly without distinction of persons in respect of its origin. This is shown in the contagion of popular excitement—e.g., panic, war-frenzy, the intensified enthusiasm of public meetings, the wild joy, the furious hatred, the boundless affection, that mark the excited crowd. The emotion, or its manifestation in some, excites similar emotions latent in the others, and forthwith by sympathetic reinforcement the emotional disturbance in each is abnormally increased. Probably it is only those who, from the beginning, have some set against the prevalent emotion that maintain a normal level throughout. Such sympathetic outbursts must be themselves short-lived, and, as the cause of excitement is withdrawn, the persons affected by contagious feeling return to their ordinary emotional level. This may even be one of indifference to the popular frenzy in which they took part. It may, indeed, be one of revulsion if they have been drawn, as sometimes happens, into a condition of which in their normal moods they disapprove. Such revulsion would happen, e.g., if an advocate of peace found that he had been drawn by fellow-feeling into a demonstration of war enthusiasm. The hot fit is followed by a cold fit. Hence the instability of popular acclamation, the apparent superficiality of feeling which appears when people liable to sympathy of this primitive unreflective kind are massed together. The most suitable material for the typical 'fickle mob' is a town population sympathetically sensitive and intellectually immature.

The short-lived character of the feeling thus contagiously aroused follows in the nature of the case, because there is no settled identification of self-conscious personality with it. I feel in a sense, but do not feel myself as feeling: I do not take the feeling into myself as mine. It is *on me* and moves me, but it does not enter into any relation to that total of ideas, impulses, feelings, and desires which is *me*. It may be a mere motive

excitement, moving me blindly to action, or it may take possession of me completely with fixed idea and over-mastering mood, acting instead of me and overpowering me. In either case I come out of it, and in the latter case as one recovered from a madness. Something like this, no doubt, befell Parisians in the brief violence of the Terror.

2. Self-conscious sympathy.—When self is identified with the feeling which nevertheless is ascribed to another person as origin, we have sympathy proper. The development of self-consciousness goes hand in hand indeed with the exercise of sympathy. We learn to know ourselves, and to become all that we are capable of becoming as self-conscious persons, by our dealings with our fellows, and *pari passu* with our consciousness of them as other selves. In so far, however, as we are clearly conscious of self, we are prepared to set bounds to the operation of primitive sympathy. A new condition of feeling, discontinuous with my previous state so as to preclude its origination in me, is roused in me by sympathetic contagion. It is to the self an invasion from without. As a feeling, moving me but not mine, it must be referred to a neighbouring conscious self, who is manifesting it independently. Our first concern, however, is its treatment by the self which is invaded. Feelings that harmonize with the total state of this self enter into it as elements in its development: the sympathy of children with parents and other elders plays a large part in the building up of their personality. Confidence in the elders who give the lead to sympathy predisposes to acceptance of their guidance. The emotional being of the child is educated in this way. If of average docility, it takes the form suggested to it by its society. On the other hand, the suggested feeling may be out of harmony with the character as already formed: thus the brave man may feel the horror communicated to him by the panic-stricken multitude, but he overcomes it as no possible part of himself. When the feeling thus communicated to us takes strong hold, the repulse by a strong character is correspondingly emphatic. In sensitive natures this gives rise to a peculiar sense of revulsion, as towards something put into us against our will; and the transference of this revulsion to the source of contagion is probably the chief cause of violent personal antipathy. Between this attitude of abhorrence towards the induced emotion and willing receptiveness of it, as extremes, lie all degrees of being moved by a feeling from which, as outside the disposition of our own personality, we nevertheless withhold ourselves. Whether we admit the feeling to influence over us, or harden our will against it in a sort of self-defence, it appears to us essentially, and throughout its action, as the feeling of another person with which in a measure we feel. This definite ascription of the feeling to another is the second characteristic feature in sympathy, and gains prominence with the developing consciousness of self and of other selves.

3. Control of sympathy.—In passing it may be noted how large a part in life is played by the partial hardening of the heart against the contagion of social feeling. This control of sympathetic distraction in general belongs to the preservation of self as maintenance of character. It is not only that undesirable emotions—e.g., of hatred, fear, envy—should be suppressed, as they are by the self-possessed though sensitive members of the excited crowd.¹ Experience soon reveals that the preservation of self, even in the ordinary physical

¹ Common self-possession, as in the man who is not liable to the contagion of feeling, must be distinguished from the subtle excellence of sympathy under control. Probably this is one of the qualities of the born leader.

sense, requires much systematic control of emotion, whether initiated sympathetically or otherwise. An emotional nature loosely controlled is morally unstable and makes for a nervous break-down in course of time. This is the hysteric type, so far as it depends on moral character. It is a main principle of moral health that the emotional life as it increases should be kept more and more strictly in subordination to the ends which it subserves. The precise definition of those ends belongs to the subject of ethics: the average man conceives them simply as the happiness of personal health for himself and his associates, together with some service in furtherance of the common weal. It may be that the rank and file of modern humanity suffer from lack of vitality and variety in the emotional life, but for the moment we are not concerned with them. Persons of the sympathetic cast are—under modern conditions more especially—liable to so much emotional invasion as must result in nervous exhaustion if not systematically kept in check. It is interesting to note how the habit of control over sympathy develops with experience from youth to maturity: the first great sympathetic grief overwhelms us as if it were our own; later we have learnt to throw ourselves outside the emotion into the actions required to assuage the sufferings of our friend; later still, to those who are overtried, callousness may come, with the exhaustion of either physique or morale.

Most of these observations apply to all feeling, however initiated. Sympathetic feeling differs from other feeling as being specially liable to increase of control by development of the element of otherness in it. This is of a piece with another useful psychological truth, namely that the tension of any violent feeling may be relieved by treating it as an object of imagination or thought. Tennyson's lines bear on this point:

'Likewise the imaginative woe,
That loved to handle spiritual strife,
Diffused the shock thro' all my life,
But in the present broke the blow.'¹

In constructing a story, an essay, or a poem which depicts the emotion as affecting imaginary persons, the sense of its personal attachment is obscured: it is projected more or less, *i.e.* thrown out of self-consciousness into the non-ego. Similarly, but as of course and instinctively, we project our sympathetic feelings back into the other self and, although still feeling them, are as a rule much relieved. This relief is no doubt chiefly due to the stop that is placed on the disturbance of the emotional personality in general by the sharp dissociation of the new feeling from those immediately pertaining to the self: it is the other person's feeling, and, though it disturbs me, I limit that disturbance by *knowing* it as something which has not its origin, and is therefore not necessarily permanent, in me. This control of the sympathetic disturbance furthers and is furthered by practical activity in relief of the other's distress.

4. Identification with the 'other.'—The exceptions indeed in this case explain the rule. When the sympathetic feeling is ascribed to a person much beloved, it may affect us more than if it were of our own origination. This, no doubt, is what is meant when it is said that another person is dearer to us than ourselves. The consciousness of the beloved person's consciousness is in this case so established as part of our own that the projection of the feeling into it does not in the least dissociate the self from the feeling. So far as we know what the beloved person feels, we go on feeling it and being further disturbed by it all the time. Indeed there appear to be, in cases of intense affection when the self identifies itself passionately with

the other, two ways in which the sympathetic feeling may become more disturbing than the equivalent primary feeling would be. (1) In projecting it on the beloved other, imagination, moved by the habit of affectionate concern, may greatly exaggerate its force and significance: the finger-prick which, in spite of instinctive tears, is a trifle to the baby may bulk large in the distressed imagination of the anxious mother; and the same kind of thing happens in a thousand hidden ways when love prevails, and it happens for pleasure as well as for pain. (2) Each person has an intimate sense of the powers and resources within himself by means of which he bears his troubles and controls his emotional being generally. About the beloved other, however intimately known, he is never quite so sure, and thus, no matter how equal things may otherwise be, the sense of mystery breeds, as it were, a germ of fear that heightens pain and, by release from it, also heightens joy. This goes, moreover, with the essential fact that love at its strongest exceeds self-love in desiring the welfare of its object. The heightening in this way of feeling sympathetically experienced may perhaps be discriminated introspectively as an additional element of anxious concern about subjective consequences. Such concern is given to their own emotions by none but morbid people. And indeed even in the lover-like relation to which this tender anxiety naturally belongs it may be so exaggerated as to be morbid concern of self for the other. For this reason it is often well that persons who get too much on one another's mind—as we say—should be sometimes separated.

The absence of this intimate affection in the case of ordinary associates makes it possible to limit the sympathetic disturbance by instinctively projecting it back into the other mind, consciousness of which is only now and then associated with the consciousness of self. There are, of course, all degrees of dependence on one another in this respect. A man may go through life without one associate in whose welfare he has any genuine lasting interest, capable of sympathy but never in danger of being shaken by it. Most persons, however, have friends sympathy with whom does penetrate into them, as well as move them out of themselves. Some men are, in the absence of contrary cause, friendly to all their associates: these are universally sympathetic also, in proportion to their primary sympathetic sensitiveness. Friendliness, however, as the disposition to identify oneself with another, must be carefully distinguished from the primary capacity to feel as others feel.¹ When they are combined, we have the sympathetic nature as popularly understood. But an unfriendly man may be sensitive to another's feelings, in which case he not only projects them on the other but sharply dissociates himself from all interest in him. It is as if he said, 'I know what you feel; I feel you feeling it; but it is nothing to me.'

5. Insight and sensitiveness.—Apart from unfriendliness, however, this cool dissociation of self from interest in the other, combined with sympathetic sensitiveness, explains the gift of neutral or cold insight which plays so large a part in the intuitive knowledge of men. Intellectual constructiveness, which bodies forth an idea of the man's character as shown by his actions, is the ordinary substitute for intuition; and in some ways it is a safer guide. The intuitionist, *e.g.*, may mistake his man by overestimating the significance of a transitory mental attitude. He is also likely to eke out his intuitions by specula-

¹ Friendship is in its degree the affectionate interest in another's consciousness of which the extreme has been described, and friendliness is the disposition to be so interested.

¹ In Memoriam, lxxxv.

tions and imaginings into which all sorts of error may creep. If he abounds in self-confidence, he is a dangerous guide: but, if he treats his gift humbly as a useful auxiliary, it will serve him in good stead and improve with such exercise.

A person of sympathetic bent may have experiences of cool insight, but with this difference that, since in such case he does not identify himself with the other, he is moved to change the state of the other into identification with him. Thus the orator feels that his audience is puzzled or hostile: they do not convert him, but he is not indifferent, so he puts out his strength to express himself and make them feel his feeling. The mere lecturer, on the other hand, only tries to show and make them see his meaning. The orator is the speaker whom the Americans call 'magnetic': he makes his hearers feel as he does, at least for the time. But the beginning which he makes is at the other end of the coil, by insight into the feeling which is theirs but not his. This is the getting into sympathetic touch. By showing this sympathy on neutral ground or even in respectful dissent, he fixes the attention of his hearers. His interest in them interests them in him: then the position is reversed, the mind of the speaker shown, and the original attitude of the audience merged in the new state by which they are identified with him. This kind of thing happens every day on a small scale in the experience of sympathetic people. To understand, to be interested though in disagreement, to persuade—these are the means, and in this order, by which one person transforms the mental attitude of another. The more instinctive the process is, the better, sympathy operating in the pair by its natural impulse to mutual identification of mental content.

6. Affinity of character.—In so far as the sympathetic bent in the full sense turns upon friendliness of disposition, persons may be characterized as sympathetic generally, *i.e.* in relation to all sorts of other persons. In so far, however, as it depends on primary contagiousness of feeling, affinities of character must profoundly affect the relation between any pair. Racial type, *e.g.*, is a basis of such affinity, and the mutual intelligibility of two compatriots, while partly arising from like habits of expression and community of associations, turns also on functional capacity to feel alike. In whatever way we explain the prime fact of emotional contagion, it is evident that no one can communicate to another a feeling of which the latter is constitutionally incapable. The fearless man cannot feel like the coward, nor the liberal man like the mean. Each can only see that the other acts in a manner directly opposite to himself and recognize the corresponding state of mind as a mystery. To sympathize with another, we must be able to feel like him. Some would say, further, that we must have felt on our own origination as he now feels; but that is not so certain, though perhaps it generally happens so. Our capacity to sympathize, therefore, is at least limited by the possibilities of our character. How far these are limited, or how far they may be extended beyond our present experience of them, we never know. Certain it is that in human society we run up now and then against mysteries, persons with whom after much acquaintance we never get in touch, who always seem to us as if they were feeling their way through life at the other side of a high wall over which we cannot see, through which we cannot hear, them. At the same time, we meet others with whom, in trifling things and large alike, we find ourselves in tune, so much in tune that diversities of aim and opinion, though standing out the more clearly, do not mar the general harmony. But mental conditions are so complex

that likeness of condition between two minds must generally be of a very partial kind.

7. Similarity and association.—Another influence to the same effect which enters into these cases is natural similarity in habit of expression. This is best seen in racial affinity: the stock of native gesture due to heredity, including facial expression, intonations of voice, and a multitude of tiny movements, felt rather than seen—all are available for that involuntary play of subtle signs which is the veiled language of sympathy. Whether contagion of feeling originates with instinctive imitation of feeling-signs or not, its development in relation to the complex psychoses of the adult is dependent on the swift interpretation of their secret signs. Human beings are indeed so profoundly interesting to each other when they really show themselves that an easy mutual intelligibility is often almost equivalent to friendship at first sight.

Intelligibility follows also on intimate association, and this is favourable to the sympathetic relation. A common stock of experiences, habits, and even feelings is formed by association in life, and the result is similar to that of congenital affinity, though lacking the charm of its ever-recurring unexpectedness. Congenital affinity, it should be noted, is not limited to cases of similar racial type. It is a happy accident of human development which may be encountered at any turn.

8. Sympathy in education.—The value of sympathy as an element in the development of moral life is too large a subject to be treated here. A few words, however, may be devoted to (1) the teacher's use of sympathy in education, and (2) the training of sympathy in the child.

(1) The teacher's use of sympathy, like that of the orator described above, begins in his own sympathy with the learner's state of mind and ends in the achievement of the learner's sympathy with his. The teacher's sympathy requires as a starting-point, therefore, some demonstration on the child's part, and to evoke this in as good a form as possible for his purpose—but in any form rather than none—must be his first care. By entering into the child's mind thus shown to him he establishes the contact of sympathy, and by maintaining this contact he leads where he will, provided he keeps to the possible levels of the child throughout. It is not so much in regard to the method of individual lessons as in respect of his general procedure and influence that the teacher's tact is shown. A mistake of intellectual method is a small matter compared with an error in the procedure of moral discipline. It is quite possible to keep in touch with the child's sympathies, even when punishment seems to estrange him for a time.

(2) In the training of sympathy the first requisite is to encourage its manifestations when they occur spontaneously, and to suggest conduct which is the natural expression of interest in others. The tendency to sympathize with joy as well as with sorrow—*Mitfreude* as well as *Mitleid*—should be called out. All this belongs to the development of the sympathetic nature, which, however, also stands in need of disciplinary training. This, for the most part, life supplies, and the educator should be wary lest he interfere unwisely and too much. The delicate process of control and moderation by which each self sets limits to its sympathies had better be left to itself; and, as a rule, it is dangerous to train the young to repress, otherwise than by more fully expressing, their nature. Wise discipline trains to the control of one function for the sake of fulfilling another more perfectly. Thus, emotion is in general controlled by using it to subserve the voluntary and intellectual life.

Thought and conduct are the antidotes to hysteria and emotional riot. As regards sympathy in particular, we should be chiefly concerned to develop first its voluntary and, second to that, its intellectual side. The barren sympathy with suffering, *e.g.*, which does not go on to some comforting act is morbid because it ends in useless emotional disturbance. Doing in accordance with the occasion is the habit to which sympathy should be most carefully trained. Its other requisite is that it should be intelligent, and this is often a much-needed lesson. A useful sympathy with others requires imagination and reflexion sufficient to construct a true ideal of what they want. This intelligent apprehension of another's case is of inestimable value in making the fellow-feeling, as well as the friendly action, fit.

Persons who are 'too sympathetic to be of any use in trouble' are persons who, by neglecting to help their fellows as need arose, have let themselves get into a habit of being overwhelmed by painful fellow-feeling. The remedy is to do something for the prime sufferer. This is the natural course in the case of an unspoiled will.

SYNAGOGUE, THE GREAT.—See JUDAISM, vii. 593 f.

SYNCRETISM.—**I. Untechnical use of term.**—The term 'syncretism' has a very curious record. It is as old as Plutarch, who seems to have coined it, or at any rate to have made it current. In his essay on brotherly love¹ he observes that even brothers and friends who have quarrelled prefer to associate with one another, in face of a common danger, rather than to fraternize with the foe; which is a Cretan precedent and principle,

'for, although the Cretans were frequently at faction and feud with one another, they became reconciled and united whenever a foreign foe attacked them. This they called "syncretism" (συγκρητισμός).'

By 'syncretism,' in this political sense, therefore, we are to understand the instinct of self-defence which sinks private differences before a threatening peril on the outside. The 'syncretists' close their ranks; they like quarrelling among themselves, but they would rather exist than indulge in fatal internecine strife at home.

After Plutarch the term became submerged. Fourteen centuries later it re-appears in the pages of Erasmus, who was in his own way, especially when the way ran through the *Adagia*, a 'syncretist' of the reconciling order, averse to feuds. Erasmus sets down the reference to Plutarch, and he also employs the term in his correspondence.

Thus we find him writing from Louvain (22nd April 1519) to Melancthon, hoping that scholars of all parties will close their ranks against the barbarians: 'Vides quantis odiis conspirent quidam adversus bonas literas. Aequum est nos quoque συγκρητίζειν. Ingens praesidium est concordia.'²

During the next century and a half the term is tossed about Europe by members of the Reformed and of the Roman Church, sometimes as an appeal, more often as a taunt; theologians who endeavoured to reconcile extremists were dubbed 'syncretists,' and 'syncretism' was indifferently and acrimoniously applied to all irenic proposals, whether

¹ *De Fraternali amore*, 19.

² *Opus Epistoliarum*, ed. P. S. Allen, Oxford, 1906-13, iii. 539.

these were the product of a Laodicean indifference or of a genuine love for moderation. In passing from the humanists to the theologians, the term upon the whole acquired disparaging associations, which continued to cling to it. 'Syncretist' became almost a synonym for 'hybrid.' It was derived from *συγκρητισμῶς*, and the supposed etymology corroborated the connexion of the term with all that was heterogeneous.

This is the predominant meaning of the term in ordinary French. In untechnical English it also denotes 'fusion' of a more or less illegitimate or artificial kind. Thus Hallam¹ says of Giordano Bruno: 'What seems most his own . . . is the syncretism of the tenet of a pervading spirit, an Anima Mundi, which in itself is an imperfect theism, with the more pernicious hypothesis of an universal Monad.'

2. Philosophical and ecclesiastical applications.—In the history of philosophy 'syncretistic' has been applied to the harmonizing efforts of those who, like Cardinal Bessarion in the 15th cent., refused to allow their love of Plato to be identified with any depreciation of Aristotle. The controversy between the Aristotelians and the Platonists was sharpened by the impetus given to Platonic studies after the fall of Constantinople. Partisanship ran strong, and the more moderate men failed to draw the rival schools together.

'Throughout all the tangles of this complicated controversy, a thread of gold is interwoven by the serene and imperturbable temper of Bessarion.'²

What happened in 15th cent. philosophy was repeated on a larger scale in the theology of the 17th century. The 'syncretistic controversy' of that age rose out of the efforts made by G. Calixtus (1586-1656), a distinguished scholar at Helmstädt, to draw the Lutheran and the Reformed Churches together. 'A plague o' both your houses,' he cried, like Mercutio. But it was Mercutio's dying cry of indignant protest. Calixtus lived and worked to check the plague. He was acutely sensible of the harm and danger to Christianity which the sharp internal divisions within the Church produced. But his broad, catholic temper met with little response among his contemporaries. The controversy lasted even after his death, assuming political as well as theological forms. The 'syncretistic' party in the Church failed, however, to carry its principles into effect. Even well-meaning and wise attempts to emphasize the fundamental Christian principles held by various Reformed Churches, or by all the Reformed Churches in common with the Roman Church, were suspect in that age of hardening division and widening cleavage. Men were told that in view of the Roman peril they would be well advised to subordinate their private idiosyncrasies in the Reformed Church; or Christians in both Churches were reminded that the menace of outside heathenism should make them close their ranks. But 'syncretism' of this kind was generally branded as a betrayal of principles or as an attempt to secure unity at the expense of truth. The 'syncretistic controversy' was a quarrel over peace, and such quarrels are not the least bitter upon earth. What the 'syncretists,' in Plutarch's sense of the term, called a harmony, their opponents called a 'hybrid.'

The Roman Church had a 'syncretistic' controversy of its own, an eddy in the turbulent dispute over the relations between grace and free will, which poured from the last quarter of the 16th century.³ 'Syncretic' is the term applied to the system of belief which endeavours to harmonize the conflicting views of the Thomist and the Molinist parties by assuming two sorts of efficacious grace, which are held together by prayer.

3. In comparative religion.—'Syncretism,' as men like Calixtus and Zwingli used it, still retained something of the practical sense which

¹ *Introd. to the Literature of Europe*, 4 vols., London, 1827-30, pt. ii. ch. iii.

² J. E. Sandys, *Hist. of Classical Scholarship*, Cambridge, 1903-08, ii. 75.

³ Cf. *CE* iv. 238 f., vi. 713 f.

Plutarch had originally attached to the expression. But this is lost in the technical, modern application of the term to a phenomenon in the history of religion, i.e. to the fusion of various religions in doctrine or in cult. Here 'syncretism' denotes generally an unconscious, wide-spread tendency, due to or fostered by some re-adjustment of political relationships or by some clash of civilizations. There is a blending of religions ideas and practices, by means of which either one set adopts more or less thoroughly the principles of another or both are amalgamated in a more cosmopolitan and less polytheistic shape. Such movements in the religious world are often preceded and accelerated by a new philosophical synthesis as well as by a political re-arrangement, but the outcome invariably is a unification of deities, which, as J. Toutain has pointed out,¹ proceeds on one or other of two lines: either two deities of different religions are assimilated by comparison or several deities are grouped together in a fresh synthesis. The motives for this re-statement are drawn from the dawning consciousness that any particular form of religion is no longer adequate by itself, that others possess like features, possibly of superior efficacy and appeal, and that such features can be incorporated without detriment to the essential principles of the particular religion in question. The study of comparative religion exhibits this phenomenon in a variety of shapes and stages, but it is specially prominent during the first four centuries of the Christian era.²

The tendency to this syncretism or amalgamation of deities and cults had been in operation long before the rise of Christianity. When one tribe conquered another, or when two tribes or nations formed a political alliance, there was a strong movement towards fusing their gods. The foreign power, especially if it were dominant, fascinated many of its subject or weaker neighbours. An exchange of deities might be made, out of courtesy. Similarities in ritual were developed, and stress was laid on what was common to the two religions. Now and then the gods were identified, and this was specially easy in the primitive days when certain gods were still nameless powers;³ men were invited to recognize their own gods under the names of foreign deities or to welcome the latter as allies. The connexion between Israel and Canaan is an illustration in point,⁴ and an equally familiar one is the influence of Assyrian rites upon the religion of Israel under kings like Manasseh and Amon,⁵ when syncretistic influences were specially powerful in consequence of the political situation. The phenomenon is by no means confined to the history of Israel's religion in the ancient world. For different reasons syncretism, or, as some prefer to term it, 'theocracy' (*θεοκρατία*),⁶ was rife at one period in Greek religion owing to Oriental influences,⁷ and as late as the 8th

cent. of our era a similar blending took place in Japan.¹ But it is in the history of Judaism, particularly during the two centuries preceding the Christian era, that the elements and issues of syncretism are most clearly marked.²

The main impetus to this rise of syncretism came from the political re-adjustment after Alexander the Great. The Seleucid period witnessed a contact between the East and the West, round the Mediterranean basin, which led not only to a fusion of Babylonian with Greek and Roman deities³ and to a ferment of Oriental religious feeling throughout the Græco-Roman world, but also to movements which, in spite of the vigorous reaction led by the Maccabees⁴ and their supporters, affected some circles in Judaism itself. The Hellenizing tendency was fostered by Jewish writers like Eupolemus and Artapanus. It went hand in hand with the allegorizing of Homer and of the OT and with the Stoic philosophy of the Logos. As the tendency to syncretism was innate in Egyptian religion⁵—the spread of the Serapiscult is only one later instance of it—and as Alexandria formed the centre of activity not only for the amalgamation of Egyptian and Greek or Syrian cults but also for speculative Judaism under the spell of the new ideas of cosmopolitanism, it is not surprising that a step was there taken in the direction of a syncretistic Judaism, which should assimilate and employ current Greek ideas of a cosmopolitan, cosmic character. The exponent of this syncretism is Philo.

¹ Un syncretisme dans lequel sont admis tous les éléments, en particulier péripatéticiens et platoniciens, qui s'accordent avec l'idée stoïcienne fondamentale de la sympathie des parties du monde, telle serait la définition la plus exacte des vues cosmologiques de Philon.⁶

Philo's aim was not to blend Judaism with Hellenism. He adhered to his religious inheritance. But he endeavoured to enrich and safeguard it by re-stating it in terms of the current religious philosophies of his day.

As Judaism on the whole resisted this Philonic speculative tendency,⁷ so did Christianity in the main resist the later Gnostic movement with its syncretistic impulse during the 2nd and 3rd centuries.⁸ Syncretism was partly an evidence of strength and partly an indication of weakness at that period. So far as it meant a readiness to set the new faith in a positive relation to the elements of truth in contemporary cults and mysteries, so far as it breathed a spirit strong enough to assimilate vital data from its new soil and yet preserve its distinctive characteristics, it was healthy. In this respect it carried on the work of the best apologists, linking the Christian tradition to the new situation and proving that the faith was too vital to remain a Semitic cult. But there was another side to syncretism, and to this the Church was keenly, if not always wisely, alert. The fascination of the movement lay in its cosmopolitan appeal—an appeal which was the more seductive that already, within paganism itself, the movement had made headway, as we see from the tone of men like Plutarch, Maximus of Tyre, and Numenius,⁹ and from a specific phenomenon like the transformation which had come over a deity such as Isis¹⁰ in the popular pieties of the age. The

passion of the time was for a vague monotheism, which should reflect and answer the unity of the empire. A cosmopolitan syncretism, in the 3rd cent.,¹ began to overlay the earlier national religions and to embrace the Syro-Hellenic and the Western cults in a synthesis which regarded all deities as so many varied expressions of the One, and all rites as more or less acceptable forms of approach to this central, all-pervasive Deity.² The individual features of the separate gods and goddesses became less and less distinct. Idiosyncrasies were obliterated, and stress was laid, from the religious as well as from the philosophical and the political points of view, upon the all-embracing unity—generally conceived as a solar pantheism. A man like Macrobius voices this in the 4th century. It underlay the pagan reaction of Julian, which was its last serious challenge to a recalcitrant Christianity. For, although the Church admitted elements which were of semi-polytheistic character, in the worship of the saints, the exploiting of miracles, and even the adoration of the emperor, nevertheless formally the sense of Christianity decided against syncretism of the Gnostic and later of the Neo-Platonic shape.³ This is the paradox of the situation. Christianity proved by its exclusiveness that it was not, and was not to be, a merely 'syncretistic' faith, in the sense of being eclectic or derivative. At the same time, it not only assimilated bravely and wisely many elements organic to its growth, but also admitted, as we see, *e.g.*, in its later Egyptian popular developments,⁴ semi-pagan features which were a handicap ultimately to its successful advance.⁵

The syncretistic situation was at once an opportunity and a risk for Christianity. The opportunity was often seized, and the risk was sometimes too much for the faith. Still, the environment did not mould Christianity as it moulded movements like Mithraism and Neo-Platonism. The catholicism of that age suffered from the desire to conciliate the natural man, but it had more in it than an indiscriminate selection or an anxious imitation, such as syncretism usually exhibited.

The tendency of syncretism, when broadly viewed, was to henoteism or pantheism rather than to monotheism. It is true that syncretistic movements meant a break away from polytheism.

The first corollary of a truly pantheistic religion is not so much toleration of all forms of worship, as a tendency to embrace them all in a single syncretistic system. The one God is the same for all. What, then, does the name they give him matter?⁶

Such is the theme of a book like the *Saturnalia* of Macrobius, and it is the principle of the religious synthesis underlying Plutarch's philosophy of things. But, as the arguments of a Neo-Platonist like Iamblichus show, this serene indifference was not incompatible with ideas which were henotheistic rather than monotheistic, and the popular cravings proved too much for even a monotheistic principle in Christianity. Pope's opening lines in 'The Universal Prayer'—

¹ The expansion of the imperial organisation, the mixture of nationalities in the capital, and the flooding of them by Oriental elements, the heightened intercourse, the prolonged residence of the legions in the provinces and their permeation by foreigners, finally, since the 3rd century, the advent of emperors who were foreigners and unfamiliar with the national spirit of Rome—all these produced the syncretism of religions' (P. Wendland, *Die hellen.-röm. Kultur in ihren Beziehungen zu Judentum und Christentum*², Tübingen, 1912, p. 152).

'Father of All! in ev'ry Age,
In ev'ry Clime ador'd,
By Saint, by Savage, and by Sage,
Jehovah, Jove, or Lord!'

echo the syncretistic aspiration in its exalted and abstract form. But syncretism, like Catholicism, appealed to lower as well as higher cravings. The adoration of a Deity like this left the heavens strangely bare for those who had been accustomed to a richer variety of worship, and thus the syncretistic tendency was welcomed as it allowed these heavens to be repopled by a host of spirits and saints. Syncretism, in practice, almost invariably fostered mythology. Sages and saints, no less than savages, yielded to its spell in this direction. It was found quite compatible, in pagan syncretism, to unite a reverence for the One with some special adoration of one or more favourite, traditional deities.¹ And it is a question how far even the Christian Church of the 4th cent., *e.g.*, which had rejected in earlier days the hospitable syncretism of a monarch like Alexander Severus, tolerated, for the sake of their associations and popular appeal, forms of adoration which were, strictly speaking, out of line with essential monotheism.

LITERATURE.—The literature has been noted during the course of the article; the 'syncretistic controversy' of the 17th cent. is discussed by I. A. Dorner, *Hist. of Protestant Theology*, Eng. tr., Edinburgh, 1871, ii. 177 f.; K. Löffler, *CE* xiv. 383 f.; P. Tschackert, *PRE*³ xix. 243 ff., and in J. H. Blunt, *Dict. of Sects, Heresies, Ecclesiastical Parties, and Schools of Religious Thought*, London, 1874, p. 685 ff. JAMES MOFFATT.

SYNDERESIS.—The word *συντήρησις*, which has no classical authority, should mean 'preservation.' In scholastic and mystical theology it appears, often in the corrupt forms *synderesis* or *sinderesis*, in a sense which is hardly justified by the etymology of the word. *Τήρησις* is used in later Greek in the sense of 'observation,' and *συντήρησις* may have been coined on the analogy of *συνείδησις*. The first example is in Jerome:

'Quartamque ponunt quae super haec et extra haec tria est, quam Graeci vocant *συντήρησις*, quae scintilla conscientiae in Cain quoque pectore, . . . non extinguitur, et qua . . . nos peccare sentimus.'²

Bonaventura³ couples *synteresis* with *intelligentia*, as *intellectus* with *ratio*. Elsewhere he connects *synteresis* with *conscientia*.

'Benignissimus Deus quadruplex contulit ei adiutorium, scilicet duplex naturae et duplex gratiae. Duplicem enim indidit rectitudinem ipsi naturae, videlicet unam ad recte iudicandum, et haec est rectitudo conscientiae, aliam ad recte volendum, et haec est synteresis, cuius est remurmurare contra malum et stimulare ad bonum.'⁴

In the *Itinerarium* he defines *synteresis* as 'apex mentis seu scintilla.' Hermann of Fritzlar speaks of it as a power or faculty in the soul, wherein God works immediately, without means and without intermission. Ruysbroeck defines it as the natural will towards good implanted in us all, though weakened by sin. Giseler uses similar language, saying that the spark (so Eckhart speaks of a *Fünklein* in the soul which cannot be extinguished) was created with the soul in all men, and is a clear light in them, striving in every way against sin and impelling steadily to virtue, and pressing back towards the source from which it came. In Thomas Aquinas *synteresis* is the highest activity of the moral sense. Gerson says that the cognitive power in man has three faculties—the simple intelligence or natural light, which comes from God Himself; the understanding, which is the frontier between the two worlds; and the sense-consciousness. *Synteresis* is the effective

¹ W. Pater notes this in Marcus Aurelius: 'To his pious recognition of that one orderly spirit, which, according to the doctrine of the Stoics, diffuses itself throughout the world . . . he had added a warm personal devotion towards the whole multitude of the old national gods, and a great many new foreign ones' (*Marius the Epicurean*², London, 1892, i. 198).

² In *Ezech.* i. 1.

³ *Itinerarium mentis ad Deum*, i.

⁴ *Breviloquium*, ii. 11.

faculty answering to the first of these, and contemplation is its corresponding activity. The word also occurs in Albertus Magnus and Alexander of Hales. Eckhart sometimes seems to identify *synteresis* with the *Fünkelein* or *Ganster*, and with the *intellectus agens* or *die oberste Vernunft*; but the tendency of his philosophy is to make the 'spark' supra-rational and uncreated; he even says: 'Diess Fünkelein, dass ist Gott.' In the earlier writers *synteresis* is usually thought of as a remnant of the sinless state of man before the fall, while in the bolder thought of the school of Eckhart it becomes the seat or organ of divine immanence and of the highest personal inspiration. The notion of an impeccable 'soul-centre' may be traced back to the Neo-Platonists.

SYNDICALISM.—See SOCIALISM.

SYNERGISM.—1. General meaning of the term and its Scriptural support.—The term 'synergism' (*συνεργεῖν*, *συνεργός*, 'to co-operate,' 'fellow-worker') became definitely fixed as a *terminus technicus* in theology in the 16th century. It was applied to the later views of Philip Melancthon and his followers on the question as to the relation between the Holy Spirit (or God's grace) and man's will in regeneration. This view, broadly stated, is that the human will can and does co-operate with the grace of God as a *vera causa regenerationis*. It opposes the position expressed in the sentence 'Homo convertitur nolens.' The human will was, it is true, not regarded as the primary cause (hence synergism differs from Pelagianism or even Semi-Pelagianism); that was unreservedly assigned to God's Spirit and to the preaching of the Word, but the energy of the human will was given a place, and its assent an essential place, in the act of regeneration. The enunciation of this view caused unusual heat among theologians, because its truth or falsehood affected the whole realm of theological truth—the effects of the fall on human nature, the nature and working of God's decrees, the responsibility of the sinner, in fact all Christian anthropology and soteriology.

The term 'synergism' owes its origin to Scripture, but the Scriptural usage of the word operates in a different universe of discourse from the theological. In the NT *συνεργεῖν* (*συνεργός*) is never applied to the psychological relation, whatever that may be, whether creative or co-operative, between God's Spirit and man's will in regeneration or conversion. Its general usage is to describe the objective co-operation of Christian brethren in the furtherance of God's kingdom on earth.

In 1 Co 3⁹ (θεοῦ γὰρ ἔσμεν συνεργοί) the co-operation referred to is that between men in their outward labours for God, not a co-operation between them individually or unitedly with God, however true that may be in itself; and at any rate it refers to post-conversion experience, not to pre- or simul-conversion relationships. In Ph 2¹³ the reference is to men already regenerated, and the same is true of Ro 8²⁸, if ὁ θεός is the true text—God works in all things for good with those who love God. It does not directly refer to what takes place in conversion, nor does it state the active elements involved therein and their relationships. Again, in Mk 16²⁰ the co-operation of the ascended Lord with the heralds of the gospel is spoken of in regard to miracles. But the word in Scripture is never used of man's natural faculties or capacities (before conversion) working together with the Spirit of God to effect regeneration, which is the specific and proper theological application of the term. If thus synergism is to be rejected or to be defended from Scripture, it must be by reference to the truth of Scripture, and not to its letter.

2. The origin and development of synergism in Melancthon's doctrine.—The earlier writings of

Melancthon betray no synergistic tendencies. On the contrary, they are in some respects more rigidly deterministic than even Luther's. The religious man is profoundly conscious of his dependence on God's grace. He does not dream of co-ordinating or equating his own freedom with the grace of God as causal in his salvation. This is true even of those who are legitimately called synergists. 'Arminians usually pray like Calvinists,' said Charles Hodge, adding, what is equally true, that 'Calvinists frequently preach like Arminians';¹ *i.e.*, they appeal to men as responsible voluntary agents. The difficulty arises when one or other of these aspects of experience is made the determining factor in the elaboration of a theological system. Truth is largely a matter of proportion and balance. To begin with, Melancthon, whose mind was eminently of a systematic cast, worked out his system under the dominating influence of the experience of divine dependence. The Holy Spirit teaches us, he says, that all things happen necessarily by predestination, and therefore there is no such thing as freedom of our will. To maintain free will was to dethrone the grace of God from its unique supremacy. This was his position in the first edition of his *Loci Communes Rerum Theologicarum*,² and it was even more rigidly expressed in his Commentary on Romans and Corinthians.³ Free will he regarded as a scholastic figment emanating from carnal wisdom and obscuring the blessings brought to us by Christ. It made men arbiters of their own salvation and consequently undermined the immediacy of Christian assurance and froze the stream of personal devotion to the Redeemer. Melancthon resolutely applied this conception of predestination to all events, physical and moral, outward and inward:

'Si ad prædestinationem referas humanam voluntatem nec in externis, nec in internis operibus ulla est libertas.' Since man is born a child of wrath, it follows that he is born without the Spirit of God, and therefore 'nihil nisi carnalia sapit, amat, et quaerit.'⁴

Man has no power over his inward affections, and, though Melancthon admits that in outward things he has some freedom, even here the power of will seems to vanish. Thus Melancthon, applying a transcendental conception, predestination, to the facts of human life, as he read them or understood them from Scripture, came to assert that no real causality existed anywhere but in God's will, and so the betrayal of Judas is as truly and as immediately an act of God as the calling of Paul. The reprobation of the damned is as properly and in the same sense the effect of God's will as the salvation of the elect. We are not to think of certain events as determined while others are allowed. All things immediately flow out of God's will necessarily. All questions as to the rightness of God's procedure he silences by regarding these questionings as issuing from man's carnal inquisitiveness.

It follows from this position that man could contribute nothing to his own conversion. He could not repent of himself, and so-called morality (pre-conversion) has no spiritual value.

¹ Homo per vires naturales nihil [potest] nisi peccare. Carnale est quidquid per naturae vires fit, Socratis constantia, Zenonis moderatio, nihil nisi carnalia affectus sunt.⁵

At this stage we see Melancthon planted firmly on the experience of God's free grace which gave its strength to the new outlook of the Reformation, combating strongly the popular Roman Catholic view according to which man's free will aided by certain ecclesiastical rites contributed

¹ C. A. Salmond, *Princetoniana*, Edinburgh, 1888, p. 177.

⁵ *Ib.* pp. 97-115.

something to man's salvation—a view which cut the vital nerve of personal trust in Christ as the alone Redeemer and opened a door by which the whole mechanism of merits and of an external ecclesiastical authority as ultimate source of redemptive assurance could be reinstated. Melancthon, however, was extravagant in his elaboration and his application of the truth of man's dependence on God for salvation. He confused in the interests of a theory natural and moral causality, and left no moral bridge between nature and grace. He raised a spiritual feeling—of supreme importance, no doubt—to a position of absolute sovereignty over man and nature and over God Himself. It was impossible that this could be the final resting-place of one like Melancthon to whom the ethical interest was so important and who was of a mediating spirit.

*'Ego mihi conscius sum, non ullam ob causam unquam re theologice, nisi ut mores meos emendarem.'*¹

Accordingly he was soon convinced, both by the development of his own experience and by the movement of events, of the necessity of defending his position from misconceptions—not now so much from the side of Rome as from pretended followers of free grace itself—and this led him to modify his earlier views. He now came to see that there were many positions previously held by him which he would have to alter. His study of the Greek fathers, whose views on free will were determined by their hostility to Eastern fatalism, and who were very conscious of the moral continuity between nature and grace (often the two were not clearly distinguished by them), influenced his thought, and we find him frequently quoting from Chrysostom: *ἔλκει μὲν ὁ θεὸς βουλόμενον δὲ ἔλκει*, or from Basil: *μόνον θέλησον καὶ θεὸς προαπαντᾷ*.²

The contentions of Erasmus as against Luther undoubtedly influenced Melancthon also, and the result was emphasis on the will's own activity in conversion.

His increasing familiarity with the classical moralists and the Stoics, but above all his earnest ethical nature, stimulated into protest by the fanaticism of enthusiasts who regarded regeneration as an immediate unmediated *opus operatum*, led him to alter his views or, as he thought himself, to replace the emphasis. Pre-conversion morality was now given a moral valuation. Men were saying that they could do nothing, and so they defended everything that they did or felt inclined to do, however wicked or outrageous. Roman Catholics were thus given an occasion to equate Lutheranism with immoralism in personal life and anarchy in society, and the doctrines of grace had therefore to be set on an ethical basis for the benefit alike of opponents and of adherents. The result was the advocacy by Melancthon of what became known in the Lutheran Church as synergistic views. It was in his eyes not a capitulation or a palinode, but an ethical rehabilitation of the doctrine of free grace, although it was viewed by genuine Lutherans as a reversion to Pelagianism.

'One egg is not liker another than his synergy is to the Pelagian,' said Matthias Flacius³ the Illyrian, a champion of Lutheranism, concerning the views of Melancthon's follower Victorine Strigel. *'Man, they say, can by the natural powers of his free will equip and prepare himself for the reception of God's grace—exactly the teaching of the godless sophists, Thomas of Aquino, Scotus, and their disciples,'* said Nicholas Amsdorf of Johann Pfeffinger and Melancthon.⁴

¹ From a letter to Joachim Camerarius, in *Corpus Reformatorum*, ed. C. G. Bretschneider and H. E. Bindseil, Halle and Brunswick, 1834-60, i. 722.

² *Loc.*, 1535, p. 276, and elsewhere.

³ Weimar Disputation, 9th session (cf. Luthardt, *Die Lehre vom freien Willen*, p. 236).

⁴ *Öffentliche Bekenntnis der reinen Lehre, des Evangelii, etc.*, Jena, 1558.

Synergism, however, is to be understood not from the extreme censures of its opponents, not even from the extreme statements of its advocates, but rather when we look on it as an ethical protest against positions that threatened to submerge the conscience and heart and to disarm the Church in her fight against licence and anarchy. It is therefore necessary to state Melancthon's position more fully.

3. Melancthon's synergism and its effect on his theological outlook.—Melancthon's interest, we have said, was mainly practical, not theoretic. Accordingly his interest latterly in predestination was that of the custodian of morals. He desired to safeguard God's moral purity from any shadow that might be cast upon it by this dogma and at the same time to free man's moral nature from the paralysing effect of a monergistic determinism. His early statements were extravagant. Now he emphatically declared that God could in no sense be regarded as the author of sin. Evil was permitted by Him, but it was abhorrent to His nature. He therefore felt obliged to give up the dogma of an eternal decree of reprobation. The cause of man's sin was in man himself, and the hardening of his heart was due to wilful disobedience and perversity. Man's own responsibility for his spiritual state was emphasized. The offer of God's grace was universal. Original sin was a fact, yet man's will, though it could not initiate a gracious state, could yet adopt an attitude of welcome or of repugnance to God's grace offered in His Word. Accordingly we find Melancthon editing the original *Augsburg Confession* in this interest.

Art. 18, which originally read, *'Justitia spiritualis* is effected by the Holy Spirit which is received into the heart through the Word,' he altered to read, *'Justitia spiritualis* is effected in us when we are helped (*adjuvamus*) by the Holy Spirit.' The same alteration, *adjuvari*, is made in art. 20. He prepared the *Leipzig Interim* in the same spirit: *'Although God does not justify men through their merits, nevertheless the merciful God does not act on man as on a block but draws him so that his will co-operates, provided he has come to years of discretion.'*

Melancthon's position is clearly stated in the revised edition of his *Loci* (published in 1533) in a sentence that became famous and stereotyped in after controversy:

'In hoc exemplo videmus conjungi has causas, verbum, Spiritum sanctum et voluntatem non sane otiosam, sed repugnantiem infirmitate suae'; or, as he expressed it in later editions: *'hic concurrunt tres causae bonae actionis, verbum Dei, Spiritus sanctus, et humana voluntas assentiens nec repugnans verbo Dei. Posset enim excutere ut excutit Saul sua sponte, sed cum mens audiat, ac se sustentans non repugnat, non indulget diffidentiae, sed adjuvante etiam Spiritu sancto conatur assentiri in hoc certamine voluntas non est otiosa.'*¹

There is little doubt that Melancthon applies this to the act of conversion, and his view was that the positive assent of the will was essential, although, as Herrlinger² points out, he maintained at times that the help of the Holy Spirit was necessary to enable the will to accept the gospel.³ While he does not make it at all times quite clear whether this assent was itself the result of the working of God's Spirit or due to the natural energy of the will, yet he seems certainly to maintain that something must be granted to the will itself, and here is the point on which the synergistic controversy hinges. This dubiety is noticeable also in some of his followers. One of them, Pezelius, interprets his master as teaching that the will was a *causa subordinata*, after the Holy Spirit in the Word had roused up the soul.⁴

Latterly he defined the will after Erasmus as *facultas applicandi ad se gratiam*, and therefore the difference between the saved and the lost is

¹ *Corp. Reform.* xxi. 658.

³ See I. A. Dorner, *A System of Christian Doctrine*, iv. 171.

⁴ See Luthardt, p. 139.

ultimately due not to election—for even God foresaw something in the elect which conditioned His election—nor to reprobation, but to man himself. The difficulty which confronted Melancthon was just to determine what constitutes responsibility, and, even if his solution is defective and open to verbal criticism, as it certainly is, it is a merit that he recognized the problem in its seriousness and that he tried to solve it on moral grounds.

Melancthon's synergism also affected his practical outlook. To those who defended civil and social outrage because they were sinners, and would remain sinners unless changed by a divine act which they could do nothing to initiate, he sternly said that man in spite of original sin had liberty in outward actions, the reason could control the will, and the will the bodily movements. No man could say, like the servant of Zeno, that he was compelled to sin by fate. It is clear that his soul loathed this Manicheism, as he called it, and his safeguarding of predestination from those who so understood it was clamantly demanded by the circumstances of the age and of many ages since. It is surely as immediate a datum of Christian experience that the sinner is responsible for his sin as that he ascribes his salvation to God's grace.

Melancthon did not take a prominent part in the Majoristic controversy, which arose over George Major's statement that 'good works are necessary for holiness,' but by various utterances he indicated that, whilst maintaining the Lutheran position that justification is of grace alone, he was anxious to show that a holy life was the inevitable consequence and the test of the reality of a justified life. Amsdorf's statement that 'good works are harmful to holiness' he characterized as a 'few saying' (*wenig sagende Rede*).¹

4. The synergistic controversy.—Melancthon's statements concerning free will were ambiguous and so hesitating that men, accustomed to the breezy statements of Luther on the same subject, felt as if he attributed to the will more than he actually expressed, and his acceptance of Erasmus's formula gave this feeling a colour of truth. Luther on this point was definite:

'In geistlichen und göttlichen Sachen was der Seelen Heil betrifft da ist der Mensch wie die Salzsäule, wie Loth's Weib, ja wie ein Klotz und Stein, wie ein todt Bild, das weder Augen noch Mund weder Sinn noch Herz brauchet.'²

What Luther advocated with zeal Melancthon admitted with reserve. Controversy was therefore inevitable, and it broke out violently, occasioned by two disputations of Pfeffinger,³ a Leipzig professor and disciple of Melancthon.

He tried to answer the question why one man under the preaching of the Word became converted and another did not, and the decisive factor, he maintained, was that one willingly assented and the other did not. The difference cannot be attributed to a difference in the activity of the divine will: therefore the difference lies in man himself. We must therefore attribute a certain synergy to our will. Man even now in his fallen state is not as a statue or a stone, nor is he purely passive, for, if that were the case, there would be no difference between the pious and the impious, the elect and the damned, Saul and David. God would become a respecter of persons and the author of contumacy in the impious and the damned. On the other hand, the human will has not the power to effect spiritual motions without the help of the Holy Spirit, but the Holy Spirit moving through the Word of God, and the mind thinking, and the will not resisting but complying under the Spirit's influence—these are the causes which concurrently produce conversion.

Pfeffinger's defence and explanation of Melancthon's views called forth violent opposition especially from Amsdorf and Flacius. The former (see above) said that, according to Pfeffinger, man could prepare and equip himself for conversion by the natural powers of his free will without the aid of the Holy Spirit. Verbally this was very unjust, but essentially it had an element of truth in it. Flacius appealed to Luther's words and declared that man was worse than a stock or

stone because he offered resistance to God's Spirit. The will therefore does not co-operate; it opposes and resists. Every one knows that this criticism, though infelicitously expressed, is in touch with reality and spoken out of personal experience. As regards regeneration, man is absolutely passive—he is spiritually dead; the image of God is not only wholly obliterated, but is transformed into the image of Satan. Man thus contributes nothing positive to his own conversion; any contribution of his is negative and resisting.

Pfeffinger replied to Amsdorf and incidentally mentioned Flacius. He declared himself more explicitly as holding that the unconverted will had the power of either obeying or resisting God's offer in His Word. Thus the controversy raged, the new university of Jena contending for the old position of Luther and violently opposing the synergistic movement, which was stoutly advocated by the faculties of Leipzig and Wittenberg. At last, at the instigation of Flacius, an attempt was made to silence opposition by authority. John Frederick II., Elector of Saxony, was appealed to, and by his command a *Book of Confutation and Condemnation* of all prevalent heresies was published at Jena in 1559. Of its nine divisions the sixth was devoted to the refutation of synergism. Those who taught that man had power in his will to co-operate with the grace of God in conversion were stigmatized as overthrowers of the grace of God. It was false to maintain that man can do anything by his free will in accepting or rejecting grace. Human nature is wholly adverse from God and hostile to God and is subjected to the tyranny of sin and Satan.

In a similar strain the orthodox Lutherans—Amsdorf, Wigand, Tilman Hesshusen, etc.—spoke and wrote against synergism and deduced this anthropology from their predestinarian views, the last-named saying that, in one respect,

'God did not wish that all men should be saved, for He did not elect all. God's will acts in one uniform way on men just as on stocks and stones.'¹

Melancthon raised his voice against this deterministic delirium and declared that it is absurd to talk of conversion until the will consents, that to reject God's grace is an act of will and not an act of God, and that human nature had at least power in outward actions. An attempt was made to make the book binding on teachers and preachers, but without success. Even in Jena, the citadel of orthodoxy, Pastor Hugel refused to read the document from the pulpit, and Strigel raised his voice on the synergistic side. Both Strigel and Hugel were imprisoned, and it looked as if synergism were doomed in Jena, for the university was strengthened in the orthodox interest by the appointments of Wigand and Judex to professorial chairs and by the recall of Musæus, all of whom were strong champions of orthodoxy. However, the prisoners were set free after an imprisonment of less than six months, and a further attempt was made to settle the dispute by public discussion. This disputation lasted from 2nd until 8th Aug. 1560, and occupied thirteen sittings. The interest for us centres in the positions defended and refuted regarding free will and God's grace.

To begin with, Strigel maintained that the substance and qualities of human nature were not obliterated by the fall nor altered, but only hindered in their activity. His position he made clear by a curious physical illustration.

A magnet, he said, cannot attract iron when smeared with onion-juice, yet it retains its magnetic properties, and it can attract though smeared with goat's blood. It is the same magnet in both cases, but its activity is hindered in the one

¹ *Corp. Reform.* ix. 407.

¹ See Luthardt, p. 241.

case and not in the other. So by the fall man's nature is not destroyed, but only weakened. He is like him who fell among thieves between Jerusalem and Jericho, half-dead, or like one weakened by disease but not dead like a corpse.

Strigel is here aiming at a distinction which satisfies many theologians—that between formal freedom and material freedom or that between natural ability and moral ability, a distinction largely used by Jonathan Edwards but in currency before his day.¹ According to this distinction, man does what he pleases and wills what he pleases. That is the very meaning of will—it is not compelled from without; but, though man has this natural ability, as a matter of fact he does not will the good spiritually simply because he does not want to—he lacks moral ability.

Seeberg contends that Strigel was groping after this distinction, but did not adequately express it.² That is certainly true of him at this Weimar disputation. He did not make his meaning clear, but afterwards he distinguished very clearly between *efficacia* (*δύναμις*) or *facultas*, on the one hand, and *capacitas* or *aptitudo*, on the other. Man has lost the first through the fall, and the Holy Spirit restores to the will the *δύναμις* or efficacy or faculty of believing, which was lost by the fall. At this disputation, however, Strigel did not go so far as that. When asked by Flacius if the human will co-operated with the Holy Spirit before conversion or only after, he hesitated and said that to him conversion was not a point but a line, not the beginning of the Christian life but the whole of it.

It is evident from reading the disputation that Strigel really wished to attribute power to the will, but at the same time to ascribe the chief place to the Holy Spirit—so that synergism is an unfortunate term to use of factors that cannot be equated. He repeated the Melancthonian formula: 'Concurrunt in conversione haec tria: Spiritus sanctus movens corda, vox Dei, voluntas hominis quae voci divinae assentitur,' a sentence which is ambiguous; and on this point no decision could be reached. On the other hand, Flacius went so far as to say that the very substance of the soul was altered by the fall and by sin, and that therefore man was purely passive, or active only in hostility to God. Peace could not be restored by public controversy. In a few months the party of the Illyrian was driven from the country, and Flacius, a man of undoubted erudition, died in his fifty-fifth year at Frankfurt-on-Main. Strigel also left and died in Heidelberg at the early age of forty-five.

5. The *Formula of Concord*.—After various unsuccessful attempts at a solution of this and other disputes the *Formula of Concord*³ appeared, and, as it became an authoritative standard of the Lutheran Church, its position on this topic must be stated here.

The problem is dealt with in artt. 1 and 2 of the *Formula*, and, while no personal names are mentioned, the views of contending parties are very clearly kept in mind. In the 1st art., dealing with original sin, a clear distinction is drawn between actual transgressions (*actualia delicta*) and the hereditary sickness of the soul. Man's nature is in all its parts poisoned by inherited sin, and for this condition man is guilty and condemned by God's law, so that by nature men are the children of wrath, and from this state they can be saved only by the benefits of Christ's merit. How this corruption is transmitted is described. God creates every soul afresh, but because of physical generation from corrupted seed the hereditary disease of

sin is propagated. Yet God is not the author of sin in either its origin or its development, nor is man's substance converted into sin. Original sin is not to be identified with the essence of man. A clear distinction must be made between our nature (which was created, and which is daily preserved, by God), in which original sin dwells, and that original sin itself which dwells in our nature. To teach otherwise is Manichæism, not Christianity. This is further corroborated by the fact that the Son of God, according to His human nature, is consubstantial with us, His brethren. He took our nature, but it was sinless in Him. Further, God in sanctifying men purifies them from sin, accepting them for Christ's sake. He gives them grace, but He has eternal hostility towards sin itself. Moreover, if original sin were the substance of the soul, the doctrine of the resurrection of believers would be null and void. Thus the *Formula* disposes of the Flacian error. Yet, while all this is so, man before God in his actual fallen state is truly and spiritually dead in all his faculties, as far as spiritual good is concerned. Strigel's illustration of the magnet will not do. Man is not simply surrounded by outward hindrances; he cannot do anything, however small, in his natural state in regard to spiritual things. He has not the capacity 'in rebus spiritualibus aliquid inchoandi, operandi aut cooperandi.'

In the 2nd art., in which we have an attempt at an analytical solution, the relation of man's powers to the Holy Spirit is set forth. In fallen man before conversion there does not remain the smallest spark ('ne scintillula quidem') of spiritual power by which he can prepare himself for apprehending God's grace, or for applying or accommodating it to himself. Rather he resists it. Man is capable certainly of being converted. He is still a reasonable creature, but as regards any real initiative 'hac in parte deterior est trunco, quia voluntati divinae rebellis est et inimicus.' He has a capacity for conversion, but a passive one, and his conversion is purely a work of the Holy Spirit. At the same time it is stated that man by natural reason and will has somehow power to live a decent outward life. Thus the *Formula of Concord*, while strongly opposing the strange view of Flacius as regards the substance of the soul of fallen man, at the same time as strongly opposes the view which would give any power to the will in initiating conversion. Of Melancthon's three causes it makes the Holy Spirit alone the efficient cause, the will and nature of man being only a subject to be converted, while the Word of God preached or read is the means through which the Spirit works. Great stress is laid on the Word of God as the means of the Spirit's working. Thus God softens men's hearts, draws them, and reveals to them their sin; and, realizing His anger, they feel in their heart contrition which makes them attend to the promises of the gospel, and so faith ('scintillula fidei') is quickened in their soul and 'hoc modo Spiritus Sanctus qui haec omnia operatur in cor mittitur.'

Thus the *Formula of Concord* unhesitatingly rejects synergism. In conversion the real agent is the Holy Ghost, the assent of the will is not a cause, but is itself an effect of the Spirit's working through the Word. Co-operation may be spoken of after conversion, but even then we must not think of God's Spirit and man's will as if they were like horses drawing a load and working side by side. God's Spirit in the converted man works on and through the will.

6. The Reformed position as regards synergism.—The problem of the relation of man's nature to the grace of God was agitated in the Lutheran Church after the *Formula of Concord* and has been a subject of dispute down to the present day.

¹ It is used by Twisse, Howe, and very clearly by Isaac Watts, the famous hymn-writer.

² *Lehrbuch der Dogmengesch.*, Leipzig, 1895-98, ii. 356.

³ See *EKE* iii. 849.

In the Reformed Church the same problem arose, though it was approached somewhat differently. The distinctive feature of the Calvinistic system is its logical consistency; every doctrine is discussed not only by itself but in the light of the whole. The supreme regulative principle in Calvinism is the sovereignty of God; and, when man's regeneration was viewed in the light of this principle, it was recognized that God's grace acted differently on men who are regenerated and on those who are not. That is obvious, but whence the difference? It was due to the determination of God. God, who had elected some, did so not as a bare matter of decree or quiescent foreknowledge or fortuitously waiting on their faith, but energetically through a series of efficient means—the redemptive mission of His Son, the preaching of the Word, the irresistible working of the Holy Spirit; and these were effective all along the line in the case of the elect, leading them from spiritual death to grace and glory. Now, in the case of the unregenerated it was a sufficient proof that this divine redemptive causality had no place, that it failed in this link of regeneration. It was non-existent here; therefore it was wholly non-existent. God did not elect them; the redemption of His Son was not purposively undertaken or efficaciously operative in their case. Thus the question of the will is so embedded in the logical coherence of the system that to moot it is to raise the question of the validity of the system as a whole, and that is what happened in the case of Arminius, and especially—for Arminius himself did not attribute regenerating power to the will—in the case of his followers Simon Bischoff (Episcopus), Philippus van Limborch, and others. The objections to Calvinism, as far as the subject of this article is concerned, were directed mainly against what was called irresistible grace and the extent of the Atonement.

The Arminians—for we may leave the Socinians out of account; W. Robertson Smith has aptly described them as 'Pelagians of the intellect'—held that grace worked similarly on all, the difference from which conversion arose being due not to God's grace but to man's own will. To them irresistible grace (or, more properly, efficacious grace) meant necessity, and so the responsibility for the final damnation of the lost fell on God. Again, they maintained that by the Atonement the possibility of salvation was opened to all, and they vehemently rejected the doctrine of the eternal reprobation of some, as Wesley so strenuously did afterwards. The Synod of Dort attempted to settle the problem, but in the Reformed Church as in the Lutheran it keeps constantly emerging. Here even more than in the Lutheran Church, which diffidently refrained from applying predestination theories to its anthropological and eschatological views,¹ the problem is an acute one, for the question of God's moral character is raised, and it is from this quarter, rather than from the sphere of religious psychology, that the opposition emerges, and here its strength lies. Hence we find that Calvinistic apologetic has largely been a defence against what is regarded as misunderstandings, perversions, and unwarrantable inferences.

In regard to efficacious grace the Calvinist did not mean that God's grace did violence to the human will by outward or inward compulsion, or that it altered the nature of the will as such, which always has worked and does work voluntarily, but that grace affected the disposition of man in such a way that the resistance of the will was changed into obedience. It was not the obedience of the will that made grace efficacious, but much more the efficacy of grace that

¹ Cf. also the Thirty-nine Articles of the Anglican Church.

made the will not only in act but in disposition obedient.

Some Calvinists, notably the school of Samur, agreed with the Arminians that the Atonement was intended for all mankind; but the Arminians contended further that it is left to the free will of man either to concur with or to reject this intention. The Calvinists felt that, while this opened a possibility of salvation to all, it made salvation certain for none; the Atonement thus became itself a contingency rather than a reality, and they could not understand a purpose of God which could thus be frustrated. To leave the future of mankind hanging on the slender thread of the free will—even if that thread was not itself an illusion—seemed too precarious to be consistent with a purposive God, and rendered the salvation of the regenerate itself problematic, a denial of the perseverance of the saints. Hence the position that the Atonement was meant for those that are saved or to be saved, and that grace is efficacious in the case of the elect; and so the empirical fact that some are not saved is itself a proof that in God's secret purpose the Atonement was not meant for them.

Here also, as in the Lutheran Church, and as in the internal disputes on this question between the Jesuits and the Jansenists in the Church of Rome, as well as in the disputes between Rome and Reformers on this point, we see the question at issue in spite of many cross currents in the discussion itself. The Calvinistic and Arminian problem is even more illuminating than the Lutheran because it is more conscious of the pervasive nature of the issue. It is a matter not of anthropology simply, but of theology in all its bearings. A survey of the discussion, in spite of the changed outlook of our own day, reveals the palpable dangers on either side and at least teaches us where we are not to search for an adequate solution.

The problem is not an accident of history, but a fundamental problem of thought, perhaps the problem which goes deepest of all—the relation between God and man. It goes deeper and higher than the question of man's place in nature or man's place in history; it is the question of man's place in relation to God.

7. Conclusion.—What, then, is the significance of the synergistic controversy for modern Christianity? It is evident that many of the preconceptions accepted by both parties alike, whether we look at the discussion as handled by Augustine and Pelagius, by Flacius and Melancthon, by Calvin and Arminius, or by Jansenist and Jesuit, are antiquated. The march of natural science has raised afresh the whole question of the nature of man, and the problem is now whether man's nature can be explained from below as a development of life in general. Alongside of the activity of science has gone a prodigious wealth of philosophical speculation dealing with the nature of man, his place in the universe, and the value of his experience and his ideals. The profound changes also in the structure of society, the emergence of democratic ideas, and the consequent application of new categories in the explanation of the significance of human life have changed the outlook considerably. The more direct activities of Christianity itself, its vast missionary ideals and efforts, the investigations into the psychology of the Christian life, the insight into what is permanent in Christian experience as distinct from what is accidental or subsidiary—in short, the main currents of modern thought and life—have poured through Christian theology till the old landmarks are submerged, and history and reflexion alone make us certain that the unity of experience is a reality and that the problems of the spirit change not,

however much the outlook may change. It is on this changed background and in the light of these tendencies that the problem of synergism can alone be approached.

(a) Modern Christianity in all its schools has had to fight against a naturalistic conception of man. From this point of view we can appreciate the emphasis laid by the early Greek theologians on man's freedom. Whatever may be thought of their view of freedom, the important point is that as against fatalism Christianity asserts that freedom has a real meaning as applied to man. So all Christian schools to-day, whether they be historically affiliated with Augustine or Pelagius, emphasize freedom as against physical necessity or direct determinism. Freedom has a meaning in regard to man that it has not in regard to matter. It is necessary to be clear on this point because naturalistic necessitarians too often claim the Augustinian and the Calvinist as on their side, whereas they are working on a different level of experience altogether. This is brought out clearly by the following considerations.

(1) According to Calvinism and Arminianism alike, man was originally created in the image of God, and his final end is 'to glorify God and to enjoy Him for ever.' This is deeper than any change brought about by sin and subsists as an inalienable characteristic of human nature.

'A lady once said to me, "The more I see of myself, I see nothing so properly mine as my sin." I said to her, "Well, you do not see deep enough. There is something far more properly yours than your sin; and your sin is improperly yours. It is a blot in your being, which, if you do not get quit of it, will never cease to be *unnatural* to you. No; the image of God is more properly yours, though you had no share in the production of it."¹

(2) It has always been held that man is responsible for his sin. He has formal freedom, nor can he ever become a non-moral being in the sense that he can become non-voluntary in his actions or place himself beyond the claims of the moral law on his character. Whatever his actual condition due to sin, these things hold true. His reason, conscience, and will always act rationally, morally, and volitionally. Again, the question here is not whether we agree with the content of this nature as explained by different schools of Christian thought. We may consider that the Arminian view gives too much, and the Calvinistic view too little, real freedom; but the important point is that from the general Christian standpoint man is not explicable in terms of mechanism, however subtle or refined in form. The synergistic controversy has no meaning either for opponent or for defender if the naturalistic view of man is true. The theory of T. H. Green² as to the relation of the character to volitions is simply Calvinistic psychology in a philosophical dress, but its whole motive is to overthrow the naturalistic conception of man.

(b) Synergism becomes a real problem when man's freedom is viewed in the light of God's activity. We are so accustomed to defending liberty against material necessity in our age that we are apt to forget that the real problem of freedom emerges on the religious plane. What meaning and content are we to give to man's freedom, not now as against nature, but as against God Himself? Two main streams of thought emerge in history on this question.

(1) The Pelagian, looking almost exclusively at man's free power of initiative, became jealous even of God's interference. Man on this view is a bare individual and largely, if not wholly, his own creator. His sin is a bare act of will, undetermined by what went before and unaffected by what comes

after. His will is his unconditionally, for the character is the result of acts of will; but an act of will can alter it easily. His merit is his own, and his salvation is his own. God never gets inside the adytum of man's free spirit, and free will is primarily the power of choosing between alternatives.

(2) To the Augustinian the problem was far more complicated. He recognized that man was organically related to the past. The influences of the past affect his will and disposition and character. He does not begin as a moral neutral or moral unit. Sin is more than a bare act of will. When a man becomes self-conscious, it is there not simply as the result of a wrong choice, but as the fruit of a vitiated disposition and itself a source of vitiation. The characteristic of moral awakening is the discovery of our bondage. We become conscious of our need of freedom more than of the fact that we are free. The interposition of God is not regarded as a violation of freedom, but welcomed as the restorer and succourer of true freedom itself, which to the Augustinian meant acting in accordance with the highest. This deeper view of man led Augustine to the certainty of pre-individual iniquity—racial evil—as it led Kant to posit a supra-temporal fall. Objections may be raised to phrases like original sin, the guilt of Adam's transgression, the fall of Adam, supra-temporal fall, and it is right to aim at verbal accuracy if possible, but it is essential that the repudiation of inadequate phraseology should not be accompanied by the rejection of the realities bodied forth by inaccurate phrases.

We have the same tendencies in philosophy in our day represented by pluralism in its many forms and by absolute idealism. The former is so alive to the importance of the individual that in its extreme and logical forms it makes the individual eternal *a parte ante*, and, if God is recognized, it is as a *primus inter pares*; the latter is so conscious of the claims of God that it tends to annihilate the personal life of the individual *a parte post*. The problem as to how a man can act against God's will is insoluble intellectually, and the Calvinist has great difficulty, in spite of his insistence on man's accountability and God's holiness, in saving himself from the pitfall of pantheism where sin is factorized into something different from what it is to the conscience. Yet, however sinful man's state may be, however the sinner may be alive to the deep-seated nature and wide extent of this disease, he accepts responsibility for it as his. He cannot devolve the responsibility on Adam or on circumstances. That is the moral attitude. The intellect may attempt to explain sin either scientifically as a residuum from our animal origin or philosophically as due to finitude or as a necessary stage in our development; but every explanation that explains away the moral attitude is itself unsatisfactory. Pantheism, material, philosophical, or theological, suffers shipwreck on the conscience. But, on the other hand, though we are compelled to recognize centres of activity acting contrary to God's will, it is impossible to give them the self-subsistence that we give to God. Even in sinning they depend on Him and are within the scope of His control. The Christian doctrine of creation—creation in time, for creation has no other meaning in regard to dependent beings—saves from pantheism and pluralism alike. While all subsist in God, personalities have a limited power of self-antagonism to God, but they do not compel God to disown His character as Source and responsible sustainer of all. He creates personalities with the capacity to create themselves. Their endowments and faculties, which vary so much as regards both individuals

¹ John Duncan, *Colloquia Peripatetica*³, Edinburgh, 1871, p. 124.

² *Prolegomena to Ethics*, Oxford, 1833.

and races, which are also so clearly dependent on their historical setting, are of God. It is this inalienable immanence of God that accounts for the presence of high ideals among men however sinful, for the unrest and lack of harmony in the life of man of which Pascal speaks so eloquently, and it is this that makes salvation possible and essential. The Augustinian tended to view man's original constitutive nature as made in God's image as an affix of an ideal human ancestor, and to leave man as he now is nothing but his sinful organic relations. A logical distinction was made an absolute distinction *in rerum natura*. The divine image in man was practically regarded as a *fulgor* appearing once in Adam for a brief space, but now no more; but sin has meaning only when the inalienable immanence of God in man is fully recognized. The Church has never agreed to the Flacian view of human nature as itself sin; but its language has often been perilously near it, and, when it has, protests have been raised, as in New England, where the amiable qualities of man have been emphasized until the need of salvation has been minimized or evaporated. On the ground, then, of man's original creation, we understand that man has freedom which, alas, has been exercised against God Himself, though given by God and intended by Him to coincide joyfully with His own.

How to reconcile God's holy omnipotence and foreknowledge with this human fact seems an insoluble problem. We must give content to God's predestinating activity; it is not enough to posit a quiescent, non-interfering divine knowledge; otherwise there is no guarantee of the ultimate success of God's purposes. But, on the other hand, we must not look on God's absolute decrees as the moral cause of sin or as acting mechanically in man, and certainly not as an insurmountable barrier to the recovery of his true freedom, and that in a moral way.

The synergist fought against a view of God which made Him in the case of some men the obstacle to salvation, withholding His grace from some, and making remedial provision only for some; and in this the synergist was right. Here again the Christian doctrine of the new creation is the safeguard. God is not only inalienably immanent in man by virtue of the first creation; He is also redemptively active in man through Christ. The Calvinist is mainly right in his psychology of conversion.

God's grace is efficiently active, and the consent of the will is the result of that activity; yet He is active in harmony with man's true being, and man's consent is voluntary. Man does not simply accept the offer of grace by the power of his unaided will and so convey it into the soul. His will is never unaided; grace comes into the soul as a power of God moulding the will itself. The acceptance itself is not the cause of its presence. The supremacy of grace and its efficiency is maintained by the religious consciousness on self-examination, but the acceptance itself is an act of will.

The miracle here also is not that a man's will should be effectually motivated to harmonize with God's redemptive activity; the miracle is that some men should resist even this. It is not to be thought that their resistance is due to the fact that God withholds or withdraws His gracious activity or that He uses it only gingerly. The gospel offer is to all, even the Calvinist says, and it is a *bona fide* offer; it is more, for the cost to God—what we mean by the Atonement—is so real and so great that the activity of God is an energy penetrating into man. God does not deal with the sinner simply in the way of punishing him;

He deals with him in a redemptive way. How can this fact of man's resistance, again, be reconciled with God's omnipotence in grace? Many, like Schleiermacher, find refuge in final universal salvation, in a probation extending beyond this life. But God's omnipotence is a reality which recognizes now man's power of resistance because it values man's freedom. This resistance does not annihilate the divine omnipotence, nor does it rob God of His character as Creator and Redeemer, were the resistance to be eternal.

The value of synergism is in its denials. It is wrong to regard God's activity as doing violence to this initiative of man. The weakness of synergism is that it tends to regard this activity of man as separate from God to begin with and as only co-operating with God. The relation between them is more intimate. God Himself is present from the outset in this freedom; and when, as in Christian experience, the soul awakens to the presence of God, then it is felt that God has done so much in Christ, and is doing so much, that it is joyfully acknowledged that the will's power is His, and the renewal of it is His work. Salvation is not an acquisition of the will so much as the welcome deliverance and liberation of the whole personality. Religion in its strength emphasizes God, and in so doing frees man into the liberty of joyful service.

LITERATURE.—The lives of the reformers, and the general treatises on the history of the Reformation, all deal with the synergistic controversy. J. W. Richard, *Philipp Melancthon: The Protestant Preceptor of Germany, 1497-1560*, New York, 1898, gives a good account of Melancthon in English; cf. Karl Schmidt, *Philipp Melancthon*, Elberfeld, 1861.

C. E. Luthardt, *Die Lehre vom freien Willen*, Leipzig, 1863, gives a detailed history of the controversy in its origin and development; also *Die Arbeiten Melancthons im Gebiete der Moral*, Leipzig, 1884; Flotow, *De synergismo Melancthonis*, Vratislaw, 1867, is a special handling of the subject referred to by G. Kawerau, who has written much on the various antagonists in the synergistic controversy; see Schaff-Herzog, xi. 223 ff., also *PRE*³ xix. 229 ff.; E. F. Fischer has a treatise on Melancthon's teaching on conversion (*Melancthons Lehre von der Bekehrung*), Tübingen, 1905; and Paul Tschackert, *Die Entstehung der lutherischen und der reformierten Kirchenlehre*, Göttingen, 1910, pp. 520-531, is an excellent summary.

The literature on the *Formula of Concord* is relevant to the discussion; cf. F. H. R. Frank, *Theologie der Konkordienformel*, vol. i., Erlangen, 1858; R. Rothe, *Dogmatik*, Heidelberg, 1870, p. 171 ff.; F. Loofs, *Leitfaden zum Studium der Dogmengeschichte*⁴, Halle, 1906. R. Seeberg, *Lehrbuch der Dogmengeschichte*, Leipzig, 1895-98, as well as other treatises on dogmatics, give relevant sections. See also H. Heppel, *Gesch. des deutschen Protestantismus*, 4 vols., Marburg, 1853-56; I. A. Dörner, *System of Christian Doctrine*, Eng. tr., Edinburgh, 1880-82, iv. 164 ff. For Reformed doctrine see literature under art. CALVINISM, and for the modern problem H. Wheeler Robinson, *The Christian Doctrine of Man*², Edinburgh, 1913. See also art. CONVERSION, FREE WILL, GRACE.

SYNODS.—See COUNCILS AND SYNODS.

SYRIANS (or Aramæans).—1. General introduction.—The Hebrew 'Aram' is rendered in the LXX by *Συρία*, 'Syria.' We may therefore take it for granted that originally the words 'Aramæans' and 'Syrians' were synonymous. At a later time 'Syrian' and 'Assyrian' were used indiscriminately: *Ἀσσυρίοις* = *Σύριοις* = *Σύροις*¹. According to Gn 10²², Aram was one of the five sons of Shem, and, according to Gn 10²³, Aram was the father of Uz, Hul, Gether, and Mash. The Aramæans, or Syrians, are therefore Semites.

A complete study of the Aramæans would include that of all the races whose languages, manners, and religions come within the Syrian scope. But our purpose here is to consider only the pagan Aramæans. We shall not touch upon Western (*i.e.* Biblical) Aramæan, represented by several quotations preserved in the OT and the NT, nor the Egyptian papyri and ostraka, particularly those of Elephantine, nor the Jewish dialects.

¹ Cf. T. Nöldeke, in *Hermes*, v. [1870] 443 ff.

represented by the Targums, the Megilloths, and the Jerusalem Talmud, nor Samaritan, nor the fragments of Christo-Palestinian literature. All those are of the greatest importance from the general Aramæan point of view, religious as well as philological, but are outside the scope of this article. The same remark applies to the different branches of Eastern Aramæan, which includes the Babylonian Talmud, the literature, language, and religion of the Manichæans, Mandæans, and Harranians (*qq.v.*). We shall also leave untouched the study of Syriac (language and literature) and the chief Neo-Aramæan (Christian) dialects.

The best known of the pagan Aramæans are the Palmyrenes (*q.v.*), the Nabatæans (*q.v.*), and the Syrians of Damascus and of the region north of Syria. We get our information on these races from the OT, ancient inscriptions, and Latin and Greek coins and documents.¹

The ethnic *arami*, אַרַמִי, 'Aramæan,' is found in 2 K 5²⁰, Gn 25²⁰, Dt 26⁵. Its fem. is *aramia*, אַרַמִיָּה in 1 Ch 7¹⁴. The plur. is *aramim*, אַרַמִּים in 2 K 8^{25f.} 9¹⁵. The corresponding Greek of the LXX is respectively *βαβυνηλ* τοῦ Σύρου ἐκ τῆς Μεσοποταμίας, ἀδελφὸν Δαβὴν τοῦ Σύρου (Gn 25²⁰), etc.; ἡ Σύρα (1 Ch 7¹⁴); οἱ Σύροι (2 K 8^{25f.}).

The adverb אַרַמִי, *arami*, 'in Aramæan,' is translated by the LXX *συριοι* in Is 36¹¹, 2 K 18²⁶, Dn 24, 2 Es 47.

The OT gives the following information on the pagan Aramæans.

Aram Soba (*Zobah*), אַרַם צוֹבָה (LXX ἡν Συρίαν Σουβά), in 1 S 14⁷, 2 S 8³ etc., 10⁶⁻⁸, 1 K 11²³ etc. This expression means an Aramæan state in the north of Canaan or its capital. The town of Zobah was situated in Lebanon, according to 1 Ch 18³.

Aram Ma'aka (*Maachah*), אַרַם מַעֲכָה (LXX ἐκ Συρίας Μααχά), in 1 Ch 19⁶, means a territory at the foot of Mount Hermon (Jos 13¹³). The name of the people is Ma'akati (Maachathites), מַעֲכָתִי, according to Dt 3⁴, the Ma'akati dwelt beyond the kingdom of Og; they were not included in the conquest of the descendants of Manasseh (cf. Jos 12⁵ 13¹¹, 2 S 23³⁴).

Aram beth Rehob (*Beth Rehob*), אַרַם בֵּית רְהוֹב (LXX Πούβ), in 2 S 10⁶⁻⁸, was a small Aramæan or Syrian kingdom which supplied mercenaries to the sons of Ammon when fighting against Joab, King David's general. They took to flight before Joab, who re-entered Jerusalem in triumph. Rehob is said to be in the north of Palestine, in the region of Laish, or Dan (Jg 18²⁹).²

Aram Naharaim (*Nahor*), אַרַם נַחְרַיִם (LXX εἰς τῆς Μεσοποταμίας), is identified by the LXX with Mesopotamia (Gn 24¹⁰, Dt 23⁵, Jg 3⁸, 1 Ch 19⁶), 'Syria of the two rivers.' This is a mistake. Naharaim means 'country of the river,' and corresponds to the Nārima of the Tel-el-Amarna letters and to Nahriina in the Egyptian inscriptions; it extended along the two banks of the middle Euphrates.³ At the time of the Khati the name Naharanna was given to the country lying between the Balikh and the Orontes.⁴

Paddan Aram (*Padan-aram*), פְּדַן אַרַם (LXX ἐκ τῆς Μεσοποταμίας Συρίας), in Gn 25²⁰ 26² 5-7 31¹⁸ 33¹⁸ 39⁹ etc. This term, 'field of Aram (?),' perhaps refers to northern Mesopotamia.⁵

2. Damascus.—*Aram Damēšēq*, אַרַם דַּמְשֶׁק (LXX Συρία Δαμασκού), in 2 S 8³, 1 Ch 18³, is Syria of Damascus, which came to the help of Hadadezer, king of Zobah; David slew 22,000 Syrians and put garrisons in Syria of Damascus (Syria-Damascus).

In the course of time Syria (Aram) comprised numerous divisions, the chief of which, besides those mentioned above from the Bible, were: Batania, or country of Bashan, Commagene with its capital Samosata, Cyrhestic with Cyrrhus as capital, Chalybonitis with its capital Chalybon (Halep=Alep), Coele-Syria with Heliopolis (Baalbek) as capital, Seleucide, or Tetrapolis, with Seleucia, Antioch, Laodicea, and Apamea as principal towns, Chalcedice with its capital Chalcis (Kinnesrin), etc. In many cases we have not enough information about these divisions to treat them separately. The best plan will be to give a

résumé of the details supplied by history, inscriptions, and other documents, grouping them round Damascus and the Damascene.

The god who received most worship was Hadad, whose consort was 'the Syrian goddess,' or Atargatis. This god was also called Ramān or Rammān. These two names appear as early as 3000 B.C. in the cuneiforms. This deity does not appear in Phœnician texts. Hadad is represented in the same way in Syria and Mesopotamia. He is the god of lightning and thunder; he shakes the mountains; he is beneficent when he sends the rain which fructifies the earth; he is the destroyer when he sends floods and inundations. According to the inscriptions of Senjirli, Hadad was the first of the gods of northern Syria in the 8th cent. B.C. His chief sanctuary was at Hierapolis (Mabbog, Manbij), near the Euphrates. He was specially worshipped by the agricultural populations of Syria as the protector-god of the harvests. In time his cult became confused with that of the sun; his head was then ornamented with rays; this identification is particularly noticeable in Heliopolis (Baalbek), where the cult of Hadad and that of the sun are one and the same. In Roman times Hadad became Jupiter Optimus Maximus; he received various local denominations (Dolichenus, Hadaranes, Heliopolitanus), but he can always be recognized by the fact that he is represented with the bull or that he is mentioned along with his consort, the Syrian goddess Atargatis. A third personage is usually connected with these great gods, regarded as their son or their daughter. These three together form the triad known as the *dii syri*. They have sanctuaries in a great many Syrian towns—Rhosus, Raphanea on the Lebanon (in Græco-Roman times). But the principal sanctuary of the Syrian gods, after Hierapolis, was Damascus, and the Bible mentions kings of Syria in the 9th cent. B.C. with theophorous names, such as Ben-Hadad, Tabrimmōn. It is even possible that this cult of Hadad exercised a certain influence on some Israelite centres, which would explain the representation of Jahweh by a young bull. In Roman times Hadad became Jupiter Damascenus. In all probability Jupiter Heliopolitanus, the god of Heliopolis (Baalbek), should be identified with Hadad.

The consort of Hadad is Atargatis, the great Syrian goddess—also under the names Allät and Venus—who must not be confused with Astarte, the Phœnician goddess. Coins of Hierapolis call her 'Ate or 'Atarate. She was represented with her head surrounded with rays. The symbol of Atargatis was composed of the crescent moon in conjunction with the solar disk.

Besides the divine couple, Hadad and Atargatis, the Syrian pantheon included other deities, of secondary rank, several of whom had a purely local character.

Reshef, or Rashuf, was the incarnation of thunder and lightning. He was often represented as a soldier armed with spear, mace, bow, and shield; he carried on his helmet a gazelle's head surmounted by two sharp horns. Reshef is also met with in Phœnicia and in Cyprus. He was in later times identified with Apollo. Some scholars regard him as a Phœnician rather than a Syrian deity.

The inscriptions also mention Rekub-El, 'the charioteer of El,' who is probably an importation into Syria of the charioteer of the sun-god of the Assyrians. El was an important deity, but did not occupy the first rank in the Syrian pantheon.

Bel was worshipped in Syria, as in Assyria and among the other Semitic races.

Alongside of sun-worship the Syrians devoted a very special cult to the moon-god. Of two

¹ Cf. Nöldeke, 'Die Namen der aram. Nation und Sprache,' in *ZDMG* xxv. [1871] 113 ff.

² Cf. F. de Sauley, *Dict. topog. abrégé de la Terre Sainte*, Paris, 1877, p. 260.

³ Cf. *La Bible du centenaire*, Paris, 1916, p. 28.

⁴ Cf. G. Maspero, *Hist. ancienne des peuples de l'Orient classique*, II.

⁵ Cf. *La Bible du centenaire*, p. 32.

Neirāb inscriptions (6th cent. B.C.) one mentions Sahar, Shamash, Nikkal, and Nusk, the other omits Shamash, 'the sun,' and mentions only Sahar, Nikkal, and Nusk. Sahar, the moon-god, was the chief deity of Harrān. His wife, Nikkal, corresponds to Nin-gal, 'the great lady,' wife of Sin, the Assyrian moon-god. Their son, Nusk (Nusku in Assyrian), represents fire, according to some scholars, and, according to others, he personifies the crescent moon.¹

The stele of Teima (an oasis in the north of Arabia) names three Aramæan deities: 'Šalm, Singalla, and Ashira, gods of Teima.' Lagrange² proposes to identify Šalm with Salmu, the 'dark,' the dark planet, i.e. Saturn. According to other writers, the word *šalm*, 'image,' 'statue,' means the idol of the local god (*ba'al*) of Teima; Singalla is of Assyrian importation and denotes the great Sin; Ashira corresponds to the Asherah of the Canaanites.

An inscription recently discovered by Pogon in the region of Aleppo, but probably the oldest Syrian inscription, mentions not only Zakir, king of Hamath, and La'ash, but also a new deity, the god Alur (800 B.C.). He is probably a local god, the *genius loci* of Hazrak, for in the continuation of the text the important part is ascribed not to Alur but to Ba'al Shamain.

Of the three Senjirli inscriptions that of Hadad, the oldest, mentions the gods Hadad, El, Reshef, Rekub-El, Shamash, who accorded to Panammu what he asked of them. Lagrange³ calls attention to the fact that no goddess figures in this list. The second inscription, called that of Panammu, dates from the reign of Tiglath-Pileser III. (754-727 B.C.) and mentions the gods Hadad, El, Rekub-El, Shamash, and all the gods of Jadi. The third one, called that of Barrekub, dates from the same period, but does not mention any deity, except that Barrekub declares that, on account of his loyalty, his lord Rekub-El and his lord Tiglath-Pileser have placed him on his father's throne.

When Zenobia was taken captive to Rome, the cult of the Syrian gods penetrated to the great city with her (or before her). This fact is now duly established by the discovery of a sanctuary to Janicula in the gardens of the Sciarra villa. There we read inscriptions dedicated to the Syrian god Adad (Hadad) of Lebanon on a small white marble altar. There is also an inscription dedicated 'diis syris' at Spalato.⁴

3. The Nabatæans.—According to some scholars, the Nabatæans were Arabs who used Aramæan as their literary language; according to others, on the contrary, they were pure Aramæans who in the course of their migrations mingled on the one side with the southern populations of Arabia,

⁴ *CYL* iii. 1961.

while to the north they became masters of Trans-Jordan as far as Damascus. The oldest Nabatæan inscriptions (1st cent. B.C.) contain no Arabisms; afterwards, at the beginning of the 1st cent. of our era, Arab influence makes itself clearly felt, especially in the regions of Hegrā and Medain Sāleh.

The Nabatæan sources now in our possession are inscriptions, which are published in the second part of *CIS*, and coins, which have been studied most recently by R. Dussaud and have revealed an almost unbroken succession of kings, from Obedas I. (90 B.C.) to Malichus III. (A.D. 106). But before these dates a Nabatæan race was known which in 312 B.C. was powerful enough to gain the victory against Antigonus. After this victory the Nabatæans, an essentially trading people, occupied the north of Arabia, the country of Edom, and the Damascene. F. H. Vincent has gathered together all that is known about the pantheon of the Nabatæans; they honoured the sun, to whom they built an altar on their houses, and to whom they offered libations and burned incense. The following are the principal deities. Dūshara (Dusarēs) seemed to occupy the first rank and to be the god of the king. Then came Allāt (fem. of Allah) and Manūthu or Manavat. The god Hobal belonged originally to Syria. Mutaba and Harisa are almost unknown. Qaysa was perhaps the ancient national god of the Edomites. The names of the goddesses Vagrah and Tada are from a doubtful reading as well as those of Nashbu and Elgē. The Syrian god Ba'al Shamain was also adopted by the Nabatæans. The Nabatæans erected temples to their gods. The temple comprised a small building to contain the statue of the god, a sacred enclosure (*haram*), votive stele, and niches for the icons.

Whether the Nabatæans were strongly Aramæized Arabs or real Aramæans, they gave a very large place in their pantheon to the deities and cult-objects of Aramæan or Syrian origin. See, further, art. NABATÆANS.

('son importance [de Pétra] nous est surtout connue à l'époque gréco-romaine. Elle est alors la capitale des Nabatæens. . . Les Nabatæens sont des Arabes. La langue de leurs inscriptions est araméenne, ce qui prouve simplement la diffusion de l'araméen à l'époque gréco-romaine. L'ancien idiome arabe s'est conservé dans les noms propres'); *CIS*, pt. ii. (vol. 1. [1893], 2 [1902], 'Inscriptions nabatæen,' no. 167-489, vol. ii. 1 [1907], no. 1472 f.).

4. The Palmyrenes.—See art. PALMYRENES.

LITERATURE.—In addition to the literature appended to art. PALMYRENES, see L. Double, *Les Césars de Palmyre*, Paris, 1877; L. G. Deville, *Palmyre: souvenirs de voyage et d'histoire*, do. 1894; R. Dussaud, *Notes de mythologie syrienne*, 2 pts., do. 1903-05; J. B. Chabot, *Les Langues et les littératures araméennes*, do. 1910, pp. 19-21; *Répertoire d'épigraphie sémitique* (published by the commission of the *CIS*), do. 1900 ff.

5. **Syrian cult.**—In their pantheon, as in their religious practices, the Aramæans had naturally very close relations with the Assyro-Babylonian cults on the one hand and with those of Phœnicia and Canaan on the other. They practised the local agrarian cults, in conjunction with the worship of sun, moon, and stars, preferably on high mountains or sharp mountain-peaks, regarded as the abode of the gods. They worshipped sacred trees (the tree of life) and plants. They also rendered worship to sacred springs, and Palmyra possessed a specially consecrated river, whose Tyche was venerated. Certain sacred rivers had miraculous powers: if the offering sank to the bottom of the water, it was approved by the deity; if it floated, it was not approved.

As among the rest of the Semites, sacred enclosures have been found among the Aramæans, known as *ḥaram*, and much used among the Arabs. The boundaries of the *ḥaram* were fixed by stelæ, several of which have been recovered during the course of excavation.

We have little information concerning the after life among the Semites in general, and the Aramæans in particular. Like the ancient Hebrews, they probably had Sheol, the kingdom of the dead. From the Senjirli and Neirāb inscriptions, which are very important funerary texts, we learn that the Aramæans believed that a part of the dead person survived, called *nephesh*, 'soul.' It was a material principle, to which they had to offer food and drink.

Among the most venerated objects of worship we must mention the sacred stones, or bætys, which assumed various aspects. The presence of the god was materialized by a stone placed in the sacred enclosure. The inscription of Hadad shows that the Aramæans worshipped the *nešib*, a hewn stone or statue. A Palmyrenian inscription shows among the Aramæans the use of the *maššēbhāh* (*q.v.*), in the sense of 'stele.' And they distinguished between the funerary stele, *nafsha*, 'soul,' of pyramidal form, and the votive stele, or *mesjida* (whence our word 'mosque,' through Arabic), which meant the place in which the deity was worshipped.

As regards the personnel of the cult, we hear of the priest, *komer*, attached to the service of such-and-such a god. It was he who offered the holocaust. Barbers played an important part, both in performing the ritual incisions and in shaving the heads of those who dedicated their hair to the deity in consequence of a vow. There were also scribes, charged more especially with keeping the accounts of the temple. Sacred prostitutes were not lacking in the Aramæan cults; and lastly we must mention the familiars of the temple, who rendered services to the faithful who came to worship or make vows, and who lived in the surroundings of the temple, finding their food in the remains of the meals offered to the gods.

6. **Calendar.**—The Aramæan calendar is fairly well known; the Nabatæans and Palmyrenians employed the Selencid era, and for a very long time the Syrians made their year begin in autumn. The names of the months of the Palmyrenians are all known: Tishri, Kanun, Kslul, Tbt, Shbt, Adar, Nisan, Ir, Sion, Qinian Ab, Elul. Those of the Nabatæans are the same, except the second and tenth, which are not known. This information refers to the Aramæans in Roman times. The ancient names of the months have not yet been brought to light by the oldest inscriptions (Senjirli and Neirāb).

SYRIAN CHRISTIANS.—1. Scope of this article.—Much confusion has arisen from the fact that several different bodies of Christians—Jacobite, Maronite, Nestorian, Malabarese, and others—habitually call themselves 'Syrians,' as well as from the fact that the word 'Syria' itself has meant different things at different times. It will therefore be well at the outset to define the scope of this article.

The East Syrians or Nestorians call themselves 'Sūriyā,' said to be a corrupt form of 'Sūriyāyē.'¹ The Syrian Jacobites are in the Syriac vernacular commonly called 'Siryānē,' by way of distinction (or better 'Sūriyānē' or 'Seweryānē').²

The name 'Syria' (Syr. Sūriyā, Gr. Συρία or Σούρα, 'e locis Palestinæ maritimis')³ has been derived from 'Tyre' (Syr. Sūr), though it is spelt with a different *s*. It varied in meaning from time to time. In Roman days, at the beginning of our era, it denoted the country west of the Euphrates and north of the Arabian desert, including Palestine and Palmyra, and extending north to the Taurus; though the Roman procurators or the Herods ruled all or part of Palestine, being more or less independent of the governors of the Roman province of Syria. At a later date 'Inner Syria' meant Palestine (and the coast lands to the north thereof), and 'Outer Syria' meant Mesopotamia.⁴ The modern Turkish *vilayet* of Syria is only a fraction of the old Roman province, and lies east of the Lebanon, extending from Hama on the Orontes in the north to the Hedjaz in the south, Damascus being the capital, while the *vilayet* of Beirut is west of the Lebanon, and the old Judæa is an independent *sanjak* under a *mutaserif*.⁵ Thus the term 'Syrian Christians' has little relation to the term 'inhabitants of Syria.' The most comprehensive definition of the former is 'those Christians who use or have used the Syriac language in their liturgical services or as a vernacular.' It thus includes the Jacobites of Mesopotamia, the Nestorians, the Maronites of the Lebanon, the Syrian and Chaldean Uniate, and the Christians of St. Thomas in Malabar.

The history of many of these Christians has usually been considered in Europe only as far as it affects their relations with certain heresies, *i.e.* only from one episode (however important) of their annals. These doctrinal questions have already been dealt with in art. MONOTHELETISM, MONOPHYTISM, and NESTORIANISM, and will therefore not be referred to in this article except incidentally, and when they are necessary to explain the history or customs of the Syrian Christians.

2. **Syriac-speaking Christians.**—Syriac is a branch of the Aramaic family of languages. The written or classical Syriac—the Syriac of the liturgies and patristic literature—was the language spoken at Edessa, and was not very distant (though differing somewhat in grammar and vocabulary) from the Aramaic of Palmyra and that of Palestine (the Biblical Aramaic of the OT, or 'Chaldee,' as it used to be called), perhaps not more distant

⁴ *Ib.*

⁵ *The Geographical Journal*, l. [1917] 13.

than some dialects of 'English' now current in the British Isles are from one another. The Edessa Syriac was the medium of commerce in the valley of the Euphrates, and was used far and wide for literary purposes. But, though this was, and is, the written language, other dialects of Syriac were spoken vernacularly throughout a very wide district, from the Mediterranean to the eastern limits of Mesopotamia, Assyria, and Adiabene (east of the Tigris), and southwards to the borders of Egypt and Arabia.¹ There were many Syriac-speaking monks in Egypt in the 4th cent. and later.² Even the Armenian Christians used Syriac till the 4th century.³ Thus there were many Syriac dialects. They were not the lineal descendants of classical Syriac, but were rather in the position of sisters or nieces of that language.⁴

Syriac gradually gave way, vernacularly and to some extent liturgically, to Arabic after the Muhammadan conquest, though it has had locally a considerable influence on the vocabulary, pronunciation, and even the grammatical forms of the Arabic which supplanted it.⁵ The only Christians who now speak it habitually are the East Syrians (Nestorian and Uniat Chaldean), among whom it is practically the only language used (though many of the Mosul Uniat also speak Arabic), the Jacobites of Jebel Tūr, and the people of Ma'lūlā near Damascus. The other Jacobites and the Maronites now ordinarily use Arabic for their vernacular. The Malabarese have probably never used Syriac vernacularly—unless the immigrants from Persia used it for a while (see below, § 9)—but have always spoken an Indian dialect. It may be noted that many Jews in E. Turkey and Persia have a vernacular closely akin to the spoken Syriac of the Nestorians; and the language of the Mandaans (*q.v.*), or so-called 'Christians of St. John,' if they still exist, is another branch of Aramaic. In the early ages of Christianity the literary language of Syria proper was Greek (see below, § 3), but Syriac was the popular language there till after A.D. 500. It should be remembered that Antioch itself was a Greek, not a Syriac, centre. The city was predominantly Greek, though Syriac was the language of numerous monks in it and its neighbourhood, and of the country people.⁶

All the above-mentioned Christians use classical Syriac as their liturgical language; and many of them use it still as their literary language, as all did till the Middle Ages. It will thus be seen that the prayers in the Church services are only imperfectly, if at all, understood by the majority of the worshippers. In Syria proper, however, many of the prayers are said in an Arabic translation, so as to be intelligible to the people; they are then written in Syriac characters, and this combination of Syriac and Arabic is called Carshuni (Syr. *garshūnī*).⁷ But those services which are the bishop's own—*e.g.*, ordination—are in Syriac only, as are all the prayers which are said inaudibly by the priest.

The vernaculars differ from classical Syriac in different degrees. The East Syrian vernacular dialects, which vary a good deal among themselves, differ from it perhaps as much as Italian from Latin, while the Ma'lula dialect has retained more of the older grammar and is less analytically developed.⁸ This last vernacular is particularly noticeable as being preserved by those who are so far isolated from other Syriac-

speaking Christians. Ma'lula (called Seleucia by the Turks) is a village of some 1000 inhabitants, situated on a high plateau about 5000 ft. above sea-level, north-east of Damascus; while two neighbouring villages, though most of their inhabitants have become Musalmāns within the last 250 years, also speak Syriac vernacularly. Ma'lula consists ecclesiastically of two divisions; half are of the Uniat Melkite rite (see below, § 6), half of the Greek Orthodox rite. Each division has an ancient monastery.¹ The local tradition is that the inhabitants are immigrants from the east, from the district of Singar or Sinjar (west of Mosul), which is now largely inhabited by Yezidis, or so-called 'devil-worshippers'; but this tradition is of very doubtful value.²

Of all the Syrian Christians, whether they have lost their own vernacular or have retained it, it may be noted that their clergy are supposed all to be able to read and write and understand classical Syriac; and most of them can do so, and can even, with some difficulty, speak it. But this is now only as a foreign language.

There are some differences of pronunciation. The East Syrians (Nestorian and Uniat Chaldean) say *ā* when the West Syrians (Jacobite) and the Maronites say *ō* (*e.g.*, *malkā*, *malkō*, 'a king'), the former being the older sound, preserved to us in transliterations like Talitha (Syr. *līthā*), Maranatha (Syr. *Māran ethā* or possibly *Mārānā thā*). The East Syrians hardly ever aspirate *p* (except when it is used to form a diphthong), and many of them never aspirate *t* or *d*; almost all of them pronounce the vowels Rbhāṣā (Rwāṣā) and Rwhāṣā alike as *ū*, the *ō* sound being produced only by a combination of the vowel Zqāpā (Zqaphā) with *w* or aspirated *b* or *p*. One point with regard to transliteration of Syriac words into Roman characters must be mentioned. European Orientalists usually write twice a medial consonant in certain verbal formations and in words derived from them, because it is said to be 'virtually doubled' (*e.g.*, 'Addal' for 'Adal'). The Syrians themselves, however, dislike doubled letters, and in their vernacular admit them only in a few (chiefly foreign) words, and in that case they pronounce each letter distinctly, like the *d*'s in 'mid-day.' On the other hand, they sometimes compensate for not doubling a medial consonant by converting a preceding short *a* into a long one. Most of them pronounce aspirated Kaph (*kh*) and Heith (*h*) alike.

3. Syrian Christianity in early times.—In considering the spread of Christianity in these regions before the theological controversies of the 5th cent. caused the divisions which exist to this day, we are faced with the difficulty that legends are the traditional groundwork of the religious history. It is not easy to estimate the amount of truth or falsehood that underlies the legends; but there is no doubt that all these regions were largely Christianized at an early period.

(a) *The Roman province of Syria.*—Here we are not troubled with legend. In the 1st cent. of our era the province extended to the Euphrates, and was conjoined with Cilicia.³ Antioch was the civil metropolis, and was likewise the headquarters of Syrian Christianity; there the disciples were first called 'Christians' (Ac 11²⁶). Greeks and Syrians were both represented at Antioch (see above, § 2). There is no evidence as to the extent to which the Church services were conducted in the Aramaic vernacular rather than in Greek; but probably, at a time when the worship was in the main extemporaneous, both languages were used. Though most of the people, perhaps, understood Greek, even if it was not their mother tongue, yet experience shows that the last sphere in which a vernacular gives way to the language of commerce and public life is that of religion. It is therefore probable that Syrian Christians in the Roman province to a large extent worshipped in their vernacular from apostolic times onwards. But Greek was the literary language. Ignatius, bishop of Antioch at the beginning of the 2nd cent., wrote in Greek (he calls himself 'bishop of Syria');⁴ Lucian and Dorotheus, Diodorus, bishop of Tarsus, and Theodore, bishop of Mopsuestia (both these of Antioch), Chrysostom, Theodoret, bishop of Cyrrhus—all of the 4th and 5th centuries—did

the same. The Antiochene school of theology was clearly a Greek school.¹ A trace of the mixture of the Greek and Syriac elements may be seen in the *Pilgrimage of 'Silvia' ('Etheria')*, a work probably of the end of the 4th cent., which describes the bishop of Jerusalem as knowing Syriac ('*siriste*'), but as always speaking Greek and having his sermons and the lectures interpreted into Syriac by a presbyter who stood by.²

In the 4th cent., when the provincial organization of the Church was promoted, Antioch was one of the great centres, and its bishop was called a 'metropolitan'; the corresponding verb is found in canon 19 of the Council of Antioch in *encaniis* (A.D. 341), and the name itself in can. 6 of Nicæa (A.D. 325), which says that the rights formerly possessed by Antioch must be preserved to it. Thus Antioch had long exercised some sort of jurisdiction over neighbouring sees. Yet the *Apostolic Constitutions*, a Greek work written in Syria c. A.D. 375, does not mention metropolitans, any more than the other 'Church Orders' do.³ This is important in connexion with the supposed dependence of Seleucia-Ctesiphon on Antioch, for which see below (c).

(b) *Edessa*.—This famous city of Mesopotamia, called in Syriac Ur-hai (now Urfa), was the capital of the kingdom of Osrohoëne (a Greek name derived from 'Ur-hai'). 'Edessa' was the Greek name for the city. The kingdom was independent till A.D. 216, when it was incorporated in the Roman empire. According to the well-known legend of Abgar and Addai, Edessa was Christianized in the middle of the 1st cent.; the legend is given in full in the *Doctrine of Addai* (see below, § 4), and in a shorter, and perhaps more original, form by Eusebius,⁴ who says that his account was translated from the Syriac. Edessa is represented as a heathen city, which worshipped (the *Doctrine* tells us) Bel and Nebo,⁵ though Burkitt suggests that these names come from a perusal of the OT and not from any real historical reminiscence.⁶ Abgar,⁷ the heathen king or toparch of Edessa, sends messengers to our Lord, and a correspondence ensues; after the Ascension the apostle 'Judas Thomas' sends Addai (called by Eusebius Thaddæus, and said to be one of the Seventy) to Abgar to teach him the faith.⁸ Addai does many mighty deeds; one of his converts was Aggai, who 'made the silks and headbands of the king,' and he was made bishop⁹ by Addai as his successor. Addai died a natural death at Edessa, but Aggai was afterwards martyred by the son of Abgar; and, as he could not consecrate his successor Palūt by reason of his sudden death, the latter was sent to Antioch and was ordained by Serapion the bishop. Narsai, king of Assyria, sent messengers to King Abgar to learn about all these matters. Such is the legend. As we have it, it is of the 4th cent., though clearly based on one that is a good deal older; R. A. Lipsius¹⁰ concludes that the extant correspondence between our Lord and Abgar was manufactured c. A.D. 200. What is the substratum of truth in all this it is not easy to say. The mention of Serapion (bishop of Antioch, A.D. 190–210) gives us a date for Palūt, and Lipsius¹¹ regards the latter as the first

historical bishop of Edessa. But there is no need to dismiss Addai entirely to the realms of myth. If the Edessenes were casting about for an early founder of their Church, they would be much more likely to fix on the great apostle 'Judas Thomas,' whose tomb was claimed for Edessa in the middle of the 3rd cent. (see below, § 9), than on the unknown Addai. It seems to be likely, therefore, that Addai (probably a Palestinian Jew) was the first preacher of the gospel at Edessa, perhaps early in, or about the middle of, the 2nd century. The real Abgar who favoured Christianity may have been Abgar IX., the last independent king of Edessa. Burkitt¹ suggests that the consecration of Palūt by Serapion of Antioch represents a movement for closer union with 'Western' (Greek) Christianity, and perhaps means a break in the episcopal succession.

In the 2nd cent. Bardaisān (Bardesanes) was born at Edessa (A.D. 155–223?);² he is reckoned as a Syrian Gnostic (though this is doubtful), and was a most learned man, a great hymn-writer,³ and author of a polemic against Marcion. All his works have perished except the extant Syriac treatise *de Fato*, which is usually thought to be his; Eusebius⁴ tells us that he wrote a book with that title. Burkitt⁵ assigns the *de Fato* (which is called in the MS the *Book of the Laws of Countries*) to Bardaisān's disciple, Philip, on the strength of the work itself; but many think that the insertion of 'Philip' (a very unusual Syriac name) is only a literary device, and that Bardaisān himself is the real author. He certainly is the chief speaker in the dialogue, which is between a Christian and a heathen, and turns largely on the question why God allowed man to sin. Eusebius⁶ and Epiphanius⁷ say that Bardaisān was originally a follower of Valentinus, and Epiphanius makes him always a Valentinian. The fullest biography of this erratic writer is by Michael the Syrian, Jacobite patriarch of Antioch (1166–99), but his details cannot be entirely trusted. The school of Bardaisān survived his death, and remained in opposition to the orthodox party; Rabbula is said to have converted the remnants of it.⁸

One of the most famous of the Edessenes was Ephraim (Ephrem) the Syrian (born c. 308, † 373). He came from Nisibis⁹ to Edessa and founded or reorganized a seminary there, which became the great university of the East, though for a while after his death it fell under Arian influences. He was a deacon only, said to have been ordained by Basil of the Cappadocian Cæsarea, and to have declined advancement;¹⁰ his own statement, that he had 'the talent of the priesthood,'¹¹ does not contradict this, for in Syriac 'priesthood' (*kāhnūthā*) includes all orders of the ministry. He was a most diffuse writer, and achieved a great fame in posterity.¹²

In the 5th cent. the most famous Edessenes were two of the bishops of Edessa. Rabbūlā (bishop from 411 to 435) was the son of a heathen priest and of a Christian mother. He was converted

⁹ As appears both from the Syriac (Nṣibhin, pron. Nṣiwin) and from the Greek, the middle *i* is long, contrary to the ordinary pronunciation. The word forms the end of a Greek hexameter in the epitaph of Abercius; see the restoration in Lightfoot, *Ignatius and Polycarp*, i. 496. Burkitt has pointed out to the present writer that the pronunciation with short *i* perhaps comes from the Armenian form of the name, 'Mtsbin.'

after he attained to manhood; and he became a great ascetic, and the friend of Cyril of Alexandria. At the end of his life he strenuously opposed Nestorius.¹ The other famous bishop was his successor, Ibas (bishop from 435 to 457), who was inclined to favour Nestorius (see below, § 8).

During all this period the Church seems to have made rapid progress. Eusebius² says that bishops from 'the whole of Syria and Mesopotamia' attended the dedication of Constantine's great church at Jerusalem in 335.

(c) *The Persian empire.*—A great deal of light has been thrown on early Syrian Christianity in Persia by the recent publication of the works of Nestorian writers. Formerly we had to rely mainly on the accounts of Jacobite authors like Bar Hebræus. The two sets of accounts correct one another and disprove more than one myth; and Neale's narrative in his *History of the Holy Eastern Church*³ needs much correction in this respect.

One legend is a continuation of that of Abgar and Addai already mentioned. Mari, disciple of Addai, travelled from Edessa and evangelized 'Persia' (i.e. what became later the eastern part of Asiatic Turkey, as well as the modern Persia), penetrating as far as the province of Fars. Mari is not mentioned in the *Doctrine of Addai*, which, however, has a hint that Christianity extended from Edessa into Persia. Nor is Mari mentioned in the lately published and very valuable *History of Mshihā Zkhā* (lit. 'Christ has conquered'), of the 6th cent., which states that Addai was the apostle of Adiabene and Assyria (this apparently contradicts the *Doctrine*, which makes Addai live and die at Edessa), and that he ordained Pqidhā as first bishop there. The Nestorian *Sūnhādhus*, or Book of Canon Law,⁴ names as the 'converters' of that region Thomas 'of the Indians and Chinese' (*Sināyē*), Bartholomew, that is Nathanael, of the Aramæans, Addai of the Seventy, the teacher of Aggai, and Mari of Mesopotamia and of all Persia.⁵ This is all clearly mythical, but is there any truth underlying the legend? Some consider that there was no Christianity, or at least no organization of Christianity, east of the Tigris before the Sasanid empire was established by a revolution, A.D. 225. This is perhaps going rather too far. If there was nothing before the third decade of the 3rd cent. to build upon, it is unlikely that so early a writer as Mshihā Zkha could have given us such details; he could not have invented Pqidhā out of nothing. It is quite probable that there were Christians in Assyria in the 2nd cent., for Tatian,⁶ the disciple of Justin Martyr, tells us that he was born 'in the land of the Assyrians.' This must be discounted by the fact that he probably wrote only in Greek, though many think that his *Diatessaron* (for which see below, § 4) was written in Syriac;⁷ and that he may therefore have been of Greek parentage, and have been converted to Christianity when in the West. We learn from Epiphanius that he laboured in Syria and Mesopotamia.⁸ In any case there was no bishop at Seleucia-Ctesiphon, the twin-capital of the Persian empire, situated on the Tigris below Baghdad, till the end of the 3rd century. Papa is the first known bishop of that city; he was consecrated c. 280.

Another legend is much later, and professes to account for the existence of a patriarch at Seleucia-Ctesiphon. It is given by Bar Hebræus and other writers, and in the *Sūnhādhus*,⁹ and is to the effect that two men went from Persia to Antioch to receive the episcopate in 190. According to the first writer, one of them was crucified as a Persian spy, as was Šlibha (pron. Šliwā, lit. 'cross,' still a common name), the bishop of Antioch, while the other escaped to Jerusalem and was consecrated there, returning with a letter conferring the patriarchate on the Church in Persia. The *Sūnhādhus* does not name Šlibha, but says that two patriarchs, 'one of the East and one of the West,'¹⁰ were crucified on the doors of the church of Antioch, and it gives the pretended letter of the 'Western patriarchs' to the 'Easterns,' bestowing on the latter a patriarchate, and absolving them from the duty of sending their patriarchs to Antioch to be consecrated. The first patriarch, it says, was either Papa or Shaḥlūpā—it does not profess to be certain.¹¹ This Shaḥlūpā was probably the bishop of Adiabene, east of the Tigris and between the two Zabs, who was a contemporary of Papa. The letter of the 'Westerns' is a late forgery. The earlier writers, like Mshihā Zkha, know nothing of the story, despite the fact that that historian wrote the life of Aḥā d'abūh, the bishop who is said to have escaped. The whole is doubtless a fiction, and it is improbable that the Persian Christians ever depended for their bishops on Antioch, though they doubtless received

their Christianity from Edessa, and Edessa possibly received it from Antioch. The idea of patriarchates, it need hardly be said, belongs to a much later time than these pretended events. The East Syrian ('Persian') metropolitanates were organized c. A.D. 410. There is no early evidence of Antioch exercising jurisdiction over the Church in Persia. When Papa was condemned by his brother bishops, he appealed, successfully, to Edessa, and perhaps to Nisibis.¹

An important event for the Church occurred in A.D. 297, when five Persian provinces were ceded to the Roman emperor.² This strengthened the ecclesiastical ties between East and 'West.' The cession made Nisibis a Roman city. Its most famous bishop at that time was James of Nisibis, who was born there towards the end of the 3rd century. Ephraim was his disciple, and was baptized by him. James himself was a great author of Syriac works.³

It is remarkable that, though James was present at Nicæa in A.D. 325, the East Syrians knew nothing officially of that council till the Synod of Seleucia-Ctesiphon in A.D. 410, when they freely accepted the Nicene decrees and creed. To this day they use a rather peculiar version of the longer form, the so-called 'Constantinople' creed, which came into general use (see below, § 9). The Arian controversy did not touch them; and an illustration of this may be seen in the fact that Aphraates, whose Homilies (see below, § 4) are a continuous exposition of the Christian faith, does not mention Arianism at all, though he lived at a time when that heresy was prevalent in the 'West.'

The principal East Syrian bishops of Seleucia-Ctesiphon after Papa and before the Nestorian period were Simeon Bar Sabā'ē (martyred under Sapor II.), Yahbh-alaha I. (pron. Yāw-alāhā), and Dādhišhū. Of other bishops may be specially mentioned Aphraates (Aphrahāt), in the 4th cent., whose see was perhaps Mar Mattai, near Moṣul (see below, § 5), and Mārūthā (early 5th cent.), bishop of Maipharqat or Martyropolis, north of Nisibis, author of the *Book of Martyrs* (see below, § 4). Mārūthā often acted as adviser to the Persian king and as ambassador to the Roman emperor. The *Sūnhādhus*⁴ mentions an earlier Mārūthā, who was (it says) present at Nicæa, but it is probable that he did not exist, and that the statement is due to a confusion.

The period was marked by many personal quarrels,⁵ a feature of later history also, and by the great persecution under King Sapor II. († A.D. 379), which lasted some 40 years and resulted in many martyrdoms.⁶ The Persian kings at one time favoured the Church and at another persecuted it. It is important to notice that even in the early days the political conditions tended, quite apart from theological considerations, to separate the East Syrians from the rest of Christendom. It was the policy of the Persian authorities when they tolerated Christianity to separate it as much as possible from that in the rival Roman empire. Another persecution, at the instigation of the Magians, whose religion was that of the State, broke out under King Bahram (Vararanes) V., c. A.D. 420. Theodoret⁷ makes it arise under his predecessor Yazdegerd, though continued under Bahram, but Socrates⁸ says more accurately that it arose after Yazdegerd's death.

The title of the bishops of Seleucia-Ctesiphon, c. A.D. 400, was 'the Catholicos of the East,' and this is still preserved by their successors. The title 'Patriarch' was added a little later, at the Council of Dadhišhu, held A.D. 424 at 'Markabta of the

Arabs.' This council firmly established the independence of the 'Eastern' patriarchate.

4. The Syriac Bible and early Syriac literature. — Before the doctrinal divisions of the 5th cent. there was a considerable activity in Syriac literature, all written in what we call 'classical Syriac' (see above, § 2). The Gospels were current in Syriac in five forms. (a) The four 'Gospels separate' (Syr. *Ewangeliyôn da-Mpharrshê*), now generally called the 'Old Syriac,' are known to us by two MSS: the Curetonian, discovered in Egypt in 1842, and ed. by Cureton in 1858; and the Sinaitic Syriac, a palimpsest discovered by Mrs. Gibson in the monastery of Mount Sinai in 1893. Both of these have the above Syriac title, which distinguishes them from the *Diatessaron* (see below). Both are perhaps of the 4th century. The Curetonian has the same type of text as the Sinaitic, but differs from it in many details.¹

(b) The *Diatessaron* of Tatian (2nd cent.), sometimes called by the Syrians 'the Mixed[Gospels],'² is a harmony of the four Gospels, and is known to us through a commentary on it by Ephraim handed down in an Armenian translation, by quotations in Aphraates, and by an Arabic translation of the Harmony itself made in the 11th cent. by the Nestorian monk Ibn at-Tayyib.³ The *Diatessaron* is mentioned in the *Doctrine of Addai*.

(c) The Pshittâ,⁴ or 'simple' version, so called to distinguish it from the complicated recension of Thomas of Harqel (see below), is the version still used by Syrian Christians. The name is first found in the 8th or 9th century. This version, which is now often called 'the Syriac Vulgate,' contains the whole Bible, OT and NT (including the OT Apocrypha), less 2 Peter, 2 and 3 John, Jude, and Revelation. Because of its universal acceptance, it may safely be assigned to a date before the divisions of the 5th century. The Gospels in this version have been critically edited by G. H. Gwilliam.⁵ It appears that Tatian's Harmony was at one time in popular use among the Syrian Christians, but early in the 5th cent. Rabbûlâ, bishop of Edessa (see above, § 3), and Theodoret, bishop of Cyrrhus, were instrumental in its being abolished and destroyed in favour of the 'separate Gospels.' Burkitt's theory has been very generally accepted, viz. that the Pshittâ Gospels are a revision of the 'separate Gospels' made early in the 5th cent. under the direction of Rabbûlâ; that the *Diatessaron* was written in Greek (but see above, § 3), probably at Rome, by Tatian, and translated into Syriac in his lifetime, c. A.D. 170; and that the 'separate Gospels' date from c. A.D. 200, the translator being familiar with the *Diatessaron*.⁶ These views are combated by Gwilliam, who is inclined to assign a much earlier date to the Pshittâ Gospels;⁷ he objects that Burkitt's theory is not adequately attested, does not explain the disappearance of the 'Old Syriac,' and does not account for the acceptance of the Pshittâ in the 5th cent. by Nestorians and Jacobites alike.⁸ The fact that the East Syrians were not definitely Nestorian in Rabbûlâ's time, or indeed for a long time after him (see below, § 8), appears to the present writer adequately to account for their being ready enough to accept such a version of the Gospels in place of the *Diatessaron*.

¹ For these two MSS see F. C. Burkitt, *Evangelion da-Mepharreshe*, Cambridge, 1904. For the date see Burkitt, *Early Christianity outside the Roman Empire*, p. 54, and *Evang.* ii. 13, 23.

² Burkitt, *Evang.* ii. 115. ³ *Ib.* ii. 4.

⁴ Usually written in English Peshitta, Peshitto, or Peshito, but all these forms give the ordinary reader an erroneous idea of the pronunciation of the first syllable. Also the first *t* is pronounced quite differently from the second.

⁸ On this last point see Burkitt, *Evang.* ii. 162, and *Early Eastern Christianity*, p. 59 ff.

(d) Recensions of the Pshittâ were made by Philoxenus, bishop of Mabng (Hierapolis, near the Euphrates), A.D. 508 (not now extant), and by Thomas of Harqel ('Harklean' version), A.D. 616. Both of these writers were Monophysites, and it appears that the only dissatisfaction with the Pshittâ that made itself felt was among the Jacobites, and not among the Nestorians. But even among the Jacobites that version remained supreme.

Some characteristics of the Pshittâ may here be mentioned. Its MSS, unlike those of the Greek Bible in the 5th cent., all show practically the same text. Some of them are as old as the 5th cent., the oldest c. A.D. 450. One rather noticeable difference between the 'Old Syriac' and the Pshittâ Gospels occurs in the Lord's Prayer, where the former has 'our continual bread,' the latter 'the bread of our need.' Another difference is in the gender of 'Holy Spirit.' The noun 'spirit' being feminine in Syriac, the older writers make 'Holy Spirit' feminine also, and Aphraates speaks of the Holy Ghost as 'our mother,' just as the *Gospel according to the Hebrews* speaks of Him as our Lord's mother. But from the time of the Pshittâ onwards 'Holy Spirit' is made masculine by a grammatical revolution, though in Lk 4 and Jn 7:39 Psh there is a survival of the older usage, the feminine being retained.

Hitherto we have considered only the Gospels. There is no extant text of Acts or the Epistles older than the Pshittâ, but quotations in Aphraates and in Ephraim's *Commentary on the Pauline Epistles*, now extant only in an Armenian translation, are of some slight help. In Aphraates and in the genuine works of Ephraim there is no clear reference to any of the Catholic Epistles. The *Doctrine of Addai* expressly confines the Scriptural canon to the Law and the Prophets, the Gospel, St. Paul's Epistles, and Acts. Thus the Pshittâ, admitting as it does the principal Catholic Epistles, shows an advance on the way to a fuller canon. The Pshittâ OT was not revised by Rabbûlâ, and is undoubtedly much older than his time, perhaps dating from the end of the 2nd century.³ The translator had a good knowledge of Hebrew, though he was somewhat influenced by the Septuagint. Burkitt thinks that he must have been a Jew, and that he made his translation for the Jews, who had probably settled at Edessa before it became a Christian centre. The OT quotations of the *Acts of Judas Thomas*, the *Doctrine of Addai*, the *Edessene Canons*, Aphraates, Cyrillona, and the genuine works of Ephraim (for all these see below) agree largely with the Pshittâ, but their Gospel quotations do not do so, rather resembling the 'Old Syriac' and the *Diatessaron*. After Rabbûlâ all the quotations but two agree with the Pshittâ, the 'Old Syriac' having thus almost entirely disappeared.⁴ The 'Old Syriac' Gospels appear to be later than the Pshittâ OT, as the translator of the former, translating direct from the Greek, uses Hebrew proper names correctly transliterated from the Hebrew, as does the Pshittâ translator of the OT. The Old Syriac Gospel translator could hardly do this unless he had the correct forms of the proper names before him already in use.⁵

Of other early Syriac works, in addition to liturgies, some of which seem in their main features to have been written before the middle of the 5th cent., and in addition also to early Syriac translations of Greek books, the following may be mentioned. (1) *The Disputation with Manes*, by Archelaus, bishop of Kashkar in Mesopotamia (3rd cent.), is now extant only in Greek fragments and in a Latin translation, but was originally written in Syriac. (2) *The Doctrine of Addai*,⁶ already mentioned, is a work of the latter part, or, according to R. A. Lipsius,⁷ of the beginning, of the 4th cent., giving the legend of Abgar (see above, § 3). (3) The voluminous works of Ephraim consist of commentaries, homilies, letters, and hymns.⁸ At least one of his works, *On the Holy Spirit*, was translated into Greek before Jerome's time.⁹ (4) Aphraates, the Persian martyr and sage, wrote his *Homilies* A.D. 337-345. Their theological attitude calls for some remark in view of their aloofness from Hellenistic influence. There is no special difference between him and 'Western' writers in the presentment of the doctrine of the Holy Trinity, and in Aphraates, as elsewhere, baptism is 'in the name of the Father and of the Son and of the Holy

⁹ *de Vir. illustr.* § 115.

Ghost.' Man is a temple for God to dwell in.¹ But the doctrine of the sacraments must be noticed. The teaching about the eucharist, indeed, is more or less that of the Greek-speaking Christians. The body and blood of our Lord are received by the faithful. Fasting communion is enjoined, but special stress is laid on fasting from sin. Yet this seems to be only the complement and groundwork of the literal fasting. One passage,² however, is thought by Burkitt³ to show that Aphraates considered baptism, and the sacramental system generally, to be only for ascetics, and not for the married laity. This conclusion has been much disputed. At least it is certain that Aphraates favoured the postponing of baptism till after marriage, just as Constantine postponed it till the end of his life. The same tinge of ultra-asceticism is seen here that appears in the *Acts of Judas Thomas* (see below and §9). But there is no evidence that this was more than the private opinion of individuals, or that the original East Syrian Church as a whole considered full membership to be incompatible with anything but the ascetic life. (5) The Syriac *Doctrina Apostolorum* (or *Edessene Canons*) was written c. A.D. 350 and is a kind of 'Church Order.' As is the case with many books of that class, it puts injunctions into the mouth of the apostles, and it is of great interest as telling us of the customs of the Edessene Church in the 4th century. It makes Addai the apostle of Edessa, and Aggai, 'a maker of silks,' the apostle of Persia, Assyria, Armenia, Media, the countries round Babylon, the 'Huzites and the Gelae, as far as the borders of the Indians and as far as the land of Gog and Magog.' This shows that the East Syrians at a very early date were a missionary body. (6) The *Syriac Martyrology* may be dated c. A.D. 350. It is found in the MS (dated 411) mentioned below. It mentions Habbib the deacon, as well as Shamuna and Guria (on whom a metrical homily is extant), but not Aggai, Sharbil, or Barsamya (see below). (7) Abba (Abha, pron. Awā), the disciple of Ephraim, wrote a commentary on the Gospels, of which only a few fragments remain. (8) Cyrillona wrote his poems c. A.D. 396.⁴ (9) The *Martyrdoms of Barsamya and of Habbib*, and (10) the *Acts or Hypomnemata of Sharbil*, are accounts of the deaths of three Edessene heroes.⁵ (11) The *de Fato* of Bardaisān (?) has already been mentioned (§ 3). (12) Mārūthā (§ 3) wrote his *Book of Martyrs* early in the 5th cent. to commemorate those who suffered in Persia in the great persecution of Sapor II. (13) The *Life of Rabbūlā* (see above) was written shortly after his death, A.D. 435. (14) The *Acts of Judas Thomas* (the apostle) is a highly interesting religious novel, written by one who was of doubtful orthodoxy, but was perhaps a pioneer missionary in E. Mesopotamia in the 3rd cent., or possibly Bardaisān himself, or at any rate one of his school. The Syriac origin of this work is maintained by T. Nöldeke and F. C. Burkitt⁶ and others.⁷ The *Acts* contain the well-known *Hymn of the Soul*, for an English translation of which see Burkitt's *Early Eastern Christianity*, p. 218 ff.; but the hymn is really an independent Syriac composition added to the *Acts*. These *Acts*, while unorthodox, are probably not Gnostic, being very different from the Greek *Acts of John*, which are thoroughly

Gnostic. In the Syriac *Acts* there is no inner circle to whom alone the whole truth is taught.¹ (15) Syriac may be the original language of the Clementine story which has been reproduced in the *Clementine Homilies and Recognitions*. An earlier form of the story,² perhaps of the 3rd cent., has lately been discovered in Syriac.³

There are also several translations of Greek works into Syriac which were made before the great separation of Syrian Christians. Thus the works of Eusebius were so translated very shortly after his death; a MS of a Syriac version of the *Martyrs of Palestine* and the *Theophania* is extant, dated A.D. 411, and this is not the original autograph,⁴ and another of the *Ecclesiastical History* is extant dated A.D. 462.⁵ Pamphilus the martyr, Eusebius's teacher, had a society, c. A.D. 300, which translated Greek works into Syriac.⁶ The Ignatian Epistles were translated into Syriac (the 'Curetonian Syriac Letters') at least in the 5th cent., and, if the six additional letters are not an integral part of this version, probably earlier.⁷ It is noteworthy that Syrian Christians, by means of classical Syriac, made many Greek works, philosophical, scientific, and religious, known to the East. Some Greek works are known to us only in their Syriac dress; and even some works in Armenian come to us from the Greek through the Syriac. The principal era of Armenian translations from the Syriac was the 5th century.⁸

5. West Syrians or Jacobites.—We now proceed to consider the divisions of Syrian Christianity which resulted from the Christological controversies of the 5th century. It is not necessary here to repeat the accounts of those controversies which have already been given in this *Encyclopædia*; but we may discuss the general history and the customs of the different Syrian bodies which separated from one another and from the 'Western' Church of Constantinople and Rome.

The Syrian Monophysites may be considered first.⁹ In Syria proper there was a constant contention between them and the Orthodox for more than a hundred years after the Council of Chalcedon (A.D. 451), and the patriarchs of Antioch were sometimes Orthodox and sometimes Monophysite. The most famous of the latter was Severus, who maintained possession of Antioch itself from A.D. 513 to 518; he was an author, and wrote in Greek. He was a great admirer and quoter of Ignatius's Epistles.¹⁰ He was the leader of his party till his death c. A.D. 540, after which a double succession to the patriarchate was continuous; and it has been preserved to the present day. The final breach between Orthodox and Monophysites may be said to have occurred in the reign of Justin II., the successor of Justinian. He persecuted the Monophysites, and an account of these troubles may be read in the third book (the only part extant) of John of Ephesus, a contemporary. John was Monophysite bishop of Ephesus in the 6th cent., but he wrote in Syriac, and was the first Syriac historian. He was a native of Amida (Diarbekr). For James of Sarug († A.D. 521 or 522), who has been thought to have been a Monophysite (but this is very doubtful), and for other early Syrian poets, see art. HYMNS (Syriac Christian), § 1.

The Syrian Monophysites are called Jacobites from Jacob Baradaï (Baradaeus), or Zanzalus, a monk of a monastery near Edessa, who came to Constantinople c. A.D. 540 to plead the cause of Monophysitism. After remaining there fifteen

⁷ For these *Acts* see further below, § 9.

years, he was consecrated bishop by the imprisoned Monophysite bishops in the capital, and sent to Syria to organize his sect. He consecrated Sergius to succeed Severus at Antioch, and appointed Paul the Black to succeed Sergius. He is said to have ordained two patriarchs, 89 bishops, and an enormous number of clergy. He is often called bishop of Edessa, but Bar Hebræus¹ says that he was a bishop with no fixed see. John of Ephesus was his panegyrist. He died in 578, and after his death the Monophysites were driven from Antioch. The term 'Jacobites' was a nickname, given by the Orthodox; but the Jacobites themselves readily accepted it, tracing it, however erroneously, to the apostle James, to whom also they ascribe their principal liturgy. Their controversy with the Greeks, like the controversy of the East Syrians with the Greeks, was not only theological; it was largely tinged with national differences. Indeed both were to a considerable extent contests between Syriac thought and Hellenistic culture.

In the 7th cent. the Muhammadans conquered Palestine, Syria, and the East; and at first the new rulers favoured the Jacobites as the rivals of the Greeks. The principal writer of this period was James (Jacob) of Edessa (†708), who was a poet, commentator, and letter-writer, and a voluminous translator of Greek works into Syriac. To him, e.g., we owe the knowledge of the 'Church Order' called the *Testament of our Lord*, a Greek work of c. A.D. 350, now extant only in Syriac.

The Jacobite patriarchs have continued to this day (at any rate from the 13th cent., or, according to Neale,² from the end of the 16th cent.) to style themselves 'of Antioch,' though they transferred their residence to various places—to Malatia on the Euphrates, to Amida, and finally (in the 12th cent.) to the monastery of Deir-el-Za'afaran (the 'saffron monastery') near Mardin, where they have been ever since.

Perhaps the most eminent Jacobite of all history was Gregory Bar Hebræus, or Abulfaraj (†1286), a man of Jewish parentage, who became a convert to Christianity and afterwards maphrian or metropolitan of Mošul, having formerly held other sees.³ He wrote many works, and his *Chronicle* (which may be read in Assemani) is a valuable history. He seems to have been greatly esteemed even by his Nestorian opponents, who attended his funeral in large numbers; he died at Maragha (south of Tabriz), but was buried in the monastery of Mar Mattai on Jebel Maqlub (Syr. Elpeph), a day's ride north-east of Mošul, and his grave is still shown there. His *Chronicle* is, for his age, fairly trustworthy, but when he deals with Nestorian matters it should be compared with the writings of that body.

A less known Jacobite writer was Dionysius Bar-salibi (Syr. šlibhi, pron. šliwi), also called James, metropolitan of Amida, a theologian and commentator, probably of the 11th century.⁴

We know less of Jacobite organization and customs, ecclesiastical and liturgical, than we do of those of the Nestorians, of which we have been fully informed in the last quarter of a century. For the modern Jacobites the best short account is to be found in O. H. Parry's *Six Months in a Syrian Monastery*, which has been largely drawn upon in the description which follows. The ecclesiastical hierarchy consists of the patriarch; the maphrian, who since the 12th cent. has had his see at Mar Mattai (see above) or in Mošul itself; and bishops of Jerusalem, Damascus or Homs (Emessa), Edessa, Amida, Mardin, Nisibis, Maipharqat (now Farqin; see above, § 3) and Ma'dan, Aleppo, Jezireh (on the Tigris), and Tur 'Abhdin (Jebel

Tur). There are also some bishops without sees, as at Mar Mattai, where, when the present writer visited the monastery in 1887, the establishment consisted of one bishop and one monk. The patriarch is elected by the people, and the election is confirmed by the bishops resident near Mardin; it is common for the maphrian to be promoted to the chief position. The patriarch, or more rarely the maphrian, consecrates all the bishops, who must be either monks or widowed priests; those chosen from the monks are called *matran*, or 'metropolitan,' while those chosen from the widowed priests are called *asqof* (ἐπίσκοπος), and are of slightly lower rank, not being eligible for the patriarchate or maphrianate. Each bishop has the prefix 'Mār' ('my lord') before his name.¹ The patriarch and the other bishops are recognized by the State as judges for their own people, especially in minor matters, and in questions of marriage and divorce. The canonical age for the ordination of bishops is 35, of deacons 20; but this has never been kept as a fixed rule. Bar Hebræus was ordained bishop at 20; deacons are often ordained as little boys, but they must be able to read the Psalms in classical Syriac. The parish priests, who are elected by the parish councils of deacons and laymen, must be married men; if their wives die, they enter a monastery or else become *asqofs*. A second marriage is not allowed to them. The priests must let their beards grow, but they shave their heads completely. The leading priest in a large town is often made a chorepiscopus, but he is not a bishop, and cannot ordain. There are many deacons in each village—they are engaged in secular work during the week—as they are indispensable for the celebration of the eucharist. Minor orders are practically obsolete.

Several ground-plans of churches may be seen in Parry.² The altar, at least in most cases, stands in an apse, not (as among the Nestorians) attached to the east wall, and there are seats for bishops and clergy behind. This is also the usual Greek custom. The whole sanctuary in Syrian churches, Eastern and Western, is called 'the altar' (Syr. *madhbhā*), though this name is sometimes also given to the holy table itself. The latter is usually of stone, though in some of the Jacobite churches it is of wood.³ There are side chapels with 'altars,' north and south of the sanctuary—the churches face east—and in some cases, as at Mar Mattai, there is another chapel at the north side for the burial of bishops, called *beith qaddishē* ('house of the saints'). Between sanctuary and nave there is a stone wall or screen, sometimes with folding doors, and always with a veil. The nave has no furniture except one or two lecterns. The altar is usually placed under a baldacchino. The Jacobites, like the Nestorians, do not allow images in their churches, but have a great veneration for the cross.

Monasteries are common; the monks are often laymen, though they are sometimes in holy orders. The monasteries are under the rule of the diocesan bishop except where they contain the tomb of a patriarch or a maphrian; in that case they are directly under the patriarch. Nunneries seem to be obsolete. The technical Syriac term for the monastic life, among both the Jacobites and the Nestorians, is 'sadness,' 'mourning.'⁴

The eucharistic liturgy ordinarily used is that of 'St. James,' a translation of which, in the Jacobite form, is given in Brightman's *Liturgies Eastern and Western*, i. 69 ff. The Syrian Jacobites, Maronites, Uniat Syrians, and Malabar Jacobites all use the same liturgy with some variations.⁵ Leavened bread is used, and must be baked for each occasion. The leaven is handed down from remote ages, as among the Nestorians. The eucharist is reserved for the sick, but only for communion on the same day. Little children (who are confirmed immediately after baptism) are communicated.

The antidoron or eucharistic bread not consecrated (Syr. *būrktā* = *εὐλογία*) is distributed after the service. The celebrant wears albe, amice, undivided stole, yellow shoes, a maniple over each arm, and a chasuble split down the front and buckled with silver at the neck. The vesting takes place in the side chapel, where also the elements are prepared. There are in some churches daily eucharists. There are no special vestments (except girdles, and often, for the deacons, stoles) at the daily offices. These last have not been published, and exist in manuscript only. One of the great features of Jacobite worship is the peculiar addition of 'who wast crucified for us' to the Trisagion ('Holy God, Holy Mighty, Holy Immortal, have mercy upon us'), which is used at many of the services. The addition was first made by Peter the Fuller († A.D. 477), and was eagerly adopted and retained as a test of Monophysitism.¹ Baptism is not allowed to be administered in private houses. The child at baptism is signed with *moron*, or unguent (which is consecrated once a year by the patriarch), anointed all over the body with oil (which has been hallowed by the *moron*), immersed in water thrice up to the neck, clothed, and confirmed.² Confession before communion is recommended by the canons, but is now almost obsolete. Some of the canons³ are more strict, and insist on confession before communion on Maundy Thursday, Christmas, and Pentecost.⁴ The fasts are somewhat severe. Besides Lent and Advent, both of which are strict fasts, there are (a) the Fast of the Ninevites, three days in spring, said to have been instituted owing to a plague in the 6th cent.,⁵ and strenuously maintained also by the East Syrians; (b) the Fast of the Apostles, after Pentecost; and (c) the Fast of Mary, August 1-15. Wednesday and Friday are fasts in each week, from sunset to sunset.

The Jacobites are to be found chiefly in Mesopotamia and northwards to Harput and Diarbekr, but there are also a good many of them near Damascus and a certain number around Moşul. The largest numbers are perhaps to be found in the hilly region of Jebel Tur (Arab. also Tūr 'Abdin; Syr. Tūr 'Abdīn), N. of the line Mardin-Nisibis—Jezireh. In this district Syriac is still spoken vernacularly. Here some of their oldest and most interesting churches are situated.⁶ It is always difficult to reckon numbers in Turkey; but Gibbon's estimate⁷ of from fifty to eighty thousand is certainly too low. We may perhaps put the total in Turkey at rather less than 200,000.⁸

Certain communities of Jacobites have become Uniat (see below, § 6). Jesuit missionaries first came to Mesopotamia in 1540. In 1646 the Uniat patriarchate was fixed at Aleppo, and the patriarch took his title from that place. The Syrian Christians in that neighbourhood mostly belong to that jurisdiction.

6. Melkites and Uniats.—The former name, which is derived from Syr. *malkā* ('king'), a word used also, like *βασιλεύς*, for an emperor, was invented

¹ But the ancient and authoritative Jacobite statement of faith (the 'Creed of our Sainted Fathers'), published by the Syrian Patriarchate Education Committee in English (*The Ancient Syrian Church in Mesopotamia*, London, 1905), emphatically states that the Trisagion with this addition is addressed to 'the Only-begotten Son,' and not to 'the Three blessed Persons' (p. 10). This 'Statement of faith' is quite free from Monophysitism. It denies that the divine nature of our Lord was commingled with the human nature, or that the two natures became commixed and changed so as to give rise to a third nature, and asserts that the two natures became united in indissoluble union without confusion, mixture, or transmutation, and that they remained two natures in an unalterable unity.

² For early Syrian baptisms see below, § 8.

⁸ For the Jacobites in India see below, § 9.

in the 10th cent. by the Jacobites for those Christians who adhered to the Council of Chalcedon. It was a nickname, meaning 'royalists,' and implying that they could stand only by the support of the Roman emperor. It may be compared with the nickname 'Erastians' used in this country at the present day; both have a somewhat similar shade of meaning. But the name 'Melkites' was quite readily accepted by those to whom it had been given in derision,¹ and was applied to all those who were in communion with Constantinople, whether Syrian, Egyptian, or Greek. In comparatively recent times the name has been given, and given exclusively, to the Christians of Syria and Egypt who have been drawn from the Orthodox Eastern Church and have been united to Rome. Such, e.g., are the 'Syrian Melkites,' whose liturgical language is, or was, Syriac.

The name 'Uniat' is applied to those Eastern Christians who have been united to Rome, but are allowed to keep their own liturgies, liturgical language, and ecclesiastical customs, especially as to the marriage of their clergy—though in all these respects modifications, sometimes very considerable, have been introduced. The earliest of these 'Uniats' are the Maronites (see below, § 7); but there are also four Uniat Churches of the Græco-Slavonic rite—the Bulgarian, Greek Melkite (formed of Arabic-speaking Orthodox after the Synod of Bethlehem, in 1672), Rumaic or Roumanian, and Ruthenian; there are also the Armenian Uniats; the Syrian Uniats, drawn from the Jacobites in 1646 (see above, § 5); the Chaldean Uniats, drawn from the Nestorians (see below, § 8); and the Malabar Uniats (see below, § 9). The Uniats have nine Eastern patriarchs. Those of Constantinople, Alexandria, and Antioch live in Rome. In addition there are Uniat patriarchs of Jerusalem (Greek), Antioch (Maronite), Antioch (Greek), Antioch (Syrian), Cilicia (Armenian), Babylon (Chaldean).² European readers are often confused by the fact that there are no fewer than six patriarchs who take their title from Antioch—one Greek Orthodox, four Uniats, and one Jacobite.

The Syrian Uniats use the liturgy of 'St. James'; the rubrics are often in Carshuni (Arabic in Syriac characters), the audible prayers both in Syriac and in Carshuni, the inaudible in Syriac only.³ The Chaldean Uniats use the liturgy of 'Addai and Mari' with some amendments; their daily services are considerably abbreviated compared with those of the Nestorians, and in the case of the long festal Night Service about six-sevenths are omitted.⁴

7. Maronites.—These Syrian Christians of the Lebanon derive their name from their teacher John Maro, or Maron, a learned monk, who was named patriarch of Antioch, perhaps early in the 8th century. He has often been confused with an earlier Maron, called by Gibbon⁵ 'a saint or savage of the fifth century,' whose relics were greatly venerated. In the time of John Maron the Monothelete controversy was still going on, and these Lebanon Christians espoused that cause.⁶ They were thus in opposition to their Christian neighbours, and later, as Christians, to the Muhammadan authorities; and they received the nickname 'Mardaites' or 'Rebels' (Syr. *marīdhé*).

In 1182 they renounced Monotheletism under the influence of their patriarch Aimeric, and were united with Rome, then numbering about 40,000 souls.⁷ At that time the connexion with the West

⁷ Neale, *Gen. Introd.* i. 154.

was through the Latin kingdom of Jerusalem. After the destruction of that kingdom in the 14th cent. relations with Rome were at times broken off, but they were resumed, and still continue. In the year 1584 Pope Gregory XIII. founded a college in Rome for training their clergy, and this institution has the honour of having in the 18th cent. educated the learned brothers J. S. and J. A. Assemani, to whose literary labours scholars are so much indebted for their knowledge of Syriac Christianity. The Maronites subscribed the decrees of the Council of Trent in 1736.

They are allowed to retain their own liturgical customs, and use the Syriac 'St. James' and other anaphoras.¹ The rubrics in the printed books are in Carshuni; some of the formulæ are in Carshuni and Syriac.²

The Maronite clergy may marry. They also elect their own patriarch, who still takes his title from Antioch. He lives at the monastery of Qānōbin (κωνόβιον), in the Lebanon, and has under his jurisdiction bishops at Aleppo, Tripoli (in Syria), Byblus and Botra, Baalbek or Heliopolis, Damascus, Berytus, Tyre and Sidon, and in Cyprus.³ Their numbers are difficult to estimate. Gibbon⁴ gives 150 priests and 100,000 souls, but they probably number about a quarter of a million.

They have suffered much from their feuds with their neighbours, the Druses, and in the year 1860, after great massacres of the Maronites, the British and French governments intervened for their protection.

8. East Syrians, or Nestorians.—We may now take up the history of the Church in the Persian empire from the middle of the 5th century.⁵ The first great event for the East Syrians after the Council of Ephesus, A.D. 431, was their final expulsion by the emperor Zeno from the school of Edessa and the consequent founding of the school of Nisibis, A.D. 489. Ibas (Syr. Ihibha, pron. ihīwā, lit. 'given'), bishop of Edessa, who was strongly Dyophysite, had been condemned by the Latrocinium, or 'Robber Synod,' of Ephesus in 449, but was acquitted and restored to his see by the Council of Chalcedon two years later, after having anathematized both Nestorius and Eutyches. During his lifetime the Monophysites made no way at Edessa, but after his death in 457 they became predominant there, and after a long struggle expelled their opponents. This was a decisive event in the Persian Church. Although up to that time it had had no direct dealings with Nestorianism, its tendency was mainly Dyophysite, and the influx of Nestorians from the Roman empire greatly strengthened that tendency. Nevertheless it is a mistake to suppose that the Persian Church at some definite date in the 5th cent. espoused Nestorianism and was therefore cut off from the Catholic Church. The process was a gradual one. The principal influence in the latter half of the 5th cent. was that of Bar Sōmā (Barsumas, lit. 'son of the fast'), bishop of Nisibis, who had taught at Edessa, and now, in the vacancy of the catholicate, organized the East Syrian Church in a Nestorian sense; he must not be confused with his namesake of the Latrocinium, who was a Monophysite. There was some opposition to 'Nestorian' doctrine, especially from the monks of Mar Mattai (see above, § 5), who to this day are Jacobites. The catholicos Acacius (Syr. Aqaq), who was bishop of Seleucia-Ctesiphon from

485 to 496, went to Constantinople on a mission from the Persian king, and there declared that his Church knew nothing of Nestorius; he was admitted to communion by the Orthodox, having anathematized Bar Sōmā.¹ We may perhaps discount his statement as an Oriental exaggeration; but the incident shows that the separation was not yet complete. Still later, good relations with Constantinople took place in the time of Mar Abha (pron. Awā) the Great, a contemporary of Jacob Baradai (see above, § 5). This prelate, a convert from Magianism, was catholicos from 540 to 552, having been a teacher at Nisibis, and having visited Jerusalem, Egypt, Greece, and Constantinople in the time of Justinian. In his Catholicate, as it would seem, the Council of Chalcedon was accepted by the East Syrian Church.² The *Sūnhādhus*³ quotes with approval one of its canons, and dates the council as '25th October, 763 of Alexander,' i.e. A.D. 452 (*sic*); the session of that day was particularly solemn, and was attended by the emperor and empress; it ended the principal work of the council.⁴

One of the first matters discussed in this period was the marriage of bishops and clergy. A council was held in 484 at Beith Laphat (also called Gondisapor, perhaps the modern Shiraz); it allowed them to marry, and even permitted a second marriage to clerical widowers. This was confirmed in a council held by Acacius in the following year. Several patriarchs were married: Babbai (pron. Bā-wā), catholicos from 496 to 505, his successor Silas, Elisha, Paul, and Ezekiel, all of the 6th century.⁵ But Mar Abha set his face against episcopal marriage, himself declining to marry; and after his time it became rare. The present rule is that a bishop must be a *rabban* ('monk,' but see below), and may not marry or have married, and must never have eaten flesh-meat; nor must his mother have eaten meat during her pregnancy.⁶ There is evidence that the rule against eating meat did not hold in the 7th century.⁷ It is noteworthy that Ebedjesus (see below) in his *Sūnhādhus* passes over the question of episcopal marriage in silence, and does not refer to the decrees which permitted it.⁸

The definite official adoption of Nestorianism, or of what was taken for such, must be dated at the beginning of the 7th cent., when the East Syrians formally repudiated the term 'Theotokos' and adopted the phrase 'two *gnomé*, one *parsoḡa* (πρόσωπον), two natures' with reference to our Lord.⁹ The opposition to the 'Nestorians' of the Monophysite minority in Persia was greatly strengthened by the influx of a large number of captives of the latter persuasion from Syria, in 540 and 573, under Chosroes I.; the influence of Shirin, the Christian queen of Chosroes II. (590-628), was latterly in their favour.¹⁰

Monasticism was at one time a most flourishing institution among the East Syrians. Thomas of Marga (see below) gives us a graphic description of his own monastery, and we have other sources of information in Sozomen,¹¹ in P. Bedjan's *Acta Martyrum et Sanctorum*, and elsewhere.¹² It seems to have been introduced into the East from Egypt by Mar Awgin (pron. Ōgin; = 'Eugenius,' † 363?), who founded the famous monasteries of Mount Izla (near Nisibis) and Deir-el-Za'afaran (near Mardin; see above, § 5). He is said to have been the teacher of James of Nisibis. His *Life* is included in

⁵ For the doctrinal controversy which occupied the Council of Ephesus see art. NESTORIANISM.

Bedjan's work, but it is remarkable that Thomas of Marga does not mention him. The great organizer of monasticism among the East Syrians was a later monk, Abraham of Kashkar, a town between the lower Euphrates and the Tigris. Abraham refounded Mount Izla in the 6th cent., and his canons, which are still extant,¹ are included in the Nestorian *Sūnhādūs*.² His successor as abbot, Dadhishu, made canons accepting the doctrines of Diodorus, Theodore, and Nestorius.³ The rules as to jurisdiction of monasteries were the same as among the Jacobites (see above, § 5); in the 'patriarchal' monasteries the diocesan bishop might not officiate nor be mentioned in the litany.⁴ One of the most famous of the monasteries was that of Beith 'Abhé (pron. 'Awé), probably founded by Jacob of Lāshūm, a monk of Mount Izla, in the 6th cent.; its situation is uncertain, but probably it was near the Great Zab.⁵ This monastery produced from the 7th to the 9th centuries many patriarchs, as well as its famous historian, Thomas of Marga. The monastery of Rabban Hormuzd, about 30 miles north of Moṣul, is close to the village of Alqosh (Elkosh), where the tomb of the prophet Nahum, in a Jewish synagogue, is still shown. The monastery was founded by Hormuzd of Beith Laphat, c. 600. He spent the last 22 years of his life there and was buried within it, as were several patriarchs.⁶ The number of monks had dwindled from fifty in 1820 to about ten in 1890,⁷ a new monastery having been built at the foot of the hills, not far away. When the present writer visited the two monasteries in 1887, there was in the new one a large number of monks, busily engaged. Both the monasteries now belong to the Uniat Chaldeans (see above, § 6). There were also many other monasteries elsewhere.⁸

Monasteries are now quite obsolete among the Nestorians, though a few *rabbans* (monks) live in the world under a private rule, neither marrying nor eating meat, such as the late well-known Rabban Yonan (Jonah) of Qūchānis.⁹

Among a large number of Nestorian writers the following may be mentioned. Narsai († c. 502), a poet and homilist, called 'the Harp of the Spirit,' went to Nisibis from Edessa on the expulsion of the Nestorians. Ebedjesus says that he wrote 360 homilies; of these 47 have been published in Syriac by A. Mingana, and those on the eucharist and baptism, translated into English by R. H. Connolly, are of the greatest importance for the history of the early East Syrian rite. Mshiha Zkha was the writer of a most valuable history in the 6th century (see above, § 3). Ishu'yahb III. (pron. Ishūyāw), who was catholicos for ten years from 650, was the reputed author or reviser of the ordination and baptismal services, and also of the *Hudhra* (see below).¹⁰ In the earlier Syrian rite of baptism, as evidenced by Narsai, the *Syriac Didascalia*, and some other Syriac descriptions, the anointing seems to have been only before baptism; the post-baptismal anointing was added among the Jacobites in the 5th cent., probably by Severus (see § 5), and among the Nestorians by Ishu'yahb.¹¹ Thomas of Marga, bishop in the 9th cent. of that city (on the Zab) and metropolitan of Beith Garmal (east of the Tigris), was a monk of Beith 'Abhé (see above); his *Book of Governors*, a monastic history, is most valuable as filling a gap of 300 years in the history, otherwise hardly known. George of Arbela, metropolitan of Moṣul and Arbela (south-east of Moṣul) in the 10th cent., wrote a commentary on the services of the Church, which is valuable for the history of the Nestorian liturgies.¹² Mari Ibn Suleiman ('son of Solomon') was a chronicler of the 12th century. Ebedjesus (E. Syr. 'Abdishu, pron. 'Odishū, lit. 'servant of Jesus'), metropolitan of Ṣubha (pron. Ṣūwā), by some identified with Nisibis,¹³ in the 13th cent. compiled the *Sūnhādūs*, or 'Book of

Canon Law,' now in constant use by the Nestorians, though many of its provisions have become obsolete.¹

The missions of the East Syrians have been far extended. Their work in India is attested in the 6th cent. by Cosmas Indicopleustes (see below, § 9). Gibbon remarks² that 'the barbaric churches, from the Gulf of Persia to the Caspian Sea, were almost infinite.' The missionaries extended their labours to Socotra, Ceylon, Turkestan, and even to China, where the Nestorian monument of Si-ngan-fu, dated A.D. 781 ('1092 of the Greeks'), attests their activity, which also gave rise to the legend of Prester John (*q.v.*), a supposed priest-king in Tartary. Wherever they carried their teaching, they used Syriac as their liturgical language, even though it was not that of the people.³ Thus the Malabarese have always used Syriac liturgies. This great activity swelled the numbers of Syrian Christians exceedingly, and the Nestorians and Jacobites together are said to have been more numerous than the Greeks and Latins together.⁴

Under Muhammadan rule East Syrian Christianity was alternately favoured and persecuted. Under Tamerlane ('Timur the Lame') in the 14th cent. it was almost annihilated. But a remnant survived and is still to be found in the mountains of Kurdistan in E. Turkey, in the upland plains of Azarbaijan in the north-west of the present Persian kingdom, especially in that of Urmi or Urumi (often called in Europe Urmia), and in the low-lying plain of Moṣul (Nineveh). The patriarch, who after the foundation of Baghdād (A.D. 762) had left Selencia-Ctesiphon for that city, later removed to the north. But disputes as to the succession divided the patriarchate. The Nestorians themselves are now under the rule of Mār Shimūn (these two words are pronounced as one and are accented on the first and last syllables), who lives at Qūchānis in the almost inaccessible mountains which surround the Great Zab, a beautiful retreat near the small town of Julamerk. Each successive catholicos takes the name 'Shimūn' (Simon), whatever his baptismal name. The East Syrians of the Moṣul plain, now called Chaldeans, have been united with Rome since 1680, when they were received by Pope Innocent XI. Their head ('patriarch of Babylon') bears the name Mār Eliyā (Elijah). He has several bishops, each styled metropolitan, under him. He retains the title ('of Babylon') which the Nestorian patriarchs often used when they lived at Selencia-Ctesiphon; it is also found in the *Sūnhādūs*.⁵ There were at one time patriarchs at Amida (Diarbekr), who also were united with Rome; these bore the name Mar Joseph.

All the East Syrians speak Syriac vernacularly, though many of those in the Moṣul plain speak Arabic also. It is common to hear the sailors on the Tigris steamers talking vernacular Syriac, these being Chaldean Uniates. The total number of Nestorians and Uniates combined is, or was till lately, perhaps about 300,000.

A detailed account of the ecclesiastical hierarchy of the Nestorians is given in Maclean-Browne, *The Catholicos of the East*, ch. ix. The patriarch, or catholicos, has under him a *maṣrān*, or metropolitan, who bears the dynastic name of Mār Hnān-ishū ('mercy of Jesus'), and several bishops, the number varying considerably from time to time. The present method of filling bishoprics (including the patriarchate) is for each bishop to bring up one or two boys or young men, his nephews or near relatives, as potential successors. Such a one is called in the vernacular *nāṣar kūrsī* ('keeper of the seat'), and is not allowed to eat meat or marry; the bishop ordinarily nominates the one

whom he wishes to succeed, but in theory the people elect from among the 'keepers of the seat.' In the 15th cent. the catholicoi made a law restricting the catholicoi to members of his own family. This was an innovation, though perhaps not a very recent one. The catholicoi consecrate the bishops; but the metropolitan consecrates the catholicoi.¹

In most villages there is at least one priest, in some several; and deacons are very numerous, as the eucharist cannot be celebrated without the assistance of a deacon or of a priest acting as deacon. Occasionally a priest is made an archdeacon (*arkān*), but this is now only an honour, not involving special duties. Formerly there were chorepiscopi and periodeutā ('visitors'); these were presbyters, not bishops. The office of periodeuta is at least as old in Syrian Christianity as Rabbūlā (6th cent.), as he mentions it in his canons.² The East Syrian *Book of Heavenly Intelligences*³ enumerates nine orders in three divisions; (1) the episcopate: patriarch (or catholicos), metropolitan, bishop; (2) the presbyterate: chorepiscopus, periodeuta (or archdeacon), presbyter; (3) the diaconate: deacon, subdeacon, reader. These are said to correspond to the angelic hierarchy (as given by pseudo-Dionysius Areopagita and others) of (1) cherubim, seraphim, thrones; (2) dominions, virtues, powers; (3) principalities, archangels, angels. Minor orders are now obsolete. There are no longer any deaconesses.

Many of the ecclesiastical customs of the Nestorians are those also of the Jacobites (see above, § 5). But there are some differences. The Nestorian priests and deacons may marry, and if their wives die they may marry again; but the parish priests are not obliged to be married, though as a matter of fact they are hardly ever single men. The churches, which (especially in the mountains of Kurdistan) have exceedingly narrow and low doors, sometimes only accessible by a ladder, and which are often built for security in a cleft of a rock or in some almost inaccessible place, are nearly all of the same pattern. Outwardly they show no sign of Christianity save a small cross beside the church door. They have no towers or spires, such as the Armenian churches have. Internally they have a stone wall reaching to the roof and dividing the nave from the sanctuary; a doorway in this wall is covered with a veil which is drawn back at certain parts of the service. On the nave-side of this wall is a raised pace called *bema* (a name which in other Eastern communions means the sanctuary), and this again is bounded by a dwarf wall with apertures in the middle and at the side, where the clergy stand to communicate the people. This raised pace somewhat corresponds to the Greek *σολέας*.⁴ Against the dwarf wall, towards the nave, are projections (said to contain relics) for the cross and for books. The altar is attached to the east wall, and is usually built into a recess therein. It is oblong, not square as among the Greeks. The people stand in the nave to worship, the men in front, and the women behind; there are no seats, and if there is any occasion for sitting, such as a sermon, the people sit on the matted floor. Two other features of the churches may be noticed: a baptistery (also used as a vestry, and usually for baking the eucharistic bread), at the south-east corner of the church next the sanctuary; and a court (often open to the air) on the south side of the nave, where the daily prayers are said in summer. This is the usual arrangement, and is that of the church of Mart Mariam (St. Mary) at Urmi in Persia, which claims to be the oldest church in the world, and to contain the tomb of one of the Wise Men of Bethlehem, built (as the most ancient tombs are) into the wall of this church—in this case at the south-east corner of the nave.⁵ The people are called to worship by a wooden board (Syr. *nāqūshā*) hit by a mallet; this is the Greek *σημαντρον*.⁶ Bells are seldom used to summon to prayer, though there are often strings of small bells hung inside the church.

The vestments worn at the eucharist differ somewhat from those of the Jacobites. For a chasuble the Nestorians wear a kind of cope (*ma'āprā*), which has no fastening at the neck, and is very difficult to keep in position. The priests' stoles, like those of the West, do not differ in shape from those of the deacons; maniples and amices are not worn. Private confession, though often referred to in the service-books, is now obsolete. The fasts are the same as those of the Jacobites, but the fasts of the Apostles and of Mary are almost if not quite obsolete, as are some others mentioned in the East Syrian books. The Wednesday and Friday fasts do not in practice begin on (what we call) the evening before, but they end at sunset; all Eastern Christians reckon the day as beginning and ending at sunset, and our 'Sunday evening' is their 'Monday evening.'

The chief liturgy used by the Nestorians is that of 'the apostles Addai and Mari.' This liturgy has many early features, especially a form of eucharistic invocation of the Holy Spirit which is not as fully developed as that in most of the Great Liturgies. It prays that the Holy Ghost may come and rest on the oblation, and bless and sanctify it, that it may become (or be) for us for the remission of sins, etc.; and it does not explicitly mention the change in the elements. But the most curious feature is the absence of the words of our Lord spoken at the Last Supper, when after 'blessing' or 'giving thanks' He gave the sacrament to the disciples ('This is my body,' etc.). Neale¹ argues on *a priori* grounds that 'Addai and Mari' must have originally had these words. But this is a precarious statement; there are other instances of at least the partial omission of the words.² This liturgy in no way refers to the Nestorian controversy. On certain days of the year the anaphora of 'Addai and Mari' is not used, but that of 'Theodore the Interpreter' (of Mopsuestia) or that of 'Nestorius' is substituted, the first part of the liturgy, and the ending, being common to all three. All these anaphoras date, in some form, from very early times; the first probably, in its earliest shape, was compiled before A.D. 431; the other two are certainly not the work of the bishops after whom they are named, but are the work of East Syrian authors. The author of 'Nestorius' must have had a Byzantine liturgy before him, as many traces of that rite are found in it. But all three anaphoras are quite distinctly of the East Syrian, not of the Byzantine, family of liturgies. All three seem to have been composed before Narsai (end of 5th cent.), though doubtless many more modern additions have been made to them.

Eucharists do not occur very often among the Nestorians—some five or six times a year as a rule, though in a few churches weekly eucharists are the custom. The people communicate, as they pray, standing, the mothers holding up the very little children in their arms to receive. All receive in both kinds separately (the species of bread in their hands), except the very little ones, for whom the celebrant dips a small portion of the consecrated bread in the chalice and then puts it in their mouth. Reservation for the sick is not allowed. The eucharistic bread is leavened.³ All services, without exception, are sung; but no instrumental music is allowed.

The baptismal customs do not differ greatly from those of the Jacobites.⁴ The service is closely modelled on the eucharistic liturgies, than which

⁴ For a description see Maclean-Browne, p. 267 ff.

it is certainly later. There is, however, no kiss of peace. The triple immersion is absolutely total. As with all Easterns, the presbyter confirms, and lays his right hand on or over the neophytes; the use of the consecrated oil at this point is not explicitly mentioned in the service-book, but it is customary for the priest, when signing the neophytes with the sign of the cross, to do so with his thumb which he has dipped in the oil. There are now no interrogations or renunciations,¹ though they are alluded to in the 5th cent. by Narsai, where the renunciations have special reference to heresy.² Private baptism is not, in practice, allowed; if a village has no church, a child must be carried to another village which has one. Thus some children die unbaptized, though it is not likely that a person would grow up without baptism. Sponsors are considered as being akin to their godchildren, and the relationship is a bar to marriage.

The non-liturgical services are of great interest, and are extremely long, at least in theory. They consist mainly of hymns and anthems.³ The great number of martyrs in the East Syrian Church is reflected in the frequent mention of them by name in these anthems. The calendar is remarkable, and in some respects unique. Most of the saints' days fall on a Friday, and suit very well with the arrangement of the ecclesiastical year, which is divided into periods of about seven weeks each, more or less—Advent, Epiphany, Lent, Easter, 'The Apostles' (after Pentecost), 'Summer,' 'Elijah,' 'Moses,' and the 'Hallowing of the Church.' A few of the holy days, however, fall on fixed days of the month, as Christmas (Dec. 25), Epiphany (Jan. 6), St. George (April 24, etc.), St. Cyriac and St. Julitta (July 15 and Dec. 22), St. Peter and St. Paul (July 29), St. Mary (Aug. 15), Holy Cross Day (Sept. 13, not 14 as elsewhere). The twelve apostles are commemorated together on a Friday before Lent, the four evangelists on another, the 'Greek doctors' (Diodorus, Theodore, Nestorius) on a third, the 'Syrian doctors' (especially Ephraim, Narsai, Abraham [of Kashkar?, see above]) on a fourth. On other Fridays are commemorated St. James the Lord's brother, St. Mary, St. John Baptist, St. Peter and St. Paul (a second commemoration), Mar Abba or else the patron saint of the church, St. Stephen, the forty martyrs of Sebaste, all the departed, the Seventy, and some others.

The choirs are divided into two parts, and according as the first or the second choir begins the anthems the week is called 'Before' or 'After,' 'Before and After' (Syr. *Qdhām ū-Wāthar*) being thus taken for the name of the ordinary book of daily services. The *propria* for Sundays, fasts, and festivals are of very great length, and are contained in the books called *Hūdhrā* ('cycle') and *Gazzā* ('treasure'), two enormous MS volumes, and some others. These two are not published; but the complete East Syrian service for the Epiphany is given in English in Conybeare-Maclean, *Rituale Armenorum*, p. 288 ff. (from a MS in the Library of the Propaganda Fide in Rome), with the cues all filled in, and a part of these two books is published in Syriac in the *Breviarium Chaldaicum*. The Psalms are said (at least in theory) all through twice a week, and the whole Psalter is recited on festivals of our Lord. In the litanies, which are numerous, and one at least of which is said at almost every service, the ruling patriarch, metropolitan, and bishop of the diocese are commemorated by name. The marriage-service and the burial-service for

laymen (*anidhā*) have been published in Syriac.¹ The burial-service for the clergy (*kūrastā*) is much longer and more elaborate than that for laymen. These burial-services are most dramatic, and consist partly of dialogues between the departed and the mourners, or between the departed and those already in Sheol. After the funeral the kiss of peace is given, at least in the case of priests and bishops. All pass in line and kiss the hand of the departed, or a cross laid on his breast, and so take leave of him.² Badger gives an English translation of the baptismal-, marriage-, and ordination-services, and of the burial-service for priests.³

9. Christians of Malabar, or of St. Thomas.—Ancient tradition, in which, however, we can have little confidence, makes St. Thomas the apostle the first teacher of Christianity in India. The legend is told in the Syriac *Acts of Judas Thomas* (see above, § 4), which, curiously enough, makes Thomas (lit. 'twin') the twin-brother of our Lord. J. R. Harris sees here traces of the influence of the Heavenly Twins on Christian legend.⁴ The Ethiopic legend of St. Thomas⁵ is still fuller. Our Lord divides the world into twelve portions, and Thomas's lot is to go to India. Very unwillingly, but encouraged by our Lord, he goes, guided by Peter and accompanied by Matthias. Jesus appears in the form of a rich man, who sells Thomas as a slave, the price to be given to the poor and needy. Peter and Matthias return. Thomas is set to work as a stonemason, carpenter, and physician; but he afterwards explains that the buildings which he undertook to build were the souls which he won to Christ. He appoints a bishop, priests, and deacons, and departs in a cloud, having been miraculously clothed again in the skin which had been flayed off him. According to another account,⁶ he was pierced by soldiers' spears and died. The opposition is said to have been largely due to his preaching encratism,⁷ and persuading wives to forsake their husbands. The *Acts of Judas Thomas* says that the relics of the apostle were transferred to Edessa (A.D. 232?). It has been suggested by some that the name 'Christians of St. Thomas' comes from another Thomas than the apostle. This later namesake, Thomas Cannaneo, is variously assigned to the 4th or the 9th century.⁸ Another legend connects Pantænus of Alexandria (c. A.D. 200) with India, where, it says, the apostle Bartholomew had already preached.⁹ Pantænus is said by these writers to have found there a copy, in the Hebrew language, of St. Matthew's Gospel, and to have left it behind him.

The first certain historical testimony to the existence of Christians in India is that of the Alexandrian merchant who afterwards became a monk, and whom we know from his Indian travels as Cosmas Indicopleustes. He travelled far, and his *Christian Topography of the Whole World* in twelve books, still extant, is a valuable historical piece of evidence, though it is marred by the erroneous geographical conceptions of the day. The first six books may be dated c. A.D. 547, the rest c. 560. Cosmas's other works are not now extant. He travelled in India and Ceylon, and describes 'Mali' (identified with Malabar) on the Indian coast, the centre of the pepper trade. He

testifies to a large number of Christian churches on the coast of India and in Ceylon and Socotra, whose clergy, he says, were ordained by the Persian archbishop of Seleucia, and were subject to his jurisdiction; the Church there had had many martyrs and a large number of monks. Thus we may gather that the 'Christians of St. Thomas' are the fruits of the missionary activities of the Church of the Persian empire (see above, § 8), and that their Christianity had begun long before Cosmas's time, probably in the 4th century.

The subsequent history is somewhat obscure. Immigrations of Christians to Malabar from Baghdad and elsewhere occurred twice in the 8th and 9th centuries, and the immigrants intermarried with the native Christians. The later of these movements was under two Nestorian priests (bishops?), Mar Sapor and Mar Peruz. The fame of the Malabar Christianity spread to the West, and King Alfred of England sent ambassadors to that country.¹ The converts were protected by the king of Cochin. They had their bishop at Angamala, and he was styled 'Metropolitan of India,' having in his jurisdiction 1400 churches and 200,000 souls in the whole district.²

A theory has lately been put forward by P. T. Geevergese, a native Malabar Syrian, in a tract entitled *Were the Syrian Christians Nestorians?*, to the effect that the Malabarese were Jacobites till the 15th cent., when they became Nestorians for a hundred years. It is agreed that their Church was originally founded from Seleucia-Ctesiphon, and that they were under the Catholicos of the East in the pre-Nestorian period; but this writer maintains that thereafter they depended on the Jacobites, not on the Nestorians. The only argument of any importance adduced in favour of this theory is the existence of two inscriptions at Kottayam, a town of Travancore, in Pahlavi, the official language of the Persian empire during the Sasanian dynasty; they are said to be of the 7th or 8th century. One of the inscriptions has a line also in Syriac, in Estrangéla characters, perhaps of the 10th century. The two run thus: (a) 'In punishment by the cross (was) the suffering of this One, He who is the true Christ, and God above, and Guide ever pure'; (b) 'Let me not glory save in the cross of our Lord Jesus Christ] who is the true Messiah and God above and Holy Ghost.' The words in square brackets are in Syriac. Geevergese amends 'Holy Ghost' to 'Guide ever pure' as in the former inscription. These are said to be anti-Nestorian. But is this the case? The 'Nestorians' of the Persian empire never failed to assert that He who died upon the cross was God. The existence in Malabar of an old Jacobite Bible of the 12th cent. or earlier proves nothing in the absence of evidence as to when it was brought there. The suggestion that the Portuguese inquisitors found some liturgical practices existing which showed traces of Jacobite rather than Nestorian influence, though *ex hypothesi* the latter had been predominant for over a hundred years, will hardly bear examination. Thus the inquisitors mention a liturgy 'of Diodorus' as being in use. There is no such known Nestorian liturgy. Therefore, it is maintained, the liturgy in use was non-Nestorian, i.e. Jacobite. It would indeed have been remarkable if the Jacobites had named one of their liturgies after the real father of Nestorianism. Renaudot³ supposes that 'Diodorus' is here a mistake for 'Theodorus,' but, as the Synod of Diamper mentions both Diodore and Theodore, this is very unlikely.⁴ Geevergese agrees that the Nestorians of the Tigris valley at the end of the 15th cent. and the beginning of the 16th sent bishops to Malabar, on the request of deputies who had come thence, and he maintains that these converted Malabar from Jacobitism to Nestorianism. It does not appear to the present writer that Geevergese has proved his theory; but there is possibly this amount of truth in it, that certain of the Malabarese Christians, who have unfortunately always been conspicuous for quarrelsomeness (like their spiritual ancestors), may have had dealings with the dissentient Jacobites of the Tigris valley, or with the Western Jacobites, before the 15th century. Thus a deputation is said to have gone to the Monophysites of Alexandria to ask for a bishop for 'India' (Malabar), A.D. 695.⁵

An ecclesiastical revolution was effected by the Portuguese in the 16th century. They established the Inquisition at Goa in 1560. The Synod of Diamper, in the south of Cochin, held in 1599 under Alexius de Menezes, archbishop of Goa, united the Malabarese, then estimated at about 200,000 souls,⁶ to Rome, and rooted out all traces of Nestorianism. Celibacy of the clergy was enforced, and made retroactive. All old books

and liturgies were destroyed, or radically altered, so that probably there does not now exist a single complete copy of the liturgies as used before the synod. Renaudot remarks¹ that the Portuguese censors incautiously condemned things which had nothing to do with Nestorianism. The liturgy which they found to be principally used was closely related to, or practically the same as, the Nestorian 'Addai and Mari' (see above, § 8). An English translation of this² is published by J. M. Neale,³ who says⁴ that it is given as revised by Menezes and the Synod of Diamper. Yet this cannot be altogether the case, as it contains the names of Nestorius, Diodore, and Theodore, as well as of Ephraim, Abraham, and Narsai (see above, § 8), and the phrase 'Mother of Christ' for 'Mother of God' (see below). Neale gives some of the prayers in what was probably the original order, but indicates by numbers the order in the form approved at Diamper.

The change from ancient customs was effected only after great opposition on the part of the Malabarese themselves, who rallied under their bishop, Mar Abraham († 1597). It was his death that made the Synod of Diamper and the real union with Rome possible.⁵

It is interesting to notice the changes of custom and of liturgy effected at Diamper. Up to this time the Malabar Christians had had but a single bishop at a time; hence, perhaps, arose the custom for the chrisam at confirmation to be consecrated by a priest (*catanar*) rather than, as elsewhere in the East, by a bishop; indeed, the Malabarese were accused of not having had confirmation at all,⁶ though this is clearly a mistake. The chief changes in the eucharistic liturgy made at Diamper were the following. The pope's name was substituted for that of the patriarch of Babylon. For the names of Nestorius, Diodore, Theodore, and other 'Nestorian' fathers, those of Cyril (of Alexandria) and others were substituted. The phrase 'Mother of God' replaced 'Mother of Christ.' Where, before the consecration, the words 'the body,' 'the blood,' occurred (as often in Eastern liturgies by anticipation), the words 'bread,' 'wine,' were substituted. In the 'Nicene' creed the phrases 'God of God, Light of light, very God of very God,' which were said to have been wanting in the Malabar form, were inserted; probably what is meant is that the first two of these phrases were wanting in Malabar, as they do not occur in the Nestorian creed (see above, § 3). The phrase 'consubstantial with the Father' was substituted for 'Son of the essence of the Father,' the usual equivalent in Syriac (Neale unfortunately does not give the text of the creed in his Malabar liturgy). The host was ordered to be elevated at the consecration. But the chief change was a reversal of prevalent Oriental conceptions of liturgy. The epiclesis, or invocation of the Holy Ghost, was moved from its place after the narrative of the Last Supper and placed before it,⁷ the wording being altered so as to make the epiclesis refer only to a good reception of the sacrament. For these changes see Howard, p. 40; but two of his statements appear to be doubtful. The Portuguese censors probably found no narrative of our Lord's words at all, as they were working on 'Addai and Mari' (see above, § 8); they probably therefore inserted them from one of the other anaphoras, though not in the place where

they are found in those anaphoras, but in the place which they thought most suitable. The other statement, that the Portuguese altered the wording of the epiclesis, is also doubtful, for, as Neale gives it,¹ it agrees exactly with the epiclesis of 'Addai and Mari,' which, as we have seen, is of a somewhat early type, throwing most of the emphasis on the effects and purpose of the consecration, for the benefit of the communicants, rather than on the change effected in the bread and wine. The history of the changes at Diamper fully justifies Renaudot's dictum quoted above, and shows that the Portuguese censors were quite ignorant of liturgical science.

The Portuguese changed the episcopal see from Angamala to Cranganor on the coast, so that it might be more accessible to them, and that they might have a greater hold on the native Church. But during the whole time of their rule in India they aroused constant opposition from the Malabarese, whom the terrors of the Inquisition were never able entirely to subdue.

In 1663, after more than 60 years of Portuguese rule, the Malabarese were enabled by the Dutch conquests in India once more to assert their independence, induced thereto by the murder of Theodore, a bishop sent from 'Babylon.' The Dutch expelled the Jesuits from Malabar soon after 1663. But the Malabarese were not united among themselves, and about half remained in obedience to the Roman see, while the rest became independent of it. These last gladly accepted Gregorius, Monophysite bishop of Jerusalem, who came from the Jacobite patriarch at Mardin in 1665. Gregorius consecrated Thomas as metropolitan, and since then the Malabarese have been in the main Jacobite. This change of front appears remarkable at first sight. Yet we must remember that in their origin neither the Malabar Church nor her mother, the East Syrian Church, was Nestorian, for they both existed before Nestorianism was propounded. And, though many East Syrians were genuinely Nestorian, it is very doubtful if their Church was consistently and officially so; still less certain is it that the Malabarese were strongly imbued with that doctrine. Hence we can understand why they grasped at the first hand that was stretched out to help them in getting rid of the Western authority which was imposed on them, but under which they had never rested content.

In the year 1700 and afterwards Nestorian bishops were sent, but they only secured the allegiance of a minority. In the 19th cent. the history is one of constant litigation between rival parties. The Nestorians of Malabar, after many lawsuits, won recognition in the courts and part of the endowments. In the year 1850 they obtained a bishop from Mar Shimun, the Nestorian catholicos (see above, § 8). Later, another was sent, but he was murdered by robbers on the journey. In 1907 Mar Shimun consecrated Mar Timotheus (Abimelech), who now holds office.²

There are now perhaps 300,000 Syrian Christians, all told, in India; the majority are Jacobites, and have since the 17th cent. adopted the Jacobite liturgies and customs.³ The metropolitan usually consecrates his own successor, from the family in which the archidiaconate has been hereditary. The archdeacon is called *ramban*. The eucharist is only rarely celebrated; the laity must communicate at least three times in the year,⁴ but there are often eucharists without lay communicants. The churches are plain, consisting of nave

and chancel without transepts.¹ There is one altar, the so-called 'side altars' being used only, as in the Nestorian churches, for holding a cross, or books, or the like. The altar itself is 4 ft. high by 6 ft. long and 3½ (or 4) ft. wide, sometimes of stone and sometimes of wood. It stands out from the east wall, as in the Jacobite churches of Mesopotamia, in contrast to the Nestorian altars. At the eucharist the altar is covered with a white cloth, and has a frontal. On it are placed a wooden cross (often with the figure of our Lord painted on the wood), two candlesticks, a book-stand, a slab of wood or marble for the chalice and paten to rest upon, a 'sponge' of silk for wiping the priest's fingers and for cleansing the chalice after the service, and three veils for the chalice and paten. The bread is leavened, and must be prepared on the day when it is used; each bread is round, and stamped with a cross. It is called variously *Qorbānā* ('Oblation'), 'first-begotten,' 'the Seal,' 'the Body,' 'the Coal' (Is 6^o). These are common Syrian names elsewhere for the eucharistic bread. The naves of the churches have earthen floors; they have no furniture except two bells inside the church; a gallery is often placed at the west side of the nave. On the nave-side of the chancel arch there is a space railed off, not unlike the Nestorian *bema* (see above, § 8), but some 12 ft. wide as compared with a 3 ft. width of the *bema*. The churches sometimes have pictures;² this is probably a relic of Portuguese influence. There is always a veil at the chancel arch, which is drawn back at certain parts of the service. Externally the churches have little adornment; the west front has three storeys, and is whitewashed. The roof is high-pitched, that of the chancel being always higher than that of the nave. The vestments worn seem to be much the same as those of the Jacobites of Mesopotamia (see § 5), and are more elaborate than those of the Nestorians. At the eucharist the celebrant wears special shoes, whereas the Nestorians take their shoes off; also a black serge or coarse cotton robe (perhaps a sort of cassock), a white linen albe, a stole in one piece with an opening for the head, girdle, maniples, chasuble (or cope) of silk damask, and cap.³ At ordination the clergy receive the tonsure,⁴ as do the Nestorians, the latter, however, only cutting off some of the ordinand's hair in the form of a cross. As in the worship of all Syrian Christians, much incense is used at the eucharist and other services.

In some externals, especially in the matter of vestments, the Nestorian Malabarese seem to have assimilated their customs to those of their Jacobite neighbours.

10. Modern missions.—Besides the Jesuit, Dominican, and Lazarist missions to the Uniat bodies mentioned in § 6, there have been during the last 80 years various missions to the Jacobites and Nestorians. The American Presbyterian and Congregational Boards of Missions have long had missionaries among them; the Archbishop of Canterbury's educational 'Assyrian Mission' has worked among the East Syrians since 1886; and later the Russian Church sent a mission to them. Similarly missionaries from the West have laboured among the Malabarese in India. To all these missions we are largely indebted for a knowledge of the people, and for the publication of the Bible in classical and vernacular Syriac, of patristic texts, and of other liturgical and educational works.

London, 1855; R. Payne Smith, *Thesaurus Syriacus*, 2 vols., Oxford, 1870-1901. The Bible in the Urmî dialect has been published by the American Bible Society, New York, 1893 (earlier edd. at Urmî), and many books in the same dialect have been published at Urmî by the various Mission presses there.

vii. *LITURGICAL BOOKS USED BY SYRIAN CHRISTIANS*.—(a) *Translations*.—F. E. Brightman, *Liturgies Eastern and Western*, i., Oxford, 1896 (has Eng. tr. of 'Syriac St. James' [West Syrian] and 'Addai and Mari' [East Syrian], and a Latin translation of an East Syrian liturgy in fragments first published by G. Bickell); J. P. Margoliouth, *Liturgy of . . . Addai and Mari* (with two other East Syrian liturgies and the baptismal service), London, 1893; E. Renaudot, *Liturgiarum Orientalium Collectio*, 2 vols., Frankfurt-on-Main and London, 1847, vol. ii. (Latin tr. of several Syriac liturgies, Eastern and Western); A. J. Maclean, *East Syrian Daily Offices*, London, 1894 (Eng. tr.) and *East Syrian Epiphany Rites* (Eng. tr. in one volume, with F. C. Conybeare's *Rituale Armenorum*), Oxford, 1905; G. P. Badger, as above (v.) (Eng. tr. of East Syrian liturgies, etc.); G. B. Howard, as above (v.) (Jacobite Malabar liturgies); H. Denzinger, *Ritus Orientalium*, 2 vols., Würzburg, 1863-64 (baptismal-, marriage-, and ordination-services of the minor Eastern Churches, etc.; Lat. tr.); J. M. Neale, *The Liturgies of St. Mark . . . and the Church of Malabar*, London, 1859 (Eng. tr. of the Malabar Nestorian liturgy). (b) *Syriac texts*.—For the Nestorians the Archbishop of Canterbury's Assyrian Mission has published from the old MSS: *Tākhā* (the three anaphoras, baptismal-service, etc.), London, 1890; *Qāhām ū-Wāthar* (Daily Offices), do. 1892; *Liturgical Psalter*, do. 1891; *Lectionary Tables*, do. 1889; *Sūrgādāhā* (calendar tables), do. 1894; *Būrākhā* (marriage-service), do. 1892; *Anidhā* (burial-service for laymen), do. 1900; *Bā'ūthā* (service for the Rogation of the Ninevites), do. pt. i., 1894, pt. ii., 1902. For the Uniat Chaldeans the Lazarists have published similar works adapted to that community, especially *Liber psalmsorum, Horarum Diurnarum, Ordinis Officii Divini et Psalterium Rogationum*, Paris, 1886; *Breviarium Chaldaicum*, do. 1888; older is the *Missale Chaldaicum*, Rome, 1767 ('Addai and Mari' only). For the Uniat Malabarese see *Ordo Chaldaicus . . . juxta ritum ecclesie Malabarice*, Rome, 1775 and 1844. For the Jacobites no Syriac text of St. James appears to have been published (Brightman, i. p. lvi), but for the Syrian Uniates see *Missale Syriacum*, Rome, 1833, and *The Book of the Clerks* (in Syriac), Beirut, 1883. For the Maronites see *Missale Chaldaicum juxta ritum . . . Maronitarum*, Rome, 1592 and 1716, Qozhaya, 1816, 1833, and 1855, Beirut, 1888; *Liber ministri missae*, Rome, 1596 and 1715; *Diaconale Syriacum*, do. 1736. An old but general collection of texts and Latin translations is J. A. Assemani's *Codez Liturgicus Ecclesie Universæ*, Rome, 13 vols., 1749-66 (eucharistic liturgies, baptismal offices, ordination-services, etc.). For a fuller bibliography of Syriac liturgies see Brightman, as above (Introduction).

T

TABERNACLES.—See FESTIVALS AND FASTS (Hebrew).

TABU.—The word 'tabu' is properly an adjective and appears to mean literally 'marked off' (perhaps from Polynesian *ta*, 'mark,' *pu*, 'exceedingly'). Applying equally to persons and things, it signifies that casual contact with them is forbidden as being fraught with mystic danger. Custom enjoins a negative or precautionary attitude towards them because of the supernatural influence with which they are temporarily or permanently charged. In short, they are 'not to be lightly approached,' and that always for some magico-religious reason. The term is native to the Pacific region, but has been adopted, with some modification of meaning, to designate a fundamental category of comparative religion. Thus, as in regard to the cognate term *mana* (*q.v.*), it is advisable to distinguish the local from the generalized sense.

i. Local meaning of tabu.—(a) *Cook's discovery of tabu*.—'Taboo,' used indifferently as adjective, noun, or verb, was introduced into English by Captain Cook. He first met with the word, in 1777, at Tonga.¹ Hence, by the way, the popular-

¹ See J. Cook and J. King, *A Voyage to the Pacific Ocean*, 1776-80, London, 1784, l. 286, and *passim*.

ization of the Tongan form *tabu*, *tapu* being usual elsewhere in Polynesia, with *kapu* in the Hawaiian group; though in Melanesia *tabu* again occurs, as also *tambu*. When Cook later on discovered the Sandwich Islands, he found the institution of tabu prevailing there with even more rigour than at Tonga, whereas it seemed to him to have been less strictly observed in the Society Islands, except as regards the tabu resulting from contact with the dead.¹ He gives a clear and consistent account of the notion involved, stating that tabu 'has a very comprehensive meaning, but in general signifies that a thing is forbidden,' being 'applied to all cases where things are not to be touched.' He also emphasizes its 'mysterious significance' and duly notes the 'mixture of religion' in a certain ceremony concerning which 'we seldom got any other answer to our inquiries but *taboo*.'² Moreover, he makes it clear that religion herein made common cause with law and government. In reference to the same ceremony, he says: 'When we returned to the king, he desired me to order the boat's crew not to stir from the boat; for, as every thing would, very soon, be *taboo*, if any of our people, or if their own, should be

¹ *A Voyage to the Pacific Ocean*, 1776-80, ii. 249.

² *Ib.* i. 286, 350, ii. 40.

found walking about, they would be knocked down with clubs, nay, *mated*, that is, killed.¹

Indeed, Captain King (who carries on the story after Cook's death) is perplexed to decide how far the 'implicit and scrupulous obedience' of the natives in regard to the prohibitions laid upon them—as when Karakakooa Bay was tabued, at the request of the navigators, while the remains of Captain Cook were being committed to the deep—was due to some 'religious principle' and how far to 'the civil authority of their chiefs.'² The whole account, however, makes it clear that king, chiefs, priests, and the gods themselves, formed one undivided theocracy, whereof tabu constituted the chief instrument, at once spiritual and temporal in its nature and effects. More especially, it ensured a complete control of the economic situation. Thus at Tonga the special officer who 'presided over the *taboo*' was a veritable food-controller:

He and his deputies inspected all the produce of the island; taking care that every man should cultivate and plant his quota; and ordering what should be eat, and what not. By this wise regulation, they effectually guard against a famine; a sufficient quantity of ground is employed in raising provisions; and every article, thus raised, is secured from unnecessary waste.³

For the rest, tabu was the corner-stone of the class-system, ensuring the subjection of women to men, of the lower orders to the chiefs, and of all to the king, whose very name was tabu on penalty of death.⁴

(b) *Primary connexion of Oceanic tabu with a theocratic system.*—Here, then, in this alliance of the religious with the civil forms of authority, we have the distinctive mark of tabu as understood in its local sense. R. Taylor's definition of it, as 'a religious observance established for political purposes,'⁵ hits off what is at any rate its leading aspect in Oceania. In the Polynesian islands a class of chiefs with a social influence proportionate to their *mana*, or supernatural power, was everywhere recognized; and in the Eastern groups at any rate there were supreme potentates who might fairly be termed kings, though sometimes, as at Tonga in Mariner's day, the religious head of the community might be said to reign while the war-chief, his inferior in the hierarchy, actually governed.⁶ On the other hand, no chieftainship proper is to be found in Melanesia. Here, however, the secret societies exercise a tumultuous, but none the less forcible, control over affairs by means of tabu; while, conversely, 'in cases where the English word taboo can be employed there is always in Melanesia human sanction and prohibition.'⁷ Thus there is every reason to suppose that throughout the Pacific we have to do with customs belonging to a single type. This view is supported by the remarkable fact that, despite the diversity of tongues obtaining in this wide area, the word tabu in one of its dialectical forms, as well as the complementary term *mana*, is in general use. But, if the nature and name of the institution are uniform, so presumably will be its origin. On the strength of this argument, W. H. R. Rivers has recently tried to show that tabu in its Oceanic distribution stands everywhere alike for the prestige acquired and the authority exercised by an immigrant folk—his so-called '*kava* people'—in its dealings with an indigenous population of markedly inferior culture.⁸ It is interesting to speculate how a system of tabus may have developed on the spot under stress of such

culture-contact—how, for instance, barbarians, already worshipping gods and respecting private property, might come to impose their will on magic-haunted communistic savages, for whom threats rather than reasons must be provided as the grounds of obedience. On the other hand, if the immigrants came from Indonesia, as the theory assumes, it is also possible that they brought some form of the custom with them ready-made, since the Indonesian *pomali* is 'exactly equivalent to the "taboo" of the Pacific islanders.'

This in Timor 'the custom of "tabu" called here "pomali," is very general, fruit trees, houses, crops, and property of all kinds being protected from depredation by this ceremony, the reverence for which is very great. A palm branch stuck across an open door, showing that the house is taboed, is a more effectual guard against robbery than any amount of locks and bars.'¹

This mode of indicating a tabu is similar to the Oceanic. Thus, when Cook wished to set up his observatory in the Sandwich Islands, the priests tabued the place for him by setting up wands;² and the *soloi*, or tabu-marks, of the Banks group in Melanesia usually consist of the leaves of some plant.³ It may well be, then, that the property-mark, with its implication of a transferable curse, came into Oceania along with the notion of private ownership. It certainly was most effective in protecting property—far more so than the guns which the early mariners discharged at the thievish islanders with a like object in view.

(c) *Secondary developments of tabu in Oceania.*—It remains to note that, whereas the essence of tabu in its local signification consists, as has been shown, in a theocratic form of government, which in its turn may have developed by way of an apotheosis of landlordism, the ramifications of the notion are endless and cover the whole religion of Oceania, at any rate so far as it is taken in its negative aspect, namely as a system of scruples. The theocracy could consecrate a site, or devote a victim, or appropriate a house or canoe, or betroth a woman, or proclaim a rest-day for men or a close-time for game, all these being cases of the communication of tabu by a ritual act of imposition, such as could at will be neutralized by a ceremonial removal.⁴ On the other hand, many tabus were inherent rather than acquired, such as those associated permanently with women, strangers, the sick, and the dead, or for the time being with the woman in child-birth or the warrior on a campaign. The world-wide distribution of similar beliefs concerning an infectious impurity makes it extremely improbable that they can be referred in the mass to an immigrant culture or treated as mere reasons of state, the by-products of the administrative scheme. At most we may say that, in so far as the direction of affairs was centralized and deliberate, they were incorporated in the political machine and to a like extent became subject to manipulation. Thus, at Hawaii in 1819, King Rihoriho at one stroke abrogated the laws of the tabu; though only, let us note, to make way for *la tabu*, the British Sunday.⁵ So much, then, for the local or Oceanic sense of tabu with its special connotation of a theocratic system of controls, a more or less consciously organized body of sanctions backed by the joint authority of Church and State.

2. *Scientific meaning of tabu.*—(a) *Tabu as an aspect of rudimentary religion.*—For the purposes of the science of comparative religion it is convenient to drop the implication of a human sanction and to insist solely on the supernatural

or mystic aspect of the penalties in store for the tabu-breaker. In this way it is possible to bring together under one head a large variety of avoidances characteristic of the less advanced peoples, of whom it may broadly be said that they have no king but custom. Just as their response to traditional rules is largely automatic, so, correspondingly, the rule itself has imputed to it a no less automatic power of self-maintenance and self-vindication. Indeed, so necessary is it for general purposes to lay stress on the immanence of the sanction normally attributed to a tabu that it is safer to deny the name altogether to prohibitions deriving their force mediately from a god or his earthly representative and to distinguish these as religious interdicts or bans. Tabu, in short, is to be understood as meaning 'unlucky to meddle with' rather than forbidden by edict human or divine. It belongs to what may be termed the perceptual (Lévy-Bruhl would say 'prelogical') stage of religion, when values are massively apprehended without analysis of their grounds. At this stage emotion of the collective or mobbish order is paramount as regards both the excitatory and the inhibitive processes that govern the social life. Now of all the emotions fear is inhibitor-in-chief, having in virtue of its haunting quality a special power of sustained control. A primary source of fear is the unfamiliar or strange as such; and this kind of fear in varying degree is always present as an element in that complex emotion of awe or reverence which is the root of religion. Tabu, then, stands for the whole mass of such fear-inspired inhibitions in so far as they proceed directly from the religious emotion, as it regulates the social tradition in the relative abeyance of reasoned direction. Here we have at any rate the psychological clue to a vast variety of customary abstinences—'negative rites,' as they may be called—of which the particular conditions are a matter for historical treatment in detail.

(b) *Tabu and the notion of contagion.*—It may next be noted that emotions are infections. It is, indeed, the leading principle of mob-psychology that emotions are propagated more readily than ideas, their external manifestations lending themselves to unintelligent imitation. Moreover, fear is, perhaps, the most infectious of all. Hence the fear-inhibition embodied in tabu always implies an infectious unluckiness—a transferable curse or meddlers. As A. van Gennep in his analysis of the *fady* (= *tabu*) of Madagascar shows, the institution rests on two notions, one being that of *tohina*, 'contagion.'¹ 'Everything,' says Jevons, 'which comes in contact with a tabooed person or thing becomes itself as dangerous as the original object, becomes a fresh centre of infection, a fresh source of danger to the community.'²

Jevons goes on to discriminate between 'things taboo,' the primary sources of such contagion, and 'things tabooed,' in which the tabu-infection is not inherent but derivative.³ 'A single thing taboo might infect the whole universe,' as he says with pardonable exaggeration;⁴ but in practice the transmissible fear is strictly limited in its possible effects, being confined to certain channels prescribed by convention. Meanwhile it is not always easy to draw the line between the two classes. The clearest cases of 'things tabooed' are those in which, as in Oceania, a divine chief tabus something hitherto common, or *noa*—say, a hunting-ground—and then after a time restores it to ordinary use. But, when Jevons accepts at its face-value the Polynesian explanation that the

tabu on the sick is due to the fact that they are possessed by an *atua*, or spirit, and therefore pronounces them 'tabooed but . . . not taboo,'¹ it is at least arguable that a 'pre-animistic' basis must be sought for the belief; for what more perceptibly contagious than certain (and those precisely the stranger and more alarming) forms of disease? It is surely no mere superstition to suppose that sickness—nay, as it were, death itself—is 'catching.' On the other hand, it is hardly profitable, in deference to the theory that the emotions of man afford the best criterion of his instincts, to regard 'things taboo' as so many danger-signals to which mankind has an innate predisposition to attend. Tabu need rather to be studied in relation to their proximate conditions, which are not biological but historical. In other words, tabus are primarily matters of custom, forming part of the social inheritance, not of the individual heredity.

(c) *Tabu and the notion of supernatural power.*—The other notion on which the tabu of Madagascar rests, according to van Gennep,² is that of *hasina* = *mana*, or supernatural power. The person or thing is not to be trifled with, because liable to react with a force of unknown range and degree. There is a spiritual electricity that must be insulated lest it blast the unwary. Now, if religion were all fear, such *mana* would rank as wholly bad, since fear is a shrinking from evil. But other primary constituents of the religious mood make rather for interest, receptivity, approach, communion. For reckless self-assurance, indeed—for what the Greeks knew as *ὕβρις*—there is always 'the devil to pay.' But fear tempered with wonder and submissiveness, and thus transmuted into reverence, is the forerunner of love. So *mana* has its good side as well, though from the standpoint of tabu this helpfulness remains, so to say, in reserve, being a consummation that lies beyond the purview of the fear-inhibition as such. Meanwhile to an advanced theology that has clarified its concepts by the method of antithesis the savage apprehension of *mana* by way of tabu seems blurred and equivocal, an experience of something monstrous, half-devil and half-god. And that there is some such ambiguity in the value perceived cannot be denied. The sacred and the abominable, the pure and the obscene, the hallowed and the accursed pivot within the same perturbed awareness of the object. Nevertheless, rudimentary religion has gone a long way towards defining in practice, if not in theory, the good and the bad manifestations of the hidden power. Thus the novice at initiation or the warrior on a campaign is tabu that he may seek and find grace in the self-concentration that ensues after spiritual crisis overcome. On the other hand, the criminal is tabu because his very soul is attainted; wherefore, as the words of his doom, 'Sacer esto,' imply, he cannot touch water and fire lest he sully their purity with his foulness.

(d) *Tabu as a source of personal religion.*—At this point it may be observed that the institution of tabu is not only the main organ of social discipline at the lower levels of culture, but likewise the seed-bed of personal religion. The latter function hinges on the fact that to be tabu with respect to society is at the same time to be tabu in relation to oneself. The external signs of this self-regarding attitude of precaution are often ludicrous enough, as when a man cannot feed himself, or must scratch his head with a stick, or needs to snuff up the holiness that exudes from his fingers. But an inward-seeking view reveals a profit even in such practices. The *mana* to be conserved is just that part of a man that he feels to be most

worth the saving—the will for power. Such power may be coveted for temporal ends. Savage shepherds of the people are not more disinterested than the rest of their kind. But at least it is proximately envisaged as a spiritual power. At least it is the sort of power that comes with and after self-abnegation and the exercise of humility. There is good evidence, too, that a sense of unworthiness consequent on the violation of his self-regarding tabus—as one might say, his ‘vows’—is enough to cause voluntary resignation of office on the part of the primitive wonder-worker. There can be no doubt, then, that the experience both of the access of inspiration and of its withdrawal is often perfectly genuine; and, again, that the due safeguarding of such a gift is a lesson first acquired in the school of tabu. Further, not to lay exclusive stress on the ecstatic experience peculiar to the religious genius, the whole development of personality, so far as this comes about by way of reverie and reflexion, arises largely out of the tabu condition. No other such opportunity is afforded in the gregarious life of the savage tribesman for that self-communing whereby man eventually becomes master instead of slave of the sense-world. Self-respect, again, is nourished on privacy; the king or priest must keep his distance from the *profanum vulgus*, lest he make himself cheap not only in their eyes but also in his own.¹ For the rest, tabu stands for the etiquette of savage life, and by encouraging mutual consideration enables manners to ripen into morals, the end of which is freedom.

(e) *Danger of the over-development of tabu.*—Hitherto the fruitfulness, the educative value, of tabu as a factor in religion of the perceptual or rudimentary type has been chiefly signalized. After all, the inhibition of impulse affords the measure of human advance. But such inhibition may be overdone, with paralysis of the will to live as a consequence. Tabu as such represents negation, and a religion made up mostly of negations is necessarily sterile. Denial, even self-denial, cannot but be soul-destroying, if taken as an end in itself. Hence a meticulous scrupulosity is a mark of degraded religion. Nothing, e.g., is so characteristic of the dairy-cult of the Todas as the web of tabus in which every action of the priest-dairyman is emmeshed, and Rivers not without good reason comments: ‘The Todas seem to show us how the over-development of the ritual aspect of religion may lead to atrophy of the ideas and beliefs through which the religion has been built up.’²

Even a positive rite such as prayer may degenerate into formalism. Much more is this likely to happen with the negative rite or tabu, wherein the nature of the spiritual activity subserved is less immediately manifest. In the last stage of such decay—and in this also the case of the Todas is instructive³—the scrupulosity itself tends to become a sham, an organized hypocrisy of evasions. The function of ritual in religion is to relieve attention in regard to things indifferent, and of negative ritual to do so in regard to things actually disturbing—all this in order to set attention free for active converse with the divine. It is true that there is in many forms of religious experience—and they are perhaps especially to the fore in rudimentary religion—a characteristic prelude of apparent inaction, a spell of listening, as it were; and, so far as the tabu condition corresponds to this halt on the threshold, it is apt to seem barren of results when it is not. To judge fairly in each case, we must watch the ritual drama as a whole

¹ Cf. *kapukapu*, ‘to put on airs of distance or separation from others,’ with *mamana*, ‘to respect oneself,’ in E. Tregear, *The Maori-Polynesian Comparative Dictionary*, Wellington, N.Z., 1891, pp. 203, 473.

³ *Ib.*

to see whether the passivity induced is of the pregnant order. As an incident in a ‘rite of passage’ to a higher plane of experience, the chrysalis stage of the soul is symptomatic of development. If, on the other hand, the will to win through be somehow asphyxiated on the way, negation has triumphed; too much safeguarding has destroyed; the husk has stifled the germinal process.

(f) *Methods of studying tabus in detail.*—This cursory sketch of tabu aims at no more than a generalized version of the institution as it bears on the earlier growth of the spirit of religion. A fuller treatment might be based on the study of the particular systems of tabu native to the various ethnic areas—as has here been attempted only in regard to the Pacific region—when many differences of detail and shades of local colour would doubtless come to light. In defence of the present method, however, it can be urged that to deal with tabus on the ethnological principle would well-nigh involve a survey of religions on the same distributive plan, since every savage people has a religion and every savage religion has its tabus. Nay more, savage religion tends to be co-extensive with the social life itself; so that a regular panorama of cultures may seem to be the logical outcome of such a method. Another way of dividing up the subject (but one again that must inevitably lead too far afield) would be that of distinguishing certain main departments of activity typical of primitive society as a whole and showing how each is conditioned by its own set of special tabus. The food-interest, e.g., is engirdled by one vast network of ritual controls, the sex-interest by another. Indeed, the critical stages of every vital process are hung about with such customary danger-signals. Sometimes these traditional fears can be shown to correspond to facts; more often they appear arbitrary, sheer aberrations of fancy, due to false analogy or what not, that have been incorporated in the tribal lore by a historical chance. Thus, however detailed our study of tabus, we are not likely to arrive at the explanation of minor features. For these reasons it has seemed preferable here simply to enlarge on the general principle that, at the primitive level, the object of religious belief or worship is always tabu, just as it is always *mana* as well; and that, moreover, tabu forms the hither aspect of the religious experience, inasmuch as fruition is reached through fear.

(g) *Tabu from the standpoint of civilization.*—Tabu being properly an institution of savagery, it would hardly be in point to consider at length its ulterior consequences for civilization—as apart from its survivals in folk-lore, which indeed are numerous. But a word about such after-effects may be added by way of conclusion. We must not look for them solely within the sphere of religion as it is now. With the gradual substitution of a rational for an emotional system of controls, there has come about a decentralization of authority whereby disciplines once merged in an all-pervasive religious sanction have been invested with quasi-independent functions. Politics to-day deals with the divine right of kings, law with the sacredness of property, morals with the virtues of temperance and chastity, and so forth. In all such cases the tendency is to refuse any validity to the old-world sentiment of tabu. Reason prefers to rest its case on grounds of so-called common sense. At most the immediacy and seeming unconditionality of the tabu-feeling might enlist the sympathies of certain schools of ethical thought. As for modern religion, while it hesitates to adopt a rationalist outlook, it is naturally anxious to purge its traditional rites of the mildew of ancient superstition. On all sides, however, so far as the influence of a philosophy of man makes

itself felt, there is of late manifested a deeper interest in the emotional life, more especially as it relates to conduct. Alike in social psychology with its study of the crowd and in individual psychology with its doctrine of the subconscious the conviction is growing that society and mind alike are controlled from below, as it were, as well as from above—that reason is at best a constitutional ruler whose authority rests not on force but on consent. It may be, then, that, examined from this point of view, the primitive institution of tabu will be found to embody elemental principles of order that to-day are as active as ever beneath the surface of a changed custom. Experience, which is experiment, has doubtless taught us to reject many a freakish usage dear to the old order; but this experience, which in its most critical form is science, bids us seek beneath the accidents of history for those essential laws whereby our racial sense of direction is continuously maintained.

LITERATURE.—(i.) For tabu in Oceania see the works cited above, early authorities such as Cook and Mariner being especially enlightening, since the original social system has long been gone, at any rate in Polynesia; compare also Th. Waitz and G. Gerland, *Anthropologie der Naturvölker*, Leipzig, 1859-72, vi.; W. Ellis, *Polynesian Researches*, London, 1831, iv.; G. Turner, *Samoa a Hundred Years Ago and Long Before*, do. 1884; *Old New Zealand*, by a Pakeha Maori, do. 1884; since the same cultural influences presumably extend to Indonesia and the Malay region (including Madagascar), see also W. W. Skeat, *Malay Magic*, do. 1900. A. van Gennep, *Tabou et totémisme à Madagascar*, Paris, 1904, brings the local into relation with a general interpretation.

(ii.) For a world-wide review of the facts about tabu see J. G. Frazer, *The Golden Bough*³, 12 vols., London, 1911-15, esp. vol. iii., *Taboo and the Perils of the Soul*, and for his general theory vol. i., *The Magic Art*, l. 111 ff., also *Psyche's Task*², do. 1913. The subject being germane to any systematic account of primitive religion, it is hard to draw up a short list of authorities, but the following, in addition to those already quoted in the text, will be found useful: W. Robertson Smith, *Lectures on the Religion of the Semites*², London, 1894; E. Crawley, *The Mystic Rose*, do. 1902; E. Durkheim, *Les Formes élémentaires de la vie religieuse*, Paris, 1912, esp. p. 427 f.; and, on special aspects of tabu, Crawley, *JL* vi. [1895] 130 ff.; E. Westermarck, *Marriage Ceremonies in Morocco*, London, 1914; H. Webster, *Rest Days: a Study in Early Law and Morality*, New York, 1916. For a psychological study of tabu see R. R. Marett, *The Threshold of Religion*², London, 1914; E. S. Ames, *The Psychology of Religious Experience*, do. 1910.

R. R. MARETT.

TAHITIANS.—See POLYNESIA.

TALISMAN.—See CHARMS AND AMULETS.

TALMUD.—Two great works are known under the title 'Talmud'—a word (תלמוד) which denotes primarily 'teaching' and secondarily 'learning.' The two works are the Palestinian and Babylonian recensions, both of which are, in form, commentaries on the text of the Mishnâh (מִשְׁנָה). The Mishnâh ('repetition,' hence oral teaching by repeated recitation) was completed about A.D. 200. The Talmud consists of the Mishnâh with the Gemara (גְּמָרָא). It represents the scholastic activities of the Jewish Rabbis from the beginning of the 3rd to the close of the 5th century A.D.

The history of the compilation of the Talmud has been dealt with in many treatises and essays.¹ It is not the design of the present article to add to these or to reconsider the critical literary problems involved. Two practical questions will occupy us: (1) the attitude of the outside world to the Talmud,² and (2) the causes and nature of the permanent value of the Talmud within Judaism.

1. The Talmud in history.—The century which saw the completion of the Talmud also witnessed the beginning of interference with the normal circulation of the Rabbinical literature. In the year 553 the Emperor Justinian was called upon to arbitrate on a difference which arose between two sections of Jewry in the Byzantine realm. Whereas some were desirous of publicly reading

the Scriptures both in Greek and in Hebrew, others wished to use the Hebrew only. Justinian¹ ordered the præfect Areobindus to promulgate the imperial decision in favour of the use of Greek (the Synagogue might use Aquila if it preferred it to the Septuagint), or of other vernacular tongues such as Latin in the Italian provinces. The emperor, moreover, forbade any attempt on the part of the heads of the schools or elders to prevent the use of the vernacular by devices or excommunication. Most significant of all was Justinian's interdiction of the practice of giving the Haggâdic exposition (δευτέρωσις) after the reading of the Scripture. The opening words of the rescript explain Justinian's intention. The Jews, he suggested, should read their Scriptures with an eye to the hidden meaning and see in them a prophetic announcement of Christianity. Hence the emperor would naturally desire to curb the popularity of the Rabbinic exegesis, which of course would confirm the Jews in their refusal to admit Christological interpretations. Thus Justinian, who introduced drastic legislative enactments against the Jews, was also among the first to attempt interference with the free use and spread of their literature.²

We must here confine our attention to that phase of interference which concerns the Talmud. It was not till the 13th cent. that the attack assumed practical shape. Paris, in the year 1244, was the scene of the first public burning of copies of the Talmud. Before that date the Rabbinic doctrines had been assailed in the *de Insolentia Judæorum* of Agobard; but from the Paris incident onwards these assaults became far more frequent and dangerous. Nicholas Donin of La Rochelle had, while a Jew, been excommunicated by the Rabbi Yehiel of Paris because of his denial of the validity of the Rabbinic tradition. This occurred in 1225; he subsequently joined the Franciscans, and in 1239 he formally laid an accusation against the Talmud before Pope Gregory IX., who addressed bulls to many lands (including England) ordering the seizure of copies of the Talmud pending a public inquiry. In France the matter was seriously taken up. Charges of blasphemy, immorality, particularism, and absurdity were formulated; a public dispute between Donin and four Rabbis was ordered. The humours and futilities of such debates have been satirized in Heine's poem 'Disputation.' But the consequences were deplorable. The Talmud was condemned; many copies of it were burnt; and popular outbreaks against the Jews resulted.

Within a few years similar scenes were enacted in Barcelona. Here again the attack originated with a Jewish convert to Christianity, Pablo Christiani. He instigated a public debate between himself and Nahmanides in 1263, as to the attributes and coming of the Messiah, and the Rabbi was sentenced to exile because his defence of Judaism was pronounced blasphemous. In 1264 Christiani induced Pope Clement IV. to appoint a Commission of censors, who expunged all those passages which appeared derogatory to Christianity. In particular, as time went on, Talmudic references to ancient paganism were misinterpreted as being attacks on the Church. This charge was brought forward by yet another erstwhile Jew, Geronimo de Sante Fè, who engineered a public dispute in Tortosa in 1410, and, like Christiani, submitted to the verdict of the crowd the most intricate problems of Biblical exegesis in relation to Messianic belief. The practical outcome again

¹ *Novellæ Constitutiones*, 146.

² The view of Justinian's rescript given in the text is the one usually adopted. It is by no means the only possible explanation, for it is possible that what Justinian prohibited was the use of the traditional Aramaic translation (see art. TAROUMS).

¹ See 'Literature' below.

² Cf. art. ANTI-SEMITISM.

was not a settlement as to the significance of Is 53, but the confiscation of copies of the Talmud.

Of much greater interest was the controversy which waged round the Talmud at the beginning of the 16th century. Owing to the part taken by Reuchlin (*q.v.*) in this incident, the Talmud became the battle-ground between the old and the new, between the obscurantists and the humanists. Again the protagonist in the attack on the Talmud was one who had left the Synagogue for the Church. It must not, however, be thought that the proverbial zeal of converts has invariably assumed this guise. In the recent assaults made on the Talmud by representatives of modern anti-Semitism (*q.v.*), powerful among the defenders of the fair fame of the Rabbinic system were such famous Judæo-Christian scholars as Daniel Chwolsohn and Paulus Cassel. The opponent of Reuchlin was of a different type. We know very little as to the antecedents of Johann Pfefferkorn, of whom Erasmus said that from a bad Jew he became an execrable Christian ('*ex scelerato Judæo sceleratissimus Christianus*'), for no reliance can be placed on the insinuations made by satirists that in his earlier days Pfefferkorn had added to the respectable calling of a butcher the disreputable career of a burglar. All that we know is that Pfefferkorn was animated by a strong animosity towards his former co-religionists, that his fanaticism far exceeded his learning, and that he found support for his campaign among the Dominicans of Cologne. Though the Jews had been excluded from that city in 1426 and only regained rights of free domicile there with the coming of the French in 1798, Cologne remained during the 15th and 16th centuries the headquarters of the campaign against Jewish books.

It would be unprofitable to repeat the details of the oft-told tale of Pfefferkorn's pamphlets and Reuchlin's rejoinders; of the seizure of Hebrew books in Frankfort-on-the-Main in 1509, their restoration, and the long-drawn-out struggle that ensued in Rome. Nor is it of any importance to us now whether or not Pfefferkorn wrote the works that bear his name. The whole incident would have been forgotten but for certain facts. In the first place, this battle of the books gave rise to a famous satire, the *Epistolæ Obscurorum Virorum*, the first part of which appeared at Tübingen towards the end of 1514. The effect of this rather savage satire was instantaneous and permanent. As an exposure of obscurantism it remains one of the most masterly efforts ever put forward on behalf of humanism. The struggle between Reuchlin and Pfefferkorn became, in short, elevated to a higher plane. Reuchlin, once for all, struck the true note when he protested against the destruction of a literature because elements of it were distasteful to certain of its critics. 'If the Talmud contains errors,' he said, 'let us render them innocuous by studying to sift the chaff from the grain. Do not burn the Talmud, but read it.' It is to Reuchlin that we owe the foundation of Hebrew chairs in the universities; the first Hebrew text printed in Germany was the edition of seven Psalms used by Reuchlin in 1512. The study of Hebrew in Christian Europe commenced with him, was taken up by his immediate successors, and has never since been relinquished.¹ Reuchlin's devotion to Rabbinism began with his interest in the *Ḳabbālā*. But Hebrew was the passion of his life. And there is no doubt that to him we owe that interest in the Talmud which soon led to the publication of a complete printed edition of all its tomes. There were, as we shall see, printed editions of parts of the Talmud available in 1510, when he wrote that 'he would like

to pay the price for a copy of the Talmud twice over but he had not yet been able to obtain one.'² He was referring to MS copies. Within about a decade of the year in which Reuchlin wrote this lament it was easy to procure the Bomberg edition printed in Venice. It was fortunate for scholarship that Daniel Bomberg began to print the Talmud in 1520, before the censorship intruded its hand. Yet the censorship has this value. In 1550 the Talmud was placed on the Index. But the Tridentine Synod in 1564 provided that the Talmud might be circulated, if the passages obnoxious to Christianity were deleted. This was done, and between 1579 and 1581 there was completed the censored Basel edition which formed the model for many subsequent editions. In this form, claims the Basel editor, the Talmud may be read by Christians not only without reproach but even with profit ('*etiam cum fructu a nostris legi potest*'). The Inquisitor Marco Marino went through the Venice edition of 1546-50, censored it, and affixed his name to the expurgated version page by page. The expurgated passages have often been edited and commented on separately. Attacks on the Talmud, nevertheless, continued. As late as 1757 copies of the Talmud were publicly burned in Poland as a result of the Kamenetz-Podolsk disputation. Literary onslaughts have naturally continued, and modern anti-Semitism has displayed much energy in seeking in the pages of the Talmud grounds for attacks on the Jews. Those pages contain enough and to spare of superstition, narrowness, folly, and intolerance. But the faults are superficial, the merits fundamental; and it is because of the latter that the Talmud retains its permanent worth.

2. **Permanent value.**—In the first instance the Talmud represents more fully than any other Jewish work the lineal development of the religion of the OT. In several important particulars, the Talmud, indeed, represents an advance on the OT. The view (adopted by the school of R. H. Charles) is untenable that Rabbinism was a degeneration, while Apocalypse was an advance. On the contrary, all the nobler elements of the OT teaching were absorbed into and developed by Rabbinism, which was essentially a prophetic system. The moral life was at once the basis of religion and its ultimate outcome. The Talmud concerned itself with life. It therefore drew little or no distinction between the secular and the religious. This is not the place to discuss the Pharisaism which is assailed in the Gospels. For, however we explain the discrepancy, the Pharisaism of the Gospels is not identical with the Pharisaism of the Talmud.

Hence, though the Talmud, because it combines secular and religious into one whole, is often inclined to attach undue importance to ritual or customary trivialities, it cannot be said that it does so at the expense of the great principles. And, when all has been said, the fact remains that, difficult though it be to harmonize the daily round with the higher calls of spiritual moments, the Talmud did effect this harmonization with a considerable measure of success. The Talmud is interpenetrated with the presence of God in human life, and worship was not merely confined to the hours spent in congregational prayers. The home was sanctified as well as the synagogue. This fact constituted and constitutes the worth of the Talmud to the Judaism of all ages. The liberals who have rejected the authority of the Talmud have not rejected its spirit and its outlook.² They, like the conservatives, feel that the hallowing of life is the purpose of life. And, among the many attempts to effect this hallowing of life—in relation primarily to God, but also in intercourse

¹ S. R. Hirsch, *A Book of Essays*, London, 1905, p. 14.

² *A Book of Essays*, p. 141.

² Cf. art. LIBERAL JUDAISM.

with man—the Talmud must be conceded a high place.

In the main, then, the Talmud retains its worth because it has so thoroughly absorbed the prophetic conception of the close interconnexion of religion and life. But life is not altogether expressible in terms of conduct. There is the intellectual side. Now, for long intervals, the Talmud was the main means by which the Jew cultivated his mind. Some of the greatest Talmudists of the Middle Ages were indeed also devoted to science and philosophy, in the technical sense of those terms. But there were masses of Jews who knew no other intellectual interest than the Talmud and the allied literature. The nature of the Talmud saved them from stagnation. For the Talmud is a work of most manifold interest. It concerns itself with every phase of human activity. To read it intelligently—and it was assuredly so read—was a liberal education in the arts and sciences and philosophies. So wide is its range that a student of the Talmud is perforce acquainted with very many subjects which nowadays are regarded as distinct disciplines. The mind of the student was kept alert; his attitude never became scholastic; at every point he was in contact with actualities. It was an essential function of the Talmud to maintain this alertness, so that to con over its pages was not identical with losing oneself in an obsolete past. The Talmud breathes with vital freshness.

This enables us to understand why the Talmud has never been superseded by the codes founded upon it even by authorities so competent and able as Moses Maimonides and Joseph Caro. The codes omit the very element which makes the Talmud so important, so unique. The codes reduce ritual and religious conduct to rule; the decisions are stated in precise paragraphs; they are anonymous. But the Talmud presents processes as well as results; there is little of rule in it, less of precision; and the dicta are largely associated with the names of their authors. We see the religious evolution in action. And, just as it is in action in the older book, it remained in action in the modern life. The claim often put forward by recent Talmudists that their beloved tomes represent a progressive Judaism is well founded. Codes have an air of finality, while the key-note of the Talmud is continuity.

For the Talmud, after all, comes into line with the newer theory of the evolution of religion. The effect of the Talmud, it has been said, was to obscure the difference between Scripture and Tradition. This may be true, but modern criticism tends (on quite other grounds) to obliterate the distinction. The Scripture is itself a traditional evolution—so the newer theories hold. The Talmud in essence anticipated this theory, not in the direction of belittling the divine character of the written text, but in the direction of magnifying the human part in the authorization of the message. Man has his part to play in bringing the Law into operation—in interpreting it, which is often another term for expanding it.

We can here merely mention the beauties of the Talmud, its felicities of thought, its flights of fancy, its parables, its poetry. The Jew did not merely feed his mind on the wit of the Talmud or his spirit on its idealism. His heart and imagination found their nourishment there also. From its pages the liturgy derived some of its choicest prayers. In germ, the Talmud already contains the mysticism which in later ages grew up so luxuriantly in Judaism. That this mysticism rarely became antinomian was due almost entirely to the Talmud, which more than permitted—for it encouraged—individualism as well as communism

in the religious life. Our present point, however, is that volumes could be compiled (volumes have been compiled) out of the fine gems presented in a literary form which is unlike that of any other work—unlike in grotesqueness as well as in efficiency.

In the presence of these merits the attacks on the Talmud failed. Partly they were theological, partly moral, partly social. Ridicule was cast on its trivialities; fault was found with its religious conceptions; objection was taken to its attitude to Gentiles. These unfavourable criticisms were not all unfounded, for the Talmud contains much of inferior value, and bears the marks of the different ages and strata of thought in which it grew up. Nevertheless, some of the attacks on the Talmud were absolutely false; in others the assailants confused the attitude towards the Rome which destroyed the Temple with the attitude to the Rome which became the seat of the papacy. Often, too, overmuch importance was attached to the *obiter dicta* of isolated Rabbis. When, however, it was protested by Donin in 1239, and by Romano in 1553, that it was the Talmud that confirmed the Jews in their obstinate fidelity to the Synagogue, the charge was largely just. But that must be assigned to the Talmud as a merit, not as a fault. At all events it explains, perhaps in the most effective manner, how it came about that a work, so curiously alien from the modern canons of excellence in literature, has maintained its position not only with those Jews who more or less order their lives in accordance with it, but also with those who, rebels against its authority, retain an affectionate regard for its spirit. Written in style far removed from modernity, the Talmud is one of the most modern of books.

LITERATURE.—S. Schechter, in *HDB* v. 57-66, with full bibliography; W. Bacher, in *JE* xii. 1-27 (also with bibliography); H. Graetz, *History of the Jews*, Eng. tr., London, 1891-92, ii. chs. xiii.-end, and elsewhere in passages indicated in detail in the Index volume (1898) to the American ed. of the translation, p. 689 ff. The well-known unfavourable view of Schürer is contained in his section on 'Life under the Law,' in his *History*, Eng. tr., ii. ii. § 23. An account of the Talmud is given in I. Abrahams, *Short History of Jewish Literature*, London, 1906, ch. iii. Special attention may be drawn to the brilliant essays of E. Deutsch (*Literary Remains*, London, 1874) and J. Darmesteter (*Reliques scientifiques*, Paris, 1890).

I. ABRAHAMS.

TAMIL-SPEAKING PEOPLES.—See DRAVIDIANS.

TAMMUZ.—Tammuz was the West Semitic form of the name of the great Asiatic nature-god, typifying the changing seasons in their relation to man's needs, desires, and passions, though the last-named were far from being so pronounced in connexion therewith as the other two aspects. For its meaning, and also other names of Tammuz, see §§ 7, 10, below.

1. *The old view of the legend of Tammuz.*—Prior to the successful reading of the Assyro-Babylonian inscriptions the legend of Tammuz was regarded as being exclusively West Semitic, owing, apparently, to the scene of the god's activities being located, in the then extant records, in Syria. There was considerable difficulty, however, in finding an acceptable root by which the name of the god might be explained.

2. *Its most familiar versions.*—According to the classic legend of Tammuz, his mother had unnatural intercourse with her own father, urged thereto by Aphrodite, whom she had offended. Pursued by her father, who sought to kill her for this crime, she prayed to the gods, who changed her into a tree, from whose trunk Adonis (the Græco-Syriac name of Tammuz) was in due time born. So charmed was Aphrodite with the beauty of the infant that, placing him in a chest, she

handed him to Persephone to take care of. The goddess of the under world, however, when she found what a treasure she had in her keeping, refused to part with him again. Zeus was therefore appealed to, and he decided that for four months in the year Adonis should be left to himself, four should be spent with Aphrodite, and the remaining four with Persephone. A variant account, however, agrees with the Babylonian legend in making him pass six months with Éreš-ki-gal (Persephone) and six with Ištar, or Aphrodite. The classic versions represent Adonis, or Tammuz, as being passionately fond of hunting, and undeterred therefrom by the fiercest quarry. His end was tragic, as he was slain through the tusk of a wild boar piercing his groin (see § 14).

3. The Syrian versions.—The centre of the Syrian worship of Tammuz was probably Gebal; in any case, Balthi ('the [divine] Lady,' as Aphrodite seems to have been called in the extreme west of Asia) was believed to have migrated thither from her realm of Cyprus for love of Tammuz (Tammuz). But before Tammuz she had loved Ares (Mars)¹ and thereby aroused the jealousy of her husband Hephæstus. In this version Tammuz is described as the son of Cuthar, king of the Phœnicians, to whom, when she fled from Cyprus, Balthi made all the villages around subject. It was not the irresponsible act of a wild boar, however, that caused the death of Tammuz, but the jealousy of either Aphrodite's husband Hephæstus or her lover Ares, who came and slew Tammuz on Lebanon whilst he was hunting wild boars.

The Syrian lexicographer Bar Bahlul also gives the legend as he had heard it: 'Tomuzo was, as they say, a hunter shepherd and chaser of wild beasts; who when Balathi loved him took her away from her husband. And when her husband went forth to seek her Tomuzo slew him,' but was himself slain later on by a wild boar which he encountered in the wilderness, and his father made a great weeping for him in the month named after him.

The Rabbinical references to Tammuz are more curious than instructive with regard to the history and development of the myths concerning him.

One (that of Rabbi Solomon Isaaki, or Rashi), commenting on Ezk 8¹⁴, in order to connect the root of the name Tammuz with the Chaldean *aza*, 'to make hot,' describes it as 'an image which the women made hot in the inside, and its eyes were of lead, and they melted by reason of the heat of the burning, and it seemed as if it wept; and they (the women) said, "He asketh for offerings."'

This and other varying traditions concerning Tammuz, however, seem to belong to the Christian era.

4. The worship of Tammuz in Syria.—In all probability the mourning for Hadadrimmon mentioned by Zechariah (12¹¹) is a reflexion of the lamentations for Tammuz, with whom this deity is said to have become identified; and in a passage in Amos (8¹⁰) the Israelites lament as for 'an only son.' The most noteworthy Biblical passage, however, is seemingly that in Jeremiah (22¹⁸), where it is said that they shall not lament for Jehoiakim, saying, 'Ah my brother! or, Ah sister! Ah lord! or, Ah his glory!' and where the word 'sister' suggests the sympathy of the mourners for his bereaved spouse or lover. When Belili, his sister, in the Babylonian legend, says, 'My brother, only (one), do not cause me pain'² (by leaving the world again to go to the regions below), we have perhaps a better parallel. Byblos, the Biblical Gebal, was the centre of the worship of Tammuz in Syria, where, in the month of June, the funeral-festival of the smitten sun-god was held, and lasted for seven days. 'Gardens of Adonis'—flower-vases planted with seeds which

¹ Mars is probably to be identified with the Bab.-Nergal rather than with En-urta (Ninip). The former was the spouse of Éreš-ki-gal (Persephone). (See § 10 below.)

² See § 6 below.

sprang up quickly, and as quickly, owing to lack of moisture, faded away—were prepared by the mourning women as emblems of the early death of the youthful Adonis. Throngs of wailing women filled the streets and the gates of the temple, tearing their hair, disfiguring their faces, and gashing their breasts. The Galli—emasculated priests of Ashtoreth, the spouse of Tammuz—took part in the mourning for 'the bridegroom of her youth.' These days of mourning were followed by days of rejoicing for his resurrection, during which a papyrus-head came over the waters of the Mediterranean from Alexandria—an emblem of the severed limbs of Osiris, which, gathered up by Isis, his inconsolable spouse, after he had been dismembered by Typhon, had of old arrived at Gebal. Thus did the legend of Tammuz assimilate itself with the Egyptian myth of the sun-god Osiris.

5. Tammuz in Babylonia, his birth-place.—So far Babylonian sources have furnished but few of the details of the Syrian and the Greek versions of the myth of Tammuz. To all appearance the legend had not been carried from Syria to Babylonia, as might be expected, but the reverse. In its original form it must have been of considerable antiquity. According to the archaic list of royal names¹ discovered at Nippur (*Niffer*), and now preserved in the museum of the University of Pennsylvania, Dumu-zi, as the Babylonians called Tammuz, was a king of Erech and ruled for 100 years. His predecessor was the god Lugal-banda, who reigned for no less than 1200 years, whilst his successor was the half-divine and only half-historical king of Erech Supuri, Gilgameš, who ruled for 160 or possibly 180 years. According to this record, Tammuz was a fisherman (Sumerian *šu-ha*) of the city Ha-a, a site as yet unidentified, but which one would expect to find somewhere in the neighbourhood of the Persian Gulf. Though king of Erech, Tammuz was more especially associated with Éri-du, the divine city of Ea, the god of the waters, at the head of the same waterway, and it was only natural that a maritime people, such as the southern Babylonians were, should make Tammuz a fisherman. In that part of the land he was evidently the god of the fruitfulness of the teeming waters, just as, inland, he was god of the fruitfulness of the fertile Babylonian plain.

6. Ištar's search for Tammuz in Hades.—Outlines of this legend are given in the articles BABYLONIANS AND ASSYRIANS² and HEROES AND HERO-GODS (Babylonian).³ From this text we see that Tammuz was, at the time of Ištar's descent, in the under world with Éreš-ki-gal (Persephone), whither he had descended in accordance with the decision of the king of the gods (Bel-Merodach=Zeus). This legend likewise shows that Tammuz had become the lover of Ištar, or, as the record puts it, 'the husband of her youth.' The sacrifices which she was willing to make on his account are noteworthy, for at each of the seven gateways of 'the land of No-Return' she parted—under protest—with an article of apparel or adornment, until she appeared in the presence of the queen of the region perfectly naked. As things went wrong on earth owing to the absence of the goddess of love, Samaš, Sin, and Ea bestirred themselves and secured her release. Here the subject suddenly changes, and the name of Tammuz appears in the text for the first time:

'If she [Éreš-ki-gal] hath not given thee her dismissal, return to her.
Upon Tammuz, the husband of [her] you[th],
Pour out pure water, [sprinkle] sweet oil.

¹ See *Egypt* xxvii. [1915-16] 519^a.

² *ERE* ii. 315^b.

³ *Id.* vi. 645^a.

Clothe him with a festive garment, let him strike up with the flute of lapis-stone—

Let the joy-maidens dance, [let] the honoured one . . .

[And] Belili set [down] her instrument,

[And] "eye-stones" filled [her] la[p] ?¹

[When] she heard her brother's voice, Belili smote her instrument . . .

Her "eye-stones"² filled [her] thoughts (?).

"My brother, only (one), do not cause [me] pain (?)."

On the day Tammuz plays on the lapis-flute, they will play along with him the tambour of chalcedony (?).

The men-mourners and the women-mourners will play along with him.

May the dead (?) arise and smell the incense.³

Belili, mentioned here as the sister of Tammuz, appears also in the great list of gods³ in connexion with Alala, as forms of the deities of the heavens, Anu^m and Anatu^m. The flute of Tammuz, like the divine vine at Èridu, was of lapis-stone, emblematic of the blue sky, and it is not unlikely that the other objects mentioned—Belili's 'eye-stones' and the 'tambour'—were of precious and similarly symbolical materials.

7. Other Babylonian references to Tammuz.—The first place ought probably to be assigned to the lists of gods, which furnish us with some of his names, and the deities with whom he was identified. The transcription of the group standing, in Sumerian, for Tammuz is 'Dumu-zi,' though a longer form, 'Dumu-zida,' is often found. The commonly accepted rendering of this group into Semitic Babylonian is *māru kēnu*, 'the true (or faithful) son.' Of the lists in which the name is found the most important is probably the trilingual text (two dialects of Sumerian and Semitic Babylonian equivalents) published in *WAI* ii. pl. 59. In that inscription his character as a sun-god is indicated by the fact that his name comes towards the end of the section referring to the sun-god Šamaš, after Kēttu and Mēšaru, that deity's two attendants.⁴ After this comes Ū-zī-zī (? from Tumu-zi), in standard Sumerian [Dumu]-zi, rendered by *šu-ma*—i.e. transferring Dumu-zi into the Semitic Babylonian column—and from the next line we see that he bore in Sumerian also the name of U-libir-si (dialectic) or Enligir-si, probably meaning 'the lord of the righteous covenant,' or the like. The next line, which begins a new section, has the name of Sir-du, dialectic Šir-ṭamu, the mother of Tammuz. Other deities in this section are 'the lady of the plain,' Ištar, and 'the lady of the gods.' A section giving further names of these goddesses follows, and then comes the final section of the tablet, beginning with Ereš-ki-gal and explaining her as Allatu^m, the Babylonian Persephone. Important as showing the feminine aspect of Tammuz, which is also visible in the Syro-Greek view of the deity, is the list⁵ in which he is called Ama-ušumgal-ana, 'the peerless mother of heaven,' which may be one of the aspects of the planet Venus, described⁶ as 'male at sunrise.' Another name, En-meršī, dialectic for Nin-Girsu, the god of Lagaš, identifies Tammuz with that deity and stamps him specifically as the great god of agriculture.⁷

8. The abodes of Tammuz in Babylonia.—The chronological list preserved at Philadelphia, U.S.A.,⁸ makes Tammuz a king of Erech and seems to indicate that his native place was a city expressed by the characters Ħa-a. In the incantation published in *WAI* iv. pl. 15, however, Èridu

¹ Probably poetically put for some such idea as 'Crystal tears filled her body'; see below.

² Probably 'crystal tears'—evidences of the grief she had felt when Tammuz descended into the under world.

³ *Cuneiform Texts from Babylonian Tablets, etc., in the British Museum*, London, 1903, pt. xxiv. pl. 1.

⁴ See the art. RIGHTEOUSNESS (Babylonian), §§ 1 and 4.

⁵ *WAI* ii. 54, 349.

⁶ *ib.* iii. pl. 53, l. 31; see *ExpT* xxx. [1918-19] 167^a.

⁷ *WAI* ii. 54, ll. 34 and 36. For references to his temple at Lagaš see § 9 below.

⁸ See § 5 above.

seems to have been his chief city, of which, therefore, Ħa-a may have been a suburb or even another name:

'In Èridu a black vine grew—in a sacred spot it was made.

Its substance was white-flaked lapis-stone, planted in the Deep.

Èa's path in Èridu is filled with fruitfulness—

His seat is the [central] place of the earth.

His abode is the bed of Èngur [the Abyss].

In his holy house, which is like a forest, [his] shelter is set—no man can enter therein.

In the midst of it is Šamaš [and] Tammuz [Dumu-zi],

Between the mouths of the rivers [or canals] on both sides.'

Here follow the names of the waterways in question: Ka-bengala, Igi-bengala, and Ka-na-ab-ul, though the true total seems to have been four.¹

Instead of 'the god Šamaš (and) Tammuz' we might read 'the sun-god Tammuz,' which would correctly describe his position in the Babylonian pantheon. The Sumerian original has expressed the name of Tammuz by the feminine Ama-ušumgal-ana.² The connexion of Tammuz with the vine of Èridu, the Paradise-city, stamps him here likewise as one of the gods of fertility, and it is owing to this that he is so closely connected with the god Èa, to whose nourishing streams the great fruitfulness of the land was due. It is noteworthy that Nin-Girsu, the god of Lagaš, who was identified with him, bore also the name of Uru, 'the husbandman.'³

9. Tammuz as the herdsman.—It has already been noted that Dumu-zi, or Tammuz, was called the fisherman (*šu-ħa = bayaru*), but later he appeared as 'the herdsman.' This view of the deity is referred to in another incantation:

'The milk of a yellow goat which has been brought forth in the holy fold of Tammuz [Dumu-zida]—

The milk of a goat of the flock—may he give thee with his holy hand.

Pour it then into the skin of an undefiled she-goat.

Azag-suga, the uz-mah-Enlila ['glorious goat of the god Enlila'], has caused [it] to be eaten with his sacred hand.

Merodach, son of Èridu, has given the incantation—

May Nin-aha-kuddu, the lady of the limpid fountain, make him [the sick man] holy, make him pure.'

'The incantation of the milk of the yellow goat, and the flour of the undefiled she-goat's skin.'

The antiquity of the association of Tammuz with the flocks in Babylonia is shown by the noteworthy text in *The Amherst Tablets*, i. (London, 1908) no. 119, where 'fleece' is expressed by the phrase 'sheep of the sky.' This indicates that the flocks of Tammuz, the sun-god of spring, were the clouds illuminated by the setting sun, and comparable with the flocks of Helios in Greek mythology. In the same publication, nos. 110, 112, and 114 refer to the 'grain of the priest of Tammuz,' and no. 118 mentions his temple at Lagaš. The date of these inscriptions is about 2300 B.C.

10. The Babylonian hymns to Tammuz.—At least two series of these existed, and they may have formed the originals of some of those chanted by the Hebrew women⁴ as well as by the Phœnicians and the other nationalities who accepted or adopted the cult. The following will show their nature:

'The ewe and her lamb he taketh;

The goat and her kid he taketh.

The ewe and her lamb he smiteth down;

The goat and her kid he smiteth down.

Arise then, go, hero, the road of "No-return."

Alas, hero! warrior, Un-azu;

Alas, hero! hero, my god Damu;

Alas, hero! son—my faithful lord;

Alas, hero! Gu-silim the bright-eyed;

Alas, hero! god Nagara, lord of the net;

Alas, hero! overseer, lord of prayer;

Alas, hero! thou who [art] my heavenly light;

¹ See *ExpT* xxix. [1917-18] 152 L, 288.

² See § 7 above.

³ Tammuz visited not only the under world, but also 'the heaven of Anu'; see *ERE* vi. 64^a.

⁴ Cf. *Ezk* 51⁴.

Alas, hero! Ama-ušumgal-ana;
 Alas, hero! brother, mother, heavenly vine.
 He goeth, he goeth, to the bosom of the earth—
 He will cause abundance for the land of the dead.¹
 For his lamentation, for the day of his fall,²
 In an unpropitious month of his year.³
 To the road of man's last end,
 At the call of the lord,
 [Go], hero, to the distant land which is not seen.'

Or, according to the Sumerian original of the last four lines:

'In an unpropitious month of thy year,
 To the road of the people's end [or rest],
 At the call of the lord,
 The worthy one, in his distant land, is not seen.'

'The unpropitious month' is probably Du'uzu, or Tammuz; 'the road of man's last end' is that leading to the under world; 'the lord,' who calls him, is possibly Merodach, but may be Nergal, king of that region, the Babylonian Mars.⁴

After a division-line the text continues:

'Alas, my abundance which has been withheld! Alas, my produce which has been detained!
 My heart is oppressed, shepherd, dwelling in exile—
 Where is his city? My heart is oppressed!
 From the house of gloom he shall be brought forth—
 Thou who art worthy, from the house of gloom thou shalt be brought forth!
 Alas, hero! warrior, Un-azu,' etc., etc., as above.

Though these lamentations may have been recited by the women and others who joined in the ceremonies, it is probable that they were originally placed in the mouth of Ištar. The abundance and plenty referred to is probably the fruit of the earth; the oppression of heart was due to the lack of these things, and also to the god's exile in the regions below.

The bearing of these hymns upon the legend is clear. We learn that (1) some accident had happened to Tammuz, by which his sojourn in the under world was brought about; (2) this accident was that in some way he 'fell'—either through an attack by a wild animal (boar) or, like Eshmun, the Phœnician deity, by his own hand; (3) the result was that he passed part of his life in the under world, whereby the earth suffered and the under world profited; (4) the under world, to which Tammuz went, was man's last abode and the place of the people's rest. Notwithstanding that he was fulfilling his mission, the exile of Tammuz was still an unpropitious event for him, the realm of Èrès-ki-gal not being, even for the earth-dweller, that place of delight which the man looking forward to life with his god in the realms of bliss would like it to be. It may be supposed, however, that the worshipper of Tammuz, when he departed this life to dwell with his god, hoped to enjoy companionship with him not only in Hades, but also on earth when his time came to return thither.

11. The transfer of the legend to Syria.—As has already been stated,⁵ the legend of Tammuz in Babylonia was of considerable antiquity—as early, in fact, as 4000 B.C. or even earlier, and it had had, therefore, ample time not only in which to spread abroad, but also to assume new forms and receive additions. Besides Byblos, the Babylonian Gublu (Gabal), Tammuz was also venerated in many intermediate states and cities—Cilicia, Cappadocia, Lycia, Lydia, Ephesus, and Pterium. Everywhere the cult was most enthusiastically adopted, falling in, as it did, so exactly with the Semitic view of the nature of things. Apart from

¹ Variant rendering: 'Šamaš will make him great in the land of the dead,' but that given above seems preferable.

² The full rendering in Semitic is 'Filled with lamentation on the day that he fell and (was) in distress,' but the Sumerian is insufficient for all this.

³ In the calendar of lucky and unlucky days (*WAI* v. 48) the entries for the month Tammuz (col. iv.) include 'weeping' on the 2nd day, and 'lamentation' on the 10th, but it is doubtful whether these really refer to the legend.

⁴ See § 3 above, and § 14 below.

⁵ § 6 above.

the theories which were held as to the creation of the universe, the legendary teaching connected with Tammuz dealt only with the continuance of what had been brought into existence by the Creator. Regarded as a sun-legend, it was recognized that 'the kindly fruits of the earth' were due to his rays, and to the fact that, when these and their accompanying warmth were withdrawn or reduced, the growth of vegetation ceased.

12. The reflex-influence of the legend of Tammuz in Babylonia and Assyria.—That this enthusiastic worship of the Babylonian Dumuzida, under the name of Tammuz, had influence in Babylonia and Assyria, sympathetically related as they were with the Western Semites, is but natural; and its greater importance in the countries of its adoption than in the land of its origin is also easily comprehensible. This was due to the fact that the Babylonians had, from the date of the rise of Babylon, accepted Merodach, who was also a sun-god, as their supreme deity. Tammuz therefore continued to represent simply one of his forms, and thus remained ineligible as chief of their pantheon, whose construction, as a philosophical system, his position of supremacy would have destroyed.

13. The development of the legend farther west.—In all probability more than one version of the legend anciently existed in Babylonia and migrated, with the worship, westwards. Representing the summer sun, with all its warmth and its vivifying and productive power, Tammuz was regarded as the god who passed the six months between the beginning of autumn and the end of winter in the under world. As the planet Venus seems to follow the course of the sun, her disappearance with him was interpreted as due to her desire to rescue him from that prison-house, but, as her movements do not coincide with the seasons, she generally had to come forth without him. When the time for his release came, therefore, he had to return to earth unaccompanied by his spouse.

In the West the legend was modified, and Tammuz-Adonis there appears as the son of the Cypriote king Kinyras and as beloved of the goddess Aphrodite. He died, it was said, in the forest of Lebanon, killed by the wild boar typifying winter; and since the time of that catastrophe the river Adonis, now the Nahr Ibrahim, 'Abraham's stream,' flows yearly, when in flood, reddened by his blood. The name Adonis is the Greek form of the Phœnician Adōn, 'lord,' which this deity, in common with many others, bore. In the Sumerian hymns (mostly in the dialect) he is constantly called the 'lord,' *un* or *uwun*, and it is probably owing to this, at least in part, that Adōn (Adonis) became one of his names.

14. Tammuz in Cyprus.—According to Ovid,¹ the scene passes, in part, from Assyria (Syria) to Cyprus. Kinyras, king of that island, had, by an incestuous relation with his daughter² Myrrha, a beautiful son named Adonis. The child was brought up by the nymphs and had hardly reached manhood when he became the lover of Aphrodite. One day, notwithstanding the goddess's supplications, he went hunting in the forest of Lebanon and was wounded by a boar sent by Ares (Mars), who was jealous of the divine youth. Aphrodite, hearing of this tragedy, filled the forest with her lamentations and tried to revive him, but without success. From the blood of the dying Adonis the anemone had its birth, and the river Adonis was thenceforth reddened yearly by his blood.

15. The legend of Tammuz in Greece.—According to Panyasis (5th cent.), Adonis was the son of a princess of Assyria (Syria), Myrrha or Smyrna,

¹ *Metam.* x.

² See §§ 2, 15.

whom Aphrodite had inflamed with a violent love for her father Theias. Myrrha profited by her father's drunkenness and the darkness, but, when afterwards Theias found out what had taken place, so violent was his anger that he attacked his daughter, sword in hand. Myrrha fled, praying the gods for protection, and the divinities who had been the cause of her ruin, recognizing that she was not really to blame, changed her into the tree which, since that time, has borne her name. Nine months later the tree opened and gave birth to the beautiful Adonis. Aphrodite took charge of him and, placing him in a casket, handed him to Persephone to take care of.

Other variants of the legend of Tammuz are recorded, but, as they are apparently later developments and seem not to bear upon the origin of the myth, it is needless to speak of them here. How far the above or any other variants may be founded upon further details from Babylonia is uncertain and will not be known until the Babylonian legend of Dumu-zida comes to light.

16. Why did the legend vary?—Not only was Tammuz faithful in fulfilling his fate and passing a part of his existence in the under world, but he was also faithful in bringing, as the god of agriculture, the fruits of the earth to perfection in their season. The climates of Babylonia and of Syria are so different that any legend common to both was bound, in its province, to differ; hence the variations in that of Tammuz noted here. According to G. Rawlinson,¹ increasingly heavy showers fall in Babylonia, in November and December, raising the river-levels. As spring advances, the showers become lighter and fewer until about May, when summer-weather arrives. From May to November rain is very rare indeed, and the sun's rays are only tempered at morning and evening by the grey mist. For five months, therefore, Babylonia is a land of drought. With this description the month-list of Lagaš, whose principal deity was Nin-Girsu—identified with Tammuz—seems to agree,² but it is the common calendar of later days³ that is the most instructive. In this it would seem that it was the fourth month, Su-(n)umuna, 'perfection of seed,' or the like (June-July), that ended the time of productiveness, and that this month was called Du'uzu, the West Semitic Tammuz, as the month of the god's greatest fruitfulness. The month next following, Bibi-gar, apparently means 'making heat' (= Heb. Ab), whilst the 6th month, August-September, is Kin-Innanna, 'the errand of Ištar,' generally regarded as that in which Ištar descended to Hades in search of her lover. Its Heb. name Elul (in Babylonian, Ululu) probably means 'grief' and seems to express the common Semitic sound of mourning and distress. In Marcheswan, the 8th month, the opening of the water-channels took place and was succeeded by the rain-clouds of November-December (the Heb. Chislew). The 11th month, January-February, was 'the month of seed' and probably marks the time when sowing became general. Finally came the 1st and 2nd Adars (Feb.-March), in Sumerian Se-gur-kud and Dir se-gur-kud, the two grain-plant cutting months, when the seedlings were cropped to encourage the increase of sprouts.

Roughly, the 12 months of the year fall into three groups of four each, Nisan to Tammuz marking the growth and perfection of the grain, Ab to Marcheswan practically barren owing to the great heat, and Chislew to Adar the season of irrigation by the rivers and the sprouting of

the crops. It is probably to this that the three periods of the year of Tammuz—with Ištar, with Éreš-ki-gal or Persephone, and at his own disposal—are due, the division of his year into two periods of six months each being apparently Western.

17. Tammuz in the late Assyrian inscriptions.—In these documents there are certain names which testify to the popularity of the god—not, however, under the name of Dumu-zi or Tammuz, but under that of Adōn. The Assyrian form appears as Adunu, and the names containing it may be divided into the specifically Syrian and the Assyrian—the latter apparently imitations, or translations from Syrian into Assyrian. Among these are Adunu-apla-iddina, 'Adōn has given a son'; Adunu-nadin-apli, 'Adōn, giver of a son'; and Adunu-māta-ušur, 'Adōn, protect the land.' The purely Syrian names seem to be Adunaiz(i) or Aduna-iz(i), perhaps 'my lord hath sprinkled'; Aduni-ṭu and Aduni-turi, 'my lord is my rock' (Heb. *šār*); Aduni-īha, 'my lord liveth (?).'; Aduni-ba'ali, 'Adōn is my lord,' is West Semitic and belongs to about 850 B.C. (he was king of Siann), but all the rest fall between 680 and 660 B.C.

Whether, with Vellay, the gods of the countries into which the worship penetrated may be regarded as having become identified with Tammuz or not is doubtful. If correct, it was due to the fact that Tammuz, under the name of Adōn, 'lord,' was designated by a word which could be applied as a title to any god, whether the Merodach of the Babylonians, the Moloch of the Syrians, or the Hadad of the Amorites. It is this, in all probability, that caused Tammuz to become, in a measure, identified with the Adonai of the Hebrews—that more general divine name which, with them, replaced the all too sacred Jahweh (Jehovah) of their own monotheistic creed.

18. The Tammuz-cult and its contemporary creeds.—Naturally, the idea of a kind of martyr-god, dying, it may be, for the good of mankind, notwithstanding the difficulty of bringing Tammuz into this category, has to be taken into consideration. The most striking parallel, perhaps, is the Osiris of the Egyptians; and the Babylonian Merodach, who died in order that mankind might be produced from his divine blood, is equally noteworthy. As Merodach, the 'steer of day,' was a sun-god, it is not unlikely that he was regarded as dying daily and as being reborn that men might live. The sun as Tammuz, however, died yearly, not so much that men might live, but because he fell under the evil influences of the spouse of Nergal, the god of battle, disease, and untimely death. Vellay contends also that Jesus Christ, like Tammuz, was a sun-god and, also like him, descended into Hades; but there are so many fundamental differences in the career of the mythical sun-god of 4000 or 5000 years B.C. and the Christ of history that comparisons may well be set aside. The half-mythical Babylonian ruler, with his 100-year reign, comparing so unfavourably with his predecessor's 1200, may easily have had a misadventure in the hunting-field which gave birth to the nature-myth which the Babylonians, Syrians, and Greeks have handed down to us.

TANJORE.—1. **History.**—Tanjore (Tamil Tanjāvūr, 'city of refuge') is the capital of the District of the same name in the eastern portion of the Madras Presidency; it is situated in 10° 47' N. lat., 79° 3' E. long.; in 1911 the population was 60,341. The District formed part of the ancient Chola country, and the kingdom reached the zenith of its power under Rājārājā I. (A.D. 985–1011). During the 13th cent. it passed under the rule of the Hoysala Ballālas of Dorasamudra and the Pāṇdyas of Madura. An independent Nāyak dynasty was established in the 16th cent., which was displaced by a Marāṭhā kingdom about 1674. It was occupied by the British in 1773 and finally ceded to them in 1799; the royal family, who were pensioned, became extinct in 1885.

2. **The temple.**—Tanjore owes much of its importance to the great temple built by King Rājārājā I., who was a devoted Śaiva, but tolerant of other religions. It is known as Brihadiśwara, Brihatiswara, said to mean 'temple of the great god,' or Rājārājīśwara, after its founder. Fergusson writes:

'In nine cases out of ten, Dravidian temples are a fortuitous aggregation of parts, arranged without plan, as accident dictated at the time of their erection. . . . The one great exception to this rule is to be found at Tanjore. The Great Pagoda there was commenced on a well-defined and stately plan, which was persevered in till its completion.'¹

Entered by a fine gateway (*gopuram*), which is supposed to cast no shadow on the ground, the outer court, used as an arsenal by the French in 1772, is 500 ft. long and 250 broad, and is surrounded on all sides by a cloister. The main shrine stands to the west, and above it rises to a height of about 200 ft. a magnificent tower, decorated with pillars and statues. The summit is crowned by a single block of granite, weighing 80 tons, said to have been raised to its present position up an inclined plane commencing at a village four miles distant. An interesting feature of the tower is that the carvings are generally of a Vaiṣṇava type, while the ornamentation of other parts is Śaiva. Another curious fact is that one of the figures on the north side of the tower represents a European; the popular belief is that it is the figure of a Dane who assisted in the building or that it was erected to foretell the British occupation. It is probable that both the European figure and the Vaiṣṇava ornamentation were erected by one of the Nāyak princes, and that he was helped by some Danes who acquired Tranquebar in 1620. The base of the great temple and many of the other buildings are covered with inscriptions which have been translated;² nearly all of them belong to Rājārājā and his successors.

Another noteworthy building is the temple of Subrahmanya, god of war, younger son of Śiva,³ with a colossal figure of Nandi, the bull of Śiva, 'a perfect gem of carved stone-work, the tooling of the stone in the most exquisitely delicate and elaborate patterns is as clear and sharp as the day it left the sculptor's hands.'⁴

'The temple, though beautiful, is not considered particularly sacred. The legendary cause of this is that the Śaivite saint Appar was refused admission to it, and that therefore it was not celebrated in his hymns or those of the other three Śaivite poet-saints. A peculiarity about it is that Śūdras are admitted to the apartment next the shrine, from which in most temples in this District they are excluded, and that Valaiyans [a hunting, fishing, iron-making, and cultivating caste],⁵ who

are usually not admitted at all, here come as far as the great bull.'

3. **Tiruvādi.**—Tiruvādi (Tiruvaiyāru, 'the five holy rivers'), six miles N.W. of Tanjore, is a place of great sanctity, said to be holier than Benares by one-sixteenth, where pious Hindus desire to die and where their bones are cast into the river. It has a fine temple, called Pañchanadiśwara, 'Lord of the five rivers,' which contains inscriptions of Rājārājā and his successors.²

LITERATURE.—The authorities have been quoted in the article. For the early Tamil history see V. Kanakasabhai, *The Tamils Eighteen Hundred Years Ago*, Madras, 1904; G. Oppert, *The Original Inhabitants of Bhāratavarṣa or India*, London, 1893. W. CROOKE.

TANNAIM.—See JUDAISM.

TANTRAS.—In the series of sacred books of the Hindus the *Tantras* occupy the fifth or sixth place. According to their character and contents they are fourth in the order of inspiration and authority, the degrees being *śruti*, *smṛti*, *Purāṇik*, and *Tāntrik*. They are also known as a fifth or the fifth Veda by those who regard them as authoritative and observe the ritual which they enjoin. In neither case is the series entirely chronological or consecutive. The *Tantras*, which succeed and are in part dependent on the *Purāṇas*, are also in parts unrelated to the latter and of greater antiquity. Their date, however, it is impossible to determine with any precision. The existing treatises are probably for the most part at least reproductions with additions and variations of older works which are no longer extant. In their present form they are usually ascribed to the 6th or 7th cent. of our era, but they may be considerably later. Tāntrik usages and popular formulas were current and practised in a much earlier age; they belong to a type of thought that is primitive and among primitive peoples varies little in the course of the centuries. Until recent years little was known of these works outside of India. A few have now been made accessible in translations, but the greater number are as yet unexplored.

The name *tantra* signifies a 'web' or 'warp,' then a continuous or uninterrupted series, and in religious usage an orderly rule or ritual. The word was then further applied to the doctrinal theory or system itself, and finally to the literary work or treatise in which it was set forth. In the last sense the word is not found in the *Amarakośa*, the great Sanskrit dictionary,³ nor is it used by the Chinese pilgrims. The *Mahābhārata* also contains no reference to the *Tantras* or to any religious system founded upon them. All these facts are confirmatory of the comparatively late origin of the existing books. Śāṅkara enumerates the titles of 64 *Tantras*, comparatively few of which can be identified at the present day. The best-known of these treatises and the most worthy of study are perhaps the *Kātrakaumudī*, *Śakti-āngama*, *Rudrayāmala*, *Kalikā*, *Kulārṇava*, *Tantratattva*, and *Mahānirvāṇa*. Translations of the two last have been published by Arthur Avalon. Parts of the *Hitopadeśa* also are known as '*tantras*.'⁴

Traditionally the authorship of these works is attributed to Dattātreyā, who was an incarnation of the Hindu trinity, Brahmā, Viṣṇu, and Śiva.

⁵ E. Thurston, *Castes and Tribes of S. India*, Madras, 1909, vii. 272 ff.

They are therefore to be regarded as equally the revelation of the three supreme divinities. In form, however, they are dependent on Śiva alone, who in dialogue with his wife Durgā, or Kālī, reveals the mystical doctrines and observances which are to be received and practised by his worshippers. This authoritative or 'higher tradition' is further said to have been delivered from his central or fifth mouth. As such it is pre-eminently sacred and secret and may not be revealed to the uninitiated. 'The Vedas, the Śāstras, and the Purānas are like a common woman, but this mystical Śaiva science is like a high-born woman,'¹ and its communication is forbidden. The real authors of the several treatises are unknown. They bear the name also of *Āgamas*, and as such are sometimes distinguished from *Nigama*, the text of the *Vedas*, *Dharmaśāstras*, and other sacred books. The Indian commentator, Kullūka Bhaṭṭa, asserts that revelation (*śruti*) is two-fold, Vaidik and Tāntrik.² In the popular knowledge and belief they have practically superseded the *Vedas* over a large part of India, where religious practice and ritual are guided by the teaching of the *Dharmaśāstras*, *Purānas*, and *Tantras*. A native writer and exponent of these works in Bengal asserts that 'two-thirds of our religious rites are Tāntrik, and almost half our medicine.' They are the *Śāstras*, the scriptural authority and rule for the present age, the *kaliyuga*, and it is therefore incumbent on all orthodox Hindus to follow their directions.

In particular the *Tantras* are the religious textbooks of the Śāktas and of their various sects. There are different Tāntrik schools, with variant traditions, the distinctions between which are little understood outside of their immediate circle of adherents. The ritual of the *Tantras* of the Dakṣiṇāchārins, however, is said to be pure and in harmony with the *Vedas*, while that of the Vāmachārins is intended only for Śūdras. Their influence unquestionably extends far beyond those who profess to accept their authority. Wilson quotes a passage from one of these treatises which claims that 'many a man who calls himself a Śaiva or a Vaiṣṇava is secretly a Śākta, and a brother of the left-hand.'³ Even the Jains of N. India are said to have adopted formulæ and ritual from the *Tantras*, and the Lāmaism or corrupt Buddhism of Nepāl and Tibet owes much to the same source.

The teaching of the *Tantras*, as of the *Purānas*, is essentially based on the *bhakti-mārga* (*q.v.*), which is regarded as superior to the *karma-mārga* and *jñāna-mārga* of the *Brāhmaṇas* and *Upaniṣads*. Adoration of a personal deity is inculcated, especially of the wife of Śiva, who is worshipped as the source of all regenerative power. In all these writings the female principle is personified and made prominent, to the almost total exclusion of the male. Ultimately their doctrine is derived from the philosophy of the Sāṅkhya-Yoga, with its theory of *puruṣa* and *prakṛti*, with especial emphasis on the mystical side of Yoga teaching and practice. Like the *Purānas* also every *Tantra* should theoretically discuss in order five subjects—the creation and destruction of the universe, the worship of the gods, the attainment of supernatural power, and union with the Supreme Being. In reality their contents are almost entirely magical and mystical, but they range over a wide variety of subjects, scientific, religious, medical, speculative, etc., and are interested in all that

concerns human need and destiny. One at least of the more important *Tantras* expounds in metaphysical terms the nature of the Supreme Brahman, who is *nishkala* and *sakala*, i.e. with or without *prakṛti*, *nirguna*, and *saguna*; in the beginning only the *nishkala* Brahman existed, etc. Great use is made of mystical syllables, *om*, *ām*, *um*, *ūm*, etc., with which sometimes whole pages of writing are filled. By the repetition of these, magical and supernatural abilities may be gained. The use of *mantras* also is enjoined, and numerous examples are given; their essence consists in certain mystical and secret letters or syllables which they contain (*bija*). The significance of the letters of the alphabet is taught, the employment of mystic diagrams (*yantra*), sacred circles (*śrīchakra*), spells, charms, and amulets (*kaṇṇaka*), symbolical movements and crossing of the fingers (*mudrā*), etc.

Together with all this, which appears to us so meaningless and puerile, there is undoubtedly much that is of historical interest in the *Tantras*, and that is of value for the interpretation and interrelation of Hindu doctrine. They are generous and broad in their sympathies, recognize no distinction of caste or sex, 'for men and women equally compose humankind,' and they forbid the practice of *satī*. According to the orthodox view, the rites and doctrine which they inculcate are to prevail until the close of the *kaliyuga*.

TĀNTRISM (Buddhist).—A complete study of Buddhist Tāntrism would include the description and the history of its rites, its deities, and its doctrines, practically the *exposé* of the many problems which confront the historian of mediæval India. Buddhist tāntrism is practically Buddhist Hinduism, Hinduism or Śaivism in Buddhist garb. The present writer intends only to provide the reader with a definition of the chief topics.

Buddhists were not quite clear as to the specific meaning of the word *tantra*, 'book.' The Tibetan canon distinguishes the *Sūtra (Mdo)* and the *Tantra (Egyud)*, but a number of texts are classified in both sections: the limits between *Sūtra* (i.e. *Mahāyānasūtra*) and *Tantra* are not fixed. On the one hand, topics which are essentially Mahāyānist—e.g., hymns to *bodhisattvas* (*stotra*), resolutions to become Buddha (*praṇidhāna*)—are met with in *Tantra*; on the other hand, *Mahāyānasūtras* include a number of fragments and often whole chapters which would constitute by themselves so many Tāntrik texts.

A good example is found in the *Saddharmapuṇḍarika*, 'Lotus of the true Law,' which contains a whole chapter¹ of *dhāraṇas*, on talismanic words, invocations in litany form to a female deity or to a female power; 'giantesses' are mentioned as protectors of the *Sūtra* and of its readers. There are good reasons for believing that this chapter is a late addition: such an addition testifies that the spirit of Mahāyāna had become largely tinted with the spirit of Tāntrism, or rather that the Tāntrik syncretism made little distinction between Mahāyānism and Tāntrism properly so called.

Tāntrik books, by assuming the title of *Sūtra*, secured authority. The *Kāraṇāvayūha* is styled *Mahāyānasūtravratānarāja*, 'the very best of the Sūtras.' As a matter of fact, the introductory section is written according to the pattern of a *Mahāyānasūtra*; it does not pretend to relate, as

¹ Ch. xxi.

¹ Quoted from Monier-Williams, *Brāhmanism and Hindūism*⁴, p. 191.

² *Śrutiśāstra dvivādhā vaidihā tāntrikīka*, note on Manu, ii, 1; H. H. Wilson, *Essays and Lectures*, i, 245.

³ H. H. Wilson, *Essays and Lectures on the Religion of the Hindus*, London, 1862.

Tantras do, the dialogue of a god with a goddess; it preserves the old phrase, 'Thus have I heard,' followed by the mention of the place, Śrāvastī, Jetavana, and the description of an audience of *bodhisattvas*. But, when we consider the chief topic of the book, viz. the glorification of Avalokiteśvara as the owner of the 'science in six syllables,' we cannot say that the author has written what we should like to style a *Sūtra*. In many cases the Tibetan scholars were not deceived by mere titles; e.g., although the *Suvarṇaprabhāsa*¹ is styled *Sūtra*, it is not in the *Mdo*, but in the *Rgyud*, that the Sanskrit and the Chinese recensions of this celebrated book are to be found. But the fact remains that *Mdo* and *Rgyud* overlap in a great number of cases.²

These confusions or 'overlappings' are accounted for by the fact that a number of speculations, beliefs, and practices which reach their full development in the Tāntrik or last period of Buddhism were not unknown during the former period—e.g., the use of talismanic spells. Again, the Westerns establish a close connexion between the word 'Tantrism' and the worse forms of Hindu (or Buddhist) paganism—magic, theurgy, left-hand worship—and so far they are right, for the magical or left-hand practices are properly Tāntrik, and not to be found in Buddhism outside *Rgyud*; but these practices are not the whole of Tantrism. *Tantra*, with the Hindus as with the Buddhists, covers a large field. We find in the *Rgyud* the texts which are concerned with worship, whether it is 'Tāntrik' worship or Mahāyānist worship, including the building of domestic *stūpas*, the erection and the consecration of idols, the *stotras* or hymns, the daily offering. Worship, with the whole of the religious practices, is a Tāntrik topic. The *Bhadracharipranidhāna*, 'Resolution of Pious Conduct,' is reckoned a *Tantra*, because the recitation of this *pranidhāna* is one of the daily duties of a Buddhist devotee of the Great Vehicle: from the point of view of the Western definition of 'Tantra,' this text is absolutely non-Tāntrik: it is free from any tinge of idolatry, it breathes the most lofty spirit of the Great Vehicle.³ Litanies, lists of 100 names, whether of Prajñāpāramitā, Avalokiteśvara, or Mañjuśrī, are also *Tantras*. Litanies may be used for Tāntrik or non-Tāntrik worship. We know that the *Mañjuśrīnāmasaṅgīti*, 'Collection of the Names of Mañjuśrī,' is susceptible of a twofold interpretation: the first is a gnostic or purely philosophical one, the second sees its way to give to the most decent phrases the worst Tāntrik meaning.⁴

Therefore, in order to draw a general outline of the history of Tāntrik ideas in Buddhist literature and life, we must disregard the traditional divisions as embodied in the Tibetan catalogues or the Western theories on the subject, and build a classification of our own.

I. **EARLY BUDDHISM.**—The Old Buddhism, as preserved in the Pāli canon and in the Sanskrit Hinayāna literature, has a number of features which are not specifically Buddhist, which are alien to the noble eightfold path, which, to put it otherwise, are more or less Tāntrik or open the way to Tantrism properly so called. Let us mention a

¹ Fully analyzed by E. Burnout, *Introd. à l'hist. du bouddhisme indien*, p. 528.

³ *Kanjur*, *Rgyud* (Beckh), xxiv. 331; also in *Vinaya* (Dulva); B. Nanjio, *A Catalogue of the Chinese Translation of the Buddhist Tripitaka*, Oxford, 1883, no. 1142, ed. and tr. by Kaikioku Watanabe, *Die Bhadracarī: Eine Probe Buddhistisch-religiöser Lyrik*, Leipzig, 1912.

⁴ The *Mañjuśrīnāmasaṅgīti* has been published by I. P. Minayeff together with the *Mahāvīryapatti in Buddhism, Researches and Materials*, Petrograd, 1887, i. sect. 2 (in Russian); we refer to the commentary called *Aṃṭakapikā*.

few topics. (1) There is a general belief in the mystic power of the 'statements of truth';¹ Śākyamuni praises the use of half-magical 'formulas of protection' which have a large place in the more recent Sinhalese Buddhism (*paritrā*, *paritta*, *pirit*).² (2) In the earliest documents respect is paid to a number of deities or non-human beings who are both powerful and unfriendly; there is an 'orthodox' way of dealing with them, but 'unorthodox' worship is the natural result of fear. Vajrapāni is regarded as the 'guardian angel' of Śākyamuni, as the protector of the *avoué* of the Church. He is the pattern of the 'Dharmapālas' of a later age. (3) The worship of relics, the building of *stūpas*, pilgrimages, and idolatry are old features of Buddhism. (4) Last, not least, the earliest machinery of meditation or trance is akin to the more intricate machinery which constitutes the basis of the *Yogatantras*. Buddhist 'meditation' is simply Hindu *yoga* more or less transformed. The 'insight into the truth' (*satyadarśana*), which is the only and the sufficient means to *nirvāna*, practically implies (a) the meditation on loathsomeness (*aśubhabhāvanā*), when the ascetic, often 'a dweller in the cemeteries,' 'purifies his bones'—i.e. fancies that his flesh is rotten and falls, and sees only the bones behind, until the whole world appears to him as full of skeletons—and thus succeeds in crushing desire; (b) the restraint of breath (*prāṇāyāma*), counting the expirations and inspirations, in order to render thought more tractable and to direct it towards the Buddhist truths; (c) the *vimokṣas*, *abhībhvāyatanas*, and *kasinas*, prolonged contemplation of disks of earth, etc., by which (d) a number of supernatural states are induced, the so-called *dhyānas* (*jhāna*), or 'trances' and *samāpattis*, or 'ecstasies.' According to the Pāli and Sanskrit theologians it is only when absorbed in those supernatural states that a man is susceptible of rightly understanding the four Buddhist Truths (*satyābhisamaya*) and thus progressing towards *nirvāna*. Now it is quite safe to state that meditations on corpses, restraint of breath, the diverse methods of inducing trance, and the trances themselves have been borrowed by Buddhism from Hindu *yoga*. Buddhism established, more or less artificially, a strong connexion between those archaic devices of *yoga* and its own spiritual aim, *nirvāna*. But Buddhists did not ignore, and their books do not conceal, the fact that the discipline of *yoga*, while it may be made 'supramundane' (*lokottara*), i.e. utilized for the conquest of *nirvāna*, also provides a man with many 'mundane' (*laukika*) advantages: he who lives in cemeteries acquires power over the *bhūtas* and the manifold spirits who haunt these places; he who 'restrains the breath' masters thought and the body; he who practises trance becomes the possessor of magical powers and secures rebirth amongst gods. In short, a man who practises *yoga* becomes a *yogin*, or a *siddha*, an owner of 'perfections' or 'powers' (*siddhi*). It is clear that the position of Buddhism is not a safe one. Let us state it in plain words. A monk must perform in a Buddhist spirit, i.e. for the sake of *nirvāna*, a number of rites and meditations which confer the most precious 'mundane' advantages; he must disregard these advantages—which, in India, are the surest mark of holiness—while he perfectly knows that he can enjoy them when he likes. We may be sure—even if there were no documents to this effect—that many of the monks of early

¹ *Satyavachana*; see E. W. Burlingame, in *JRAS*, 1917, p. 429.

² See, e.g., R. Spence Hardy, *Eastern Monachism*, London, 1860, pp. 26, 30, 240; H. C. Warren, *Buddhism in Translations*, Cambridge, Mass., 1896, pp. 302, 321. A large portion of the *Rgyud* is *paritrā*.

Christianity were not strong enough to resist so powerful a temptation; e.g., they performed miracles for 'vain glory.' In such cases they acted as 'mundane' yogis; technically they followed the rules that later constitute the *Yoga-tantra*.

II. *MAHĀYĀNA*.—In Mahāyāna *bhakti*, or devotion, and *pūjā*, or worship in the Hindu guise, increase.

Mahāyāna is, like Hinayāna, a thoroughly Buddhist discipline, viz. a way to *nirvāna*; the disciple of Mahāyāna is a candidate for Buddhahood (*bodhisattva*, future Buddha), because Buddhas alone reach *nirvāna*; he will become a Buddha by acquiring the wisdom and accumulating the merit of a Buddha. But an essential feature of the doctrine is that the candidate for Buddhahood cannot succeed without the help of the Buddhas and of the future Buddhas nearing Buddhahood; this help is secured through *bhakti*. The early Buddhist paid worship to Śākyamuni, to the relics, to the holy places, but there was little or no *bhakti* in his respectful behaviour. Now the objects of worship are so many living gods, so many *bhagavats*, quite different from Śākyamuni, very much like the Hindu *bhagavat*, and they are entitled to the *bhakti* of the faithful. As has been pointed out several times,¹ *bhakti* is seldom free from elements which easily take a Tāntrik shade. To mention only one point: a man will be saved by remembering at death the name of Avalokita or of Kṛṣṇa. The names of the Buddhas or the *bodhisattvas*, the mystic formulas in which they have themselves placed a wonderful force, acquire a rôle in the sanctification of the devotee. *Bhakti* has exalted the god to such a degree that *bhakti* is no longer necessary. Sāntideva, an orthodox divine of the Mahāyānist school, praises without reservation the use of *dharanī*s for the pardon of sins.² The schools of the Mahāyāna known as the Sukhāvati sects place the highest spiritual advantages at the command of the man who knows how to worship Amitābha.³

Every form of *pūjā*, including the circumambulation of a *stūpa*,⁴ offering flowers to a *stūpa*, giving food to the monks, etc., was considered very useful from the beginning. A treatise like the *Ādikārnā-pradīpa*⁵ shows us that Mahāyāna has added much to the primitive liturgy; it gives a description of the many acts of worship which a Mahāyānist devotee, a 'beginner' (*ādikārmika*), was expected to perform—recitations of formulas, symbolic offerings, wonderful advantages to be obtained by acts which easily assume a mechanical character, so many features which give to Tantrism its specific aspects. A daily observance was the eightfold high *pūjā* (*aṣṭavidhā anuttarā pūjā*), a sort of worship 'in spirit and truth': confession of sins to the Buddhas and *bodhisattvas*—to the Buddhas who have a special claim to the title of 'Buddha of confession'⁶—resolve to become a Buddha, 'application of merit' (*pariṇāmanā*), etc. That this eightfold *pūjā* often becomes a mere ritualistic performance—a special kind of *dharanī*—is proved by the fact that it is a part of the *sādhana*s (see below). It is well known that Mahāyāna is prompt to admit any sort of spells

¹ E.g., by A. Barth, *Œuvres*, Paris, 1914, I, 190.

⁴ See *Śikṣāsamuchchaya*, p. 207; I-Tsing, *A Record of the Buddhist Religion*, tr. J. Takakusu, Oxford, 1896, ch. xxx., 'On Turning to the Right in Worship'; 'What is walking towards the right or towards the left, however, would seem a little difficult to determine' (p. 141). I-Tsing has many details on worship as practised in Mahāyānist convents.

⁵ Ed. and tr. L. de la Vallée Poussin, *Bouddhisme: Etudes et matériaux*, London, 1898, pp. 162-252.

⁶ See *Śikṣāsamuchchaya*, p. 250.

that provide 'mundane' advantages¹—of course it objects to 'black magic.' From our point of view, it is more important to observe that Mahāyāna worships a number of beings which are no longer Buddhist in character.² The demoniac origins of Vajrapāni are not forgotten; he nevertheless obtains a high rank in the pantheon; as he is the 'destroyer of the enemies of the Law,' he is probably one of the first gods who have been worshipped under a 'choleric' aspect.³ Female figures—e.g., the Tārās—are associated with the Buddhas, but there is not in this association any tinge of 'properly so called Tantrism.' The same can be said of Hārītī, the former goddess of smallpox, the account of whose avatars is one of the most curious and the best known pages in the religious and iconographic history of Buddhism. Her worship, both in the monastic and in the popular milieu, gives a correct idea of the Mahāyānist and of the half-Tāntrik methods of worship.⁴

III. *TANTRISM PROPER*.—Tantrism, properly so called, bears a twofold character; on the one hand, it is a systematization of the vulgar magical rites and it has existed under this form for many centuries in India and in Buddhism itself, together with its formulas and its pantheon; on the other hand, it is a 'theurgy,' a highly developed mysticism styled Vajrayāna; under this form Tantrism is an innovation in Buddhism.

Tantrism has its professionals, the sorcerers (*yogin*, *siddha*), and its laymen, the *clientèle* of the sorcerers, also all the Hindus who worship deities or idols of the Tāntrik type. The sorcerers, who are at the same time 'mystics' or adepts of the Vajrayāna, constitute a number of schools; there are many rival secret traditions characterized by different sets of formulas, of deities, and of theories.

We shall deal with only two points which deserve special notice: (1) the methods of *sādhana*, (2) the *vajrayoga*. To be complete, it would be necessary to study a number of *vidhis*, or rites, many of which are part of the Tāntrik daily cult and have been adopted by Mahāyānist Buddhism.⁵

1. *Sādhana*.—In order to perform a *sādhana*, i.e. the evocation of a god, the ascetic must be duly instructed by a *guru* and duly consecrated. The ascetics who have established the manifold secret sects of Tantrism had to propitiate the gods by long austerities and meditations before being favoured with the manifestation of the god; they at last received from him the secrets they are now able to teach to their pupils. The *guru* therefore assumes great importance: he is the paramount god of his pupil and the incarnation of the Buddha himself. When he has been taught all the details of the rites, the Tāntrika must undertake the *sādhana*, by which he renders visible any god he wishes and obtains control over him. The most important items in these magical performances are the knowledge of the *bija*, the mystic syllable which is the 'germ' or the 'seed' of the god, and the knowledge of the *vidyā* or *mantra*, which gives to its owner control over him.

On a chosen day the ascetic, after performing the regular ablutions, wearing a neat dress or a new dress, goes to a solitary place, either auspicious—a wood or the bank of a river

¹ See, e.g., *Tiṣṭavustik* (*Bibl. Buddh.* xii.), ed. W. Radloff and A. von Staël-Holstein, Petrograd, 1910.

² We say 'in character,' for it is difficult to say whether Amitābha, e.g., is not originally a sun-god; but Amitābha is 'Buddhistic'; he is the *sambhogakāya*, a modern name for the quasi-eternal Buddha of the Docetic school.

³ The latest authority on the subject is A. Foucher, *L'Art gréco-bouddhique du Gandhāra*, Paris, 1905-18, II, 48-64.

⁴ A. Foucher, *The Beginnings of Buddhist Art and other Essays*, tr. L. A. and F. W. Thomas, Paris, 1917; Noël Peri, 'Hārītī, la Mère-démons,' in *Bulletin de l'École française d'Extrême Orient*, xvii., fasc. 3 [1917]; cf. *JRAS*, 1895, p. 149.

⁵ A glance at the catalogue of the *Rgyud* will show the variety of the *vidhis*.

—or loathsome—a cemetery—according to the purpose. He sits there at ease in a purified spot and fulfils in order the different acts of a Mahāyānist *pūjā*, offering of flowers and perfumes, either mental or real, to the host of Buddhas and *bodhisattvas*, confession of sins, etc.¹ He continues in the same style by practising the virtues of friendship, pity, joy, indifference, by dwelling on the essential voidness of all things. Thus he is supposed to have acquired both merit (*puṇya*) and wisdom (*jñāna*): all this is only a preparation to the rite itself. The rite begins with the meditation on the *bija* of the god who has been chosen for some technical reason (every god has his own department in mundane and supramundane affairs). If the god is Yamāntaka or Yamāri (the enemy or the destroyer of Yama, god of death), the syllable is *hūm*; it is to be written on the disk which in the magic circle (*maṇḍala*) is the symbol of the sun. The ascetic causes to arise from *hūm* the wrathful Yamāntaka, hair bristling, blue, with six faces, with six arms, with six feet, riding a bull, standing in the *aiṅhā* pose, adorned with a garland of skulls, exceedingly frightful. When the god has been summoned in that way, the ascetic undertakes the second part of the rite: he fancies that he is the god; the identity of the ascetic and the god is a metaphysical truism; the ascetic does not identify himself with the god, he only realizes the identity. As soon as the ascetic knows that he is the god, he possesses all the powers that belong to the god: any wish he utters in the proper form—for his voice must be the voice of the god—will surely be accomplished.²

As A. Foucher, from whom this definition of *sādhanā* is borrowed, rightly observes, the description of the gods as given in Tāntrik treatises must be accurate: any mistake in the mental representation of those frightful persons would be fateful. The *Sādhanā* treatises have been the pattern according to which Hindu and Tibetan artists worked, and they furnish the best means to the identification of the icons or idols.

Sādhanas serve all sorts of purposes—worship, white and black magic. In many cases they are complete with their first part, the summoning of the deity, to whom worship and prayers are respectfully offered. More often, when the deities are the 'girls' or 'princesses' (*kumārī*, which is not 'virgin'), or the 'ascetic goddesses' (*yoginī*), we have to deal with the worst features of paganism.³

2. *Vajrayāna*.—But Tantrism is much more than a pagan system of rites of worship and sorcery. It is a vehicle (*yāna*, *naya*), a way to final liberation or to the *summum bonum*. Tantrism is the Tantrayāna, or the Mantrayāna (= *naya*), 'Vehicle of the Magic Formulas,' more often and more technically, the *Vajrayāna*. *Vajra*, 'lightning,' is originally and remains the weapon of Indra, of Vajrapāni, of the ascetics or *yogins*, against human or demoniac enemies. But *vajra* has assumed new meanings: (1) it designates the mystic or divine energy which is identified with 'intelligence' (*viññāna*): there are *vajrabodhisattvas*, 'bodhisattvas of vajra,' *vajrayoginīs*, 'divine female sorcerers,' *vajravārāhī*, 'the divine sow'; all divine beings are so many *vajrasattvas*, 'beings of vajra'; the supreme being, the Ādibuddha,⁴ is the *vajrasattva par excellence*. (2) On the other hand, *vajra* (with the variant *maṇi*) is a decent or mystic phrase for *liṅga*, the male organ, just as *padma*, lotus, is the literary rendering of *bhaga* or *yoni*.⁵

To this twofold meaning of *vajra* correspond two Tāntrik schools, right-hand and left-hand. Both owe much to the Mahāyānist doctrines, to Madhyamaka, and to Viññānavāda;⁶ they cling

³ On the Tāntrik pantheon see A. Grünwedel, *Mythologie du Bouddhisme au Tibet et en Mongolie*, tr. J. Goldschmidt, Leipzig, 1900. The description of the local deities of Nepal in S. Levi, *Le Népal*, Paris, 1905, i, 316-392, practically applies to all parts of Buddhist India.

⁴ See *EBE* i, 93.

⁵ On the spell *om nani padme hūm* see *JRAS*, 1915, p. 397, and L. A. Waddell, art. *JEWEL*, vol. vii, p. 555. The old translation, 'Jewel in the lotus,' may be right after all.

⁶ See art. *PHILOSOPHY (Buddhist)*.

to the theory of universal voidness (*śūnyatā*), but they develop the concepts of *tathatā*, *tathāgata-garbha*, etc., and result in an undisguised monism. While Mahāyāna states that all beings are 'future Buddhas,' that all beings are 'embryos of *tathāgatas*,' the two Tāntrik schools maintain that all beings are *vajrasattvas*, are the unique *Vajrasattva*; they also maintain that the nature of *vajra* is immanent in all beings and can be actualized by appropriate meditations and rites.

Now the left-hand school conceives the nature of *vajra* according to the Śaivite pattern; the right-hand school is nearer the Vedāntist or Yoga tradition: on the one hand the traditions of the *Mahākālatantra*, etc., on the other hand the Church of the *Mahāvairochanābhīṣambodhi*, the *Vajrasekhara*, etc.—the modern Japanese sect of Shin-gon-shū.

In the Tantras of the Śaivite type we have to deal with a Buddhist adaptation of Śaivism and Śāktism. The three traditional bodies of a Buddha are preserved, but the true nature of *vajrasattva* is his fourth body, 'the body of bliss' (*ānanda*, *sukhamaya*, *mahāsukhākāya*), the body of *vajra*; it is with that body that the eternal *tathāgata* or *bhagavat* eternally embraces his *sakti*, Tārā or Bhagavatī. From this erotic conception of the nature of being or the divine being it follows that, in order to actualize his real divine nature, the ascetic must perform the rites of union with a woman (*yoginī*, *mudrā*) who is the personification of the *bhagavatī*,¹ who is Bhagavatī herself; as it is said, *buddhatvam yośidyonisamāśritam*, 'Buddhahood abides in the female organ.'² This truth was discovered by Śākyamuni, who, according to the *Chandamahārośaṇa*, conquered Buddhahood by practising the Tāntrik rites in the *harīm*. The most conspicuous topic of this literature is what is called the *śrīpūjā*, 'worship of women':³ disgusting practices, both obscene and criminal, including incest, are a part of this *pūjā*, which is looked upon as the true 'heroic behaviour' (*duḥkara-charyā*) of a *bodhisattva*, as the fulfilment of the perfect virtues. Buddhist mythology and mysticism are freely mixed with *śāktas*: the semen is the five Buddhas, etc. The leading idea that 'everything is pure to a pure man,' *omnia sancta sanctis*, is often expressed. 'Lust is to be crushed by lust. . . . Do strenuously that which is condemned by fools, united with your chosen deity, intent upon the purification of thought. Women stirred with the poisonous fire of love provide their lovers, ascetics of pure mind, with all the fruit of love. . . . Enjoy all the pleasures of love without fear. Do not fear; you do not sin.'⁴

We may add two remarks. (1) Some 'moral' rules are to be observed even in the ceremonies (*chakra*) which are provided for the thorough enjoyment of the *ma* (*māṇsa*, 'meat,' *madya*, 'alcohol,' *maithuna*, 'sexual union'). A modern Śaivite work, the *Mahānirvāṇatantra*,⁵ explains that 'the ascetics should drink so long as their eyes do not roll and mind is not agitated. Beyond it, drinking is like that of a beast.' The rite of *pūṇābhīṣeka* or *tattvachakra* must not be practised with any woman, but with one's own wife; so far, good, but there are two sorts of marriages, one for life, the other contracted for the purpose of the rite and lasting only till the completion of the rite. (2) Secret rites are the business of a few 'devotees.'

¹ We meet the formula, *Bhagavān bhagavatībhageṣu vijāhāra*.

⁵ Tr. Manmatha Nath Dut, *Wealth of India*, Calcutta, 1899-1900, vii-viii.

On the whole and for the largest number of its adherents, Tantrism is simply paganism.

According to the left-hand Tantrism which we have described, the rites of union (*maithuna*) are not efficacious by themselves; before practising them the candidate for *vajrasattva*-hood must be 'purified' in a threefold respect; he must possess the body, the voice, and the thought of a *tathāgata*. This threefold purification constitutes the Tantrism of the right hand.

These are 'aspersions' or 'consecrations' (*abhīṣeka*),¹ 'marking' (*nyāsa*) which consecrates the different limbs of the body, 'prayers' (*japa*) which purify the voice. The most intricate part of this discipline concerns thought. No Western scholar has yet endeavoured to understand the three mysteries of the body, the voice, and thought, the *vajradhātu* and the *garbhadhātu*, the five *tathāgatas* (the so-called *dhyānibuddhas*²) who are associated with five wisdoms, with the five *dhātus* (earth, etc.), etc.; the Buddha, Vajra, and Padma class of formulas, etc. We depend on the descriptions of the Shin-gon-shū sect, which are too meagre and obscure to be thoroughly intelligible.³ The opinion of the present writer is that a number of schools are to be distinguished: there are branches which are connected with *rājayoga* (meditation and knowledge are the only means to the actualization of the nature of a *tathāgata*); some other branches praise ritualistic performances, especially 'intertwinings of the fingers' (*mudrā*);⁴ some will admit the rite of union, but with a female described as a *jñāna-mudrā*, a mental female.⁵

TAOISM.—Taoism is one of the three 'Teaching' (*San Chiao*) of China, the others being Confucianism and Buddhism. Like Confucianism, and unlike Buddhism, it claims to be a native growth.

1. Lao-tse.—The primary source for our knowledge of Taoism is the *Tao-Teh King*. This small

¹ See *IMITATION* (Buddhist), vol. vii. p. 321, under 4 and 5.

² This phrase has never been met in any Sanskrit book.

⁴ See Si-do-in-dzou, 'Gestes de l'officiant,' *AMG, Bibl. d'Études*, t. viii., Paris, 1899.

⁵ *Mudrā* has a twofold meaning.

book of about 5000 characters, usually divided into two parts, 'Concerning Tao' and 'Concerning Teh,' comprising 81 chapters, is traditionally ascribed to Lao-tse (born 604 B.C.), an older contemporary of Confucius. Lao-tse, surname Li, name Erh (= 'ear'), also known as Tan, a character which implies some aural peculiarity, is said to have been an official at the court of Chow and to have been visited on one occasion by Confucius, who after the interview compared him in his lofty incomprehensibility to a soaring dragon. Despairing of the world, Lao-tse retired from office and disappeared through the Western passes, the guardian of which induced him before leaving to compose the *Tao-Teh King* as a record of his teaching. This account of him was in later times supplemented by many marvels—*e.g.*, his prolonged gestation, which entitled him to be called 'old boy,' as his name Lao-tse might also be translated. Si-ma Ch'ien († 85 B.C.), who gives the more sober account of Lao-tse, gives also the names of his son and grandson and of the great-great-grandson of this grandson. He tells us further that about the middle of the 2nd cent. B.C. a book of Lao's was a favourite with the widowed empress of the second Han emperor. The emperor King (156-143 B.C.) is said to have made it a 'classic.' Still further back than Si-ma Ch'ien we have in Hwainan († 122 B.C.), Han Fei († 230 B.C.), and Chwang-tse (4th cent. B.C.) many quotations from Lao-tse (or Lao Tan) which are to be found in the *Tao-Teh King*. According to Legge, the first two of these authors quote the whole or parts of 71 out of the 81 chapters of that book. On a review of the evidence thus summarized, Legge concludes that he does not know of any other book of so ancient a date of which the authenticity of the origin and genuineness of the text are so well substantiated.

Criticism, however, has been busy both with Lao-tse and with his book. Founding upon the name Lao-tse, which may mean equally well 'old philosopher' or 'old philosophers,' an extreme criticism has resolved him into a number of ancient thinkers, some of whose sayings are preserved for us in the *Tao-Teh King*. For this view there is no ground except the ambiguity of the name. A less drastic criticism, of which H. A. Giles is representative, allows that at a remote period Lao-tse lived and thought and taught, and that some fragments of his teaching are preserved in the *Tao-Teh King*, in which we have those fragments pieced together by a not too skilful forger of the 2nd cent. B.C. with padding of his own. This conclusion is said to be practically certain. The criticism, however, by which it is attempted to establish this conclusion is somewhat crude. The external evidence summarized above at least does not support it; nor is it warranted by the occurrence in early Taoist writers of sayings ascribed to Lao-tse which do not appear in the *Tao-Teh King* and of sayings ascribed to Hwang-ti which do appear there, or by the evidence adduced from the *Tao-Teh King* itself (repetitions, quotations, late characters, rhyme), while the discrimination of what is admitted as genuinely from Lao-tse from what is rejected as compiler's padding is too subjective to be convincing. In favour of the earlier date of teaching and in the avoidance of technical terms current in later Taoist authors it may be noted that, in its general type of teaching and in the leaves on the reader the impression that it belongs to a less developed stage of Taoist thought than is found in them. The *Tao-Teh King*, however, still awaits a thorough application of sound critical principles. Indian influence on both the matter and the form of the *Tao-Teh King* has been asserted by some. The truth of this assertion cannot be considered apart from the general archaeological question of the intercourse between India and China. There is a certain congruence between the mood of the *Tao-Teh King* and Buddhism, but not such as requires the dependence of one on the other as its explanation, and the present state of our knowledge hardly warrants the assumption of contact with Indian thought early enough to influence the *Tao-Teh King*, unless that book is dated later than all the other evidence seems to demand. According to D. T. Suzuki, the so-called Indian influence on the early Taoists is not probable. It is curious that in *Tao-Teh King*, ch. 39, § 3, there is an illustration taken from a chariot and its parts to which T. W. Rhys Davids quotes a close parallel as having been used by Nāgārjuna, the founder of the Madhyamika school of Northern Buddhism, who taught about the beginning of our era. It is to be noted, however, that the same argument, only with a horse instead of a chariot as illustration, is found in Chwang-tse, bk. 25, p. 126.

It is not difficult to cull from the *Tao-Teh King* admirable ethical maxims.

¹ *Buddhism*, London, 1878, p. 97.

'The highest goodness is like water. Water is good for advantaging all things and does not strive. It takes the place that all men hate' (ch. 8). 'He who raises himself on tip-toe cannot stand; he who straddles cannot walk' (14). 'He who overcomes men has force; he who overcomes himself is strong. He who knows he has enough is rich' (33). 'I have three precious things which I count and hold precious. The first is gentleness. The second is moderation. The third is not daring to take the first place under heaven' (67). To these might be added, but for the considerations mentioned below, the famous 'Recompense injury with kindness' (63).

The virtues commended lie in the line of self-suppression. For the inward state of which they are modifications the characteristic word is *hsü*, 'emptiness,' i.e. freedom from desires. Corresponding to this inner freedom from desires is the outward life of non-action (*wü wü wü*), i.e. absence of self-determined action for particular ends. Hence the world is an ethical danger (12), for it is by the world that we are drawn out into desire and action away from the stillness of our inner being, which it should be our object to keep (5), though this true type of life is unattractive except to the sage (35). He attains this life by a process of abscission of motives, by which he arrives at a childlike state of spontaneity and tenderness, in which there is also exemplified the paradoxical possession of security and strength (10, 20, 28, 55). This ethical ideal is supported by various arguments. Thus in ch. 13 the argument seems to be that to be in a position to enjoy what the world regards as honour is to be exposed to what the world regards as calamity. That which makes me a possible subject of either is just that I am an object to myself. The sage therefore treats his person as if it were alien from him. He never identifies his happiness with this or that, so never loses his happiness. Having no private ends, his private ends are realized (7). Again, it seems to be argued that as ideas suggest their contraries—e.g., to know beauty is also to know ugliness—so the sage, seeing that everything is dogged by its opposite as by its shadow, refrains from all positive action (2). From the external world Lao-tse gathers illustrations, both negative and positive, of his teaching. The short-lived storm of wind and rain suggests the futility of violent action. Water in its fluidity and taking the lowest place exemplifies absence of self-determination and humility, while, as it also benefits all things and wears away that which is hard, it illustrates the paradoxical issue of *wü wü* ('Do nothing') in *wü pu wü* ('There is nothing that is not accomplished'). Specially is illustration to be found in vegetable life, which in obedience to an inner impulse or appointment passes through its cycle of growth, culminating and again subsiding (16). The Taoistic life is therefore a life of equable indifference, outwardly of non-action, devoid, i.e., of action for chosen ends; moved in obedience to an inward spontaneity rather than motivated by outward inducement; a life conscious, rather than self-conscious, spontaneous rather than self-determined. Hence the sage is 'simple' (19) with the simplicity of unwrought wood as contrasted with the definiteness of a carved beam; i.e., he is free from self-determinateness. Again, he grasps 'the one' (22), withdrawing himself from the manifoldness of self-determination along particular lines and holding to 'the one,' i.e. the principle which Lao-tse knows as *Tao*.

The metaphysics of the *Tao-Teh King* centre in this conception of *Tao*. In many passages *Tao* has its common meaning of 'a way,' either the ethical way that men should follow or the method of action followed by Heaven (cf. 'course of Providence') or prescribed by Heaven for man's following. But elsewhere it is a metaphysical principle (chs. 1, 4, 14, 21, 25, 34, 37, 40, 42, 51, 62). The gist of what is stated in these chapters is as follows:

The origin of heaven and earth is nameless (1), is indeed non-existence (40), something quite indefinite, which, when we attempt to define it, becomes nothing (14, 25); if we must make a name for it, we may call it *Tao*: it may seem to be prior to God (4); it becomes nameable in relation to the universe that springs from it (1), in an order which may be partly known (42); not only is it the origin of the universe as a whole, but it presides over all beginnings (21), reaching everywhere (25, § 3) and doing everything, while it seems to do nothing (37).

Summing up what we have here, we may say: (1) as transcendent existence *Tao* is something quite indefinite, which Lao-tse struggles to express by negatives; (2) from this indefinite ground the universe of things issues by a process which is emanation from *Tao* as mother and not creation by *Tao* as agent; (3) *Tao* is immanent in the world, working in an unobtrusive way, producing and bringing to perfection individual existences. On the whole, we perhaps come nearest to the meaning of *Tao* when we say that it is pure being (most abstract of categories) endowed with spontaneity, the ultimate essence and impulse of all definite things. Obviously this conception of *Tao* excludes all idea of its equation with God. In ch. 4 Lao-tse says of *Tao*, 'I do not know whose son it is: it appears to be before God (*Ti*).' There can be no doubt that with Lao-tse *Tao* is the ultimate ground of all definite existences, *Ti* among them, while, by saying that he did not know whose son *Tao* was, he lets us see that, having arrived at his conception of *Tao*, beyond which he could not go, for in the line of logical abstraction there is no going further than 'being' which is nothing, he yet dimly felt that it did not explain itself.

The only other term in the *Tao-Teh King* capable of a theistic interpretation is *T'ien*, Heaven. In some instances of its use a near approach is made to what we mean by Heaven when we use it as equivalent to Providence. In this, its highest, use it is not merely the physical sky, but a power supreme in the world of visible things obscurely connected with the sky, which is the supreme exemplar of *Tao*, but, even so, posterior and subordinate to it. *Tao* is to Lao-tse the ultimate and determining fact.

His metaphysic, as thus explained, explains his ethic. The ground of existence being a perfectly indefinite spontaneity, a dark abysmal one from which, for no reason assigned, the multiplicity of the world emanates, by the immanence of which the world is and is moved—all this agrees with the ethical doctrine of abstention from self-determination and of sinking back on the inner ground of our being that we may be as this spontaneity in us causes us to become. Here is the justification for regarding Lao-tse's doctrine as simply a variant of 'Follow nature'; only we must remember that *Tao* is both the substantial essence and the dynamic spontaneity of all things. This, of course, brings up the difficulty of accounting for the existence in *natura naturata*, the world of concrete things, of any contrariety to *natura naturans*, *Tao*, and raises the question, neither asked nor answered by Lao-tse, why a short-lived storm is not as much an expression of *Tao* as the enduring stillness of Heaven.

Before turning again to the practical side of Lao-tse's teaching, we may refer to what may, by courtesy, be called his theory of knowledge. It is by freedom from desire that we can attain to a knowledge of the mysteries of *Tao* (1). Inasmuch as *Tao* is the principle of all existence, knowing it, we are at the heart of all knowledge. There is no need for the sage to expatiate over the world. Without moving out of doors he already knows (47). Knowing one case, he knows all, for *Tao* is the one universal principle (44).

We can best return to Lao-tse's practical teaching by the word *Teh*, which next to *Tao* is his key-word. Like *Tao*, it received from Lao-tse a

new meaning, since it is the outcome of *Tao* (51). There is indeed a *Teh* which begins where *Tao* ends (38). This is the *Teh* which is the result of effort, self-conscious *teh*. *Teh* in the Taoist sense is usually distinguished by some epithet—'mysterious,' 'large,' 'lasting,' etc. As the outcome of *Tao*, it is activity devoid of self-determination, the expression of the spontaneity of the immanent *Tao*. The various virtues commended by Lao-tse are aspects of, or approximations to, this *teh*. It is in this Taoistic sense that we must take the famous maxim 'Recompense injury with *teh*,' where it is a mistake to translate *teh* by 'kindness.' The maxim is no more than a precept of indifferent self-possession: 'Be a Taoist, even though provoked' (cf. 5).

Lao-tse's practical teaching is completed by his speculations on physiology and politics. As to the former, it is asserted that the Taoist adept attains to 'lastingness' (7, 16, 44, 59). There is no place of death in him, and so he passes through dangers unscathed (50). Hints are also given of a death which is not destruction, implying a persistence in spite of death which is true long life (33). This thought, however, is not developed. With the other form of longevity appears to be associated a certain management of the breath (10, 52), and through this vein of thought there is a connexion with later Taoist developments.

In Lao-tse's politics, as in his ethics, there are attractive thoughts—*e.g.*, the protest against luxury in the court alongside misery among the people (53) and the detestation of war (31). The Taoist method of government is *laissez-faire*. The sagely king does nothing, and everything comes right of itself (32, 37, 57). Logically Lao-tse's thought implies that any sage would be the centre of a universal sway (49, 57, 77), but it is hinted that the influence of a sage becomes effective only when he has the advantage of high place (56). Here Lao-tse is in line with Confucius, who asserted that his principles would transform the world if only he could find a ruler wise enough to give him office. In describing the society which would come to being under Taoist influence, Lao-tse pictures small stay-at-home communities devoid of letters and of luxury, content with what is theirs and utterly incurious of what is not. As men within a Taoist society so societies in their relation to one another are to act Taoistically. The right way is one for men and for States (61).

There are unexplained remainders in the *Tao-Teh King*, but Lao-tse does give us a reasoned view of things. As we think back and back, we come to something which we cannot see or hear or touch, an obscure something from which all things come. It is in all things, which could not be apart from it. Yet it never parades itself. It simply is, a mysterious, ever-during, all-working existence. Let us conform ourselves to this: let us become one with it. For it is in us as in all else—our essence which would realize itself if it were not hindered by our self-will and self-seeking. If we put away these, then we know it and are and become what it tends to be. It is *Tao*, unqualified being, origin of things, and in them as essence and spontaneity.

2. **Taoism before Lao-tse.**—The question has been raised whether Taoism existed prior to Lao-tse. That there was such an early Taoism is argued on the grounds of quotations in the *Tao-Teh King* from earlier Taoists, the persistent reference of Taoism not only to Lao-tse but also to the at least semi-mythical Yellow Emperor (Hwang-ti, 2697 B.C.), so that 'the words of Hwang and Lao' came to be a term for Taoist teaching, and the allusions in the *Tao-Teh King* and other Taoist writings to an age when the

world moved on Taoist principles. It has also been argued that, while the *I-King* is dualistic, it also contains allusions to a monistic and idealistic strain in pre-Confucian speculation, and that a doctrine of that from which the dual principles derived (*Tao*) was in various forms well known. Hence, it is claimed, the *I-King*, the doctrine of *Tao*, and some strongly held ethical principles intuitively known were the materials on which Confucius and Lao worked, Lao appropriating the monistic sayings of the *I-King* but placing his chief reliance on the doctrine of *Tao* as handed down from the Yellow Emperor.¹ In the same line E. H. Parker² says that there is little doubt that Lao-tse simply gave a name (*Tao*) to a floating group of ethical principles already for many centuries spread far and wide over China and already well known as the maxims of Hwang-ti, and that every single thought in the *Tao-Teh King* had been foreshadowed, usually word for word, in the *Book of History*, *Book of Rites*, *Record of Rites*, *Book of Changes*, *Book of Odes*, or other very ancient work. Among these other ancient works Parker puts the volume attributed to Kwan-tse, which he dates from the 7th cent. B.C. In spite of all that is here said, it may still be reasonably maintained that there is no conclusive evidence of an explicit Taoism previous to Lao-tse. Even Parker does not deny a certain originality to Lao-tse in developing a new quietistic conception of how human affairs once presumably were, and ideally should be, regulated. There may have been a floating group of ethical principles which Lao-tse took over, but it is the reasoned quietism of the *Tao-Teh King* based on *Tao* as metaphysical principle that alone has the right to be called Taoism, and of the earlier existence of this proof is yet lacking. In the *Tao-Teh King* itself there is no mention of Hwang-ti, and the allusions to the simpler social conditions of earlier times do not prove the existence then of a reasoned Taoism. Certainly this would be proved if we found Lao quoting 'from some sage anterior to himself who had already formulated the doctrine of inaction in the very terms we are accustomed to associate with the name and fame of Lao-tse himself.'³ The reference is to *Tao-Teh*, ch. 57. But the introductory phrase may be translated 'Therefore the sage says,' meaning that such language is characteristic of the sage, whether actually or hypothetically existing, just as the next chapter contains a similar gnomic reference to the sage's action. Five other quotations (22, 41, 50, 69, 78) may be admitted, but they are not of a kind to prove the existence of Taoism anterior to Lao. Only if numerous other phrases introduced by the formula '*ku yüeh*' are treated as quotations, can justification be found for speaking as Legge does of 'the sentence-makers often drawn on by Lao-tse'⁴ or for saying that Lao-tse 'abounds in sentences out of some ancient lore of which we have no knowledge but for him.'⁵ But these phrases may not be quotations so much as aphoristic expressions of Taoistic teaching, perhaps already current with Lao and his school. Parker's wide reference to ancient literature must be heavily discounted. It is difficult to justify his appeal to books so innocent of Taoism as the *Book of History* and *Book of Odes*. Moreover, it is one thing to find in ancient literature expressions congruent with Taoism and quite another thing to find expressions essentially Taoistic. It is true that *Tao-Teh* is a conjunction of characters

long consecrated by use in the *Book of Changes* and the *Book of Rites*.¹ In the *Book of History* or elsewhere we may meet with phrases such as 'The Son of Heaven acts as the people's Father and Mother, and as such is the King of the world,' or 'That the Prince of a State should hold dirt in his mouth is the Providence (*Tao*) of Heaven.' But such things do not prove the existence of Taoism as a scheme of thought prior to Lao-tse. Nor, when we read in the *Tao-Teh King*, 'Thus we cannot say that the ancients meant nothing by the expression "Bend and survive,"' is it quite legitimate to annotate, 'Note Lao's allusion to more ancient philosophy.' There is no evidence that the ancients grounded this maxim on a metaphysical *Tao*. The *I-King* does in parts² contain indications of what may be called Taoist philosophy; but this very fact leads Legge to put the origin of these parts posterior to Lao-tse in the 5th or 4th cent. B.C. Kwan-tse may be dated in the 7th cent. B.C., but the work ascribed to him is suspected of being a forgery of a later date. In the present state of our knowledge it is probably right to say that the existence of a Taoist philosophy prior to Lao-tse is not proven. The *Tao-Teh King* may still be taken as the earliest example of Taoist thought.

3. Taoism after Lao-tse.—The history of Taoism immediately subsequent to Lao-tse is obscure. Somewhat later its development can be traced in a succession of authors.

(a) *Lieh-tse*.—The earliest of these may be Lieh-tse (=Licius, 5th cent. B.C.), but the authenticity of the work ascribed to him is doubtful. According to him, the whole of things is in perpetual transformation. The ultimate basis of all is a vague something which differentiates itself into *ch'i*, *hsing*, and *chih*. The second and third terms may be translated 'form' and 'matter' respectively, though we must beware of assuming an exact equivalence to these terms as used elsewhere (e.g., in Greek philosophy). *Ch'i* is more difficult to translate. Giles³ gives as its meanings 'the vivifying principle or aura of Chinese cosmogony: breath, vital fluid: force: influence.' The state of things when these three were in an undifferentiated and therefore imperceptible condition is called 'chaos,' whether this is or is not to be identified with the ultimate origin and basis of things. Progress is made from chaos by an evolution vaguely indicated, in the final stages of which the pure and light portions form 'heaven,' the heavy and gross form 'earth,' and 'man' appears as the vehicle of their harmonious *ch'i*. The general ethical temper is quietist, based now on ignorance, now on fatalism. Another root for it is found in the subjectivity of knowledge, and the absence of any criterion of truth and falsehood, right and wrong, though this is hinted at rather than developed. Along with this may be noted a disclaiming of any discrimination in worth between waking and dreaming experiences. Views of death are given which are perhaps not quite consistent. On the one hand is put the question, which might suggest Buddhist influence, 'When the spiritual enters its gate and the material returns to its root, where do "I" survive?' On the other hand, it is asked whether death may not be another birth. Lieh-tse makes much use of anecdotes, a good many of which seem to have been treated by Taoist writers as the stock property of their school. The magical side of Taoism shows in Lieh-tse considerable development as compared with the *Tao-Teh King*. The secret of it is such a selfless identification with the life of nature as brings the Taoist into harmony with

all its forces, animate and inanimate. The alleged immunity of a drunken man from injury by accident is used to illustrate the still higher immunity which one would enjoy who was entirely under the influence of the 'heavenly' (i.e. 'natural' as opposed to 'self-determined') element of his constitution.

(b) *Chwang-tse*.—The most brilliant of the Taoist writers is Chwang-tse (c. 330 B.C.). In him as little as in the *Tao-Teh King* is there any systematic exposition of Taoism. In the development of his views he uses various literary devices— anecdote, allegory, and imaginary conversation. In some places he handles somewhat freely not only Confucius, but even more ancient worthies, such as Yao and Shun. How little historical accuracy or consistency is regarded is shown by the fact that Confucius is also introduced speaking in quite a Taoist vein. It is not easy to see the drift and relevance of all Chwang-tse's chapters, but the reader cannot fail to find a characteristic attitude towards reality. As in the *Tao-Teh King*, the metaphysical basis of everything is *Tao*, which as the explanation of all things is not itself a thing. It is more abstract even than non-existence, which is made definite by its opposition to existence, and so it may be called non-existing non-existence. To call it *Tao* is only a metaphor. From this absolute indifference all existences, including spirits and God, have come. No explanation is given of this coming into existence of definite things, though, to be consistent with the general scheme, the evolution must be unmotivated and spontaneous. The process from unconscious indifference to the world of consciousness and of differentiated things is described in the allegory of 'Heedless' and 'Hasty' pitying insensible Chaos, and digging in him orifices of perception with the result that he died (bk. 7). *Tao* is in things, their reality and the regulator of their processes. In accordance with this view *Tao* and things are the hints of the illusory nature of all knowledge coming through the senses. The truth of things is perceived by the spirit, and Taoist adepts, when most in touch with reality, are in a trance, their bodies like rotten tree-stumps and their minds like slaked lime. One may notice also the incipient scepticism based on the relativity of knowledge and the phenomenon of dreaming. A paragraph more quoted perhaps than any other from Chwang-tse, though by no means the most central to his position, is that in which he hesitates to decide whether he is Chwang-tse dreaming that he is a butterfly or a butterfly dreaming that he is Chwang-tse. Since *Tao* alone really is, the truth of life is to be found in the above-mentioned trance when self-consciousness and self-determination are completely lost. But, as in the *Tao-Teh King*, so here, things are taken for granted, with *Tao* as their spontaneously operating essence; and in accordance with this assumption the ethical ideal is with Chwang as with Lao a life of spontaneity. There is inculcated an abscission of all definite volition and an indifferent yielding of oneself to the course of nature. Hence follows a characteristic attitude towards death, which is regarded as natural and therefore as little to be feared as birth. The Taoist is independent of all accidents, which are of no importance in comparison with the independent worth of self as an expression of *Tao*. It is only false opinion which differentiates between this and that outward state. If all self-determined effort is a departure from the truth of life, it follows that the devotee of virtue and the worker of iniquity fall under the same condemnation. Hence results a paradoxical levelling down of moral distinction. A similar strain of thought appears in Yang-tse, the heresiarch whom

¹ Parker, p. 70.

² E.g., Appendix, iii.

³ *A Chinese-English Dict.*, London, 1912, s.v.

Mencius criticized, and is there regarded as congruent with the teaching of Lao Tan.¹

(c) *Han Fei-tse and Hwainan-tse*.—Other writers reckoned as belonging to the Taoist school are Han Fei-tse († 230 B.C.) and Hwainan-tse († 122 B.C.). The writings of the former are preserved in 55 chapters, two of which (21 and 22) are entitled 'Explanations of Lao' and 'Illustrations of Lao.' Apparent quotations from the *Tao-Teh King* occur elsewhere in his writings. Han Fei-tse hardly discusses the metaphysical side of Taoism. His book is ethico-political, and is marked by shrewdness rather than by loftiness of tone. One sympathizes with the Chinese student who protests against his being classed as a Taoist and explains what he regards as the degenerate nature of his teaching as due to a perversion to a scheming selfishness of such sayings of Lao-tse as 'When one is about to take an inspiration, he is sure to make a previous expiration' (36) and 'The sage wishing to be above men, puts himself by his words below them' (66). Hwainan-tse is a more genuine Taoist than Han Fei, but his writings in their fanciful analogies and extravagant statements give evidence of a progressive deterioration of Taoism. Ethically he is superior to Han Fei. In at least one statement of his fundamental ethical position he shows a close verbal approximation to orthodox Confucianism: action in accordance with the nature (*hsing*) is called *Tao*, and this nature is to be distinguished from the passions (*yü*).

4. **Later Taoist literature.**—Later Taoist literature is voluminous and reflects that medley of subjects which make up Taoism, such as the search for immortality (which Chu Hi singles out as its main object), the conquest of the passions, alchemy, amulets, the observance of fasts and sacrifices, ritual and charms, and the multiplied objects of worship. Much of present-day popular hortatory literature may be reckoned as Taoist. Probably the most popular of all Taoist writings is *The Treatise of Actions and their Retributions*, which dates from the Sung dynasty. According to the original text, retribution takes effect in this world. The practiser of virtue indeed not only may receive earthly happiness but also may hope as the culmination of his reward to become immaterial and immortal, *hsien-jen* (= *rsi* of Buddhism). As for the transgressor, he suffers in his person and fortune, and, if at his death guilt still remains unquated by punishment, judgment extends to his posterity. Of this retribution Heaven and spiritual beings are recognized as the agents. In the illustrative anecdotes added in many editions to the original text the stage of retribution includes the other world and successive rebirths in this world. The inculcated morality has many excellent details, but extends also to tabus—e.g., striding over a well or leaping over food.

5. **Present-day Taoism.**—Chang Tao-ling (A.D. 34) has been regarded as the founder of present-day popular Taoism, which is not unfairly described as a mass of superstitious magic. The earlier literature, however, makes it evident that before his time Taoism had yielded to the love of the marvellous. Chang Tao-ling is said to have received from Lao-tse himself, who appeared to him from the realm of spirits, a sword and other apparatus in virtue of which he was able to exercise control over the spirit world. Descendants of Tao-ling, in each of whom it is said the soul of their ancestor is successively incarnate, and whose residence is at Lung-hu Shan in Kwangsi, have inherited his powers, and since A.D. 748 hold by imperial decree the hereditary dignity of 'Master of Heaven.' They are often spoken of in works

on China as Taoist popes. After the introduction of Buddhism into China Taoism shows very evident traces of Buddhist influence, which was particularly potent in the 3rd and 6th centuries A.D. In its religious literature and practices it follows Buddhist models and borrows Buddhist phraseology. It has its temples, priesthood, and monasteries. Giles' statement, that the celibacy of Taoist priests has been strictly enforced since the 10th cent.,¹ is subject to qualification. Eitel says that Taoist monks or priests do not take the vow of celibacy. They may keep their families outside the cloister walls and spend the whole time between meals at home.² Doolittle distinguishes two classes of Taoist priests.³ A Christian influence in the names and titles of objects of Taoist worship has also been traced by some (e.g., Wiegner). Many of the best known objects of popular worship are members of the Taoist pantheon; e.g., Yü Hwang Shang-ti, who is the Supreme Taoist god, is also he to whom the great name Shang-ti 'sans phrase' would be most readily referred by the ordinary Chinese. Lao-tse is himself worshipped as one of the 'Three Pure Ones' whose images are prominent in every Taoist temple, the two others being Yü Hwang and Pan Ku. Taoism has produced a plentiful crop of legends and fairy-tales, the influence of which is seen in Chinese art.

The gulf between the Taoism of the *Tao-Teh King* and present-day Taoism is a wide one. It has to be remembered, however, that even in the *Tao-Teh King* there are passages which suggest a marvellous mastery of nature by the Taoist adept and provide a starting-point for that search after immortality which, according to Suzuki, first opened the door for the inrush of superstition. The suggestion has also been made that, as the opposition sharpened between Confucianism and other strains of thought, all of popular religion and superstition that found no encouragement in Confucianism took refuge in Taoism. Over and above any such accretions and any particular phrases in the *Tao-Teh King* which might provide a germ of magical developments, the general position of Taoism from the beginning exposed it to such deterioration. Starting from the assumption that man and nature are fundamentally one, its quietism obliterated the line between moral and physical, and promised its adept such a harmony with Nature as laid open to him her secrets and made him merely the vehicle of her great powers. The distinctness of the moral person was lost in the all-embracing sweep of *Tao*. Confucianism also speculated on the relation between man and nature, and thought of the sage as exercising a cosmic influence. But this influence is the issue of moral development, and the Confucian emphasis on self-determined morality prevented any sinking of man into nature.

The nobler elements of Taoism are, however, not extinct. The Taoist pope is not recognized as head by all the Taoist priesthood. There are celibate Taoists among whom the nobler Taoist strain is cherished, who disclaim any connexion with him. In some of the secret societies also elements of the higher Taoism survive. Even in Confucian circles classical Taoism has influence. The writer recalls one scholar who would not have described himself as other than Confucianist, who was well acquainted with the *Tao-Teh King*, and who used to repeat with genuine appreciation, 'The highest goodness is like water.'

6. **State relations.**—During its long history Taoism has experienced a considerable vicissitude of political favour and disfavour. In the pre-Ch'in

times the various schools of Chinese thought seem to have been allowed free play. With the Ch'in dynasty, the first emperor of which tried to suppress Confucianism, Taoism was in favour, and it continued to enjoy imperial patronage under the early Han dynasty. Thereafter its political relations were chequered; e.g., in the 6th cent. it was suppressed in favour of Buddhism, while in the 8th cent. it was honoured by the emperor Hsüan Tsung. After other such vicissitudes it was by the late Manchu dynasty reckoned along with Buddhism and Christianity as a heterodox teaching in contrast to the sacred teaching of Confucius.¹ See also art. MYSTICISM (Chinese).

TAPAS.—See ASCETICISM (Hindu).

TARGUMS.—Though the term 'Targum' was used by Jewish authorities to designate the translation of the Hebrew Scriptures into any language, it was specifically restricted to the Aramaic renderings (cf. Ezr 4). Aramaic versions were used liturgically; the Hebrew text was read from a scroll, and this was followed by the Aramaic, recited without book by the official called *meturgeman*. This custom continued to the 10th cent., and was in parts maintained beyond that date. It is possible that the famous rescript of Justinian² was directed against the liturgical use of the Targum.

The most widely read of the Targums was that ascribed to Onqelos (i.e. Aquila), who lived in the 2nd century A.D. Aquila really rendered the Scriptures into Greek, but his name became associated also with the Aramaic version. Onqelos is a translation of the Pentateuch only, and it is known as the 'Babylonian Targum,' not so much because of its language, as because of its official adoption in the Babylonian Jewish academies. Thus, though edited in Babylonia, Onqelos is dialectically Palestinian. Onqelos probably includes elements of considerable antiquity, which were derived from oral tradition; some of it, on the other hand, is obviously of literary origin. Onqelos went through various re-editions, so that the extant text is not usually referred to an earlier period than the 4th or 5th century. The 'Palestinian Targum' (known also as the 'Targum of Jonathan'), though later than the earliest recension of Onqelos, contains elements older than the latter. The most remarkable theological characteristic of the Targums is the avoidance of anthropomorphisms. They are thus paraphrases rather than translations, though in very large part Onqelos is literal enough.

Similarly there were two Targums to the Prophets: the 'Babylonian' (ascribed to Jonathan, son of Uzziel), which originated (despite its Babylonian use) in Palestine; and the 'Palestinian,' which is fuller of homiletic elements. As selections were read from the Prophets (*haftaróth*) in the synagogues, these Targums also partook of an official character.

On the other hand, there were no such official Targums to those parts of the Bible from which no *haftaróth* were derived. Hence these Targumim to the Hagiographa form independent groups. On the whole they are freer, and in some cases (as in

¹ Sacred Edict Maxim, 7.

² See art. TALMUD.

the Second Targum to Esther) are of greater interest for folk-lore than for exegesis. The Targum to the Song of Songs is throughout allegorical.

TATHĀGATA.—Whatever it may have meant originally, or from whatever source it may have been derived, Tathāgata is an epithet of Buddha used to express his very personality. It is, first of all, an appellation to specify his dignity as an enlightened being and a teacher of men and gods. He is the one who has realized the four truths according to reality (*yathābhūtam*) and, consequently, mastered the way to the realization of the truths. Sensation, perception, and thoughts are all under his own control. He is free from the bondage of the six senses and attachment to their objects, because they are not his masters, as they are with the common people, but he is master over them.¹ Thus he is beyond all the commotions and disturbances arising from contact with the objects of sense and thought. He was born a man, but has become a superhuman being in respect of and by virtue of these highest moral and intellectual attainments.² In order to express these superhuman excellences of Buddha's personality, the Buddhists from the earliest time used to call their master the Tathāgata with a special reverence. In this use, therefore, the appellation signifies nearly the same thing as Sugata ('the one who has gone blessed'). Here Tathāgata means the one who has gone (*gata*) from the realm of attachment to the other beyond according to reality (*tathā*, which means the same as *yathābhūtam*).

But the virtue of a Buddha does not consist in attaining this position for himself alone. He teaches the people the Way to the same attainment and guides them in its realization. He is the Master who, having himself reached the castle of fearlessness, invites and leads them to the same. The Tathāgata is not only sure that he is the perfectly enlightened one and has thoroughly overcome the miseries of existence, but also equally sure that he is the master of the Truth and the Law. With this confidence he turns the supreme wheel of the Law and roars a lion's roar in the assemblies of beings.³ Thus the Tathāgata is the enlightened one who knows the Way and reveals that Way by treading which he himself has become the 'thus-gone.'⁴ He practises as he preaches (*yathā-vādi tathā-kāri*) and *vice versa*.⁵ Though this explanation of the term is, as etymology, certainly far-fetched, it is quite natural that the Buddhists saw in their Master a being without any falsehood and self-deceit. The association of the appellation with the very personality of an unerring Master of the way to final emancipation is undeniable. A stanza which is said to have been uttered by the disciples at the death of the Master is another testimony to this association. It reads:

¹ See *Majjhima*, nos. 102 and 123 (tr. K. E. Neumann, iii. 33, 261 f.), and *Saṃyutta*, xxii. 94, xxxv. 136 (*PTS* ed. iii. 139 f., iv. 127).

² See *Saṃyutta*, xxxv. 90, xlv. 2 (*PTS* ed. iv. 64, 380).

³ See *Saṃyutta*, xii. 21 (*PTS* ed. ii. 27), and *Āṅguttara*, iv. 9 (*PTS* ed. ii. 9).

⁴ See *Saṃyutta*, viii. 7 (*PTS* ed. i. 191), xxii. 58 (*PTS* ed. iii. 65); cf. *Āṅguttara*, vi. 64 (*PTS* ed. iii. 417); *Majjhima*, no. 35 (*PTS* ed. i. 372); *Saddharma-puṇḍarīka* (*SBE* xxi. [1884] 120 f.).

⁵ See *Itivuttaka*, 112 (*PTS* ed. p. 122); *Āṅguttara*, iv. 23 (*PTS* ed. ii. 231). Cf. below, *Lotus*, ch. ii.; and *Mahāvastu* (ed. Sénart, Paris, 1890, ii. 260, 266, 362, etc.).

'The Master, such a Master as he is (*yathā cētāso*), without any parallel in the world, the *Tathāgata* . . . is gone.'¹

'Thus-gone' is the Master who has seen the way and revealed it to us, according to reality.

To the Buddhists their Master was the 'thus-gone' or 'thus-destined' (translation of Edmunds) to final emancipation, the 'perfected' (*der Vollendete*, Neumann) in wisdom and its realization, in short, the 'truth-winner' (Rhys Davids). The appellation was certainly a self-designation of Buddha, but it was more used by his disciples to express their confidence in the Master.

So far the empirical aspect of the concept. We must now take up the metaphysical side of the idea conveyed by or attached to the term. The Buddhists were, probably in Buddha's lifetime, nearly realizing for themselves the truth that the revealer of the Way must be at home in it, and that therefore he is the Way itself. They said:

'The laws (*dhammā*) are real and not otherwise as they are, and these are perfectly known by the *Tathāgata*.² Here 'the laws' mean not only Buddha's teaching, but the things taught in his teaching and their essence. Hence the saying: 'He, the Blessed One, knows having known (the laws), sees having seen, born of Light, born of Wisdom, born of Truth (*dhamma-bhūto*), and born of Brhmi; He is the one who reveals and tells, the One who gives immortality, the Lord of Truth, the *Tathāgata*.'³ Here we have translated the *dhamma* by 'truth,' i.e. the truth expressed in Buddha's laws.

The ideas here formulated cannot be called metaphysical speculations; still they show a tendency to base the faith in the Master on the transcendental entity of the Truth, not only revealed to us by him, but also represented personally by him. The foundation and elaboration of these ideas must proceed to a further development of Buddhological (so to speak, in analogy with 'Christological') speculations. The fact of the faith has been laid down by the personal influence of the Master; thought and clear conception must follow it. And it is quite natural that the Buddhological ideas were always closely associated with the appellation *Tathāgata*. These thoughts may be studied from three aspects or phases of their development. They are: (1) the relation of the *Tathāgata* to the Truth (*dhamma*) which he revealed, (2) the communion of the *Tathāgata* with the many other *Tathāgatas*, and (3) the eternity of the personality of the *Tathāgata*.

(1) The term *dhamma* (in both singular and plural) is a very flexible one. But the various aspects of the concept have a necessary connexion, when viewed as centring in the person of the Master. The *dhammā* (plural) are qualities of things, both physical and mental, which are transient, but subject to the laws. These laws make up existence,⁴ and our attachment to and thirst for them are the causes of the miseries of life. Misery, its genesis, its extinction, and the way of release from it—these truths have been revealed by the *Tathāgata* according to reality (*yathābhūtam*). Thus our emancipation from the miseries is possible only by realizing to ourselves the laws according to reality. These are the laws or teachings (*dhammā*) of the *Tathāgata*. Therefore the laws have their root, light, and basis in the Blessed One.⁵ Buddha is the king of the laws. On the other hand, however, Buddhahood is attainable only by the comprehension of the laws. Hence it is true also that Buddha is the protector of the laws, who, leaning upon the laws, reveres, honours, and adores them.⁶ The Law and its revealer are mutual in their relations. He who

⁵ See *Saṃyutta*, xxiv. (*PTS* ed. iii. 202-217), etc.

⁶ See *Anguttara*, iii. 14 (*PTS* ed. i. 109), v. 133 (*PTS* ed. iii. 150), etc.

sees the Law sees the Master, and *vice versa*.¹ The *dhamma* is not merely a phenomenon or an instruction; it is in reality the Truth, according to and by virtue of which the Master and his followers, and consequently the Buddhas of the past and future, have attained or shall attain Buddhahood.

(2) According to a commentator, as given by Burnouf, *Tathāgata* (*tathā-āgata*, 'thus-come') means the one who has come thus, in the same manner as his predecessors, the Buddhas of the past; it is, on the other side, *tathā* and *gata*, 'thus-gone,' and means the one who has proceeded or departed as they.² The oneness of enlightenment and Law among the Buddhas of the past and of the present is an idea as old as the history of Buddhism, and the development of its philosophy has always had a close relation with the idea. 'The *Tathāgata* (plur.) lead men by the right law (*saddhamma*)'³—these are the words believed to have been spoken by Buddha himself to his temptresses. This and similar passages, speaking of the *Tathāgatas* and the Law, indicate the communion of the *Tathāgatas*, or the unity of Buddhahood in the same truth. Not only has the Law been proclaimed by the Law-born Buddhas,⁴ but they all have one and the same road to tread. This one road (*ekayāna*)⁵ consists in nothing but reverence towards and realization of the Law. Herein lies the very essence of the teaching of all the *Tathāgatas*, or, speaking metaphysically, their entity—*dhammatā*⁶ or *dhammassa saddhammatā*.⁷ In this concept of the essence of Buddha's teaching or Law, and consequently of his personality as the Law-born, the Buddhist philosophers have found a metaphysical basis for their faith in Buddha as the *dhamma*-born. They were to find, by the help of this idea, a metaphysical unity in the communion of all the *Tathāgatas*. It is quite natural that Nāgārjuna,⁸ the Mahāyānist philosopher of the 2nd cent. A.D., founded his theory of Buddha's *dharma-kāya*, or *dharma-tīma*, upon this concept of *dhammatā* and the authority of the verses speaking of the *ekayāna*, above referred to.

(3) This point gives us a key to the consideration of Buddhological speculation on the eternity of the *Tathāgata*'s life. Whether the *Tathāgata* exists after his bodily death or not is a question that had been asked from very early times in Buddhist history. Buddha is said to have neither affirmed nor denied it.⁹ It is remarkable that every time this question is asked Buddha is named by the epithet *Tathāgata*. Whatever this connexion may have implied, we see that the question is affirmed on a metaphysical basis in the Mahāyāna texts, and that here again the appellation *Tathāgata* comes most conspicuously to the front. We have two most important texts, which devote each a whole chapter to the question of the duration of the *Tathāgata*'s life (*Tathāgata-āyus-pramāṇā*)—the *Lotus of the Law*¹⁰ and the *Golden Light*.¹¹

⁹ A whole chapter called the *Aryākāra*. 'Undefined,' *Saṃyutta*, xlv., is devoted to the question; cf. *Saṃyutta*, xxii. 85 f., xxiv. 15-18, xxiii. 1-10; *Majjhīma*, nos. 63, 72, etc.

¹⁰ *Saddharma-piṇḍarīka*, *SBE* xxi. ch. xvi.

¹¹ *Suvarṇa-prabhā* (ed. Chandrar Das, Calcutta, 1898), pp. 8-9.

The first of these texts expounds at length the transcendental side of the Buddhological speculation, and the chapter above referred to may be taken as the conclusion of the exposition. Though the whole text seems to be a composite one, made up of heterogeneous elements, a definite line of argument may be found from its opening up to ch. xv. Ch. ii., entitled 'Tactfulness,' gives a view of the Buddha's personality as a skilful and tactful teacher of the Law, who, being versed himself in the deepest truth, knows how to guide men to enlightenment and how to carry out the one vehicle.¹

The Tathāgata is a perfect being who knows all and is perfected in all virtues.² 'The Tathāgata only can proclaim the Tathāgata's Law, those laws which the Tathāgata knows. And the Tathāgata knows all laws, i.e. what are (*ye te*) the laws,³ how (*yāvrāsā*) they are, of what characteristics (*yallakṣaṇās*) they are, of what essence (*yat-svabhāvas*) they are. In these laws (i.e. truths) the Tathāgata is versed face to face. . . . Believe me, I speak what is real, I speak what is truthful, I speak what is not otherwise (*bhūtvāvidi, tathāvādi, ananyathāvādi*). . . . Having seized the one vehicle (*ekayāna*) I proclaim to beings the Law, the Buddha-vehicle; there is no second vehicle, nor a third. This is the nature of the Law (*dharmatā*) universally in the worlds in ten directions. All the Tathāgatas of the past, of the future, as well as of the present, proclaim the same one vehicle.'

After elucidating this mastership of the one vehicle by two parables, the text proceeds, in ch. v., entitled 'On Plants,' to reveal the entity of the Tathāgata's personality and his omnipotent powers. The Tathāgata who knows all dharmas is identified here with the dharmas themselves, or rather all the dharmas are concentrated in, and derived from, the personality of the Tathāgata. He is the king of the Law, as is stated in the *Nikaya* texts. But the king is not a mere legislator: he is the very entity of the laws.

Whatever law for any case is laid down by the Tathāgata it becomes really so. The Tathāgata aptly ordains and lays down all laws. By the Tathāgata-wisdom he lays down the laws in such a manner that they enter into the position of omniscience.'

The Tathāgata is such a being because his omniscience, the *Tathāgata-jñāna*, is the very essence of all the laws, the real metaphysical foundation of all their manifestations. The saying that one who sees the Tathāgata sees the Law finds here a metaphysical interpretation, illustrated by a parable of rain which nourishes all plants, each according to its capacity and nature.

The discourses and dialogues following this chapter try to disclose the mysteries of Buddhahood. It is explained as of remote origin and in communion with all the enlightened of the past and future. The person of the Buddha, who was born among the Sākyas, and who has attained Buddhahood at Gayā, is nothing but a personal revelation of the eternal *dharmatā*,⁴ i.e. the Tathāgata.⁵ This faith is illustrated and supported figuratively by the issuing of innumerable saints out of the earth. The idea is that these saints cannot be the Tathāgata's disciples, unless he is Buddha from an infinite past. The argument reaches its climax in ch. xv., entitled 'The Duration of the Tathāgata's Life,' which brings to light the true measure of the Tathāgata's life. A corporal manifestation of the Tathāgata is for the benefit of those who need to be educated in that way. In reality he was perfectly enlightened long ago (*chira-abhisambuddhā*), and he is everlasting (*sadā sthita*). Therefore the Tathāgata declares, at the close of the chapter, that he knows eternity. Then he proclaims to all beings: 'I am the Tathāgata' (*lec. var. 'I am thus and thus, tathā tathā ham*).

In the *Golden Light* it is first asked why the life of Sākyanuni lasted only eighty years. Buddha answers by affirming the immeasurableness of his life. All the saints and celestial beings utter verses praising and adoring the Buddha of an immeasurable life. Here we shall give an abstract of the verses, which are indeed the statement of a metaphysics of the Tathāgata. They say:

Hearken, unimaginable is the entity of the Lord of the world, the Tathāgata, who proceeds according to reality (*yathā-ākrama*). All the Buddhas are equal in their virtue, having the same *dharmatā*. The Tathāgata is unoriginated, and our Master is not a conditioned being. The Perfectly Enlightened has the Law as his body (*dharmakāya*),⁶ the Tathāgata has the Law as his realm (*dharmadhātu*). Neither does the Buddha vanish nor does the Law perish, yet he shows extinction, in order to bring the beings to perfection. Unimaginable is Buddha, the Blessed One; the body of the Tathāgata is eternal; for the sake of compassion towards all beings he manifests himself in various appearances.

Here, as in the *Lotus*, remains a problem to be elaborated—the question of the relations between the unchangeable entity of the Tathāgata and his manifestation. A Chinese version⁷ of the text, produced by I-tsing, adds a chapter after these verses, and it treats of the three bodies (or personalities) of the Tathāgata. This may be the work of a commentator, but it indicates how the Buddhological speculations have been closely connected with the appellation Tathāgata.

⁷ Nanjio, no. 126.

In summing up these ideas we may see that with the Buddhists the Tathāgata has meant the personal aspect of the *dharmā*. To found metaphysical ideas upon faith in the person of the Tathāgata has always been the task of Buddhist orthodoxy, even in its phases of development in the East. But, in addition to this, we should consider two currents of thought which flowed beside the central one. (a) One of them is the theory that denies personality in the Tathāgata or anything else. It may be designated the theory of 'no-sign' (*alaksana*) and is represented by *The Diamond-cutter*¹ and other texts of the so-called Prajñā class. There the person of Buddha remains as the preacher of the sermons, and the epithet Tathāgata remains also; but nothing is allowed to be defined, any definition or qualification being thought to be a limitation, which means the same thing as illusion. Thus the texts which assert the omniscience of the Tathāgata deny to him any ascribable quality (*lakṣaṇa*). 'Tathāgata means one who does not go to anywhere, and does not come from anywhere.'² Here we see that the very idea of Tathāgata is put away. Nevertheless, in the midst of thorough negations, the identity of the Tathāgata and the Law is asserted.³ This is indeed a testimony to the tenacity of the idea.

(b) Another current, opposite to the above, may be called the theory of 'signs' (*dharmalaksana*). In its theoretical aspect this doctrine cannot be distinguished from orthodoxy, being founded upon the idea that all the *dharmas* are realities, which are realized in the person of the Tathāgata. But in practical aspects it looks to a Tathāgata beside the historical Buddha. Amitābha, the lord of the Sukhāvātī, or Vaiśā-jya-guru, the lord of the Eastern paradise, or Maitreya, the future Buddha in the Tusitā heaven, is the object of their adoration and their hope of salvation. The cult of the Tathāgatas in various heavens is found also in the *Lotus*,⁴ and it has proved to be useful for propagandism. Buddhism of this kind, whichever may be its Tathāgata and ideal heaven, is founded upon the belief that any Buddha or saint is the manifestation of the one Tathāgata. This philosophy of the *dharmalaksana* is a natural outcome of the early Buddhist concept of *dharmā* and is in conformity with the faith that every *dharmā* is the manifestation of Buddha's wisdom (providence, so to speak). Moreover, the religion of adoring this or that Buddha as the being of compassion or as our saviour is not only in accordance with the philosophy, but also has a very sympathetic aspect of faith and piety. But the defect of this system lies in its losing concentration of faith in the historical Tathāgata and therefore in its running sometimes to an extreme pantheism.

To sum up the results: Buddhist philosophy started with the ideal of release from the miseries of life in conformity with the real nature of things (*dharmā*). As the reality, so the existence (*yathā dharmā tathā sattā*). This *yathā tathā* has been revealed by the Tathāgata, whose personality consisted in *yathā-vādī tathākārī*. This Buddha's personality is inseparable from the metaphysical entity of *dharmā*, and vice versa. The idea of the Tathāgata has, in this way, become the pivot around which both philosophical speculations and religious faith have moved and developed.

⁴ Ch. xx.

TATI BUSHMEN.—1. Race and distribution.—The Tati Bushmen, called by the Bechuana Masarwa, and by the Matebele Amasile, are a branch of the Bush people of S. Africa, with whom they have many characteristics, both morphological and linguistic, in common.

The Bushmen in general were formerly spread over a much larger area of the continent of Africa than they occupy at present. Traces of their occupation, such as paintings, weapons, and implements, have been found far beyond their present limits. Indeed there is good reason for believing that at one time they occupied practically the whole continent and were driven by other peoples into their present territory. They are considered therefore by most anthropologists to be the true aborigines of S. Africa. In their legends they speak of a time when they were the only inhabitants of S. Africa. Paintings in the W. Sudan, in the caves of Algeria, and in Central France are strangely reminiscent of the Bushman paintings of Rhodesia or Cape Colony. The Grimaldi race, who inhabited some of the European caves in Aurignacian times, may have been either the ancestors of the Bushmen or a portion of the people who crossed over into Europe probably as slaves of the Cro-Magnon race. The Bush people are now confined to the country west of the Drakensberg Mountains and south of the Zambesi River to the Atlantic Ocean, but are principally found in the northern parts of Cape Colony, the Bechuanaland Protectorate, S.W. Protectorate, and S. Rhodesia. There are few, if any, Bushmen between the Drakensberg and the Indian Ocean, and not many in the Transvaal. So far as is known, there are none north of the Zambesi. From the Bantu traditions they must be recently extinct in N. Rhodesia and Nyasaland.

The Bushmen are divided into many different tribes and clans, speaking languages differing widely from one another, but all of the same general type. According to Meinhof,¹ the Bushman tongues are purely isolating and have their closest relations among the isolating languages of the W. Sudan. While this is true to a certain degree so far as the language of the Tati Bushmen is concerned, it is too sweeping a generalization in the present state of our knowledge. The Tati Bushmen inhabit the country between the Zambesi and the Crocodile Rivers, from the Transvaal and S. Rhodesia on the east to Lake Ngami on the west. They are fairly tall, 5 ft. 3 in. being the average stature of the men, while they are much darker in colour as a whole than the southern Bushmen. The Cape Bushmen seldom exceed 5 ft. in height, the average stature being 4 ft. 9 in., and are dirty yellow in colour. Among the Tati Bushmen some individuals attain a height of 6 ft., but they are rare. The face of the typical Bushman is triangular in outline, flat in appearance, with weak chin, depressed nose, and prominent cheek-bones. The ears usually have no lobes, the hair is thinly scattered over the skull in small tufts, there is little or no beard, and the whole appearance of the face is wild and foxy. Most of these characteristics are shared by the Tati Bushmen. Their bodies are small but tightly built, and they are seldom fat. Steatopygy is common among them, as among the southern Bushmen. The whole Bush population of S. Africa probably does not exceed 10,000, of which the Tati people may number 1000. They are a fast vanishing race.

2. Culture and organization.—The Bushmen,

as their name (originally given to them by the early Dutch settlers) implies, are a people of the open country, a race of hunting savages living largely in the Stone Age. Their love of freedom amounts to a passion, and they are passionate, irresponsible, courageous, and cruel. Consequently they have practically no tribal organization, and very little clan system, except in the sense that a particular portion of country was the possession of a certain clan, the families of which, under the leadership of a man of known prowess, would combine to defend it against intruders. But usually all that obtained was that the various families combined in the face of danger, under the strongest and most capable leader, and, once that passed, the combination came to an end. They do not cultivate the soil and have no domesticated animals except dogs. They therefore depend entirely upon the chase. Their dwellings are caves or holes in rocks, or shelters made of a few branches stuck in the ground, with skins or mats thrown over them, which they carry away with them when they migrate from the district. Their material civilization is thus very meagre, being restricted to what is absolutely necessary for the capture and cooking of game. A little coarse pottery is or was made, while ostrich egg shells are used to hold water. Beads of dried wild berries and necklaces made from disks cut from ostrich egg shells are worn by both men and women. Ear-rings made from pieces of bone or wood, or—since the white man came to the country—of metal, usually brass, are common. Leather arm- and leg-rings, together with fillets of skin round the head, into which are stuck ostrich and other feathers, are also worn. Clothing is scanty and generally consists of the skin of an animal thrown over the shoulders in cold weather. The women wear a small piece of skin with fringes in front, while the men are content with a narrow piece of skin passed between the legs and tied round the waist with sinew or cord. Children of both sexes go naked. In warm weather to prevent the sun from blistering the skin, and in winter to keep out the cold, they smear the body with fat, often rancid, so that they smell very offensively. Weapons of war and the chase are spears, bows and arrows, and throwing-sticks. The tips of the arrows are smeared with poison made from the Bushman's poison bush (*Accanthera venenata*) and the two-rowed *Amaryllis* (*Amaryllis distichia*), mixed with snake poison, and in some cases with poisonous ants. The food of both sexes consists of the flesh of animals, locusts, larvæ of ants, called 'Bushman rice,' gum, and various tubers and seeds. For the collection of tubers an implement called the *!kibi* or *!kwe* is employed. It is a stout stick about 3 ft. long, upon which a round flat stone with a hole in the centre is fastened about 9 ins. from the end. This is the well-known digging stick, which is also used to excavate graves.

3. Mentality; artistic and moral life.—The Bush people as a whole are low in the scale of mental acquirements. They have an extensive knowledge of the outdoor world, especially of the habits of wild animals. They are wonderful as trackers and have a remarkable sense of direction. Their reflective faculties are not highly developed, although some of their paintings, and more especially their folk-tales and songs, are not wanting in this respect. The most interesting thing about the Bushmen is their artistic ability. They have left paintings upon the walls of caves and rocks and incised figures upon boulders all over the country. Most of these paintings or chippings indicate objects of the chase, the habits of animals,

¹ C. Meinhof, 'The Language of the Hottentots,' *Addresses and Papers read at the Joint Meeting of the British and South African Associations for the Advancement of Science*, South Africa, 1905, iii. 193.

or more rarely scenes of war and domestic life. The drawings of the wild animals are in many cases really well executed, though one can trace in places the gradual evolution of the art of painting. A fresco recently discovered in the Matopo Hills near Bulawayo is remarkable for its artistic merit. There is not much perspective in most of the paintings, while the execution as a whole reminds one of the paintings of the Old Stone Age. Certain paintings of figures are supposed to have a mythological signification, as they cannot be connected with animals or circumstances of the present day. Some caves were called after particular paintings—*e.g.*, the Cave of the Great Serpent, the Cave of the Lion—and hence were held in a certain degree of reverence by the people. To such caves they would periodically return as to a rallying-point to talk over their wild adventures. It has been suggested that the art of the Bushman is due to sympathetic magic, that this was the idea underlying it—in other words, that the Bushman painted the animals on the walls of his cave-dwelling to give him power over them in the field. While this is possible, and may be probable in some cases, there is not any good evidence of it. It has been maintained that paintings usually depict animals desirable for food, and that noxious animals are conspicuous by their absence. So far as Bushman paintings are concerned, this is not true. If animals such as lions, leopards, snakes, and rhinoceroses are to be considered noxious animals, they occur often enough on the paintings. But such animals are not undesirable as food to the Bushmen, as they eat practically everything, and certainly would not refuse to eat the flesh of a lion, unless it happened to be the totem of the hunter. On the whole the paintings reflect no more than the ordinary life of the people *plus* the caprice of the particular artist. At intervals of leisure—and the Bushmen, when food was plenty, had much of that—the scenes of the past would rise up in their minds, and they would attempt to visualize them by painting them on the rock, and by constant practice the faculty of drawing improved. The colours employed were yellow, brown, red, and sometimes white, and blue. Some of these paintings are ancient, and some are quite modern, as certain of the artists are or were recently alive. The faculty of drawing and painting was said to be hereditary in certain families. The theory has been advanced that the painters and sculptors belonged to different tribes, but there is no good reason for accepting this.

The Bushmen are passionately fond of dancing, more especially at full moon and at certain seasons of the year. Fires are lit outside their caves, and dancing is kept up all night, or until the performers are exhausted. Some of these dances, in which the performers paint their faces and bodies, are of a religious nature. Some of them are more or less coarse. Songs are sung by the leaders, and the other performers join in the chorus. The motions are not at all graceful. Some dances are called after animals—*e.g.*, the eland bull dance, the baboon dance, the bee dance, and the frog dance—and each has its own peculiar tune. The dancers give very good imitations of the animal in its different attitudes. The instruments used to accompany these dances are stringed instruments similar to an ordinary bow, with a tortoise-shell as a sound-box variously called *!kopo*, *!kangen*, and *!gora*, 'reed,' 'flutes,' and 'drums.' The dancers have rattles round their ankles, made of the skin of the inside of the springbok's ear, with small pebbles inside to make as much sound as possible. Circumcision dances are performed after the boys have undergone the ceremony.

These are of a distinctly religious character. Bushman music is, as might be expected, of a very primitive character—the melancholy and monotonous repetition of a few notes. It does not usually consist of more than six tones (which do not belong to our scale), but the strangeness and wildness of the melody give it a peculiar charm. There are other tunes which show some advance, especially one by the Natal Bushmen. Harmony does not exist.

The Bushmen have an extensive range of terms for family relationships, both male and female. Some of these are connected with tabus; *e.g.*, a mother-in-law must not see her son-in-law or mention his name; he, on his part, must not mention hers. The same rule applies to some other relations also. A woman must avoid mentioning the name of her husband or any of his near relatives. There are different terms for these relationships, but the system among the Bushmen is not nearly so perfect as that among the Australians.

Marriage is usually a very simple matter among the Bushmen, some of whom are monogamists and some polygamists, according to their individual worldly position. Two young people very often simply go off and live together, but usually the young man has to prove his prowess by going into the veld and slaying some wild animal—the strongest and fiercest he can find—and presenting the whole or a selected portion to the girl's father. Among some tribes this is considered indispensable before asking the hand of a girl in marriage. If the present is accepted, the marriage is complete. Sexual intercourse before marriage, while looked upon as a crime, is very often practised. Divorce too is simple. A man or woman leaves his or her partner and goes off with some one else. The custody of the children does not cause much trouble, as the young people are accustomed to fend for themselves at an early age. Parental control is thus exceedingly weak. Marriage usually takes place within the clan, but a man cannot marry a woman of the same family as his own—*i.e.* bearing his own surname. So far as we know, a man cannot take his own sister to wife, because of his totem, but he may take his sister-in-law. Although there is much freedom in the intercourse of the sexes, incest and adultery are regarded as crimes and are punished by death, usually by retaliation on the part of the injured person. Murder, theft, abduction, and especially witchcraft, are crimes against the Bushman moral code and are punished by fines, expulsion from the tribe, or even death in the case of persistent offenders. The old people, when too infirm to follow the family in its wanderings or unable to procure food for themselves, are left to die.

4. Totemism and religion.—As has been remarked, totemism exists among the Bushmen, especially among those tribes that have had long contact with the Bantu peoples, but they are too much the children of the wild to have developed it to any extent. Some call themselves the Zebra clan, or the Eland clan, or the Duiker clan, and, while they avoid killing and eating these animals or certain portions of them, they are not at all strict about the matter when pressed by hunger. In the case of the Duiker clan, the members may eat all of the animal except the heart. Those clans whose totem was the buffalo did not scruple to eat every portion of a domestic ox, although they might not eat every portion of a wild buffalo, even though they looked upon oxen as tame buffaloes.

They believe in a spirit which the northern tribes call Thora, and the southern !Kang or !Kaggen.

W. H. I. Bleek,¹ J. M. Orpen,² and others think that !Kang is simply the mantis insect, for which they have a great reverence, but there does not seem to be great force in this contention. While it may be true of the Bushmen of Cape Colony, it is certainly not true of the Tati Bushmen. These tribes say that Thora is a spirit, that he sends the rain, the lightning (of which they are very much afraid), good weather, bad luck, and plenty. They are not very clear as to whether he is a person or not, but he is usually spoken of with dread, as a malevolent spirit, with whom it is advisable to keep on good terms. They also say that he made the animals, but they are not sure if he made the first men. The Tati Bushmen reverence the mantis to a certain extent, and do not like killing it if they can help it. All Bushmen have a great dread of death, and in common with many peoples believe that it is due to bewitchment by an enemy. Arbousset,³ speaking of the Bushmen of Basutoland of his day, says that they looked upon death as a sleep. It is difficult to ascertain what they do really think on the subject, as they are so unwilling to speak of it at all. They also believe in some form of future life, but do not know what it is really like. They imagine that it does not differ much from the present life. This is shown by the burial customs of some tribes. They used to drag their dead into the surrounding bush to be devoured by wild animals, but generally they bury the bodies in a hole or cleft in a rock, which they carefully wall up, or they excavate a round hole about 3 or 4 ft. deep and place the dead man at the bottom in a sitting or lying position, with the legs doubled up to the chin, and in each case place beside him some food and his weapons of war. They generally indulge in a funeral feast afterwards, desert the locality, and never mention the dead man's name. Why they keep silence regarding the departed they cannot explain. Some tribes place the dead with his face to the rising sun; others observe no such custom.

The Tati Bushmen have no regular priests, but they have certain individuals, whom they call doctors, who possess a considerable knowledge of the properties and uses of wild plants, and thus exercise great influence over the people. This knowledge is sometimes confined to certain families, who jealously guard it. They have a considerable knowledge of vegetable poisons and have antidotes for them. Malicious poisoning does not often occur among them. Bushman doctors profess to cure malaria, typhoid, blackwater fever, dysentery, and other diseases, and, according to reliable information, are often successful. Most of the plants which they use are employed in religious ceremonies or in ordeals and trials for witchcraft. In fact, much, if not all, of the Bushman practice of medicine has a religious signification.

The Tati Bushmen, in common with most other Bushmen, practise circumcision. At present they perform the rite according to the Bechuana custom. Boys are operated upon at about the age of twelve years, development being rapid with them. A stone knife was formerly employed and still is by most tribes—a matter of necessity at first, but now a matter of custom, or of hygiene, as the knife is thrown away and a new one made for each ceremony. A number of boys of approximately the same age are operated upon at once. The method is as follows. The foreskin is pulled forward over the glans as far as it will stretch and then cut off

with one slash of the knife. It quickly retracts and so prevents excessive bleeding, and usually heals rapidly. It is not known for certain whether the girls underwent the rite or not. The southern Bushmen cut off the last joint of the little finger of the right hand in the case of boys, and of the left hand in the case of girls. This was also a religious ceremony, but whether it took the place of circumcision or was additional thereto is still uncertain. Cutting off the joints of one or more fingers was also practised as a sign of mourning. The Tati Bushmen, whatever they may have done in the past, do not now practise finger-cutting.

5. Omens.—The great factor in the life of the Bushmen is their divining bones, commonly but erroneously called dice. The Bushmen would undertake no expedition without consulting them. They are four and sometimes five in number, and designated male and female. The female bone is usually longer than the male. They are made from the hoofs of animals, bone, horn, wood, or even the stones of wild fruits. Sometimes they are ornamented with designs on back or front. To consult them a man would clear a small space of ground, rub the bones with various kinds of medicine, blow upon them, and then cast them upon the ground. From their positions and conjunctions he divines what he wants to know, according to certain laws. If the result is unfavourable, it is useless for him to persevere in his object. Divination is also practised by means of the shoulder-blade of a springbok, and by certain other animals, such as the mantis, lion, jackal, and snake.

6. Spirits.—The Bushmen personify some animals and look upon them as men in another state of existence. They also believe that men, especially witch-doctors, can assume animal shapes at will and compel other people to do the same. This, they say, is to 'have power' over such victims. It has been held to indicate a belief in the transmigration of souls, but the point is very doubtful. They certainly believe in transformations of animals. The Tati Bushmen thoroughly believe in the existence of spirits, usually of a malevolent character, and, when closely questioned, admit that they can change their shapes at will, but they do not seem to believe that these spirits can be born again into other animal shapes. Lightning, wind, eddies of dust, storms, and other natural phenomena are looked upon as spirits. This is probably a relic of primitive man's belief that the animals and things about him were not different from himself—certainly to some extent the Bushman view. There are spirits of rivers, fountains, and thermal springs known to the Bushmen and much revered by them.

7. Mythology of the heavenly bodies.—The Bushmen have no regular system of mythology in the sense that the ancient Greeks or the modern Hindus have, but they have the elements of such. They are said to have worshipped the heavenly bodies and are therefore to be included among those people who attained to sidereal worship. Among the Tati Bushmen no special ceremonies are connected with these bodies, although it is evident from numerous tales in which the sun and moon appear that a considerable degree of reverence is paid to them. The new moon figures in many of their tales.

The moon is the shoe of the mantis. Her waxing and waning is explained as her dying and coming to life again. The Tati Bushmen have some of these tales in a more or less modified form; e.g., one speaks of the moon coming down to wash her face in a pool of water. The Bushmen do not know why the sun is hot, and why there is no heat in the moon. Among the southern Bushmen the sun is spoken of as a little boy by the wayside; sometimes he is said to have been thrown into the sky by some children while he was sleeping. Again, the moon is spoken of as being cut by the sun and after death

carries away the people who are dead. Some of the Tati Bushmen say that the stars were once human beings and animals, and the Cape Bushmen speak of girls as having been turned into stars and flowers by the rain. Certain prominent stars have particular names among the Bushmen; e.g., Jupiter is the Dawn's Heart; the Magellanic Clouds the Male and Female Steinbok, the Southern Cross the Giraffe Star (Tati Bushmen), Aldebaran the Male Hartebeest, Procyon the Male Eland, Orion's Belt the Female Tortoise. The origin of the stars is explained in the following manner. A girl of the early race, being angry with her mother because the latter asked her for a certain kind of food which she had put to roast in the fire, threw it together with the wood ashes that were upon it into the air. The food was changed into stars, and the ashes became the Milky Way. The rising of particular stars at certain seasons of the year was noted, as they were connected with the return of the seasons. Shooting stars were considered unlucky by the Tati Bushmen, and, if they appeared in great numbers, inspired terror.

8. Folk literature.—The Bushmen have a great body of folklore, mostly relating to animals and natural objects, customs, and so on, but next to none of a historical character, certainly none that throws much light on their origin and migrations. Not a tittle of those folk-tales have been garnered, and, as the race is a fast vanishing one, they will soon be completely lost. Bleek collected a large number of tales, and a selection from his great mass of materials was published in 1911 by his niece, Miss Lloyd. Smaller collections by Schultze, Theal, and Dornan have been issued. A study of these tales throws much light on the mental and moral outlook of the Bushmen.

S. S. DORNAN.

TATUING.—The word 'tatu' or 'tattoo,' meaning to mark or puncture the skin, is derived from the Tahitian word *tatau*, a reduplicated form of the root *ta*, 'to strike.' It was used by Captain Cook in the account of his visit to Tahiti:

'Both sexes paint their Bodies. *Tattoo* as it is called in their Language. This is done by inlaying the Colour of Black under their skins in such a manner as to be indelible.'¹

Cook was thus the first to introduce the word to the civilized world of his day. Many writers since his time have included in the general term 'tatu' the practice of marking the skin with cicatrices; the two processes are, however, very different. Tatu proper is the insertion of pigment under the skin, whereby a practically permanent stain is produced, while cicatrization is the marking of the body, either by cutting or burning the skin in such a way as to cause scars forming small depressions or by cutting into the skin and keeping the wounds open, so that keloids, or raised scars, are formed, which stand out prominently from the surrounding tissue.

¹ *Journal during his First Voyage, 1768-71*, ed. W. J. Wharton, London, 1893, p. 93.

1. Antiquity and distribution.—Both these modes of personal decoration are of considerable antiquity and of wide distribution; they have been found among people of greatly varying culture, from the aborigines of Australia, who adorn their bodies with cicatrices, to the Polynesians and Japanese, who have developed tatu proper into a fine art. At a very early stage man no doubt felt a desire for personal decoration and learnt to use pigment for this purpose; and it is possible that tatu was resorted to as a means of giving a permanent character to the designs thus made to beautify the body at a stage prior to the use of clothes. Archaeological evidence can, unfortunately, give us no direct proof of the existence of such a custom as tatu in pre-historic times, but it is well known that Aurignacian man was skilful in the use of colour. Déchelette suggests that the finely pointed implements found in Magdalenian deposits may have been used for tatu. Referring to the practice among primitive peoples of cicatrization and tatu, he says:

'Les premiers habitants de l'Europe préhistorique s'ornaient le corps à l'aide des mêmes procédés, mais en général il nous est impossible de distinguer nettement pour cette période entre la teinture corporelle simple et le tatouage. C'est là un fait établi par des preuves indirectes mais décisives pour la fin des temps quaternaires, pour l'époque néolithique et le commencement tout au moins de l'âge du bronze.'¹

In the pre-dynastic tombs of the old Egyptians excavated by Flinders Petrie, de Morgan, Amélineau, and others, some rude human figures have been found bearing marks that suggest the use of tatu—e.g., the female figure discovered at Tukh.² In the second Theban empire the Egyptians tattooed themselves on the breast or arms with the names or symbols of deities, but decorative tatu marks are rare on Egyptian remains of the classical period.³ The prohibition in Lv 19²⁸, 'Ye shall not make any cuttings in your flesh for the dead, nor print any marks upon you,' indicates that the Jews had seen these practices carried on by the heathen nations among whom their lot was cast, and perhaps had themselves adopted them.

There are many classical allusions to tatu in Europe. Herodotus writes of the Thracian women being tattooed as a sign of nobility.⁴ Pliny⁵ says that the men of the Dacians and Sarmatians marked their bodies ('corpora sua inscribunt'). That tatu was known to the Pictones and other tribes of Gaul is shown by the evidence from coins.⁶ Chinese tradition says that the great Chinese hero Tschaipé found tatu among the Ainus of Japan, who indeed practise it to this day. In China it ceased at a very early time to be a desirable mode of decoration and survives only as a method of imposing a distinctive mark. A. T. Sinclair says that 'among the ancient natives in the West Indies, Mexico and Central America, tattooing was general if not almost universal.'⁷ It was also practised by the early inhabitants of S. America, as notably among the coastal tribes of Ecuador and ancient Peru.⁸ G. Elliot Smith finds it along the coast-lines of a great part of the world and includes it in the culture-complex of the 'heliolithic' track.⁹ Darwin, in drawing attention to the universality of the custom among primitive peoples, said: 'Not one great country can be named, from the Polar regions in the north to New Zealand in the south, in which the aborigines do

not tattoo themselves.¹ W. Joest goes so far as to say that no race or people exists that has not had the custom of either painting or tattooing the body.² On the other hand, some investigators have failed to find traces of cicatrization or tatu among certain primitive tribes, such as the Veddahs of Ceylon,³ the Mafulu of British New Guinea,⁴ the Tati Bushmen,⁵ and others; but this negative evidence does not rule out the possibility that such practices were once known to these people and have become lost arts. Cicatrization is mainly confined to dark-skinned races, while tatu proper prevails with those of lighter colour. Thus we find cicatrization in Australia, Tasmania, New Caledonia, Fiji, and other parts of Melanesia, in Torres Straits islands, among the Papuans of New Guinea, in the Malay Peninsula (Sakai), the Andaman Islands, and in negro Africa. It has been superseded in S. America by tatu proper, but has been observed among the Caribs of Guiana and in Brazil. The light-coloured races who have practised tatu proper include the Maoris of New Zealand and the inhabitants of the other islands of Polynesia. It is also found in Melanesia, Micronesia, the Malay Archipelago, the Malay Peninsula, Burma, India, among the Tibeto-Burman peoples in general (but rare in Tibet), and in Japan. In Africa it is found in Algeria, in Egypt, among the For, the Tushilang, the Namaqua Hottentots, and other tribes, but it is by no means so widely distributed in this continent as cicatrization. On the other hand, tatu proper was very prevalent in the New World, especially among the Indian tribes of N. America, such as the Iroquois, the Pricked Pawnees, the Delawares, and others. It is used extensively at the present day by the Haida Indians of the N.W. American coast, and also by the Eskimo, and in S. America, notably among the Mundrucu and Guaycura tribes.

Tatuing is said to be one of the chief occupations of the Oriental gypsies. Sinclair found that most of the tatuing among the lower orders in Syria, Mesopotamia, Arabia, Egypt, and some parts of Persia was done by them. They also tatu themselves, and in this they differ from European gypsies, for these do not wear tatu marks. Hence their tatuing is an easy mode of identifying Oriental gypsies, who are often seen in all parts of Europe and America.⁶ At the present day tatuing persists in Europe among the lower classes. Lombroso made a comparative study of tatu among soldiers and criminals, and concluded that it was especially prevalent among the latter. He noted that the designs in criminal tatu are often extremely complex and of a cynical and obscene character.⁷ There was a considerable revival of tatu among the soldiers and sailors serving with the British forces in the recent war. A revival, too, has been evident in Japan since 1881, when tatu ceased to be a penal offence and came once more into vogue, with the result that it is now an elaborate art.⁸ Apart from these and similar isolated revivals, tatu is, on the whole, rapidly declining, especially in Polynesia, once the centre of a highly developed system of tatu. This change is due, no doubt, in a great measure to the action of the missionaries, who have discouraged the practice, because of the orgies that often accompanied the tatuing operations.

2. Methods and implements.—The methods and implements used to produce these marks on the body vary considerably in different parts of the world and often reflect the cultural conditions of the people among whom they have been found. It is impossible here to do more than indicate briefly some of the more striking variations of the processes which have been recorded and add a few examples by way of illustration.

(a) *Cicatrization.*—In Central Africa prominent keloids are formed by detaching a piece of skin, which is raised and held by a pellet of tow till the wound is healed. A. L. Cureau alludes to 'dandies of the Upper Ubangi and Equatorial Congo' who undergo this operation as a means of obtaining 'the prominent crest which gives them a fierce expression.'¹ Irritant substances are sometimes rubbed into the incisions to prevent the wounds from healing too rapidly. Among the Bageshu, a Bantu people on the south and south-east slopes of Mt. Elgon, the girls use a crescent-shaped flesh hook sharpened to a needle point at one end. Scars are formed on the forehead and stomach by pinching up the flesh between the thumb and finger and running the hook through it; fine dust from a wood fire is then rubbed into the wounds.² Natives from the interior of Mozambique wear marked *rugæ* on the forehead.

These are formed 'by making vertical incisions in the skin, rubbing in a medicine, and then binding tightly with a cloth, so that wrinkles are formed in the line of the incision.'³

Cicatrization begins with the Andamanese at the age of eight and continues at intervals until the sixteenth or eighteenth year is reached. It is usually done by women, who use a flake of quartz or glass held between the forefinger and thumb. The arms and back are marked first, while fasting, and afterwards the chest, abdomen, and legs, but never the face; the special tribal marks are, in some tribes, made by men with a pig arrow. Pork is not eaten while the wounds are healing; and the northern tribes have certain ceremonies connected with the operation.⁴ The aborigines of Central Australia cut the skin with flakes of flint or glass and rub in ashes or the down of the eagle-hawk.⁵ At Port Essington (N. Territory of Australia) scars are formed by burning the flesh with a red-hot stick.⁶ In N.W. Queensland they are made by lighting charcoal on the flesh and allowing it to burn there. The implements used in Melanesia differ in different islands; e.g., in the Solomons the circular or chevron-shaped cicatrices worn by both sexes on the face are made with the claw of the flying fox,⁷ while in Florida Island the pattern is 'marked out in circles with a bamboo, and the skin is cut with the bone of a bat's wing.'⁸ The keloids and scars called *koito*, which are customary in New Britain, are made with obsidian flakes.⁹

(b) *Tatu proper.*—A method which seems to suggest a combination of cicatrization and tatu proper is that of cutting the flesh and rubbing pigment into the wounds. Livingstone says of the Makoa (Makua) of Central Africa, who have double lines of keloids on the face: 'After the incisions are made, charcoal is rubbed in and the flesh pressed out, so that all the cuts are raised above the level of the surface.'¹⁰ The charcoal gives a bluish tinge to the skin, 'and the ornament shows brightly in persons of light complexion, who by the by are common.'¹¹ The Ainu women of Yezo (Japan) cut gashes on the face with a sharp knife and rub in soot from burnt birch-bark, which

produces a bluish-black effect.¹ This method has also been observed in some of the islands of Micronesia.

The implements used for pricking the skin range in complexity from such simple natural objects as thorns, fish spines, cactus spikes, shells, and bones, to the elaborate metal appliance of the Burmese and the steel and electric needles of Japan and Europe in use at the present day. The Roro-speaking tribes of British New Guinea obtain the desired effect by very simple means. The operator, who is generally an old woman, applies colouring matter—soot mixed with water—with a fragment of wood frayed out at one end to form a coarse brush. The colour is pricked in by means of a pricker having one or more thorns set at right angles to its long axis; these thorns are driven into the skin by tapping the pricker gently with a small wooden mallet. The women of these tribes are tattooed from head to foot, but the operation takes place at intervals, and there is a regular order in which the different parts of the body must be tattooed; thus the hands and arms are done in childhood, and later the tatu is gradually increased until at marriageable age it is applied to the buttocks, legs, and last of all to the face.² The Polynesian method of tattooing is generally to trace the design on the skin first with charcoal and then to follow the pattern with a small adze-shaped implement furnished with a serrated bone edge. The skin is perforated by hammering or tapping this implement with another made of wood and shaped like a paddle. But the ways and means employed vary a good deal in the South Sea Islands, and the operation is often accompanied by much ceremonial and feasting, and the keeping of certain tabus; e.g., brides in the Fiji, while being tattooed, are *tabu siga*, and are kept in seclusion, for they must not see the sun.³ In New Zealand a very strict tabu has to be observed by the person undergoing the ordeal; he may not communicate with any one not in the same condition, nor may he touch his food. The Maori chief had to be fed through a special funnel during the process, which entailed a good deal of ceremonial of a somewhat religious character. The Maori tatu, or *moko*, was of two kinds, of which the older method was a cutting into the skin with a small chisel-like tool made of sea-bird's wing-bones, shark's teeth, stones, or hard wood, and of different sizes and shapes. The edge of the chisel was applied to the skin and tapped by a small mallet, which sometimes had a broad flattened surface at one end used to wipe away the blood. This chiselling process was superseded by prick tatu, which was done with small-toothed or serrated implements dipped in colouring matter obtained either from charcoal mixed with oil or dog's fat or burnt and powdered resin.⁴ In Borneo the design is pressed on to the skin with a tatu block dipped in pigment made from a mixture of soot and sugar-cane juice. The needle points of the pricker, which are also charged with pigment, are then driven into the skin by taps from a striker. Among the Kayans the men carve the designs on the blocks, but the tatu is done by women. The artists are under the protection of a tutelary spirit to whom sacrifices must be made, and the operator has to avoid certain foods. The women are tattooed in a hut built for the purpose; their male relatives are dressed in bark-cloth and must remain indoors until the operation is completed; in fact it cannot be commenced unless their men-folk are at home.

⁴ Major-Gen. Robley, *Moko: Maori Tattooing*, London, 1896, pp. 47, 62.

It is prohibited to tatu women at seed-time, or if a dead body lies unburied in the house, and bad dreams, such as 'a dream of floods, foretelling much blood-letting, will also interrupt the work.'¹ In Burma the outline of the desired pattern is roughly sketched on the skin with a camel's hair brush and is then pricked in by a series of punctures close together, which merge into a rough line. The pricker is of an unusual kind, being two feet long and weighted at the top with a brass or lead figure; the pigment is contained in a style four inches long, which fits into a hollow pipe and is thus joined to the weighted end.² In Japan steel needles of four different sizes are used; the effect of shading is procured by tying rows of needles together. Sepia, vermilion, and Prussian blue are used in the designs, which are very ornate.³ In some parts of N. America the pigmented effect is obtained by running a needle-like implement through the skin threaded with some material coated in pigment.

This method was followed by the Salish tribes, who used a 'needle of fish-bone or a cactus spike, which passed a fine thread coated with charcoal under the skin,' or sometimes the charcoal was carried on an unthreaded needle, 'which was thrust under the skin in a horizontal direction.'⁴

The Eskimo use a needle and thread smeared with soot or gun-powder. Thus, speaking of the personal appearance of the Greenlanders, D. Crantz says:

'No one . . . is a finished beauty till the skin of her cheeks, chin, hands and feet, has been threaded by a string smeared with soot, which when drawn out leaves a black mark. The mother performs this painful operation on her daughter in childhood, fearful that she will else attract no husband. This custom obtains among the Indians of North America, and various Tartar tribes, where both sexes practise it; the one to heighten their charms, the other to inspire terror.'⁵

3. Patterns.—A detailed study of the patterns would doubtless yield results of considerable ethnological interest as pointing to the migrations and culture-contact of peoples. Flinders Petrie⁶ has drawn attention to the resemblance between the Algerian patterns described by Lucien Jacquot⁷ and those on the female figure found at Tuhl and on the Libyans in the tomb of Seti I. (XIXth dynasty, 1300 B.C.). The dominating designs in Algeria are a cross and a figure resembling a fly, which are thought to be degenerate forms of the swastika—a device widely distributed in Africa and elsewhere, and of great antiquity, as is shown by its appearance on a leaden figure⁸ in the second city of Troy (about 2500–2000 B.C.) and by its prevalence in ancient Crete. The designs in favour among the Haida tribes on the north-west coast of America are similar to those on their boats, house-fronts, pillars, and monuments, and include family crests and totemic symbols such as the thunder-bird, wolf, bear, codfish, and so on. There is a great variation in the patterns of the Polynesian tatu, for almost every island has some distinctive characteristic of its own. The Marquesans, e.g., tatu in broad straight lines. Many of their signs suggest a hieroglyphic system which can be interpreted only by their priests; in Anaa, however, sea-urchins and quaint zoophytes are well represented on the leg and thigh. The Marquesan women have a design somewhat resembling a gridiron tattooed on their lips.⁹ In Tahiti the patterns are simpler, but of greater taste and elegance than those of the Marquesas Islands.

The coco-nut tree is a favourite object, and figures of men, animals, and flowers also occur, as well as stars, circles, and lozenges.¹ The Maori tatu stands out in striking contrast to that of the rest of Polynesia, its chief feature being the blending of spirals and sweeping curves, which follow the conformation of the human form, the face being generally completely covered. This prevalence of curved lines suggests Melanesian influence; for Polynesian tatu is generally rectilinear in character. Melanesian tatu is often asymmetrical, perhaps because it is done at different times and by different artists. Here again the patterns are very diverse and suggest, as regards some islands, Polynesian influence. Each of the three principal centres of tatu proper in New Guinea has peculiarities of design and execution; thus, curved lines prevail in Humboldt Bay instead of the broader stripes of the south coast, and in the central district the designs used in tatu resemble those on the pipes and gourds, which show a preponderance of straight lines over curves and an absence of human or animal forms. The Motu (Port Moresby) and kindred tribes are said to have a geometrical art, and their tatu is angular in character, but there seems to be good evidence that many of their designs were naturalistic in origin and became conventionalized later.² In the Admiralty Islands the men wear cicatrices on chest and shoulders in the form of circular spots of the size of half-a-crown. Tatu proper is mainly confined to the women, who have rings round the eyes and all over the face, and diagonal lines on the upper part of the front of the body crossing one another so as to form lozenge-shaped spaces.³

Complicated serial designs are worn by the women in Borneo. The fingers and feet are done at the age of ten, the forearm at eleven, the thighs partly at twelve, being finished at puberty; it is thought immodest to be tattooed after motherhood. The men have isolated designs, such as the dog design, in elongated or rosette form—a device prominent in Kayan art and one that can be traced in the shoulder tatu of many of the tribes including the Barawans (Sarawak). The most primitive tatu in Borneo is that of the Uma Long women of Batang Kayan; it is stippled—in the forearm only—in irregular dots. Indigenous patterns are done by freeland, no blocks being used for them. The thigh tatu in Borneo produces the effect of tight-fitting breeches, and resembles that found among the Burmese and some of the Naga tribes. The latter have an elaborate face tatu called *ak*, formed of continuous lines across the forehead, round and underneath the eyes, over the cheeks, to the corners of the mouth and the chin. 'Rows of spots follow the outside lines, and two fine lines mark out the nose in a large diamond space.' With the Nagas both sexes tatu, but some tribes do not mark the face, and have the tatu placed on the breast, shoulders, back, wrists, and thighs.⁴ The Burmese tatu generally from the waist to the knees, but among the Shans it extends from the neck to the feet. The designs include mystic squares, triangles, and a great variety of animals. The old or jungle style was to cover the skin with tracery producing an indefinite effect; the new style is distinct in outline.⁵ Perhaps the most highly developed tatu is that of the Japanese, who cover the body with fantastic figures of dragons, birds, flowers, and landscapes, in a manner that recalls the patterns on their silks.

4. Use and significance.—(a) *Magico-religious*.—The use and significance of these marks were manifold, and they have played an important part in the life of primitive man, since they had a magico-religious as well as a social aspect. Their widespread use, even at the present day, as a magical protection against sickness and other misfortunes shows a very general belief in their supernatural efficacy. The Yun tribe of S.E. Australia wear vertical cicatrizations round the upper arm to make boomerangs glance off.¹ In Timorlaut scars are made with red-hot stones on the arms and shoulders in imitation of smallpox marks to ward off that disease.² The Andamanese believe that cicatrization is good for rheumatism, toothache, headache, paralysis, epilepsy, and phthisis; it is resorted to for these and other ailments when all else fails. The Todas use it to cure the pains caused by milking buffaloes. Tatu proper is a remedy for rheumatism much in favour with the men of the Halba caste, who work on the lands in the south of the Raipur District and the Kanker and Bastar States in India; its action is probably that of a counter-irritant.³ The Gonds and Baigas have a number of designs for the protection of different parts of the body, including a figure of the monkey-god Hanuman to give strength, of Bhimsen's club to assist digestion, of the foot-god to cure pain, and so on.⁴ The Burman has similar safeguards worn on all parts of the body; they are a protection against wounds and secure freedom from pain, and are sufficiently potent to procure even the favour of princes. The only tatu worn by the Burmese women is a love-charm in the form of a triangle between the eyes or on the lips or tongue; it is done with the 'drug of tenderness'—a mixture of vermilion with herbs and other ingredients such as the skin of trout-spotted lizards.⁵ The Shans tatu boys as a test of courage, but special designs are added to prevent injuries or other mishaps. In Borneo the Kayan men wear a special tatu on the wrist called *lukut*, which keeps away illness. The *lukut* is a much-valued bead, which was formerly fastened on the wrist of the sick man to 'tie in' the soul; but, as the bead was liable to be lost, a tattooed representation of it came to be worn instead. The Ainu women are tattooed on the lips and arms to keep away the demons of disease, who are thus led to believe they are the wives of the gods, since these are all tattooed in this manner. If an epidemic occurs in a village, the women must tatu each other; they also use tattooing as a remedy for failing eyesight.⁶

Many races believe that the efficacy of tatu marks extends beyond the present life to that of the next world, where they serve as marks of identification—e.g., Nagas of Manipur, Kayans of Borneo, N. American Indians, and many others—or as a guide, or as currency enabling the traveller to accomplish his journey.

The Dhanwâr, who inhabit the wild hilly country adjoining Chota Nâgpur, say that tatu marks 'remain on the soul after death, and that she shows them to God, probably for purposes of identification.'⁷

Women of the Brâhman caste believe that after death they will be able to sell the ornaments tattooed on their bodies and to subsist on the proceeds. In Africa a similar belief is found among the Ekoi women, who think that in the next world they can exchange their scars for food, and that the ghost is able to remove them one by one for this

purpose.¹ The Eskimo and the Fijians believe in Elysium only for the tattooed; the Fijian women who have not these marks are said to be served up as food for the gods. Some investigators have insisted upon a considerable religious element in tatu, since the operation is often accompanied by sacrifice, prayer, and other religious ceremonies, and the designs frequently represent sacred animals, or other objects that may be regarded as symbols of gods. These serve to express a close union between the god and his disciple; hence the need for certain tabus to avoid the dread consequences of contact with persons in this dangerous state. The priest of the Ewe-speaking people of W. Africa has special tatu marks indicating the deity whom he serves and the rank that he holds in the priestly order; the shoulder marks in this case are so sacred that they must not be touched by the laity.² In San Domingo the priests did not wear a distinctive dress, but had a figure of a *zemi* (idol) tattooed or painted on their bodies.³ Tatuing was regarded by many people as a sacred profession, and the artists were under the special protection of deities of the craft. In Tahiti these were the children of Taaroa, the principal deity; their images were kept in the temples of those who practised the art professionally, prayers being addressed to them by the operator before he began his work. The Tahitians say that tatuing originated among the gods, and there are legends in Samoa and elsewhere telling of its sacred origin.

(b) *Informatory*.—To people who do not possess a system of writing the wearing of permanent and distinctive body-marks is not merely an æsthetic advantage, but in many cases a real necessity. Used extensively by uncultured peoples, these marks became a convenient means of conveying to their fellow-men all kinds of information concerning their activities and environment. They serve as a record of achievement and a means of identifying a man's tribe, clan, totem, social status, age-grade, and so on; and they have been regarded by some authors as a primitive form of writing.⁴ Thus, in Africa cicatrization is a common form of tribal mark, the scars being worn on the face or on other parts of the body and arranged in a certain pattern. The Shilluk, Dinka, Dahoman, Mxosa, Mtyopi, and Hausa tribes are among those who follow this practice. Scars are used for the same purpose in the Andaman Islands, and in Melville and Bathurst Islands of N. Australia. Ellis, writing of the Maoris of New Zealand, says that their faces were much tattooed:

'Each chief had thus imprinted on his face the marks and involutions peculiar to his family or tribe; while the figures tattooed on the faces of the dependants or retainers, though fewer in number, were the same in form as those by which the chief was distinguished.'⁵

Even individual Maoris could be identified by special marks which were tattooed on the face—usually near the ear—in addition to the general pattern. These came to be used as the signature of the wearer and have been accepted as such on documents relating to transactions carried on between the Maoris and white men.

The Salish and Déné tribes of N. America have markings—generally on the breast—symbolic of the totem or *manitu* of the individual wearing them. The Haida Indians of Queen Charlotte Islands have their family totems or crests tattooed on their bodies with great skill. The designs are

often very elaborate and resemble those on the totem-posts that stand outside their houses. A. C. Haddon records an instance of the use of cicatrization to represent the totemic device in the Torres Straits, where he saw some women wearing it cut into their backs. He was told that the men wore it cut into the shoulder or calf of the leg.¹

The Kavuya Indians of California formerly used the tatu designs worn by a landowner as a property mark by cutting or painting them upon trees and posts selected to indicate the boundaries. It was customary for the Maidu women to have a red spot tattooed on the forehead by which, if taken prisoners in war, they could be identified by friends and so ransomed.²

A curious use of tatu occurs in the well-known story in Herodotus of the slave who was sent from Susa to Aristagoras of Miletus by Histiaus with instructions that he was to be shaved, and that Aristagoras should look at his head; this being done, it was found that a message had been tattooed on the man's head, urging Aristagoras to revolt against the Persians.³

Cicatrization and tatu proper are included in the puberty rites and initiation ceremonies of many primitive peoples. In an account of one of these ceremonies in Australia Spencer and Gillen report:

'The final ceremony of initiation to manhood in the Urabunna tribe is called Wilyaru, and the same name is given to men who have passed through it. The most important part of the ceremony consists in making cuts on the back, one in the middle line of the neck and four or six others down each side of the backbone.'⁴

In the Marquesas Islands tatu proper was the principal initiatory rite.

In Samoa 'until a young man was tattooed, he was considered in his minority. He could not think of marriage, and he was constantly exposed to taunts and ridicule, as being poor and of low birth, and having no right to speak in the society of men. But as soon as he was tattooed he passed into his majority and considered himself entitled to the respect and privileges of mature years.'⁵

It sometimes marked the admission to secret societies, as in the Banks Islands (Melanesia), where at the performance of the *kole-kole* ceremonies the head of the *tamate* design adopted by members of the society is tattooed on the wrist, a part of the body highly valued.⁶ Mary H. Kingsley says of the initiation of boys in Africa:

'The boy, if he belongs to a tribe that goes in for tattooing, is tattooed, and handed over to instructors in the societies' secrets and formulae.'⁷

In New Zealand tattooing began with both sexes at puberty, the women being tattooed chiefly on the lips and chin.⁸ Chin tatu on women signifies marriage, not only in New Zealand, but also among the Eskimo, the Chukchi, the Indians of the Pacific Coast, and in Syria, Egypt, and Tunis. Women are usually tattooed at puberty. This is not, however, always the case, for in some of the islands of Fiji and among the Todas of the Nilghiris it is deferred until they have borne children, while with some races it is begun in infancy and completed at marriage. Only women are tattooed among the Chukchi, most Californian tribes, the Ainu of Japan, and in many parts of India. In the Omaha tribe of N. America tatu marks on women signified great honour and a rank equal to that of a chief. Bachofen saw in the limitation of tatu to women among the Thracians an expression of their distinction and good social position.⁹ This is contrary to the view taken by Plutarch, who said that the Thracians tattooed their wives as a punishment to avenge the murder of Orpheus. In

Melanesia, where tatu is mainly confined to women, their social position is very inferior, whereas in Polynesia it is comparatively good, and they are seldom tattooed. But it is questionable whether there is any necessary correlation between the tattooing of women and their position in the social scale. The limitation of tatu to one sex or the other may be due to other causes; *e.g.*, it is possible that in the South Seas it may be connected with the migrations of different peoples.¹

The social rank and profession of men are often indicated by their tatu marks, as in the case of the Maori chief who wore a complicated face tatu, and the Creek Town king who was marked in blue with figures of the sun, moon, and stars, animals, landscapes, and even battle-scenes. It has already been noted that priests sometimes had distinctive tatu marks. In some parts of India they serve as an indication of caste. All Gowari men—a herdsman caste of the Marātha country—are tattooed with a vertical line on the forehead, the possession of this mark securing admission to the caste feasts.

Among some Indians of Brazil the executioner, or *matador*, was scarified above the elbows by the chief of the clan 'so as to leave a permanent mark there; and this was the star and garter of their ambition, . . . the highest badge of honour. There were some who cut gashes in their breast, arms and thighs, on these occasions, and rubbed a black powder in, which left an indelible stain.'²

The wearing of tatu marks proved a convenient method of recording, among other things, great achievements demanding personal valour and skill. The Koita tribes of British New Guinea have a special tatu for homicides.³ Those of the Baronga (Bantu) who have slain an enemy used to be decorated with special marks from one eyebrow to the other:

'Dreadful medicines were inoculated in the incisions and there remained pimples "which gave them the appearance of a buffalo when it frowns."⁴

On the Mendalam river in Borneo, the Kayans reserve thigh tatu for head-taking braves. With the Western Eskimo the men are tattooed as a sign of distinction. Those who have captured whales have marks to show this, so that their tatu becomes a kind of whale tally.⁵

In many countries it is not only a record of great events, but also a memorial of the dead. In the Saibai and Dauan Islands (Torres Straits) the women wear a shoulder scar for a brother's death; it represents his nose, and the longer the nose, the longer the scar.⁶

In New Zealand 'the women were the chief mourners at funerals. . . . The custom was, in days gone by, that they should wash their faces, neck, arms, and bodies with sharp shells until they streamed with blood; the *narahu* or moko-dye was sometimes applied to the wounds, and the stains commemorated the scenes at which the women assisted.'⁷

In Polynesia the tongue was tattooed as a sign of mourning. Ellis saw this operation performed in a house where a number of chiefs had assembled for the purpose, and has described the tattooing of Queen Rihorihoro's tongue after the death of her mother-in-law.

(c) *Decorative*.—Perhaps the most general use to which tatu has been put is that of personal adornment. Ellis, after noting that tatu was used in Polynesia as a badge of mourning and a kind of historical record, adds: 'But it was adopted by the greater number of people merely as a personal ornament; and tradition informs us that to this it owes its existence.'⁸ Among the

Kayans of Borneo, who have a very artistic style of tatu, the men affect it chiefly for ornament: so do the women in Greenland, New Zealand, and elsewhere. In fact both sexes in many parts of the world attach to it considerable æsthetic value. In regard to cicatrization among the Andamanese, Man says that it is primarily for ornament and secondarily to prove courage in enduring pain. It seems evident that in the Torres Straits islands it was adopted as a means of acquiring a certain accepted standard of beauty, for Haddon says that the women had a Λ -shaped scar to prevent the breasts from becoming too pendulous.¹ This fashion is also found on the neighbouring coasts of New Guinea and was observed by Seligman among the Otati, an Australian tribe on the east coast of Cape York.

In contrast with the opinions expressed in the writings of Waitz-Gerland² and others in reference to the religious significance of tatu, Joest and Westermarck see in it only an expression of man's vanity and love of adornment: 'At present tattooing is everywhere regarded exclusively, or almost exclusively, as a means of decoration, and Cook states expressly that, in the South Sea Islands, at the time of their discovery, it was in no way connected with religion.'³ Westermarck admits, however, that it has been made to subserve many purposes, but adds: 'Nevertheless, it seems to be beyond doubt that men and women began to ornament, mutilate, paint, and tattoo themselves chiefly in order to make themselves attractive to the opposite sex,—that they might court successfully, or be courted.'⁴ Wundt suggests that the marks at first gave magical protection against evil powers, but gradually became merely decorative, and were used to make the personality of the wearer more striking, as in the case of warriors, who wore them to increase their terrifying aspect.⁵ On the other hand, E. Grosse thinks the priority should be given to the taste for embellishment, and that the marks only later came to have a tribal or social significance: 'Summarizing the results of our investigations of the significance of primitive scarification and tattooing, we find that the marks serve partly as tribal tokens and have perhaps as such sometimes a religious meaning, although this cannot be proved for a single instance. But in other and the largest number of cases the scars and tattoo marks are for ornament.'⁶

5. *Origin and development*.—Many theories have been put forward to account for the origin and development of the practice of thus marking the human body: as regards the origin, however, they must remain, for lack of evidence, little more than mere speculations. Instances have been known of involuntary tatu occurring among mechanics and other workmen, who have accidentally grazed or cut themselves while handling charcoal or other colouring matter. Primitive man may have arrived at the notion of tatu by accident, such as the pricking of a finger by a half-burnt splinter or thorn while kindling a fire. The unusual mark thus made might well excite his interest and so lead to an attempt at imitation and to elaboration and invention. Herbert Spencer thought that the practice arose from the custom of making blood-offerings to departed spirits, and that the marks thus made expressed subordination to or close union with them, and became in many instances tribal marks, 'as they would of course become if they were originally made when men bound themselves by blood to the dead founder of the tribe.'⁷ In this connexion F. B. Jevons writes:

'The marks or scars left on legs or arms from which blood had been drawn were probably the origin of tattooing, as has occurred to various anthropologists. Like most other ideas, we may add, that of tattooing must have been forced on man; it was not his own invention, and, being a decorative idea, it must have followed the laws which regulate the development of all decorative art. . . . So the scars from ceremonial blood-letting may have suggested a figure; the resemblance was deliberately completed; and next time the scars were from the beginning designedly arranged to form a pattern.'⁸

M. Neuberger regards tatu as one of the popular customs that have sprung from primitive therapeutics: 'Smearing the skin with earth led to painting the body, and scarification of wounds and rubbing in the earth or rust (according to whether the pain was to be lessened or increased) developed into tattooing.'¹ Wundt, Joest, and others see a possible causal connexion between body-painting and tattooing and suggest that the latter was a crude attempt to fix the designs once painted on the body. Wundt regards both these practices as specific stages in primitive art; and in tatu he recognizes two types, the one being a crude system of simple marks often intensifying the natural lines of the body, and the other a stage in which the skin is treated as a material to work on—just as sand or rock is used for drawing upon—when the simpler marks are replaced by fantastic symbols. Capart points out the practical importance of replacing temporary marks by permanent ones, if they have a special meaning attached to them: 'Les dessins que le primitif se peint sur la peau n'ont aucun caractère de persistance et l'on peut à volonté les faire disparaître et les remplacer par d'autres. Il peut y avoir parfois intérêt à les rendre indélébiles, lorsqu'ils sont, par exemple, des marques de tribus ou des marques religieuses. De là naît la coutume de tatouage.'²

Concerning the origin of *moko*, or Maori tatu, native tradition says that the first settlers marked their faces for battle with charcoal, and later these warlike decorations were made permanent to save trouble. 'Hence arose the practice of carving the face and the body with dyed incisions.'³

How difficult and well-nigh impossible it is to arrive at an accurate knowledge of the early history of such a custom may be gathered from the admission of W. Ellis, who, after many years of personal contact with, and careful observation of, the natives of the Polynesian islands, said in reference to their tatu: 'Although practised by all classes I have not been able to trace its origin.'⁴

Hamblin on 'Tattooing as a Means of Emotional Expression.'

CONSTANCE JENKINSON.

TAUROBOLIUM.—The *taurobolium*, a sacrifice performed in connexion with the cult of the Great Mother of the Gods, but not limited to it, was one of the most peculiar and most celebrated rites of the last two centuries of paganism. A striking description of it is put by the Christian poet Prudentius, of the 4th cent., into the mouth of one of his characters, Romanus the Martyr (*Peristephanon*, x. 1006 ff.). The high priest of the Great Mother, a golden crown on his head, his temples richly bound with fillets, his toga worn *cinctu Gabino*, descends into a deep foss which is completely covered by a platform of planks pierced by a great number of fine holes. On to this platform is led a huge bull, bedecked with garlands of flowers, his front gleaming with gold. His breast is pierced by the consecrated spear, and the torrent of hot, steaming blood floods the covering of the trench, and rains through the thousand chinks and perforations on the expectant priest below, who throws back his head the better to present cheeks, ears, lips, nostrils, and even tongue and palate, to the purifying baptism. When life has fled and left cold the body of the slain bullock, and the flames have removed it, the priest emerges and, with hair, beard, and vestments dripping with blood, presents himself to the expectant throng of worshippers, who salute and do obeisance to him as to one who has been purified.

There were two principal motives which prompted

the ceremony of the *taurobolium*. In the earlier period, the 2nd and 3rd cent. A.D., it was usually a sacrifice whose object was the welfare of the Empire, Emperor, or community. An entire college, community, or even province could give it, and a frequent date for it was March 24, the *Dies Sanguinis* of the annual festival of the Mother and Attis. The more frequent motive of the rite in the late 3rd and 4th cent. was the purification and regeneration of an individual. Its efficacy lasted for twenty years, or was even eternal, the baptized person being spoken of as 'renatus in æternum' (*CIL* vi. 510, 512). It was performed by laymen as well as priests, and by persons of all ranks and both sexes. A special altar was erected for the occasion, the time occupied by the ceremony varied from one to five days, and the expense was borne by the individual or association that inaugurated it. Besides the personal and the patriotic motive, it was performed as a fulfilment of vows, or at the command of the Mother herself. In Rome it usually took place near a shrine which existed where the present church of St. Peter stands. The *criobolium*—the sacrifice of a ram—was instituted later in honour of Attis on the analogy of the *taurobolium*, in order to give him due prominence in the rites of the cult. See art. **CRIOBOLIUM**.

As the *taurobolium* was celebrated in honour of both the Great Mother and Attis, it probably possessed a significance regarding that part of the legend which concerned them both (see **MOTHER OF THE GODS**). The priest descends into the dark pit and leaves the light of day; Attis dies; the vegetation of the earth withers; the priest is bathed in blood, and rises from the pit purified; Attis is restored; the vegetation returns.

The similarity between Christian doctrine and the phrase *renatus in æternum* ('born again for eternity') is startling, and has suggested belief in some connexion between the two religions in the way of borrowing, especially as paganism vied with Christianity in later days in promising such benefits as the latter conferred. The *taurobolium*, however, is better explained as the survival of a primitive Oriental practice based upon the belief, not uncommon among rude peoples, that the strength of brute creation can be acquired by consumption of its actual substance or by contact with its blood. The spiritual meaning of the practice first came with the advance of culture and the discarding of the primitive, literal belief (see **Cumont**, *op. cit.* below).

Though the *taurobolium* might with reason be supposed to have come, with the cult of the Great Mother, from Asia Minor, there is no positive evidence that it was originally connected with it either in the East or in Italy. Cumont thinks that it was a rite in honour of the eastern Artemis Tauropolos, deriving from her its name *tauropolion*, which was corrupted to *taurobolium*; and that the rite, having become wide-spread in Cappadocia and the neighbouring provinces in connexion with the worship of Artemis Tauropolos and other deities closely allied or identified with her—principally Anaitis and Bellona—naturally found its way with them into Italy early in the 2nd cent. A.D., after the annexation of that part of Asia to the Roman Empire, and was soon afterwards adopted and popularized by the priesthood of the Great Mother. Its first known celebration took place at Pozzuoli in A.D. 134, in honour of Venus Cælestis, who, Cumont thinks, was Anaitis under a Roman name. His conclusion that it was celebrated in connexion with the worship of Bellona rests on slender evidence. Others believe it to have been a part of the Great Mother's worship in Asia Minor (Hepding, *op. cit.* below). Whatever its origin, its popularity was attained through the cult of the Great Mother.

It spread throughout the Empire, and maintained its importance up to the fall of paganism, the last celebration known occurring at Rome in 394.

GRANT SHOWERMAN.

TEETH.—I. Ornament and trophy.—Among both pre-historic and savage races teeth of animals and human beings are used as an ornament, usually strung together as a necklace, headband, or girdle. Such ornaments are already found among burial remains of Solutrean, Magdalenian, and Azilian horizons, the corpses having been buried wearing them. In a ceremonial burial of thirty-three skulls in the grotto at Ofnet, on the upper Danube, the skulls were ornamented with stag's teeth and shells.¹ Among savages the custom of wearing teeth is well-nigh universal,² and, while it may simply serve an ornamental purpose, the intention often goes farther. The teeth are worn as a trophy. Thus, among the tribes of the N.W. Amazon, necklaces are made of the teeth of the tiger and other animals, bored and threaded, or of human teeth bound into a necklace with fibre string. These denote the skill of the wearer as a hunter, or his bravery in war, and the human teeth, which are those of an enemy, are 'a visible and abiding token of completed revenge,' and are buried with the owner. Sometimes the larger animal teeth are ornamented with lines or carved.³ Analogous to the practice of wearing teeth as a trophy is the curse used by savages, 'Let their teeth be broken,' and the Psalmist's words, 'Break their teeth' (58th), 'Thou hast broken the teeth of the ungodly' (37). The suggestion is that of enemies as ferocious beasts deprived of their power to tear and rend.⁴ Men doubtless used their teeth in early times as a weapon, as savage men and maniacs still do. Divine images are known to have actual teeth set in their mouths, possibly as a trophy or offering.⁵

Possibly teeth worn by men also served the purpose of an amulet, as having a connexion with the qualities of the animal or person from whom they were taken,⁶ or as protecting the wearer from similar animals in time to come.⁷ On the other hand, a person's own tooth might serve as an amulet. Pliny says that the first tooth shed by a child was so used and protected him from pain.⁸ Where teeth are knocked out at initiation, they are sometimes carefully preserved, or regarded as sacred, or used for magical purposes.⁹

Teeth taken from a corpse were used to cure toothache or for magic, and those of an old woman were used as a fertility charm in the yam garden by the New Caledonians.¹⁰

2. Mutilation of the teeth.—Filing the teeth to a point either singly or in pairs, and knocking out certain teeth as a ceremonial act, usually at

initiation, and the purposes which these practices serve, have been already discussed.¹

Staining the teeth is practised by several lower tribes—*e.g.* in S. America and Indonesia—as well as at higher levels—*e.g.* in China (applying lac to the teeth).²

3. Teeth as relics.—Teeth of Christian saints have often formed relics, and in early Buddhism the four canine teeth of Gautama were among his 'seven great relics.' One of these has been famous in Ceylonese Buddhism as the *Dalada*. Its miraculous preservation from every means taken to destroy it by a hostile Indian king, and its ultimate arrival in Ceylon in A.D. 312, are the subjects of a long narrative, and the Chinese traveller Fa-hian describes the procession of the relic as he saw it in 405. At a later time the Portuguese are believed to have destroyed it, though the Ceylonese allege that they only destroyed a counterfeit and that the real tooth is the one still preserved at Kandy in a shrine. It is probably not genuine.³

4. Teeth in myth and legend.—Greek myth told how Kadmos, having slain the dragon guardian of the spring Areia, at the suggestion of Athene scattered its teeth on the earth like grain. From the teeth sprang armed men called Spartoi ('scattered') from the manner of their birth. A similar myth was told of Jason.⁴

In the 16th cent. a report that a child had been born with a golden tooth in Silesia caused much anxiety in Germany, being regarded as a portent. The physician Horst in 1595 published the result of his astrological researches on the subject, and declared that the tooth symbolized a golden age, preceded by the expulsion of the Turks from Christendom.⁵

TELEOLOGY.—I. INTRODUCTORY.—1. The term.—The word 'teleology' (Mod. Lat. *teleologia*, Germ. *Teleologie*, Fr. *téléologie*) appears to have been devised by Christian Wolff in 1728. He felt the need of a term to designate the branch of natural philosophy which had to do with ends (Aristotle's *τέλος* or *ὄν ἐνεκα*) or final causes (the *causa finalis* of the schoolmen) as distinguished from efficient causes (*ἐξ ὧν γίνεται*, *causa efficiens*). For Wolff, accordingly, teleology signified the study of ends or final causes in nature, and more precisely the explanation or interpretation of natural phenomena in the light of the concept of end or final cause. In popularizing Leibniz's philosophy, he set explanation based on final cause side by side with explanation by efficient cause. Presumably Wolff derived teleology directly from *τέλος*, 'an end,' but, as J. Burnet has remarked,⁶ the word is properly derived in the first instance from *τέλειον*, 'complete.' Thus, etymologically regarded, it does not bear the implication, which it has historically, of an external end; and the

⁶ *Greek Philosophy*, pt. i., *Thales to Plato*, London, 1914, p. 346, note 1.

prevalent 'organic' use of it in modern thought is justified.

2. **The concept.**—As already indicated, the concept is much older than the term. It attaches itself primarily to that organic view of nature which was developed in the ancient Greek philosophy as against the mechanical view. According to the mechanical view, the whole is the product of the parts by their mutual interaction. According to the organic doctrine, the whole is ideally prior to the parts and constitutes the explanation of their mechanical actions and reactions. This last was a doctrine influential not only in the sphere of natural philosophy but in the spheres of political and social philosophy as well, and it led to the teleological interpretation of nature as a realm of ends or final causes. As the whole was an unchangeable form, it gave to all movement a purpose and goal; and in the light of its purpose and goal the movement itself was most deeply interpreted. This ancient opposition between the mechanical and teleological standpoints, as represented by Democritus and Aristotle respectively, set a problem which runs through the whole history of philosophy. The fundamental question at issue is, Are natural processes subordinate to conscious rational purpose, or is the world to be explained and interpreted by mechanical principles alone? That is the deeper philosophical issue in its most clear-cut form. There is a narrower issue which has assumed increasing definiteness in modern times. The fundamental question here belongs to scientific method rather than to metaphysics, and is most prominent at the present time in the dispute between mechanism and teleology in biological theory. Are the characteristic problems of biology (*q.v.*) capable of solution by means of mechanistic categories, or must teleological factors also be postulated?

II. **HISTORICAL.**—A. ANCIENT PERIOD.—1. **Anaxagoras** (c. 500–428 B.C.) has been hailed as the father of teleology, but he is so only in a qualified sense.¹ His explanation of nature—to judge from the fragments of his *Περὶ φύσεως* preserved by Simplicius and from the references in Plato and Aristotle—appears to have been virtually a mechanical explanation on the basis of a qualitative atomism, nor is it even certain that his First Cause of motion was an immaterial or incorporeal essence. The movement and order of the universe he ascribes analogically to *Noûs* (mind, intelligence, reason), which by an initial impulse imparted a rotatory motion to the pre-existent chaos in which 'all things were together.' But, once the rotatory motion was set up, *Noûs* apparently had little else to do. It may be that a thoroughgoing teleological view of nature is logically involved in the Anaxagorean doctrine of *Noûs*, whether *Noûs* (which is represented as omniscient and omnipotent) be regarded as a spiritual or a corporeal essence, as mind or mind-stuff. On the other hand, it is altogether probable that Anaxagoras did not carry out the full implications of his doctrine. Socrates in the *Phædo*² complains that in actual explanations he called in only mechanical causes—'airs, æthers, waters, and such like absurdities'; and Aristotle in his *Metaphysics*³ (in a passage reminiscent, as Burnet⁴ allows, of the passage from the *Phædo*) charges him with making use of *Noûs* merely as a *deus ex machina*, to account for the formation of the cosmos or for phenomena that he could not explain on mechanical grounds. Similar objections, as J. Adam⁵ reminds us, were

afterwards urged against Descartes and Newton. But, however we may interpret the Anaxagorean concept, we cannot but recognize its significance in the history of thought.¹

2. **Diogenes of Apollonia.**—The teaching of Anaxagoras was apparently influential upon his contemporary Diogenes, who attributes *Noûs* to his primary substance, air, inasmuch as all things are 'disposed in the best possible manner'—a phrase which sends one's mind on to Leibniz and his theological optimism. It is, however, impossible to say whether Diogenes followed up his affirmation of purpose or design in nature any farther than Anaxagoras appears to have done; and this difference between them remains, that, whereas with Anaxagoras the teleological inference is in the direction of theism, with Diogenes it is definitely pantheistic.²

3. **Socrates.**—The teleology of Socrates (*q.v.*) is to be found in the *Phædo* and the *Memorabilia*. (a) The Socrates of the *Phædo* expresses himself as mightily pleased with the book of Anaxagoras in which *Noûs* is affirmed to be the cause of all things, but as disappointed with the failure of Anaxagoras to transcend the mechanical view. He is dissatisfied with a philosophy that cannot show how everything finds itself as it is 'because it is best for it so to be. He has grasped the distinction between mechanical and final causes in nature, and discovers only in the latter a true ground of explanation. To rely upon mechanical causes alone would be as absurd as to say that the real reason or final cause of his sitting in prison was certain bodily dispositions, and not his mental resolve to abide by his sentence, as the best thing to do. Had this not seemed the best, then 'by the dog these muscles and bones would have been off to Megara or the Bœotian frontier long ago.'³ (b) Consistently with this representation in the *Phædo* the Socrates of the *Memorabilia*⁴ is found affirming an immanent Reason in the world, and consistently too with the general doctrine of the Platonic Socrates concerning the individual and the State (which Adam would sum up as 'nocracy,' or the supremacy of *Noûs* or Reason).⁵ At the same time the Anaxagorean concept receives in the *Memorabilia* a development so one-sided that it becomes difficult, if on no other ground than this, to believe in the representations of Socrates in Plato and Xenophon respectively as both even essentially historical. W. Windelband⁶ suspects the influence of Cynicism and Stoicism upon the representation in Xenophon. In any case it is an exclusively anthropocentric teleology that is here formulated. The whole world of nature is said to yield traces of design, as appears in particular from the wonderful adaptations of means to end in the structure of the human body, in man's psychical constitution, and in the phenomena of external nature; and, furthermore, all is designed towards the one end of the advantage and well-being of men. (c) The Socrates of the *Memorabilia* gave perhaps the first formal exposition of the 'argument from design.' Formally, and often naively, he argues from the evidences of design in nature to the existence of an intelligent and beneficent Deity (*σοφὸς τινὸς δημιουργοῦ καὶ φιλοζώου*).⁷ This anthropocentric teleology, with the theistic inference associated with it, impressed itself strongly upon subsequent religious thought.

4. **Plato.**—(a) The teleology of Plato (*q.v.*) is so far indicated in what has been said regarding the Socrates of the *Phædo*, but it has a deeper philosophical setting than can actually be found in

Socrates. In keeping with his ethical and social philosophy, Plato seeks in his metaphysics to interpret the real in terms of the end or ideal of the Good. Ethics is for him the foundation of metaphysics, as it came to be for Lotze, and reality yields up its secrets according as its ethical meaning is apprehended. His conception, already adumbrated in the *Phædo*, of a 'Jacob's ladder of science' (as E. Caird calls it¹), beginning with the lower principles of explanation and reaching to the highest principle of unity or the idea of the Good, by which all the others are explained, is developed more fully in the *Republic*.² The Good or Universal Reason (Νοῦς) is the final cause of every event and change, and to the idea of the Good all the other ideas are teleologically subordinate. The Good, as we may learn from a famous passage of the *Laws*,³ is the perfection of the whole; and in the preservation and perfection of the whole every creature has its own proper end to fulfil. Thus it was that Plato sought by means of his theory of ideas to interpret the rational principle of Anaxagoras more adequately. He looks upon the world, says J. Hutchison Stirling, as 'a single teleological system with the Good alone as its heart.'⁴

(b) In applying his metaphysical principles to the interpretation of nature, Plato is hardly liable like the Socrates of the *Memorabilia* to the charges of externality and anthropocentrism. For the *Timæus*, in which such a teleology may be found, is, in its details at least, 'mythical.' In consistency with his theory of ideas, Plato could not have claimed more for his accounts of the phenomenal world than that they were 'likely tales' (εἰκότες λόγοι). In any case he does not, even in the *Timæus*, lay much stress upon particular instances of adaptation in nature, nor does he encourage the notion of adaptations as designed exclusively for human needs. (c) In the *Timæus*, as indeed in the *Philebus* in non-mythical form, a theological interpretation is offered of the teleological constitution of the world. In offering it, Plato would apparently overcome the dualism between the ideal and the phenomenal which is inherent in his theory of knowledge and reality. God, the Demiurge, is represented as bringing order and harmony out of the moving chaos of not-being (ἄν ὄν), in accordance with the pattern of the Good, and in so far as natural necessity (ἡ ἀνάγκη) allows. Thus natural necessity comes in when divine activity according to ends fails as a principle of explanation, and something is yielded to Democritus. But, while the teleological explanation involves a recognition of divine activity, and is so far on the lines of the theistic argument, the Demiurge of the *Timæus*—the self-moved mover who fashions the world—is not identified with the Good, nor is he to be equated with the God of modern theism.

5. Aristotle.—(a) While it may be allowed to Plato that no ultimate explanation of anything is possible apart from the discovery of its final cause, we have to turn to Aristotle (*q.v.*) for a more adequate recognition of mechanical causes as principles of explanation, and this although Aristotle is the protagonist of the organic and teleological view of the universe. In the endeavour to overcome the Platonic dualism of ideas and things, Aristotle gives an even more thoroughgoing interpretation of the Anaxagorean Νοῦς than is to be found in Plato. With Plato he believes in the real existence of the form or idea, but he cannot think of it as separate from the world. It exists in the world and in things. Reality is a process of development, in which the change from more imperfect to less imperfect being is to be interpreted in the light of the τέλος, which in things that are not eternal is the moving form or final state of actuality (ἐνεργεία). The moved matter, which is the primal state of potentiality (δύναμις), exists for the sake of the form.⁵ The individual is both form and matter, being form in relation to what is lower in the scale of things, and matter in relation to what is higher. The marble is form in relation

to the materials composing its substance, and matter in relation to the statue which is made from it. The tree is form in relation to the elements of the soil that enter into the process of its growth, and matter in relation to the house built of it. The Good is the highest form of all, being pure form without matter, and is the ultimate end or final cause of all existence and all movement. It is not actually generated in the world-process, but is eternally implied in it, as the goal of the creation.

(b) With this peculiar speculative idea of development which fills the central place in the *Metaphysics* Aristotle opposes Democritus (*q.v.*) and the atomists, who appeared to him as mere 'drunken stutters' in comparison with Anaxagoras. Even in inorganic nature he finds purpose or final cause operative. Just as an army moving on the field, or a ship cleaving the sea under full sail, offers an instance of effort directed towards an end, so, wherever we observe in natural processes the regular achievement of results, we may similarly discern the presence of purpose. But it is principally the realm of organic nature that is viewed thus teleologically. How absurd, he urges, to ascribe the forms and activities of living beings to the operation merely of accident (τὸ αὐτόματον) or chance (ἡ τύχη)! Empedocles (*q.v.*) was emphatically wrong in his theory of the origin of species, in which he avers that nature produces in her prodigality every possible type of animal form, and that only those forms survive which are coherently and consistently constructed. If, as Empedocles believed, nature once produced 'man-faced cattle' (Βουγενὴ ἀνδρόπρωρα), presumably she also produced at one time or other 'olive-faced grapes'! Nature is a cause which acts purposively, and if her end is sometimes unattained, it is due to the mechanical necessity to which matter (ὕλη)—Plato's 'not-being'—is subject.

(c) Much more clearly than in Plato we find in Aristotle, especially in the *de Partibus Animalium* and other biological works, the recognition of the double play of mechanism and teleology in nature, especially in organic nature, which does not operate with the refractory medium of matter. As a naturalist he is content to lay stress upon only two forms of causation—material or mechanical (ἐξ ἀνάγκης) and formal or final (ὄν ἐνεκά), and the formal or final cause comes first, being the reason which determines the whole process. The mechanical causes are the servants and instruments of the final causes. Thus in Aristotle both mechanism and teleology are accepted as factors in the explanation of nature, though the Platonic principle preponderates. It is not quite true, however, to say that Aristotle has succeeded in reconciling Plato and Democritus, that by his cosmo-teleology he mediates between the onto-teleology of the theory of ideas and the mechanism associated with the atomistic hypothesis. Owing to his scientific limitations, notably in connexion with the mechanics of the heavens, Aristotle pushed explanation by final causes farther than his general principles warranted. Frequently resting upon final causes alone, he at once hindered the progress of his own scientific thought and lent his authority to the narrow and one-sided finalism of the scholastic interpretation.

(d) Aristotle's organic or teleological doctrine, based on the metaphysical concepts of matter and form, strikingly anticipates certain modern positions in biological and psychological science. Applied, e.g., to the conception of the organism, it offers, as L. J. Henderson assures us,¹ a complete formulation of the biological principle of organization. Aristotle conceives of the living thing as an autonomous unit, having the teleological principle within, and with every part functionally related to every other and existing as the servant of the whole. That is the implication, we are told, of his comparison of the organism to a well-governed commonwealth, in which, once order is established, the individuals duly play their parts and a separate monarch is no more needed.

6. The Stoics.—(a) Among the so-called sects that came after Plato and Aristotle the Sceptics (*q.v.*) had no contribution to make in teleology. If causality was suspect with them, as with Hume in a later age, so also was finality. The contribution of the Epicureans (*q.v.*) was distinctly negative. Epicurus is to be classed with Leucippus and Democritus, of whom Aristotle said that they 'rejected design and referred all to necessity.'² But the Stoics (*q.v.*) recognize the principle of teleology. There was one philosopher indeed, an Aristotelian, who came near to Stoicism in his opposition to the mechanical explanations of the atomists; but, on the other hand, as Windelband puts it,³ he 'threw away the keystone of the Aristotelian teleology.' This was Strato of Lampascus, who denied the existence of pure form as of

³ *Hist. of Ancient Philosophy*, p. 301.

pure matter, declaring form to be always immanent in matter, and so converting the Aristotelian system into a consistent naturalism. Stoicism may also be described as naturalism, but it was at the same time a pantheistic system. The old dualism of form and matter which Plato and Aristotle had inherited from Anaxagoras, and had failed to throw off, gave place to an eclectic and somewhat facile monism, in which one eternal substance manifested itself as spirit (*λόγος σπερματικός*) and matter (*πνεῦμα διάπυρον*). It was essentially a teleological explanation of the world that was given by Stoicism, because, although every particular phenomenon was said to be determined by natural necessity, as Democritus had maintained, natural necessity was not based, as with the atomists, on quantitative differences and initial movements, but depended on the vital activity of the whole.

(b) In carrying out its teleology, Stoicism made much of the beauty, order, and harmony of the world and the adaptations of means to end, especially in organic nature, as manifestations of the rational unity and ideal meaning of things. The evils of the world, which offered even more difficulty on the monistic hypothesis than in the Platonic and Aristotelian systems, were optimistically explained as instruments or concomitants of the great cosmic movement, and it was said that they would be recognized as such, if the individual could take the point of view of the whole. But the Stoic appeal to order and adaptation often descended to externality and anthropocentrism, as in the teaching attributed to Socrates in the *Memorabilia*. Thus it was said that the peacock was made for the sake of its beautiful tail, and the ass to carry man's burdens. Yet an immanent or intrinsic teleology such as is characteristic of Plato and Aristotle would have been altogether congruous with Stoic principles.

(c) If the *Memorabilia* is possibly influenced by Stoicism, Cicero's *de Natura Deorum* indubitably is. There the inference to God from the order and beauty of the universe is eloquently set forth in a well-known passage¹—reminiscent perhaps of Plato's story of the Cave—attributed to Aristotle, where is depicted the impression that would be made on men whose dwellings had been underground, on their first beholding the glorious spectacle of earth and sea and sky. It has been suggested² that in the argument for the being of God contained in the *de Natura Deorum* it is Aristotle we have chiefly before us; e.g., the comparison, in several passages, of the world to a furnished or inhabited house or an adorned and decorated temple of the gods (a comparison which is to be found also in writers like Philo the Jew and Minucius Felix the Christian apologist) is said to have come from Aristotle. This suggestion is odious to philosophers who are jealous for the purity of the Aristotelian doctrine of the end, especially as Cicero in the *de Natura Deorum* furnishes the prototype, in the ancient world, of Paley's *Natural Theology* and the Bridgewater Treatises.

7. Teleology of history.—While in the ancient Greek philosophy a teleology of nature was expounded, in the religious period of the ancient world and within the early Christian Church the idea of a teleology of history gained ground. The opposition in the Gnostic view of history to the OT religion as the revelation of an inferior Deity led to the view of history which has established itself as the truly Christian. It fastened upon the Pauline doctrine of the pædagogic function of the Law, which gave to the Law a distinctive place in a teleological series of divine processes; and the whole course of the ages was interpreted in the light of the great divine plan of redemption culminating in Jesus Christ. With Irenæus the teleology of nature is ancillary to the teleology of history as thus expounded from the Christian standpoint. At the hands of Augustine the whole conception receives an impressive treatment, and the human race is regarded as a teleological unity, as being destined to receive entrance into the catholic or universal Church (*civitas Dei*). This anthropocentric view of the world as the scene of the divine redemption in Jesus Christ still prevails in Christian theology, in which the teleological principle of history is sometimes described as Christological or Christocentric.

B. MEDIÆVAL PERIOD.—Thomas Aquinas.—All through the Middle Ages, in Christian and

Muhammadan countries alike, the Aristotelian teleology dominated philosophical and scientific thought. Unfortunately it was the Aristotelian teleology in its defective form of explanation by final causes alone (*i.e.* apart from mechanical causes), and it laid an arrest upon the movement of natural philosophy. Yet Archimedes and others who came after Aristotle had shown that mechanics at any rate could altogether dispense with the hypothesis of final cause. Aquinas (*q.v.*) makes use of the so-called teleological proof, which was the favourite proof in the patristic and scholastic ages, and he quotes as exponents of it John of Damascus and Averroës on Aristotle's *Physics*. There is an intelligent 'somewhat,' says Aquinas, by which all natural objects are ordered in relation to an end, and this 'somewhat' we call God—which, indeed, is the gist of the teleological argument, whether in its popular or in its more philosophical form. Aquinas also catches up the patristic idea of the teleological unity of nature and history, and through his doctrine of the State gives it a more systematic expression. The State was not with him, as with Augustine, the devil's province (*civitas huius seculi*), but was based on natural law or right (*lex naturalis*), which has its source in God; and the life of virtue, which Aristotle said was to be realized in the political society, was the preparation for the higher life of grace in the society or community of the Church. 'Gratia naturam non tollit sed perficit.'

C. MODERN PERIOD.—1. Bruno.—The transition from ancient and mediæval to modern thought is well illustrated, in this matter of teleology, as in others, in the views of Giordano Bruno (*q.v.*). His whole philosophy represents an attempt to combine in a unitary system the Platonic and Aristotelian idealism and the modern mechanical view of nature, of which Democritus was the precursor. Like the atomists, he affirmed that only, as it were, after repeated experiments on nature's part did combinations of elements arise which, as being adapted to ends, conserved their stability. At the same time he affirmed—and here the idealistic strain appears—that there is a world-soul, or inner principle of motion in nature, which is purposive in its working, and so orders all things as to secure the world's progress. Thus the mechanical and teleological views are united in this thinker.

2. Bacon.—Though Francis Bacon (*q.v.*) may also be said to belong to the age of transition, he was more definitely on the side of the modern scientific movement. It would appear that he looked upon the philosophies of Plato and Aristotle as 'planks of lighter and less solid wood' than the physical philosophies of ancient Greece lost in the wreckage of the Roman Empire. For him philosophy was restricted to the investigation of nature, and there were certain 'idols of the tribe,' or common prejudices, to be dismissed from the mind if nature was to be explained aright. Among these was interpretation by final causes. Under the illusion that man is the measure of things (which Protagorean utterance, curiously enough, is actually become the watchword of a recent philosophical movement) we interpret things in reference to ourselves (*ex analogia hominis*) instead of universally (*ex analogia universi*). Yet Bacon does not reject the reality of final causes.

¹ For the cause rendered, that the hairs about the eyelids are for the safeguard of the sight, doth not impugn the cause rendered, that pilosity is incident to orifices of moisture.' Final causes in physics are, however, sterile like Vestal virgins, and, worse than that, they are 'impertinent,' being indeed 'but remoras and hindrances to stay and slug the ship from further sailing.' But final causes have their place in metaphysics and religion. The divine wisdom even appears more admirable when nature 'intendeth' one thing and providence 'draweth forth' another.¹

¹ Bk. ii.

² See Hutchison Stirling, *Philosophy and Theology*, p. 170 ff.

¹ *De Argumentis*, iii. 5.

Thus Bacon throws off the two thousand years' yoke and touches hands with Democritus and Leucippus across the centuries. But, while vindicating physical causation as the one form of causation of which physical science need take cognizance, he conserves the metaphysical and religious interests which were bound up with the Platonic and Aristotelian teleology. It were incredible to him that this 'universal frame' should be 'without a Mind.'¹ He failed, however, to appreciate the scientific importance of the Aristotelian concept of organization in biology, as also—but this was the legacy of the schools—the philosophical depth of the essential Aristotelian doctrine of the end.

3. **Hobbes and Descartes.**—(a) Hobbes (*q.v.*), following Bacon and Galileo, tried to liberate philosophy from the Platonic and Aristotelian ideas and forms and to substantiate the mechanical view not only in the realm of nature but in the realms also of mind and society. He reduced all cause to motion, and philosophy to a doctrine of motion.

(b) Though Descartes (*q.v.*) also dispensed with final causes in nature, he did not fall like Hobbes into materialism. He explained natural phenomena by the mechanical principles of matter and motion, so founding the now orthodox systematic view of mechanics, but he dissociated himself from the ultimate positions of the ancient atomistic philosophy. Mechanical explanation was not ultimate explanation. But his rejection of final causes in nature was on theological rather than epistemological grounds. We may legitimately enough, he thought, attribute ends or purposes to God, but we cannot hope to discover these, as they are hidden 'in the inscrutable abyss of His wisdom.' Here, as in Bacon, there is a clear distinction between the scientific and the metaphysical and religious interest in final causes—a distinction which became clear only in the modern period of thought.

(c) For the issue between mechanism and teleology in scientific explanation Descartes possesses considerable significance, not merely because of his peculiar vitalistic theory that the *vis viva* might alter the direction of motion if unable according to the law of conservation to change its quantity, but chiefly because of his law of conservation itself. In the effort to reach the true principle of mechanical causation, he arrived at the belief that God conserved in things as a whole all the movement which He introduced into them at the creation: so that in virtue of this initial disposition the necessary world-process was at every stage teleological. His vitalism was a short-lived theory, but his principle of conservation marks a notable advance in the teleology of nature.

4. **Spinoza.**—(a) The most vigorous, as it was the most uncompromising, attack upon final causes in nature came from Spinoza (*q.v.*). In explaining a particular phenomenon we cannot, he said, go beyond the particular attribute of the one divine substance, be it the attribute of thought or of extension, under which the phenomenon appears to us. For, while the attributes are parallel to each other, there is no interaction between them. Thus material phenomena, including the movements of the human body, are only explainable in physical terms. Matter cannot be grounded in mind. There can be no ends or purposes in nature.

(b) Apart from the incompatibility of the doctrine with his fundamental philosophy, two main objections are urged by Spinoza against final causes. The first is Bacon's objection—that acceptance of final causes hinders the investigation of nature: recourse to the will of God in the explanation of natural phenomena, and in particular of untoward phenomena like tempests, earthquakes, and diseases, is a refuge of ignorance (*asylum ignorantie*). The secrets of nature are with those who abandon final causes and place their trust in mathematics, which, as dealing with the essences and properties of things, leads to rational knowledge. The other objection is that the method of explanation by final causes encourages false anthropomorphic conceptions of God. A God who works purposively, or towards ends, is subject to fate or necessity and lacks perfection of being. It implies defect in God that He should be in need of anything. Nor have we any right to infer distinctions

in the divine nature analogous to the elements of the human mind. The intellect and will we may ascribe to God are no more analogous to our intellects and wills than the constellation of the Dog to the animal that barks.

(c) Undoubtedly Spinoza did good service in exposing the weakness and superficiality of the traditional teleology, but it should be observed that, while the denial of teleology is already involved in the doctrines of substance and parallelism with which he sets out, at the close of his thought a certain light breaks in upon his system. The *amor intellectualis Dei* with which he concludes is part of the infinite love wherewith God loves Himself, and we may learn from it that with His universe God is well pleased. The ideas of satisfaction and value which are essential to a teleological interpretation of the universe appear to be here conserved.¹

5. **Leibniz.**—(a) Despite the able efforts of the Cambridge Platonists (*q.v.*), such as Cudworth and More, to vindicate for final causes a place in physics, the mechanical view found increasing support, being applied also as against Platonists and vitalists to the phenomena of life, and it was left to Leibniz (*q.v.*) to attempt a reconciliation of the opposing principles. Leibniz's essential position still meets with great acceptance among scientists, philosophers, and theologians. In the phenomena of nature, he says, everything happens mechanically and at the same time metaphysically, and the source of the mechanical is the metaphysical. This position finds clear expression in two sayings that may be placed side by side—one from a recently discovered fragment, and the other quite familiar: 'Omnia in tota natura demonstrari possunt tum per causas finales, tum per causas efficientes.' 'Causae efficientes pendent a finalibus.'

(b) While Leibniz was as 'corpuscular' as Descartes or Spinoza in the explanation of particular phenomena, he could not, for two reasons, rest in the mechanical explanation. One reason appears in his metaphysical construction of the concept of substance. Rejecting the Cartesian and Spinozan opposition of extension and thought, and affirming substance to be force (*un être capable d'action*) and force substance, he passed from an abstract to a more concrete monism. Matter was no longer to be defined as extension but as a form of force, more specifically as power of resistance; and mind was no longer to be restricted to the sphere of consciousness, and was represented as comprising subconscious states (*petites perceptions*). With this view of substance, and with the aid of the Aristotelian principle of continuity and development, Leibniz at length reached the speculative position that the real world consists of an infinite host of independent monads or individuals, at countless different stages of development, whose activity is fundamentally spiritual or perceptual. Now it is the very nature of the monad to strive after the realization of all its latent possibilities. It has to rid itself of confused perceptions and attain true ideas, and so to enter into the mind of God the Supreme Monad—an end which may only be achieved on the plane of self-consciousness and spiritual freedom. So it is, according to Leibniz, that the forces active in mechanism may be interpreted from the standpoint of teleology. Everywhere in nature purposive activity may be discerned. Take but the inward view, or, rather, take but the universal view, and the world of physical causes and effects becomes a world of means and ends.

(c) The second reason that led Leibniz to uphold the teleological interpretation of the world starts from his postulate of 'pre-established harmony,' which is intimately connected with his monadology. Though independent or 'windowless,' each monad 'mirrors' the rest of the universe. Though subject to its own laws, each monad is in harmony with the universal development. Geulincx and Spinoza had already applied the principle of harmony or correspondence to the two Cartesian attributes, but Leibniz applies it to the totality of substance. He compares the correspondence which he has in view to different bands of musicians who may keep perfectly together without seeing or even hearing one another. He compares it also, using a frequent analogy of the time (and with the relation of body and mind chiefly in view), to two clocks so skilfully made as never to get out of time. The pre-established harmony is not imposed upon the world from without, but belongs to the inner life of the monads; none the less it needs to be explained. The only possible explanation is to be found in the will and purpose of God. It is God alone who brings to pass the union or inter-complexion of substances whereby the world is orderly and rational. Thus the order of the world, interpreted as a pre-established harmony, necessitates the teleological inference to God.

(d) The principle involved in the teleological inference is named by Leibniz the principle of determinant or sufficient reason, viz. that nothing can exist or be true without a sufficient reason why it should be so and not otherwise. Without such a

¹ *Essays*, xvi., 'Of Atheism.'

principle, implying the complete rationality of existence, philosophy would for Leibniz have ceased to be, as indeed for Descartes or Spinoza. But Leibniz gave the principle a characteristic application. He regarded it as the foundation of the contingent truths of natural science, just as the principle of identity and contradiction was the foundation of the necessary truths of mathematics and logic. So that the conservation of force or energy and the equivalence of cause and effect in the world must be teleologically explained as dependent upon the divine wisdom and order.

(c) In biology, as in physics, Leibniz advanced the teleological problem. He is said to have established the truth that biological organization is compatible with the mechanistic theory, but in comparing the organism to a kind of 'divine machine' or 'natural automaton' he still comes short of the Aristotelian teleology.

6. Rationalistic theism.—(a) In the 18th cent. Leibniz's theology was more influential than his monadology. There appears to be a certain looseness of connexion between the two, and it was accentuated by Wolff's effort to systematize and popularize the master's doctrines. In Wolff the harmony of the world is no longer an immanent order, but an order externally imposed by God; and the world's chief end is utility and advantage for man and beast—especially utility for man. This externalism impressed itself upon the 'popular philosophy' that arose in Germany about the middle of the 18th cent., and it promoted a remarkable and many-sided growth of natural theology or teleological physics and organics, the aim of which was to multiply the evidences of design in nature in the interests of the teleological inference to creative wisdom and benevolence. There were astro-theologies, litho-theologies, phyto-theologies, insecto-theologies, ichthyotheologies, and numerous others. As among the Stoics, the ideas of advantage and utility were often beaten out into petty trivialities (*Nützlichkeitskrämerei*).

(b) In France Fénelon had already written eloquently on natural theology on similar lines, although later the materialism of d'Holbach and the scepticism of Bayle were to cut at the root of the popular teleology, and Voltaire was to pour contempt upon its anthropocentrism and shallow optimism.

(c) In England, too, natural theology was early developed on the lines of a superficial utilitarianism, beginning in the 17th cent. with the works of the naturalist Ray (on whom Milton drew in *Paradise Lost*), and of Boyle, Barrow, and Parker, continuing with Derham and many others through the 18th cent., and receiving classical exposition in Paley's *Natural Theology*.¹ So exhaustively had the teleology of nature been discussed that the Scottish divine Thomas Chalmers, in the first *Bridgewater Treatise*,² turned to mental as distinguished from physical teleology, discoursing on the adaptation of nature to mind and on adaptations within the mind; while McCosh³ laid the emphasis upon moral teleology, inferring from the moral order a moral Governor.

(d) Notice should here be taken of a universal view of teleology held by the English deist Shaftesbury,⁴ who rose above the particular views that so largely prevailed in the deistic as in the orthodox circles of his time. His was an aesthetic teleology, and in the beauty and perfection of the world he found a proof of the existence of God. Not only does the unity of the world point to a universal Spirit; but beauty lies not in matter but in form or formative power, which must work with design.

7. Hume.—(a) The speculative sincerity of David Hume (*q.v.*) was probably not so great as

¹ London, 1802.

⁴ See art. DEISM, § 3.

his speculative genius. In the *Treatise of Human Nature*¹ he reduced the world to a mere complex of sensations—not an ordered complex, which could be ascribed to a divine Author; and yet in his theological writings, notably in the *Dialogues concerning Natural Religion*,² we find him apparently assuming order and purposiveness in the universe. If the tendency of recent interpretations of the *Dialogues* is to be trusted, we may even regard Hume as sincerely adhering to what is there called a 'genuine theism,' and as accepting the essential core of the argument from design as its rational basis. We may hear Hume himself speaking through Cleanthes, the rationalistic theist, when it is maintained that at every turn we are obliged to have recourse to the hypothesis of design in the universe; or through Philo, who is sceptical and naturalistic in tendency, when he admits that all objections to the hypothesis of design appear mere 'cavils and sophisms' to those who realize the beauty and fitness of final causes.

(b) None the less the criticisms of the teleological inference which are put in the mouth of Philo are of great historical interest and importance. Cleanthes, who states the theistic argument from design (round which the discussion of natural religion mainly turns), compares the world of order to a great machine, subdivided into an infinite number of lesser machines, which, even in their most minute parts, are all adjusted to each other with marvellous accuracy. This universal adaptation of means to ends so resembles the products of human contrivance that we are led by all the rules of analogy to infer that the Author of nature is somewhat similar to the mind of man, though possessed of much larger faculties. Philo replies, in Hume's own sceptical vein, that the principle of analogy is not a sure basis of argument, especially as we depart the more from the similarity of the cases. Can we really speak, *e.g.*, of analogy between the fabric of a house and the generation of the universe? And why should thought, design, intelligence, be made the model of the whole? If it is valid to say that, because the world resembles a machine, it arose from design, is it not at least equally valid to say that, because the world resembles an animal, it arose from generation? And why go beyond nature in search of a transcendent cause? To take one step beyond the mundane system is to be forced to go on in an infinite progression. For the ideal world, into which the material world is traced, is itself to be traced into another ideal world, and so on. May it not be that there are forces in nature by means of which, even after a botching and bungling of many worlds throughout an eternity, this orderly and harmonious system was struck out? At most the argument from design can only prove the existence of a being in time and space, fashioning a given material, and all pretension to ascribe infinity to the Deity or even perfection in His finite capacity must be renounced. Can we even pretend to decide from the phenomena of nature as to whether the Deity is one or many? (A similar reference to the limitations of the argument is found in the *Enquiry concerning Human Understanding*,³ in which the criticism is in the form adopted and made famous by Kant.)

(c) By the objections thus urged by Philo a strong impression is made upon Cleanthes, who is also led to admit, in view of the problem of evil, that the Deity might be described in the terms of 'benevolence, regulated by wisdom, and limited by necessity'—an old position of the Greek theology with which we have been familiarized in recent thought. The carefully formulated conclusion of the *Dialogues*, that (as Philo says) 'the cause or causes of order in the universe probably bear some remote analogy to human intelligence,' may not have represented in Hume's mind the whole of 'genuine theism,' but it dealt a destructive blow to the rationalistic theology of his time, with its deistic implications, its petty teleology, and its hedonistic view of life.

(d) On the scientific or philosophical side, however, Hume made a positive contribution to the problem of natural teleology. The idea goes back as far as Empedocles, and is expounded in Lucretius, that in nature the principle holds of the survival of the fit. In the *Dialogues*, as we have seen, Hume gives expression to this principle, and he does so in respect of both inorganic and organic nature. Described as the tendency towards equilibrium or equilibration, it is recognized in modern physics and biology as teleological in character; but, when Hume speaks of it further as perhaps originally contained in matter, he at least suggests the idea that there is a deeper and

¹ 3 vols., London, 1739-40.

² London, 1779.

³ London, 1748.

more original teleology in nature than ordinary mechanistic theory suspects. So that with Hume the teleological appearance of nature is perhaps more than a postulate of the reflective or subjective judgment, as it is with Kant.

8. Kant.—(a) In his early work on *Universal Natural History and Theory of the Heavens*¹ Kant acknowledged the great value of the arguments drawn from the beauties, harmonies, and perfections of the universe, and more particularly of the starry heavens, to establish the existence of a supremely wise and powerful Creator. At the same time he rises above the popular teleology. In a later pre-critical work on *The Only Possible Proof of the Being of God*² he declares himself impressed with the physico-theological argument, but, like Hume's Philo, he doubts the validity of the inference to a Creator who is perfectly wise and good. In the *Critique of Pure Reason*³ a similar criticism appears, with a famous tribute to the physico-theological argument as 'the oldest, the clearest, and that most in conformity with the common reason of humanity.'⁴ The argument at the best, however, cannot take us beyond the great power and wisdom of the Author of the universe; and it can prove, not a Creator, but no more than an Architect, who is necessarily limited by the character of His material. Contingency belongs not to the matter but to the form of the world. The attempt to show that matter is contingent and dependent upon a principle of intelligence is to fall back upon the cosmological proof, which in its turn rests upon the ontological, with the consequence that the claim of the physico-theological to be a pure induction from experience is invalidated. This argument in fact originates in the propensity of the human mind to view the order and purposiveness of nature as though they were the products of intelligence and design—a propensity for which on the principles of the critical philosophy there can be no real basis.

(b) We need not dwell on Kant's views in his pre-critical writings of the teleological principle. It is sufficient to note that they were on the lines afterwards developed in the *Critiques*. In the *Critique of Pure Reason* he justifies, as against Hume's scepticism, the mechanical or scientific view of nature as subject to causal determination. In the *Critique of Practical Reason*⁵ he vindicates the teleological view of the spiritual life as a realm of moral freedom and independence. From the critical standpoint therefore the doctrine of nature and the doctrine of morality may each be true in its own sphere, and mechanism and teleology be so far reconciled. In the *Critique of Judgment*⁶ he seeks to overcome the dualism—in his own phrase, to bridge the gulf—between nature and the moral order, which he had regarded to begin with as closed systems, independent and separate. He realized that the sensible world of things and persons is but one aspect of reality, and the supersensible world of moral values but another, and that the two must be interrelated. Accordingly he draws attention to certain things belonging to the sensible world of nature which we cannot describe adequately without that notion of purpose or end which has its proper sphere in the supersensible world of spirit. One of these is the phenomenon of beauty, the other that of organic being.

(c) The first section of the *Critique* treats of the æsthetic judgment. In the æsthetic experience the beauty of nature, as of art, is felt to be purposive, in the sense that, while it arises out of the sensible, it is in harmony with our 'undefined idea' of the supersensible. The second section has to do with

the teleological judgment, in which nature is regarded as purposive in itself, and not merely, as in the æsthetic judgment, in relation to the subject of experience.

(d) The purposive character of living beings raises for Kant anew the whole problem of the world as a teleological or organic system, and he now gives the notion of judgment a wider meaning than before. In its use of the principles of the understanding for the subsumption of the particular under the general (in which the faculty of judgment consists) judgment had been shown in the first *Critique* to be determinant or, as we might say, mechanical; i.e., its function is to determine or specify the phenomenal world of experience as a mechanical system under inviolable principles. But judgment is also of another kind, viz. reflective. In subsuming the particular under the universal, reflective judgment makes use of the idea of subordination to purpose or end as the guide to its operations. The determinant judgment is analytical, and simply brings particular facts under the universal principles of the understanding. The reflective judgment is synthetical, and, operating with the idea of nature as a teleological or organic unity, discovers its specific laws. As Windelband¹ remarks, in this application of the category of the practical reason to the object of the theoretical, we have evidently the highest synthesis of the critical philosophy.

(e) But still there is no real transcendence of the dualism between the realms of nature and ends, between the factual world of experience and the ideal world of purpose and meaning. For the principle on which reflective judgment proceeds—that the form of nature implies purpose, that the specific laws of nature are to be regarded as though determined by purposive intelligence—is not constitutive of objects. Transcendental though it be, as involving an *a priori* synthetic judgment, it remains a subjective or regulative principle, serving as a rule or guide for the organization of experience and the further extension of knowledge. Yet without the conception of end or a purpose of reason, as realized in the form of organized beings, we could not make such beings intelligible to ourselves. Even a simple blade of grass is inexplicable unless we look upon it as purposive.

(f) The conception of the organism as purposive leads, moreover, to the view of collective nature as an organic whole or teleological unity. But it should be reiterated that we cannot affirm the principle of end or final cause as belonging to the essential constitution of nature. Could we penetrate to the hidden ground of nature, we should possibly discover that the principles of mechanical and teleological causation are assimilated in one single principle. The very limitation of our knowledge suggests to us the idea of a higher intelligence, possessed of knowledge which is direct and not mediated by a subjective principle. For such an intuitive or perceptive understanding there would be no such separation as our discursive understanding makes between means and end. As it is, the mechanical and teleological principles are at once complementary and heterogeneous, though the teleological is the final or inclusive principle.²

9. Hegel.—(a) In the course of his examination of the critical philosophy Hegel (*q.v.*) dealt with Kant's view of the physico-theological proof. He agrees with Kant as to its inadequacy as a rational or logical argument. The conception of design, like that of cause in the cosmological proof, cannot express the true nature of the relation of the world to God. At the same time the argument represents a further stage, the first stage being represented by the cosmological argument, in the process whereby in the hidden or implicit logic of religion thought reaches the full apprehension of God as spirit or self-conscious intelligence. Kant might have allowed this, but for the rigidity of the distinction he drew between the phenomenal and noumenal worlds, which made it impossible for thought to pass from the one to the other. But the distinction is only relative, and from the ultimate standpoint the two worlds are one. (b) As for the critique of the teleological judgment, here again Kant's doctrine is vitiated by the view of the phenomenal and the noumenal as abstract opposites. Yet Kant indicates, if indirectly, the right principle of cosmic interpretation. For it is impossible to distinguish the categories of mechanical and teleological causation as being constitutive and regulative, objective and subjective respectively. With his true apprehension of the idea of purpose as internal and immanent, Kant, but for his rationalistic prejudices, might have advanced to the recognition of the constitutive character of the organic or teleological principle. Internal

adaptation or design is no less constitutive than the principle of mechanical causation. To overcome, says Hegel, the opposition of phenomena and noumena, we must follow the development of the world from the realm of nature to the realm of mind and thence to the unity of nature and mind in the idea of God, in whom the world is seen to be a rational system.

10. **Schelling: the philosophy of nature.**—(a) If Kant promoted the movement of German idealism, he also promoted—perhaps indirectly rather than directly—the new German humanism. We shall take occasion later to speak of the teleological or organic view of history associated with the names of Schelling and Hegel, who carried forward the work of Bossuet and Montesquieu, of Herder (*q.v.*) and Lessing (*q.v.*). Meantime we refer to another aspect of the humanistic movement, viz. the teleological or organic view of nature which was upheld under the leadership of Schelling by the so-called philosophers of nature. For Schelling, as for Plato and others among the ancients, there was a world-soul which as an inner principle of life united all differences in nature in a single organic system. It was felt by the new humanists, as J. T. Merz¹ puts it, that in the Kantian and more particularly the Fichtean philosophy the details of the scenery of nature were forgotten in the interest of studying the attitude and the emotions of the beholder. (b) Under the shelter of the humanistic movement, it should be noticed, there was a recrudescence of vitalistic theories in biology (which term was first used in this period by Treviranus to cover the whole of the science of life). Though the biological implications of the *Critique of Judgment* are difficult to grasp, vitalism could readily appeal to Kant's philosophical authority against the mechanical theory of life. For, while Kant handed over the inorganic realm to the mechanical theory (in this only sanctioning a *fait accompli*), he had maintained along with the teleological unity of nature as a whole the Aristotelian concept of biological organization. So at least it was generally thought, despite the metaphysical distinction he drew between the determinant and the reflective or teleological judgment as constitutive and regulative respectively. It is a distinction indeed which science cannot but ignore. When science employs teleological concepts such as function or adaptation, it gives them the same validity as the concept of mechanical causation.²

11. **Lotze.**—(a) The humanistic movement soon lost its force. The vitalistic theories which had received their impulse from it, and which culminated in Johannes Müller, fell into comparative neglect, and the mechanical view of life was once more dominant. The most solid, according to H. Driesch,³ of all the attacks upon the older vitalism was made by Lotze (*q.v.*), whom he describes as a static teleologist in physiology in that he believed in the irreducibility of the category of the organism, but a dynamic teleologist or vitalist in psychology in that he believed the soul to be productive of absolutely new mechanical movement. (b) But the significance of Lotze for teleology lies not so much in his work in the domain of biology as in his philosophical system. In him science and philosophy, which since Leibniz and Kant had been going separate ways, meet once more. For he combines the mechanical view of nature with a teleological metaphysics (which he holds Schelling also did). It is his aim to show, as he says in the Introduction to the *Microcosmus*, 'how absolutely universal is the extent and at the

same time how completely subordinate the significance, of the mission which mechanism has to fulfil in the structure of the world.'¹ In his scientific materialism he was at one with the great body of the scientific thinkers of his age. In his speculative teleology he had affinities with Leibniz, Spinoza, Kant, and Herbart. Following Leibniz, he was led to conceive of the world as a plurality of real spiritual elements, but in mutual interaction according to the principle of immanent as distinguished from transeunt causality. In his endeavour to account for the causal relation and the reciprocal interaction of the elements, he was led, by a similar process of thought to that which Spinoza went through, to the idea of a universal all-embracing principle, which for religion has the value of God. Under the influence of Herbart and the Kantian criticism, he utilizes the principle of human analogy in interpreting the inner reality of nature, which he regards as the instrument of a purpose, viz. the purpose of supreme good, though it is by a practical conviction rather than a logical or rational process that we pass from the world of things and forms to the world of values. So it is that Lotze reaches his teleological interpretation of nature.

12. **Darwin.**—(a) At first sight it would appear that the theory of biological evolution associated with the name of Charles Darwin so strikingly vindicates the mechanical view of nature as to banish the idea of teleology altogether, not only from scientific explanation but also from philosophical interpretation. Certainly, as Darwin himself realized, the doctrine of descent by natural selection gave a fatal blow to the old argument from design as expounded by Paley.

'We can no longer argue,' he says, 'that the beautiful hinge of a bivalve shell must have been made by an intelligent being, like the hinge of a door by a man.'²

Paley had not appreciated the metaphysical difficulties involved in the notions of an external designer or contriver and of special external adaptations, and he laboured under the further limitation that he believed with the orthodox science of his time in the fixity or immutability of species. If species were not fixed and permanent forms but the results of long evolutionary processes determined by necessity or chance, then Paley's argument was still further discredited. There appeared to be no more design in the principle of natural selection than 'in the course which the wind blows.'³

(b) But, while the Darwinian theory was subversive of the teleological argument in its popular form, which was deistic or rationalistically theistic, it was not really anti-teleological in the Aristotelian and post-Kantian sense. No doubt the principle of natural selection is in itself fortuitous or non-teleological, and that despite the teleological flavour of the terms 'selection,' 'fitness,' by which it is expressed; so that J. Ward, borrowing a 'plain' term from Herbert Spencer, would describe the principle in mechanistic language as one of 'equilibration.'⁴ Moreover, in the hands of ultra-Darwinians natural selection of random variations has been employed as an exclusive explanation of the modification and transformation of species, and, so employed, may be properly described as anti-teleological. But Darwin himself did not urge natural selection as an exclusive principle. He recognized in evolution other factors besides, both non-teleological and teleological; *e.g.*, in the last edition of the *Origin of Species* he makes a

point of saying that natural selection is 'aided in an important manner by the inherited effects of the use and disuse of parts.'¹ Ward contends that this, the Lamarckian factor, like the factors of sexual and human selection, is strictly teleological in the sense that it presupposes psychical activity, conscious or at least sentient, directed to the end of the satisfaction of needs or desires. Whether the Lamarckian is a real or supposititious factor in evolution is a point with which we are not here concerned. It might be added, however, that the anti-Darwinian theories of evolution are more favourable to the teleological idea than the Darwinian and ultra-Darwinian theories; also that Darwin's general theory of organic evolution, like the general cosmogonic theory of Kant and Laplace, is being increasingly recognized as not inconsistent with an ultimate teleology, profounder, subtler, and less rationalistic than Paley's.

'Unless the cosmos itself,' says Ward, 'is to be regarded as a finite and fortuitous variation persisting in an illimitable chaos, we must refer its orderliness and meaning to an indwelling, informing Life and Mind.'²

13. Lachelier. — In Merz's opinion Lachelier's short tract, *Du Fondement de l'induction*,³ is 'a corner-stone in the edifice of modern thought.'⁴ Lachelier faces the problem of the contingent (or the collocation of things in space) which, along with that of the discontinuous, is involved in the Lotzean formula, that 'the things which surround us are the material in which, the laws of nature the forms through which, the world of values, or the Ideals, are, or have to be, realized.'⁵ Following Cournot, he took up into his philosophy the old distinction between nature passively conceived and nature hypostatized or taken actively (*natura naturata, natura naturans*). The possibility of inductive reasoning rests, he says, on the recognition of both these aspects of nature, which are complementary. From the one standpoint nature is a mechanical or serial unity in which the antecedent determines the consequent; from the other it is a teleological, systematic, or harmonious unity in which the whole determines the existence of the parts. Efficient causes and final causes are both needed in the inductive process. Nature is at once a science, for ever producing effects from causes, and an art, for ever setting about new inventions. As there is a principle of regularity in nature, so there is a principle also of harmony or order. The contrast of mechanism with teleology, as Bosanquet has put it, 'is rooted in the very nature of totality.'⁶ We shall see that this philosophical position of Lachelier has been fruitful in the scientific investigation of the problem of universal teleology.

III. SYSTEMATIC. — A. TELEOLOGY IN EMPIRICAL DESCRIPTION. — 1. Description, explanation, interpretation. — (a) In proceeding from the historical to the systematic discussion, it will make for convenience of treatment to distinguish three aspects of teleology. Historically they have been closely associated, and it is impossible to separate them in any rigid fashion. They may be named, however, the descriptive, the explanatory, and the interpretative. If one hesitates to set up the distinctions here implied, one hesitates more as to the terms by which to designate them. For description, explanation, and interpretation are ill-defined terms in current usage, although—perhaps because—they circulate so freely in discussions of the world and its meaning. By descriptive

teleology we mean the teleology which answers at once to the definition of the concept of end or purpose and is immediately recognizable. It might be otherwise named as formal, empirical, or *de facto* teleology. By explanatory teleology we mean the teleology which is postulated in scientific theory in explanation of things, processes, and events. It might be otherwise named as methodical or logical teleology. By interpretative teleology we mean the teleology which offers in philosophy and religion a spiritual interpretation of the world as a whole. It might be otherwise named as speculative, ideal, or spiritual teleology.

(b) It might be objected in particular to this scheme that modern physical science leaves explanation to metaphysical philosophy and claims for its formulas no more than descriptive validity. It concerns itself only with the question, 'What is it?', and hands over to metaphysics and religious philosophy the questions, 'How came it to be?', and 'Why came it to be?' But it appears to us that physical science has been suffering in the last generation from an excess of reactionary modesty. Behind its so-called descriptive formulations, which are broad generalizations, lie worlds of patient observation and experiment and a host of flashing inspirations; and, if it does not tell us all about the 'How,' it tells us a great deal about it, and is richly entitled to the larger claim involved in the term 'explanation.'

'It is an interesting point,' remarks J. Arthur Thomson, 'that just about the time when physics began to proclaim emphatically that its office was to describe and not to explain, natural history in Darwin's hands passed emphatically from description to historical explanation.'

For the rest, there is in any case against and already classical authority for a certain individualism in matters of terminology.²

2. Descriptive teleology. — (a) Teleology, in the sense of purposiveness or activity directed towards an end, is immediately recognizable in the ordinary work-a-day world. Conscious striving after ends, with adaptation of means to ends, is characteristic of human life. The concept of end or purpose is itself derived from observation of the human mind, and conative activity involving ends is central in human experience. But the idea of teleology is readily extended beyond the reference to consciousness. There is a teleology below consciousness, just as there is a teleology above consciousness.

'Neither Christianity nor the coral reef,' says Bosanquet, 'were ever any design of the men or the insects who constructed them; they lay altogether deeper in the roots of things.'³

(b) As in human history teleology or purposiveness appears to be present in the process, though the individual goes forth, like Abraham, not knowing whither he goes, so it is also in the spheres of subconscious and unconscious life. Many biological processes show the appearance at least of purposiveness, and Kant was right in saying that we could not attain to the knowledge of living things except under the form of the teleological judgment. The structure of the organism, the reciprocal relation of its parts as both means and ends for each other, and its growth, in which it is at once continually self-produced and self-producing, all appeared to him to demand a teleological explanation. It may be that, as Kant's critical philosophy forced him to admit, the teleological principle is subjective and only regulative of knowledge. All we have to say here is that the phenomena of organismal life have been explained both mechanistically and teleologically, but *prima facie* they are susceptible to description in teleological terms.

¹ *The System of Animæ Nature* (Gifford Lectures), 2 vols., London, 1920, i. 13.

² Cf. C. C. J. Webb, *Studies in the History of Natural Theology*, Oxford, 1915, p. 6.

³ *The Principle of Individuality and Value*, p. 155.

(c) When we pass from organic to inorganic nature, we meet no longer with the appearance of purposiveness, because in inorganic nature there are, to the eyes of sight at least, no individual beings. Yet, if we were to indulge the 'pathetic fallacy,' we should look even upon inorganic nature, the air, the sea, a rock, as responsive to our varying moods and thus as so far teleologically constituted.

(d) But, if purposiveness may not be discerned in the inorganic world, it is recognizable in products of art and man's device that are composed of inorganic elements. To our fancy a piece of machinery is often informed with life and purpose, like the machines in Samuel Butler's satire of *Erewhon*, but the purposiveness resides not in the parts but in the processes they subservise. A machine, as Driesch¹ says, is distinguished from other human 'artefacts' as being made for processes. It is, as it were, the depository of a purpose. That is why the comparison of the world to a machine in the old natural theology, as by Cleanthes in Hume's *Dialogues*, is apt enough, especially when the Deity is deistically conceived as purely transcendent. On the other hand, it is also the reason why the comparison is inept from the standpoint of materialism or naturalism, and why from such a standpoint mechanism as applied to the world is not a particularly happy term.

(e) Nor should it be forgotten that under descriptive teleology may be included the recognition of order, beauty, and adaptations in nature as a whole. These things are upon that empirical level of reality which has been attained by the unreflective processes of common sense, and are consequently appreciated by all; and they form the sufficient basis of the traditional argument from design. For order, beauty, adaptation, all speak the language of teleology.

3. The argument from design.—The argument classically expounded in the ancient world by the Stoic Lucilius Balbus in Cicero's *de Natura Deorum*, and in the modern world by Paley in his *Natural Theology*, is doubtless made more impressive, but is not essentially strengthened, by the multiplication of curious instances of extrinsic and intrinsic adaptation derived from the scientific order of nature. It is sufficiently based, as already said, on the fact of the empirical order. As an integral part, nay the very marrow and substance, of the old natural theology of Paley and the Bridgewater Treatises, the argument is liable to criticism for its deistic flavour, its hedonism, its antiquated pre-evolutionary science, its old-fashioned teleology; and apart from its limiting historical associations it is liable, as Hume and Kant made it abundantly clear, to the charge of being essentially fallacious. In inferring divine purposeful agency from the teleological appearance of nature, it is guilty, as the logicians would say, of the fallacy of transcendent inference. Obviously it must be restated in a profounder way, if it is to retain validity. The essence of the argument, says R. Flint,² is that order implies intelligence. It is an argument not from but to design, and it is only to be regarded as part of a great cumulative argument. G. T. Ladd³ admits that the argument is properly an argument from universal order, and he is careful to say that it implies the validity of the ontological argument. From the 'orderly totality' of the universe he would postulate a world-ground conceived of as absolute will and intelligence. But the 'plain man,' with his eye only upon the empirical order, uses the argument without hesitation or logical scruple. When his mind beholds

the chain of causes 'confederate and linked together, it must needs fly to Providence and Deity.'¹ Nor need the man of science, with his deeper appreciation of nature's order, be hesitant to follow the 'plain man.'

'The Logos,' says J. Arthur Thomson, 'is at the core of our system, implicit in the nebula, as now in the dewdrop. It slept for the most part through the evolution of plants and coral-like animals, whose dream-smiles are a joy for ever. It slept as the child sleeps before birth. It became more and more awake among higher animals,—feeling and knowing and willing. It became articulate in self-conscious Man,—and not least in his science.'²

'There is . . . something,' says D'Arcy W. Thompson, 'that is the order of the cosmos and the beauty of the world, that lives in all things living, and dwells in the mind and soul of man. . . . You may call it Entelechy, you may call it the Harmony of the World; you may call it the *Élan vital*, you may call it the Breath of Life. Or you may call it, as it is called in the Story-book of Creation, and in the hearts of men—you may call it the Spirit of God.'³

B. TELEOLOGY IN SCIENTIFIC EXPLANATION.—

1. Cosmology.—(1) *Mechanical explanation*.—The teleological appearance of nature and the forms of life, considered above, has set a problem which science no more than philosophy can afford to ignore. In cosmology, however, narrowly interpreted as the science of inorganic nature, teleology is not required as a principle of explanation, whether the cosmos be considered in the spatial or in the temporal reference, *i.e.* from the standpoint of cosmography or from that of cosmogony. The inorganic world is not teleological, for physical science at least, in the sense of exhibiting immanent purposiveness. In its formulations of the things and processes of the inorganic world science employs only the mechanistic terms of kinematics, mechanics, physics, and chemistry; and it has amply vindicated its right to employ mechanistic terms exclusively in this sphere. Whether it may also do so in the spheres of biology, psychology, and sociology is another question. But in cosmology it has no use for the category of end or purpose, or for that matter for the categories of cause and substance, but assumes the working only of the non-spontaneous, the automatic, the mechanistic. It may possibly be that such real categories as substance and cause (whether efficient or final) are, in Mach's phrase, tinctured with 'fetishism,' but the exact sciences as such are by no means committed to a materialistic or naturalistic standpoint. Materialism and naturalism are ultimate positions, and scientific explanation is not necessarily that ultimate explanation which we would include under the term 'interpretation.' In point of fact, exact science increasingly recognizes the abstract and artificial quality of its explanations, as it realizes increasingly the distinction between conceptual formulation and perceptual reality. Its formulas have been variously characterized as symbols or counterfoils of reality, as a kind of conceptual shorthand, as economics of thought, as convenient hypothetical summations, or, in J. Royce's favourite metaphor, as the ledger entries and balances of a particular method of book-keeping. It is open to science, as he truly remarks, to enter its accounts by other methods of book-keeping.⁴ Gravitation, *e.g.*, may yet be explained as a mere appearance of some more genuine process of nature.

(2) *Collocations*.—In view of the foregoing, we may allow that mechanical explanation, if abstract and hypothetical, reigns supreme and alone in the physical domain. While therefore Chalmers strengthened the case for physico-theology by reviving the Cartesian distinction between the

laws and the dispositions or collocations of matter, he placed his argument in jeopardy when he said that 'the main evidence for a Divinity lies, not in the laws of matter, but in the collocations.'¹ 'But what would become of this main evidence for a Divinity,' remarks J. Ward,² 'if the laws of matter themselves explained its collocations?' Yet, although science has been gathering the collocations within the mechanism of nature, the problem of order still remains. As in the biological sphere, so in the cosmological there is an ultimate collocation or configuration to be acknowledged which natural laws cannot explain. Says L. J. Henderson:

'The forms and states and quantities of matter and energy in the nebula determine the resulting solar system.'³ So that we may affirm that the universe possesses an original teleological character.

(3) *Fitness of the environment.*—(a) But is it possible to discover an explanation of the order of nature beyond the laws of nature's uniformity? Henderson thinks positive thought has found a clue. He points out that, if the scientific or mechanistic origin of the natural order is to be explained, it must be through principles that account not merely for the general character of orderliness in the phenomena of nature and the products of evolution, but also for that radical or fundamental diversity which Herbert Spencer declared necessary to the evolutionary process. Such principles, clearly, are to be sought not so much in the laws of nature as in the properties of matter. Accordingly Henderson has investigated the properties of the elements hydrogen, carbon, and oxygen, and of their compounds water and carbon dioxide, which have been the chief factors in both geological and organic evolution. These properties are found to constitute a unique group of singular physical and chemical characteristics, so that they are *maxima* or the fittest possible for organic life; e.g.—to take the compounds, which are the primary constituents of the environment—the solvent action of water is greater than the solvent action of any other liquid, and the solubility of carbon dioxide in water is such that it must always be evenly distributed between the atmosphere and aqueous liquids. Or—to take the elements themselves—hydrogen, carbon, and oxygen possess the greatest number of compounds and enter into the greatest number of reactions, involving the greatest transformations of energy known to the chemist. Further (and here a teleological consideration appears), the aforesaid unique ensemble of properties is uniquely favourable to the existence of systems—of which the world of physics and chemistry consists—of numerous, diverse, stable systems. In fitness for systems no other elements and compounds even approach hydrogen, carbon and oxygen, water and carbon dioxide. In short, the arrangement of the properties of matter among the elements makes the diversity of the evolutionary process possible.

(b) It is Henderson's opinion, following up these results of physico-chemical research, that, as according to the law of probabilities the connexion between the properties and the process cannot be due to mere contingency, the properties can only be regarded as a preparation for the process, or, in other words, as resembling adaptation. There must be a functional relationship between them—something like that known to physiology—which must be described as teleological. How otherwise can we express the fact that the collocation of properties unaccountably precedes that to which they are unquestionably related? Just as biological organization is teleological and non-mechanical, so with the connexion between the properties of hydrogen, carbon, and oxygen and the process of evolution. This is the positive contribution Henderson has to offer towards the vast problem of the contingent set for natural science by Lotze and Lachelier, and it goes to strengthen the philosophical position that mechanism and teleology are both at the foundation of the natural order.⁴

2. *Biology.*—(1) *Evolution.*—(a) The term 'evolution' (*q.v.*) is itself teleological in its primary meaning, and denotes more than mechanistic process; but it is possible that the mechanistic (*i.e.* physico-chemical) explanation of biological descent may be found sufficient in natural science. Possibly the evolutionary process is mechanistically determined through and through by natural selection interpreted as non-teleological (whether working upon so-called fortuitous variations or upon variations themselves subject to the law of probability), or by natural selection supplemented by other non-teleological factors, perhaps by some

non-teleological factor yet to be discovered. On the other hand, we have seen that Darwin did not regard natural selection as exclusive of teleological factors, and it may well be that the psychological principles of self-conservation and subjective selection, on which J. Ward would lay stress, are required to give natural selection a *point d'appui*.¹

(b) It is a searching test of the sufficiency of mechanistic explanation that H. Bergson in the rôle of biologist proposes. If it could be proved, he says, that life may manufacture the like apparatus, by unlike means, on divergent lines of evolution, then pure mechanism would be refutable and finality in a certain sense so far demonstrable. Accordingly he examines the evolutionary hypothesis in the two forms of it that have emerged from the welter of biological controversy since Darwin's time. He puts it to neo-Darwinism and neo-Lamarckism alike. What is the explanation of the structural analogy between the eye of a vertebrate and that of a mollusc like the common pecten?² It appears impossible on neo-Darwinian principles, which enter readily into a mechanistic philosophy of life, to account for the production of the same effect by two different accumulations of an enormous number of small causes, whether the possibility be urged, as by the stricter Darwinists, on the theory of insensible accidental variations or, as by de Vries, on the theory of sudden and simultaneous variations or, as by Eimer, on the theory that assigns a direct rather than an indirect influence to the environment, explaining the evolution of the various organs by a kind of mechanical composition of the external with the internal forces. To account for the convergence of effects we must appeal, continues Bergson, to some inner directing principle. Here Bergson's sympathy with the neo-vitalism of Driesch and Reinke appears, though he is more interested in their critical work than in their constructions. Turning to neo-Lamarckism, which explains variations not as accidental or determined but as springing from the effort of the living being to adapt itself to the environment, he declares it to be the only form of the later evolutionism capable of admitting, as it actually does with Cope, 'an internal and psychological principle of development.'³ Weismann has shown, however, that the Lamarckian hereditary transmission of acquired characteristics is at most the exception and not the rule. How then may an organ such as the eye be developed? Is not the organic effort a deeper and more psychological thing than any neo-Lamarckian supposes? So Bergson returns to his speculative theory of life. He finds the fundamental cause of variations that accumulate and create new species, in the transmission of the *lan vital* from one generation of germs to the next through the developed organisms which bridge the interval between the generations. Life does not proceed by the association and addition of elements, which is the false anthropomorphic view both of mechanism and of finalism. Life proceeds by dissociation and division. It starts with a direction or tendency no doubt, and is in this sense finalistic, but we cannot foretell how and where it will end.

(2) *Mechanism and vitalism.*—(a) Leaving genetic considerations, we find ourselves still pursued by the mechanistic hypothesis, which affirms 'living matter' to be completely describable as a physico-chemical system, and organization and regulation—those distinguishing marks of living bodies—to be conceivable in physico-chemical terms. But it is also maintained as against this that the way of physico-chemical analysis and synthesis yields but an abstract product falling short of what answers to that *vue d'ensemble* which Comte advocated in the study of the living.

(b) Mechanistic theory in biology may be said to follow two main types, so far as regards the relation to teleology. Sometimes it has no traffic with teleology at all, and is still afflicted with what von Baer called 'teleophobia,' in its jealousy for the mechanical explanation. Sometimes again—and this represents the predominant tendency—it finds room for the teleological view, re-affirming in fact the Aristotelian doctrine of the internal teleology of the living thing, which is its self-regulation.

(c) But, with the more synthetic method involved in this type of mechanistic theory, vitalism has appeared once again in the history of biological theory, if in subtler and more elusive forms. The difference between the prevalent mechanistic theory and the vitalistic hypothesis may be expressed in the distinction due to Driesch between statical

and dynamical teleology.¹ Whereas in static teleology the processes of life are judged to be purposive in virtue of a given machine-like order or form underlying them, in dynamical teleology it is in virtue of their possession of a peculiar autonomy; and dynamical teleology leads, as Driesch thinks, to some form of vitalism. We suppose L. J. Henderson, who is a mechanist, might then be also named a static teleologist; for, while on the whole persuaded that organization (the central issue between the mechanism and vitalism of to-day) is capable of explanation—though not as yet explained—in physico-chemical terms, he is also persuaded that the teleological concept of organization, if to be found also in sociology and in the meteorological cycle, is a necessary biological category, and that a mechanistic physiology is at fault in not recognizing this.² But, though he thus believes with Driesch in teleology as an 'irreducible peculiarity' of vital phenomena, he is not a dynamical teleologist in the neo-vitalist sense. He might allow that organisms, like machines, are inert embodiments of purposiveness; he would not allow that they are actuated by purposiveness.

(d) The anti-mechanists also fall into two main groups. In the first are the neo-vitalists, of whom Driesch is the most prominent representative. They contend that biological processes are not properly explicable as physico-chemical processes within the living matter of the organism, but that some non-physical principle (like Driesch's entelechy or unifying causality) impresses itself upon those processes, to suspend, regulate, or control the physical and chemical reactions. With such a principle at work, the outcome of events, experimentally considered at least, is no longer determinate and unequivocal. Bergson's *élan vital* is such another non-perceptual determiner. Now, as Bergson realizes,³ the contention of neo-vitalism is relevant and weighty on the critical side, but on its positive side is beset with difficulties. Even granted the existence of the mysterious non-mechanical semi-psychical entity postulated in the theory, it is impossible to say where and how it works in the biological processes. In recent constructions, no doubt, there is none of the crudity ridiculed by Molière in the older vitalism when he declared the cause of sleep to be the 'dormitive virtue' (which reminds one of the Johnsonian legend that the noise of wheels was once attributed by the learned doctor to the strepitousness of circumrotatory motion). All the same the conception of neo-vitalism remains mystical in quality, and biological science is reluctant to entertain it. An entity such as Driesch formulates, which is neither an energy nor a material substance but an agent *sui generis*, non-spatial, albeit acting into space, non-material, but logically belonging to nature, may have a strange fascination for the metaphysician, but will hardly retain a place for itself in the world of scientific explanation. We are assured, moreover, that the second law of thermo-dynamics, which entelechy is said to be capable of suspending, will hold even in the obscure cases in morphology on which Driesch founds his theory.⁴ We are also assured that the non-physical something which is supposed to intervene in physical and chemical processes is invariably dependent upon the existence of physical and chemical conditions, yet it is not explained what part these conditions play in

bringing about the actual results.¹ Vitalism sets itself a hard task indeed in seeking to steer between the Scylla and Charybdis of the mechanical and metaphysical explanations.²

(3) *Biologism*.—(a) Even as a scientific hypothesis neo-vitalism appears already on the way to occupy an intermediate position. The issue now seems to lie between some kind of mechanism and a form of teleological theory even more anti-mechanistic than neo-vitalism. For want of a better name, the theory may be called 'biologism.' It is the biological as distinguished from the mechanical theory of life. It is vitalistic in a sense, for it regards it as impossible to conceive distinctively biological phenomena in physical and chemical terms. For it the autonomy of life is more than a static conception involving a teleological and non-mechanical relationship between mechanical things and processes. The autonomy of life is a dynamical conception, involving a dynamical teleology. But it is the living organism itself, and not some directive force within it, as in properly vitalistic theory, that is dominant in organic activity. The organism exists as such, and its structure and activities are the expression of its existence.

(b) Here, as is claimed by J. S. Haldane,³ a protagonist of the biological theory of life, we have a good working hypothesis, necessary to biologists, and capable of overcoming the failures of the physico-chemical conception. Biology, he urges, is something very different from physico-chemistry applied to life. Its phenomena differ, not merely in complexity but also in kind, from physico-chemical phenomena. Although physico-chemistry has much to teach us concerning the origin and destiny of the material and energy in the body, it fails to throw light upon the apparently teleological ordering of that material and energy. The inadequacy of the physico-chemical explanation appears when we enter into the deeper problems of the organism's activity, not to say fundamental problems, such as reproduction and heredity. Animal heat, respiration, circulation—to take these examples from physiology—all contain teleological (*i.e.* physiological) elements that do not yield to physico-chemical analysis. Life is a unity of structure, environment, and activity, and is not resolvable into mechanism. Separate a living part from its environment, or suspend its activity, and you alter it completely. What therefore matter and energy are to physics, or the atom to chemistry, the living organism is to biology.

(c) Haldane is further of opinion that, inconsistent with each other as are the biological and ordinary physico-chemical theories of life (so that personally he would as soon go back to the mythology of his Saxon forefathers as to the mechanistic physiology), a common meeting-ground between biology and physico-chemistry will yet be discovered. That will mean, however, not a reduction of the organic to the inorganic, but the inclusion of the inorganic into the domain of biology.⁴ In such an opinion the contrast between the principles of mechanism and biologism is sharply revealed, but with it we seem to be carried beyond the universe of discourse of natural science.

(d) It appears to us that in their bearing upon scientific explanation the differences between the mechanist or static teleologist and the biologist or dynamical teleologist (if we may wrest Driesch's terms to our own use) is not so very radical after all. It is significant that Henderson accepts the mechanistic hypothesis as *upon the whole* most consistent with the evidence,⁵ and that Haldane advocates the biological hypothesis on account of the unsatisfactoriness of the *ordinary* mechanistic (*i.e.* physico-chemical) explanation.⁶ They both accept the principle of organic autonomy, and are good Aristotelians (as indeed Driesch is also), and possibly they would unite upon the formula: 'Not mechanism or vitalism, but mechanism *and* teleology.' This is a thesis admirably supported

by R. F. Alfred Hoernlé,¹ who would make the particular point that in biology teleology not only is compatible with mechanism but is 'logically dominant' over it. Teleological terms are required, he says, not as substitutes for physico-chemical terms but to express the dominance of the structures and processes of life, which—as he goes on to say—cannot be reduced to exclusively physico-chemical terms without disregard of the difference, on which Bergson insists so strikingly, between the living and the dead.

(e) In an intimate and eloquent discussion of mechanism and vitalism J. Arthur Thomson² makes it abundantly clear that biologism is at present no more than a descriptive or methodological theory. It distinguishes itself from mechanism in demanding ultra-mechanical categories, but what these categories should be is not as yet determinate. He himself describes the organism in Bergsonian language as 'a historic being which has traded with time, and has enregistered within itself past experiences and experiments, and which has ever its comatose bow bent towards the future.'³ Hesitating to interpolate with Briesch and the positive vitalists a new agency or directive activity, he is content to say that the organism reveals new aspects of reality, transcending theoretically mechanical formulation.

3. **Psychology.**—(1) *Body and mind.*—(a) If the teleological standpoint is required in the scientific explanation of the world of organic nature, it is also required in respect of the world of mind or consciousness. The world of mind is the native sphere of purposive activity, and only a very abstract view of it can dispense with teleological categories. According to W. R. Sorley's⁴ analysis, the contrast between a purely mechanical and a purposive system lies in this, that, although purpose is consistent with the law of causation and the principle of the conservation of energy, yet as the result of a purpose or mental idea there is a liberation of energy passing from the potential to the kinetic form, and the same purpose may also control, non-mechanically, the direction of the movement. Therefore it is not to account completely for the activity of a purposive system to describe it in merely mechanistic terms. When this position is challenged (as it is in psychology as well as in biology), as not fitting into the mechanistic hypothesis, the discussion passes inevitably into the speculative sphere.

(b) In psychology the mechanistic position founders upon the Cartesian law of psycho-physical parallelism, which represents the relation between brain-processes and psychical changes as one not of interaction but of concomitance, and it usually takes the form of the parallelistic hypothesis known as conscious automatism or psychical epiphenomenalism (*Begleiterscheinung*), in which inner or conscious states are accounted for as collateral products of the physical phenomena. On such principles as are embodied in this form of psycho-physical parallelism, the appearance of purpose or ideal direction is an illusion, and the consciousness of purpose either belongs to a different order or level of reality or is simply a result or effect, however vague, shadowy, impalpable, of the neural organization. On the first alternative, every neurosis has its psychosis, but they cannot affect each other. On the second alternative, every neurosis has its psychosis, but the neurosis cannot react even a very little upon the psychosis. Either, then, the mechanical theory does not apply to consciousness or the principle of the conservation of energy breaks down. The mechanist must either give up his case or overthrow the foundations of his faith. If this line of argument laid down by J. Ward⁵ be valid, then we are free to turn from the mechanistic hypothesis to one that allows full value to the teleological appearance of conscious life, say, the animistic theory which has so long persisted in human thought and for which W. McDougall⁶ has made out so strong a case in recent times, or the double-aspect theory with which the name of C. Lloyd Morgan⁷ may be associated, and which J. Arthur Thomson favours as in line with his biological contention, largely based on a study of behaviour, that the organism is a psycho-physical unity.⁸

(2) *Psychologism.*—(a) But the working scientist need not commit himself to any speculative position on the problem of the relation between what we

call body and what we call mind. If he is of opinion that psychology is more than physiology, as biology is more than physico-chemistry, he can at least affirm a descriptive or methodological 'psychologism,' transcending merely biological concepts and claiming teleological categories of its own, exclusive and irreducible. A merely physiological psychology, avers J. S. Haldane, is as inadequate as a mechanical physiology. A conscious organism, which reacts not only in space but also in time, and in its temporal reactions joins itself at once to the actual past and the potential future, shows itself to be more than a mere organism, such as we commonly regard a plant as being. The relation to its environment, which is established through perception and volition, is no mere external relation, as in the case of a mere organism. There is a real connexion between the external world and the internal organic world. The environment is 'teleologically determined' by our organic needs, and but for this 'teleological determinism' the world of our conscious experience would lack unity and coherence. To disregard therefore the psychological aspect of living things, especially human beings, and to describe their behaviour in other than psychological terms is to deal unduly in abstractions.¹

(b) If we may extend a remark of J. Arthur Thomson,² in which this idea of the autonomy both of biology and of psychology is summed up, there is not one science of nature but several. There is the physical order of nature—the inorganic world—where mechanism is dominant (always on the assumption, as W. R. Sorley³ reminds us, that qualitative differences are really reducible to quantitative differences of molecular and infra-molecular structure). There is the vital order of nature—the world of organisms—where mechanism is in logical subordination to teleology; and there is the psychical order of nature—the world of mind—where purpose is dominant. In biology the primacy of the biological standpoint, and in psychology the primacy of the psychological standpoint, is to be maintained.

(3) *Discontinuity.*—It may be thought that discontinuity of the categories makes against a unified theory of nature, such as mechanism offers. But a unified theory of nature does not require, says Hoernlé, 'the reduction of all universals to one kind, or the restriction of all variables to one type of values,' but may be achieved by 'the correlation of different types or groups or levels of phenomena.'⁴ It is such a correlation, or cumulative integration, that is here supported. Nor need exception to it be taken in the name of ultimate or metaphysical unity. The categories of mechanism, life, and mind, which are fundamental hypotheses of natural science, are, in the wider view of philosophy, only provisional. It is possible, as J. S. Haldane has hinted, that the principle of continuity may yet be amply vindicated even in the scientific order of nature, and that without surrender to the mechanistic hypothesis. From his own standpoint of philosophical idealism he can say that the categories are the forms which the riches of the spiritual world assume in their progress towards the truly real.⁵

4. **Sociology.**—(1) *Two functions of psychology.*—A. E. Taylor⁶ speaks of two functions of psychology. The first, which is not its proper function but which it exercises 'pending the majority of cerebral physiology,' is to set forth mental processes as mechanical uniformities of sequence. The other function is to treat of purposive activities and adjustments, and thereby to afford a suitable terminology for the sociological sciences, and in particular ethics and history. Apart from

the teleological symbols supplied by psychology, ethical appreciation and historical interpretation would be impossible. With this remark let us pass to the consideration of the teleological method in ethics and history.

(2) *Ethics*.—The teleological standpoint has its place in ethical theory, just as teleological symbolism necessarily enters into the appreciation of conduct. Among the possible divisions of ethical theories a fundamental one is into the teleological and the formal or jural. In the first case the moral standard is represented by the idea of good or value, in the second by that of duty or right. The teleological theory, which is found in Greek philosophy, takes the form either of hedonism or, as F. Paulsen,¹ borrowing an Aristotelian term, phrases it, of 'energism.' With Aristotle as with Plato the ethical end or ideal was the good personally realized in social relations as the actualization or full fruition of human powers and capacities. In modern ethical theory both the hedonistic and energistic forms of the teleological method have been revived. The formal or jural method is older than the other, as attaching itself to the legalistic stage of religion. Through Judaism it entered into theological ethics, and it received classical exposition at the hands of Kant, the fundamental idea of whose ethics is the original mental principle of the good will. As against a Kantian formalism and in favour of the teleological standpoint in ethical theory, it has often been urged that norms and motives of action are not abstract and transcendental principles but, as psychology and history teach us, generalized rules of the will which grow out of individual and social experience, and their value consists not in defining but in their power of promoting the ethical end.²

(3) *History*.—(a) The teleological principle has also been applied to the interpretation of the process of history. As we have already noticed, a teleological view of history took shape under the influence of Christianity, receiving various expression in Augustine and Thomas Aquinas. But it was not until Lessing and Herder, or rather not until Hegel, that history was reflectively and intimately treated in the light of the Aristotelian principles of continuity and development.

(b) We may distinguish in this connexion three types of historical theory. J. S. Mill recognized the principle of continuity, but in his 'inverse deductive' method he applied to historical development the atomizing, mechanizing principles of Democritus and Descartes, treating history as a kind of social dynamics, human motives and actions as causes and effects, and the course of events as a rigorously determined sequence. Against this view it may be maintained that the hypothesis of mechanical causation is irrelevant in the sphere of history and of sociology in general, as in the sphere of psychology in its most characteristic aspect. Psychical events are not duly appreciated by means of subpersonal categories. A similar criticism is applicable to Herbert Spencer's theory of history. Although Spencer, here following Comte, applies the idea of organic or super-organic evolution to the interpretation of the historical process, he never really breaks with the conviction—'fixed probably in his mind,' says J. T. Merz, 'through his engineering education'³—that change and progress in society, as in nature and mind, are explicable on mechanical principles.

(c) The second type of historical theory is represented by Hegel himself, for whom the course of events is a continuity, not of mechanical causation but of evolutionary development. It is still a rigidly determined movement, but it is teleologically conceived, the end dominating the process. 'As the germ carries within itself the whole nature of the tree, the flavour and the form of the fruits, so the first vestiges of mind virtually contain the whole history.'⁴ The history of society is for Hegel the necessary evolution of the immanent Idea, and the process is fixed in all its stages. Through human interests and actions the final purpose of history is carried out, but the purpose itself—such is the absolute cunning of reason—is beyond and external to human interests and actions.⁵

(d) It may be objected to this organic view that, in so generalizing the conception of historical development, it does not bring out its true nature as a process of interaction between conscious and self-conscious minds. Nor does it appear to offer a true rationale of human progress. A better explanation of the historical process, in our judgment, is implied in the words of G. Galloway, who, following Stebnick, says: 'Progress is the spiritual vocation of humanity: it is a task which it sets to itself, not an inherent necessity of its constitution. The . . . ideal is freely pursued, and what ought to be is never that which perforce must be.'¹ In other words, the organic view is to be replaced by the historical or spiritual view, in which the freedom of human personality is more clearly acknowledged.²

(e) The fuller justification of such a position must lie in the metaphysical sphere. It may be here observed that the third type of historical theory might be distinguished from the others as teleological indeterminism. In its development is acknowledged to be epigenetic or, in Wundt's phrase, creatively synthetic, whereas in the teleological and mechanical determinisms above named development is the necessary effect, as it were, of an attraction from before or an impulsion from behind, of a *vis a fronte* or a *vis a tergo*.

(f) It may be also observed that teleological indeterminism in the theory of historical science naturally leads in metaphysics to a form of spiritual pluralism (*q.v.*), that teleological determinism makes a ready alliance with pantheism, and that mechanical determinism is at home in a naturalistic or positivistic setting. Yet it is not without significance that in J. S. Mill a survival of the deistic tendency of thought is to be found. For it may be not unjustly said that deism, as a dogmatic or theological position, with its shallow rationalizing of religion and its mechanical conception of the relation of God to the world, largely promoted what J. Royce calls the 'mechanistic dogma' of our time. An 'absentee God' may be done without, so long as the mechanism of the universe keeps going. At any rate naturalism, deism, pantheism, and pluralism will meet us as we pass from the world of scientific explanation into that of philosophical and religious interpretation.

C. TELEOLOGY IN SPIRITUAL INTERPRETATION.

—1. *Universal teleology*.—As we view the world in its totality and seek to discover its meaning, we pass from empirical description and scientific or logical explanation to spiritual, i.e. philosophical and religious, interpretation. Here we are face to face with the metaphysical aspect of teleology, which is the aspect it has chiefly presented in history. The need of a philosophical interpretation of the world has always been more or less consciously realized, and in recent years there has been a renewal of interest in the deeper problems of nature, mind, and spirit. Philosophy and religion alike welcome the tendency among natural scientists to make incursions into what science has for long regarded as the 'foreign field' of metaphysics—a tendency begotten of the increasing recognition that no more than materialism does naturalism speak the last word on the perennial metaphysical problems. This has been largely due to 'the liberating influence of biology,'³ and is marked among biologists. We have already noticed the idealistic position of J. S. Haldane, and Driesch has advanced beyond a conceptual phenomenalism, having even formulated a critical metaphysics which leans to theism.⁴ The new and wider scientific outlook is well reflected in the significant postscript to T. C. Chamberlin's discussion of the geogonic, geological, and biological processes in his remarkable book, *The Origin of the Earth*:⁵

'It is our personal view that what we conveniently regard as merely material is at the same time spiritual, that what we try to reduce to the mechanistic is at the same time volitional; but whether this be so or not, the emergence of what we call the living from the inorganic and the emergence of what we call the psychic from the physiologic, were at once the transcendent and the transcendental features of the earth's evolution.'

⁵ Chicago and London, 1916.

2. **Teleology and naturalism.**—(a) It is the essence of naturalism to construe the phenomena of life, mind, and society in terms of the mechanical and non-teleological conceptions which serve in physical science. But we are persuaded that thus to reduce the world to a mechanism is to fail to account for large tracts of experience. Mechanism is an undeniably excellent methodical principle, but is inadequate as an ontological dogma. Moreover, with the mechanistic dogma teleology cannot live, *i.e.* teleology as philosophical interpretation. It has ever been the contention of teleologists from Aristotle onwards that meaning and purpose underlie all material and mechanical processes, that mind or spirit is ideally prior to matter and more fundamental to reality. Naturalism, it may be said, ignores the distinction implied in Lotze's remark that 'the machinery which produces the image of a phenomenon is not identical with the meaning of this image.'¹

(b) The counter-contention of spiritual philosophy is to be justified on epistemological grounds, as by J. Ward in *Naturalism and Agnosticism*. Ward insists boldly with Kant that the intellect makes or fashions, though it does not create, nature. He shows that the fundamental principles of knowledge, unity, causality, and regularity have entered anthropomorphically into our conception of nature, and that nature itself as one and uniform is teleological, being found conformable to human intelligence and amenable to human ends. The result is that unity of nature and man in one rational and coherent scheme of things, that confronting of human reason by universal reason, in which idealism or spiritualism has always consisted. It is the fault of naturalism, as Pringle-Pattison expresses it, that it prematurely closes the record, that it substantiates the antecedents in abstraction from their consequents.

'There is no system,' as he says, 'no whole of being, no real fact at all, till the external gathers itself up, as it were, into internality, and existence sums itself up in the conscious soul.'²

3. **The essence of teleological interpretation.**—Teleological interpretation is then confessedly anthropomorphic, or, as F. C. S. Schiller would say, humanistic. It rests upon the general epistemological principle of analogy, and is itself a particular instance of it. According to the teleologist, the worlds of nature and history are to be interpreted after the analogy of the purposeful life of which man is conscious in himself. Since Hume and Kant, at any rate, the analogical character of the teleological principle has been widely recognized. We saw it in Lotze, who believed none the less that the category of end or purpose afforded a definite clue to the nature of ultimate reality. We may see it in Bergson, who, however, regards the category of end or purpose as applicable only to the lower scientific order of reality. Yet, as H. Höffding³ points out, Bergson himself actually employs the principle of analogy along with that of intuition. With him intuition is only the first step towards the interpretation of reality. As mechanism proceeds by analogy in taking the organism to be a machine, and finalism in making it respond to a preconceived plan, so is it not to go by analogy to understand life as an *élan*, a thrust, an effort? But in this instance, it must be allowed, the analogy is drawn not as in finalism from the intelligent self-conscious life, but from the spontaneous and semi-conscious psychical life. While there is force in this criticism of Bergson's position, it does not follow that Bergson's philosophy of life is thereby discredited. All metaphysic, as Leibniz said, is founded on analogy.

¹ *Kleine Schriften*, iii. 229, quoted by Merz, iii. 549.

² *The Idea of God*, p. 215; cf. also p. 332.

³ *Modern Philosophers*, Eng. tr., London, 1915, p. 290 ff. (see ref. at p. 292 to *Den menneskelige Tanke*, French ed., pp. 318-327).

Apart from the analogy of human experience, no kind of knowledge would be possible, and it is entirely reasonable to proceed by way of that analogy to the consideration of the truly and ultimately real. But it may be urged, as against Bergson, that the analogy of purposeful self-conscious activity—so central a feature in human experience—offers a better clue to the nature of the absolute experience than does any analogy based on experience which is subpersonal. In any case what is claimed here is that teleology is a valid principle of interpretation, and that divine purpose may be recognized as a true cosmic principle. We shall see that, if divine purpose is actually so recognized, the *analogia hominis* must not be pressed in detail. The category of purpose or end, viewed from the side of the Absolute, requires to be delicately handled.

4. **Pragmatic teleology.**—Pragmatism (*q.v.*) claims to be different from other philosophies in respect of the clearness of its consciousness that teleology is no more than a methodological postulate. It is astounded at the misunderstanding revealed in the recent criticism¹ that it assumes a teleological constitution of the universe guaranteeing in mediæval fashion satisfaction to human desires and needs—an assumption out of keeping, the critic adds, with the spiritual pluralism or radical empiricism which pragmatism generally professes. In reply F. C. S. Schiller² insists that, while the pragmatist makes use of the teleological principle, it is not for him an *a priori* truth that the universe is going to prove good and to be found favourable to his desires. His is a heuristic teleology. He assumes commensurability between the supreme reality and human faculty, and then acts upon the assumption in hope. In contrast to this methodological optimism, one recalls the attitude of Bertrand Russell,³ who repudiates the 'will to believe' as an argument and can only face the universe with 'unyielding despair.' For, according to his naturalistic view, the universe is blind to good and evil and indifferent to human interests. Perhaps, as C. A. Richardson⁴ suggests, it is the preoccupation of logical pluralism with the objective side of experience that leads it to look upon the notion of teleology with doubt and suspicion. But more likely the attitude arises out of a personal conviction or resolution of character.

5. **Teleology in personal idealism.**—(a) Where personal idealism means spiritual pluralism of a theistic type, the concept of purpose applied to the interpretation of the universe yields a conclusion that satisfies. Consider first how thoroughgoing an application of this concept is embodied in personal idealism. It conceives reality, as in the monadisms of Leibniz and Lotze, as consisting of a plurality of experiencing subjects or spiritual centres of experience. In this it builds upon the analogy in respect of purposiveness between human persons and the lower forms of organic life, and upon the conjecture that even inorganic matter is composed of purposive individuals. Like organic species arrested in their evolution, or apparently so, these exhibit the minimum of spontaneity and the maximum of habit, according to the idea expressed by J. Ward, 'Routine presupposes antecedent living purpose.'⁵ The essential nature of the monads or spiritual individuals is affirmed to be their self-activity, involving self-determination (conscious, subconscious, or unconscious) in

¹ J. M. Warbeke, in *Journal of Philosophy, Psychology and Scientific Methods*, xvi. [1919] 207, 'A Mediæval Aspect of Pragmatism.'

⁵ *Proceedings of the Aristotelian Society*, 33rd session, 1911-12, p. 260; cf. also C. A. Richardson, *Spiritual Pluralism*, p. 53.

reference to ends. Thus spirit and spontaneity, which naturalism banishes from the world, are restored on this pansychist hypothesis throughout the whole vast range of experience. But that coherent experience may be made possible, a sympathetic *rapport* or responsive sympathy is, as with Lotze, postulated among the monads.

(b) With this the theory of personal idealism advances from its pluralistic base to its final theistic position, in which the world-ground is also teleologically conceived. Sympathetic *rapport* implies unity in the plurality, and unity implies a unifying principle, and the unifying principle is best stated not in the abstract terms characteristic of absolutist systems but in terms of that conative unity, that striving after the realization of ends, which is given at once in the most simple and the most complex individual experience; and in terms, moreover, of conscious and self-conscious activity, according to the teleological principle of the interpretation of the lower by the higher. Further, if we describe the world-ground as an ultimate self-conscious will, we are not to think of it, as in absolute idealism, as a purely immanent principle. Though God gives unity or system to the plurality of monads, He is not Himself the unity in which they subsist. There is a principle of distinction in a self-conscious mind, in virtue of which it belongs to itself and does not merely enter into other selves. So it is that G. Galloway,¹ e.g., presses to a theistic conclusion.

(c) The map of reality consists, according to this theistic argument, of simple monads interacting within a common medium or environment, which is grounded in a transcendent self-conscious will. It is claimed that the theory offers a better key to the understanding of unity and individuality than absolute idealism or natural realism can supply. It is a brave attempt at any rate (and this is our particular point) to justify the teleological view of the universe on metaphysical grounds. Whether it yields too much to the voluntaristic psychology we do not pretend to judge; but we appreciate its consistency with the theism of the moral and religious consciousness, in which the teleological character of the world is felt.

'At the heart of religion and morality,' says Siebeck, 'is the feeling that the existence and development of the world is not an indifferent matter, but is designed to realise a highest Good.'² When therefore ethical theism, with its religious conception of God as the absolutely good, is set beside the metaphysical theism of the pluralistic approach to reality, it seems possible to state a conclusion in terms such as these. (1) In the language of philosophy: though individual existences and personal spirits have a being for themselves and are variously endowed with spontaneity, the development of experience remains in the control of the world-ground. (2) In the language of theology: though the actions of the creature are not absolutely foreordained or predestinated but manifest spontaneity and freedom in various degrees, they fall within the providential government of God. (3) In the language both of philosophy and of theology, and in Galloway's concluding words, if the world have its ground in a self-conscious and ethical will, which comprehends and sustains all the individual centres of experience, faith in a providential order of things is sufficiently justified.³

6. Teleology of deism.—(a) While it may be said from the humanist side that the development of the universe is towards the goal of spiritual personality, it is difficult to conceive of the world-process *sub specie aeternitatis*. The deistic con-

ception of it, however, is an easy target for criticism. Its view of the world has been described as 'heterotelic.' The world is regarded as a sphere of divine purpose, but divine purpose is as it were imposed upon it from without. There is an inherent dualism in this, as J. S. Mill realized.

(b) In the traditional form of the 'argument from design,' where the setting is deistic, the divine Artificer fashioned the world to its present form out of an already given matter; or else, as in the ecclesiastical doctrine, the matter was first created out of nothing by divine power, then shaped by divine wisdom and beneficence. But this initial dissociation of matter and form is inconceivable, and has been 'as much a bugbear as a chimæra.'¹ The idea of external adaptation should be replaced by that of internal or immanent purpose. God is not beyond or even alongside His world, says a truer theism; He is within it as immanent life, will, intelligence.

(c) In the sphere of history, as in the sphere of nature, the deistic teleology is also superficial and inadequate. Its language, if not inappropriate in the world of concrete relationships in which religion lives and moves, can hardly be literally applied in philosophy. It looks upon God as a moral governor who imposes His laws upon man after the fashion of an earthly potentate. But, says a truer theism again, the divine laws are not externally imposed, but are immanent in man's heart and conscience; and the divine providence is not exercised *ab extra*, but is an immanent righteousness working in and through free human agency.

(d) May we not say that the end or purpose of God in nature and history is His self-manifestation or self-communication to personal self-conscious individuals capable of a spiritual response to Him whereby His own life receives enrichment? But, even in so saying, we speak in the manner of men in terms of time rather than eternity.

7. The purgation of purpose.—(a) With the deepening of its philosophical interpretation, the teleology of theism loses undoubtedly much of its traditional and popular meaning, but a substantial meaning may remain. The finite element of contrivance, with external adaptation of means to end, may rightly fall away from the idea of purpose as applied to the nature of the infinite experience. No part of the world is then in danger of being handed over, as virtually in deistic theology, to mechanical necessity; and the inorganic becomes essentially related or adapted to the organic, and both inorganic and organic to the whole cosmic process. It is the strength of idealistic interpretation that it can thus dispense in the cosmic reference with the 'theistic Demiurge'² and associate itself with what has been called an 'autotelic' view of the world-process. When purpose is no longer thought of as superinduced in creation and providence upon particular events of the world, but is intimately applied to the world in its totality, we learn to appreciate Kant's ideal of nature as a complete teleological system, in which for the intuitive or perceptive understanding the distinction of means and end is transcended, and the whole appears as the unity of its members and the members as the differentiation of the whole.³

(b) If the notions of contrivance and external adaptation are to be dismissed as unduly anthropomorphic, is the notion of a preconceived plan to be retained, or is the so-called plan but the nature or process of the whole? It would be easier for the personal idealist or theistic pluralist to retain the notion than for the absolutist. It was the

conviction that God cannot be regarded, except by the logical imagination, as devising schemes and selecting methods that led Spinoza, from his standpoint of abstract monism or singularism, to repudiate the principle of human analogy altogether and to deny of God the faculties of intellect and will. These, as being exercised in the outcarrying of finite plans and purposes, could not be predicated of the eternal Being. There is danger as well as truth in such a position, but what we are here concerned to say is that Spinoza's views are not incompatible with the essential idea of teleology. He denounces externalism and anthropocentrism, but none the less he looks upon the world as a significant whole, necessitated indeed, but necessitated by the divine nature itself, which is the nature of the whole.

'It is the idea,' says Pringle-Pattison, 'of the divine necessity as a self-affirmed life, and not as a blind force acting within the universe like a fate which it undergoes, that constitutes the differentia between a theistic and a non-theistic doctrine.'¹

(c) In support of Spinoza's objection to the notion of a pre-existent cosmic plan, it is pointed out that the conception of purpose therein involved is even inapplicable to human action of the highest kind, such as moral conduct or artistic production. We may therefore grant it to A. D. Lindsay,² a sympathetic interpreter of Bergson, that, if the world is a purposive system, it possesses a unity or individuality in time as well as in space. Apparently such a consideration lies behind Bergson's rejection of radical finalism—such as Leibniz's—as being only an inverted mechanism, as implying that things and beings realize a programme previously arranged ('*Tout est donné*'). To postulate the totality of the real as thus complete in the beginning is to make time (*q.v.*) of no account. If time *does* nothing, it is nothing. Yet, according to Bergson, time—not abstract spatialized time but concrete time or real duration (*la durée*)—is the very substance of our world, and there is no stuff more substantial or more resistant.

(d) The force of what Bergson here essentially contends for is acknowledged by idealistic thinkers. If the course of the world is preformed and predetermined—'the dull rattling off of a chain that was forged innumerable ages ago'³—there is indeed not much to choose between naturalism and idealism. In this connexion it is significant that naturalism and idealism, like fatalism and predestinarianism, often meet and, like righteousness and peace, kiss each other. It is also significant that the crusade of spiritual pluralism, in its various forms, against the absolutist systems is for the redemption of the spiritual values sold by them—'treacherously sold,' says F. C. S. Schiller⁴—into the bondage of naturalism. If then we abandon radical finalism with its illusion of preformation and predeterminism, shall we say that 'the history of the universe is the history of a great adventure'? So C. F. D'Arcy⁵ puts it, in sympathy with the Bergsonian view.

(e) Where idealism differs from Bergsonism, if not from Bergson himself, is in holding that the adventure is not in the experience of the absolute but in the experience or from the standpoint of the finite subject. Moreover, for a theistic idealism there are bounds to the scope of the adventure. The theistic universe is fundamentally ethical. It is the very heart and core of theistic faith that an eternal purpose of good is working itself out in the world. In terms of

modern Christian theology, the world is the scene of the progressive realization of the Kingdom of God.

(f) It is but to state the complementary side of this faith to affirm that the world must possess value and real existence for the divine experience, and that into the divine experience the time-process must enter somehow. The purpose which God possesses in Himself is independent of time, which is not as in Bergsonism an ultimate reality, yet it is somehow connected with the time-process in which it is being realized. How time is retained and yet transcended in God we do not know, nor can we. Yet we are not without a clue. In mystical contemplation and in artistic enjoyment the sense of time, as we are told, may almost vanish from the consciousness; and it is claimed that the life of the philosopher or artist bears in this respect some kind of analogy to the divine life. It is at least suggestive of the idea for which Pringle-Pattison contends, that purposive activity is the concrete reality and time only the abstract form.¹ If this be so, then Bosanquet's criticism of teleology, in the sense of 'aiming at the unfulfilled,' is so far met. Such a teleology, he says, gives undue importance to time and to the last term of a time-sequence.² But, says Pringle-Pattison:

'The last term is only important because in it is most fully revealed the nature of the principle which is present throughout. It is precisely this linkage of the first term with the last and, to that extent, the transcendence of the mere time-sequence in the conception of an eternal reality, that seems to me to be expressed by the profound Aristotelian idea of *τέλος* or End.'³

(g) The question may be raised here whether the purpose that may be attributed to the infinite ground of the universe is to be regarded as conscious or unconscious. On this question Bergson would appear to range himself in the succession of Schopenhauer (*q.v.*) and von Hartmann,⁴ with this difference that for them the gates of the future are closed. Undoubtedly the *via media* of unconscious purpose avoids the difficulty of explaining how one self-consciousness may exist within another, the finite within the infinite, but it possesses inherent difficulties of its own. It has to account for inorganic arrangement and process, and for the transition from the unconscious to the conscious and self-conscious, nor can it explain the reason why the vital impetus should tend in one direction rather than another.

'If,' as W. R. Sorley says, summing up an illuminating discussion, 'purpose be admitted as necessary for the interpretation of organisms, and if organisms are held to have arisen out of inorganic material, then there is good reason to postulate that the process which led to organic and purposive life was itself animated by purpose,' not individual nor merely racial purpose, but universal purpose acting, moreover, not 'after the fashion of impulse' but 'in the manner of mind or consciousness.'⁵

This theistic postulate of universal conscious purpose is to be justified in face of the facts of dysteleology,⁶ yet it appears a more reasonable postulate than that of unconscious purpose, and more hospitable too of human experience in the realms of fact and value.

8. Teleology and value.—The category of end or purpose, when purged of its finite incidents of preconceived plan and external adaptation of means to end, tends to pass into the category of worth or value (*q.v.*). In the teleological view of the universe the end, which is the nature of the whole, is an ethical end worthy of being purposed, *i.e.* worthy, so to speak, of enlisting the desire

and effort of the Absolute. And may we not attribute desire and effort—conative activity—to God? May we not say that in the Infinite Experience conation and its correlative satisfaction are to be found, that, as Bosanquet¹ strikingly puts it, 'the contradiction of a conation co-existing with fruition must somehow be realized'? It seems to us that we must say this if the world is to be regarded as truly a 'vale of soul-making,' in which Providence rules and not fate, the concurrence of the living God and not the eternal decree, and in which spiritual values are created and realized. It is our belief that God is thus present and active in the process of the world, and that the true image of Him is not the pre-existent Creator of the deistic theology, nor the static timeless Absolute of acosmic pantheism, but the eternal Redeemer of the religious consciousness.

LITERATURE.—The literature of which the writer has made most use is mentioned for the most part in the footnotes. For the historical discussion of the subject histories of philosophy may be consulted. For the general history of philosophy, J. E. Erdmann (Eng. tr., 3 vols., London, 1890-91), F. Ueberweg² and ⁹ (4 vols., Berlin, 1898-1903), W. Windelband (Eng. tr., New York and London, 1893), A. K. Rogers² (London, 1907), A. B. D. Alexander² (Glasgow, 1908), C. C. J. Webb (London, 1915). L. J. Henderson, *Order of Nature*, Cambridge, U.S.A., and London, 1917, contains a useful sketch of the subject from the scientific standpoint. For ancient philosophy, E. Zeller (5 vols., Leipzig, 1876-1909), F. Gomperz (Eng. tr., 4 vols., London, 1901-12), W. Windelband (Eng. tr., London, 1900), R. Adamson (Edinburgh, 1908), C. C. J. Webb (London, 1915), and J. Burnet already mentioned. For modern philosophy, H. Höffding (Eng. tr., 2 vols., London, 1900), *Modern Philosophers* (Eng. tr., do. 1915), R. Adamson (2 vols., Edinburgh, 1903, esp. vol. i.), J. T. Merz—for nineteenth century—(esp. vols. 3, 4, Edinburgh, 1912-14), B. Pünjer, *Hist. of the Christian Philosophy of Religion* (vol. 1, Eng. tr., Edinburgh, 1887); A. Caldecott, *The Philosophy of Religion—for England and America*—(London, 1901). For the systematic discussion works on metaphysics, philosophy of religion, and philosophy of science may be consulted; in addition to the works already mentioned, J. Johnstone, *The Philosophy of Biology*, Cambridge, 1914; *The Philosophical Review*, vol. xxvii. no. 6 [1918] (a series of articles on 'Mechanism and Vitalism'); *Mind*, new ser., no. 113 [1920] ('The Categories of Biological Science,' by F. H. A. Marshall); R. Otto, *Naturalism and Religion*, Eng. tr., London, 1907; J. Watson, *The Interpretation of Religious Experience* (*Gifford Lectures*), 2 vols., Glasgow, 1912 (historical and constructive); J. Lindsay, *A Philosophical System of Theistic Idealism*, Edinburgh, 1917; O. Pfeiderer, *Philosophy and Development of Religion* (*Gifford Lectures*), 2 vols., do. 1894; P. Janet, *Final Causes*, Eng. tr., do. 1883; A. Trendelenburg, *Logische Untersuchungen*², Leipzig, 1862, n. 1 ff.; C. Sigwart, *Kleine Schriften*², 2 vols., Freiburg, 1889, 'Der Kampf gegen den Zweck,' ii. 24-67 (a useful essay); W. Wundt, *Logik*³, 3 vols., Stuttgart, 1906-08; P. N. Cossmann, *Elemente der empirischen Teleologie*, do. 1899; L. T. Hobhouse, *Development and Purpose*, London, 1913; V. F. Storr, *Development and Divine Purpose*, do. 1906. The 'argument from design' is sympathetically discussed from a theistic standpoint in the last-named work, also by J. Martineau, *A Study of Religion*, 2 vols., Oxford, 1900; A. C. Fraser, *Philosophy of Theism*² (*Gifford Lectures*), Edinburgh, 1899; C. C. J. Webb, *Problems in the Relations of God and Man*, London, 1911; A. J. Balfour, *Theism and Humanism* (*Gifford Lectures*), do. 1915. See also J. M. Baldwin, *DPhP*, iii. B. 2. 1, for a full bibliography. See also the art. END, EPISTEMOLOGY, THEISM, THEODICY, VALUE.

WILLIAM FULTON.

TELEPATHY.—Telepathy, 'feeling from afar,' is a term coined by F. W. H. Myers, on the foundation of the Society for Psychical Research in 1882, to express the apparently supernormal transmission of information from mind to mind in 'thought-transference' experiments and the like, just as 'teleesthesia' was suggested to cover the alleged facts of clairvoyance and clairaudience. It was defined as 'communication between one mind and another otherwise than through the known channels of the senses.' As thus defined, the notion was in the first place not free from vagueness. For, as a certain amount of hyperesthesia of the known senses was admitted to occur under exceptional conditions, and this could be so extended as to amount to miracle, while it yet in a way explained away miracle, it

was not clear how hyperaesthesia was related to 'telepathy.' Secondly, the definition was essentially negative, a declaration of ignorance, which suggested no agency or adequate cause for the phenomena it described. Now this was neither satisfactory nor a very strong or stable position logically. Even if the difficulty about the limits of hyperaesthesia is not raised, and if it is admitted that the possibilities of communication through the senses may be taken as fairly completely explored, we are impelled to develop such a definition in one of two directions. We may imagine some unknown sort of vibration, radiation, or 'brain-wave,' as a physical explanation of the phenomena alleged, undeterred by the facts that no positive support has yet been found for any such agency, and that, unlike physical forces, it would appear to be indifferent to distance; or else we may conceive telepathy as essentially psychic in its nature, and shall then tend to exalt it into a fundamental 'law' of spiritual being, as Myers himself subsequently inclined to do. But, so conceived, it is manifestly a challenge to further exploration of the spiritual world of which it claims to be a law; and yet it proves rather a double-edged weapon for believers in a spiritual world. It enables them indeed to hold that every mind, incarnate or discarnate, may in principle communicate directly with any other by telepathy; but it seems to formulate this possibility so broadly as to render it almost impossible for a discarnate mind to authenticate itself by communicating information. For any verifiable information must normally be, or have been, known to incarnate minds; and, if any living mind can 'tap' any other, and if knowledge can 'leak' subconsciously from any mind to any other, and still more if we entertain the somewhat fanciful but not unsupported hypothesis that all knowledge may be pooled in a vast 'cosmic reservoir' before it bubbles up in individual minds, the telepathic hypothesis can evidently be used to discredit nearly all the *prima facie* evidence in favour of 'spirit-communication.' Accordingly the opponents of this belief have made great play with it, even while holding also that the evidence for telepathy is itself insufficient to establish it as a *vera causa*.¹ This objection the believers endeavour to meet in various ways. They point out rightly that, if telepathy is a fundamental psychic law, it cannot be restricted in its operations to living minds. They argue, however, that unrestricted telepathy between incarnate minds, and such alone, is antecedently improbable, and quite unsubstantiated. Lastly, they try to develop methods of experimentation which avoid this objection, because the information communicated, though verifiable *ex post facto*, can be shown never to have been, as a whole, in the possession of any living mind. Hence the importance of 'cross-correspondences' between the information received through several channels and dovetailing into a coherent message; by this method some striking successes have been recorded, though different minds will long continue to vary widely in the estimation of their weight. Again, certain sorts of prediction may baffle explanation by telepathy. At present, however, no agreement, either about the nature of telepathy or about the degree to which it may be taken as a fact in nature, can be said to exist. More evidence is still required, and, until it is obtained, opinions will be determined not so much by the evidence itself as by the bias with which it is regarded.

The existing evidence is usually classified under the heads (a) *experimental* and (b) *spontaneous*. The former includes the evidence of hypnotization at a distance, recorded especially by Gibert and

¹ *Proceedings of the Aristotelian Society*, 33rd session, 1911-12, p. 251.

¹ Cf. art. PSYCHICAL RESEARCH.

Pierre Janet, and experiments at close quarters, though without contact between the 'percipient' and the 'agent,' in guessing such things as cards and numbers, in reproducing diagrams and figures, etc. The transition to the 'spontaneous' evidence is mediated by a few rare cases in which the experimental projection of a phantasm is attested, on the strength of which it becomes possible to conceive the ordinary 'ghost' as an apparition telepathically projected by the dying or the dead. In all these cases the transfer of information has an emotional interest which is generally lacking in experiments of the first class, and this may conceivably account for their apparent capacity to override the obstacle of distance, which conspicuously differentiates them from the former. Still it should be remembered that to ascribe these phenomena to telepathy is a hypothesis which is possible only if telepathy is established independently by experimental evidence. Accordingly it is on this that the real stress falls. Now, as regards this evidence, it may be said in general that its character is very similar to that for other supernormal phenomena. Much of it is bad, some respectable, none beyond cavil. Its quality is not better than that of the best evidence for some of the most extreme phenomena, such as 'materializations.' It is liable, moreover, to the same or similar sources of error, fraud (in the shape of codes, collusion, and mendacity), mal-observation, lapses of attention, errors of memory, coincidence. The ultimate reason for these defects is that there plainly does not exist as yet any real experimental control of the phenomena and their conditions, so that the evidence cannot be accumulated at will, crucial experiments cannot be made, and the pragmatic test cannot be used to apply the doctrine of the direct intercommunication of minds and to distinguish the real from the alleged phenomena. As, however, this sort of situation occurs commonly enough in the beginnings of a science and sometimes lasts for centuries, it is no disproof of the reality of what is now provisionally called 'telepathy'; it may well be dispersed by pertinacious and concerted investigation, and in any case the matter should not be left in its present ambiguity.

LITERATURE.—This is largely the same as given in art. PSYCHICAL RESEARCH and SPIRITISM. There may be mentioned in addition E. Boirac, *La Psychologie inconnuée*, Paris, 1912, and *L'Avenir des sciences psychiques*, do. 1917, Eng. tr., *Our Hidden Forces and The Psychology of the Future*, New York and London, 1918; the art. by F. C. Hansen and A. Lehmann in *Philosophische Studien*, xi. [1895] pt. 4, 'Ueber unwillkürliches Flüstern'; E. Parish, *Hallucinations and Illusions*, London and New York, 1897; J. E. Coover, *Experiments in Psychical Research at Leland Stanford Junior University*, Stanford University, Cal., U.S.A., 1917; L. T. Troland, *A Technique for the Experimental Study of Telepathy and other Alleged Clairvoyant Processes*, 1917. All but the first of these attack the historical evidence, with some success, while the last two confess also (almost) complete failure in repeating the card- and number-guessing experiments of the Society for Psychical Research. F. C. S. SCHILLER.

TELUGU-SPEAKING PEOPLES. — See DRAVIDIANS.

TEMPERAMENT. — The doctrine of the temperaments is at once one of the earliest and one of the most persistent and popular efforts to classify the diversities of mental character in relation to bodily characteristics. It has always been recognized that there are broad differences of type in mind, and that some of these differences are in-born, and, practically at least, unmodified throughout life. It was natural that these should be looked for mainly in the feelings and emotions, which appear both more dependent upon the bodily constitution and less under individual control than either cognition or will. The temperament is accordingly a permanent disposition to certain

forms or degrees of feeling, so far as such disposition is dependent on the inherited organic constitution. The number of temperaments has been variously given as two, three, four, six, eight, and even much larger numbers, but on the whole the classic 'four' has held the field down to our own day, as if it corresponded in some mysterious way to some ultimate differences in mind or body, or both.

This number was derived originally from the four elements of Empedocles, fire, earth, water, and air, and the four qualities, warm and cold, dry and moist; on these in turn was formed Hippocrates' theory of the four cardinal humours of the body—blood, corresponding to air, warm and moist; phlegm to water, cold and moist; yellow bile to fire, warm and dry; and black bile to earth, cold and dry. From these came through Galen the names of the main temperaments, *sanguine*, *phlegmatic*, *choleric*, and *melancholic*. Occasionally physiologists have suggested other terms for the phlegmatic and the melancholic, as 'lymphatic' and 'nervous,' lymph and nerve being at least known constituents of the body;¹ but the names as well as the number of the old four have kept their ground. For the Greeks the temperament meant a mixture or union of the four elements, qualities, or humours; where this contained a certain ideal proportion of each, there was bodily and mental health; where an excessive degree of one or more, or an excessive defect, there was distemper or disease. There should therefore have been only one ideal temperament, and a large variety of *intemperaments*,² but actually the four temperaments were regarded as falling within the limits of health and as implying only a slight predominance of one or other of the four qualities. With the progress of physiology, the physical basis of the temperaments underwent a series of changes in the conception of the theorists; first the mixture was sought in the blood itself, as conveying nutriment to all the tissues of the body—e.g., the proportion of fibrin to fluid in the blood, the width of the vessels, the porousness of their walls and of those of the tissues; then stress was laid on the tissues of the body themselves, and especially the nervous tissue, its strength and its excitability (Haller); and finally on the more delicate qualities of the nerves as shown in intensity, and in rate, persistence, etc., of impression and of reaction. Here we are probably nearest to the truth, since it is with the nervous system that mental qualities and degrees are most directly correlated, but it must be admitted that we have no really scientific knowledge as yet of the precise relation of one to the other.

The problem may be approached from another side by considering the actual characterization or description of the four temperaments, the psychical qualities which each reveals; these are inferred of course from the behaviour, more especially the emotional expressions and the reactions of the will upon impressions; and here also there has been a constant tendency to simplify by seeking the main features of the temperaments in two pairs of mutually opposed characters, such as receptivity and spontaneity; change and persistence; feeling and action; pleasure and pain, etc. The most satisfactory of these psychological accounts is that of Wundt, based on the strength or weakness, and on the quick or slow rate of change in feeling and in mental life generally.³ Strong and quick is the choleric temperament; strong and slow, the melancholic; weak and quick, the sanguine; weak and slow, the phlegmatic.

¹ Henle, *Anthropolog. Vorträge*, i. 108.

² Volkman, *Lehrbuch der Psychologie*⁴, i. 207 f.

³ Wundt, *Grundzüge der physiologischen Psychologie*⁵, iii. 637.

As E. B. Titchener has put it, 'the man who thinks quickly and feels strongly, is choleric, the man who thinks quickly and feels weakly, sanguine. The phlegmatic thinks slowly and feels weakly, the melancholic thinks slowly and feels deeply.'¹

The classification does not adequately explain, however, the fact that the feelings of the sanguine are predominantly cheerful or pleasant, those of the melancholic predominantly painful or gloomy; and Höfding has suggested another pair of temperaments, or another division—'the bright and the dark temperament'—in order to explain 'the tendency to one or other of the two great opposites of the life of feeling, which gives colour and direction to the whole disposition.'

'This opposition is more fundamental than that upon which the other four temperaments are based, for it has its root in the fundamental conditions for the preservation of the individual organism.'²

More recently an interesting attempt to analyse the dominant characteristics by experimental methods has been given by Narziss Ach;³ he finds that it is mainly on the strength or weakness of the 'determination,' along with the persistence or rapid falling away of the determining force, that the feelings, the associations, and generally the whole mental life depend; accordingly he makes these characters the basis of his five temperaments—for he adds a fifth, the *reflective (besonnene)* temperament.

Whatever the ultimate characters may be, mental or physical, they must be such as exercise a decisive influence on the whole life, inner and outer, of the individual. The facts that the pure temperament is rare; that it makes, as Volkmann says, 'an almost uncanny impression,' when it does appear; that most of us are of 'mixed' temperament (however illogical such mixture may be); that the old terms have lost all meaning, and that the scientific analysis is still to seek—these facts, which have led many psychologists to drop the doctrine of the temperaments altogether, do not dispose of the existence of broad and deep differences of mental type, mainly in the spheres of feeling and action, for which *some* names, and a scientific analysis, must be found.

The organism, through the afferent nerves, sends from its every part a stream of influence to the brain; to the functions of every tissue there correspond impressions and feelings which may or may not reach or effect separate consciousness, but which produce a mass-effect in the *cœnesthesia*, or organic sensibility, and in the general feeling-tone which corresponds to it. This is the basis of the self-feeling: it is the inner or subjective aspect of the temperament. There is, as Henle says, a *tonus*, or degree of tension, in every nerve, even when the muscles which it contracts or the sense-organs from which it is impressed are 'at rest'; it differs in degree in different individuals; for each individual it varies from time to time, under varying conditions of health, fatigue, etc., but there is a relatively constant value for each below which it does not fall, so long as the nerves have life. Where the tension is high, response of feeling and action will be energetic and rapid; where it is weak, or low, response will be feeble and slow. The *tonus* is the physiological fact corresponding to the mass-feeling—vague and indefinite as it necessarily is—out of which the different moods of the individual, and his emotions, his passions, down to the simplest feelings of sensory pleasure and 'un-pleasure,' emerge like waves on the sea. Like all feelings, the temperamental feeling is both an index of bodily condition and a cause of bodily

expression and action; like all feelings, it influences alike the intensity, the quality, and the course of thought. Hence the detailed descriptions of character which we find in the older and even in some of the later writers on temperament are not without interest.

Johannes Müller,¹ who regards the *phlegmatic* as the highest type—the ideal temperament—finds that in such a man, with a well-developed intelligence, his phlegm enables him to accomplish results impossible to others, even with their livelier feelings and desires; easily retaining control of himself, he cannot be induced to acts 'of which he would repent on the morrow'; he can calculate in all security the chances of the success of what he undertakes; in danger, at the decisive moment, he is master of himself, wherever it is not a question of sudden decision and energy; 'he feels his ills little, and bears them patiently, nor is he much moved by those of others'; speed and quickness of choice often give others an advantage over him; but, 'when he has time before him, he arrives quietly at the goal, while others, heaping mistakes upon mistakes, are lost in endless side-issues.' On the other hand, Müller finds that the species of phlegm characterized by laziness, apathy, insensibility, irresolution, ennui, slowness of intellect, and the like, is not the true type, but a pathological form. The *choleric* has a remarkable power of action, both in energy and in persistence, under the influence of passion; his passions inflame at the least obstacle; his pride, his jealousy, his desire of vengeance, his thirst for domination, know no bounds, as long as his passion moves him. He reflects little, acts without hesitation, on the spur of the moment, because he is convinced that he is right, and above all because such is his will. He rarely turns aside from error, but follows the course of his passion to his own ruin and that of others. With the *sanguine*, pleasure is the dominant tendency, along with great excitability, and a short duration of any mood. Sympathetic and friendly to others, but without persistence or constancy; quick to anger, but equally quick to regret; prodigal of promises, but equally ready to forget them; credulous and confident, he loves to make plans, which he soon lays aside; indulgent to the faults of others, he claims the same indulgence for his own; easy to appease, frank, open, amiable, sociable, incapable of interested calculation. With the *melancholic*, sadness is the prevailing tendency; his excitability is equal to that of the sanguine, but disagreeable sensations are both more frequent and more durable than those of pleasure. The sufferings of others call out his sympathy to a high degree; for himself he is fearful, undecided, distrustful; a trifle wounds and offends him; the slightest obstacle discourages him, and renders him incapable of reasoning to overcome it; his thoughts are full of melancholy, and his sufferings appear to him beyond all consolation.

In their *Psychology in the Schoolroom*² T. F. G. Dexter and A. H. Garlick venture to describe, on behalf of teachers—for whom it is necessary to know their pupils' temperaments—not only the mental but also the external physical appearance of the types. The *sanguine*, lively, excitable, quickly but not deeply roused, with feeling generally uppermost in his character, has the circulatory and respiratory systems well developed, has red hair, blue eyes, skin fair, and face animated. The *choleric*, self-reliant and confident, with will uppermost, has the muscular system well developed, hair and eyes dark, complexion sometimes sallow, face impassive. The *phlegmatic* or lymphatic, mind heavy and torpid, sometimes nearly stupid, patient, self-reliant, and slow, has the abdomen large, face round and expressionless, lips thick, body generally disinclined to exertion. Finally the sentimental (i.e. *melancholic*), with great love of poetry, music, and nature, and marked indifference to the practical affairs of life, has the head large, eyes bright and expressive, figure slender and delicate, movements quick.

It may be doubted whether teachers would be well advised to guide their treatment by such physical characters as these, when noted in their pupils. Nor has the attempt been very successful to look in the different temperaments for predisposition to certain diseases of the body. It is, however, antecedently probable, and appears to be confirmed by experience, that different temperaments are liable to different forms of insanity; at least it is true that in insanity the differences of temperament are as clearly marked as in health.

As in drunkenness one man is 'talkative and boastful,' another 'maudlin,' another 'tetchy and violent,' another 'melancholy and silent'; so 'the lunatic of sanguine temperament . . . is puffed up and vain, his dreams are of marble halls and flattering voices; the choleric patient suspects everywhere the plots of his enemies, and hears voices insulting him or urging him to deeds of violence; and whilst his hallucinations are more often auditory than visual, the contrary is the case with the

³ *Ueber den Willensakt und das Temperament*, Leipzig, 1910, p. 312 ff.

¹ *Handbuch der Physiologie des Menschen*, French tr. 2, ii. 567.

² London, 1906, p. 343.

melancholic, and especially, as the name implies, with religious "visionaries."¹

It is especially in the melancholic, nervous, or, as it is called in extreme cases, the 'neurotic' temperament that the tendency to insanity is marked. T. S. Clouston gives a striking description of the modern phase of this temperament.

'The man of this temperament is in body small, shapely, tending towards a dark complexion, thin skin, with delicate features, a well-shaped head, a quick, bright, restless eye; in figure small and wiry, nervous, highly strung and sensitive, feeling pain keenly and tolerating it badly, subject to dyspepsia and insomnia. His muscles are incessantly active. He is quick in mind and body, imaginative, keen, sensitive, ever alert, fine in the grain, subtle, fond of intellectual work, not always resolute in decision because he sees there are two sides to every question, often artistic in feeling, ambitious, and with an ill-concealed contempt for fools. When run down, this man is "ill to do with." When he grows old he gets thin, dyspeptic, irritable, and often neuralgic. The diseases he is specially subject to are nervous and mental.'²

In religious psychology also the temperaments are of considerable importance, owing to the great suggestibility of some (the sanguine and melancholic) as compared with others, the greater excitability of the sanguine and choleric, the brooding tendency of the melancholic or nervous, the insusceptibility of the phlegmatic, and the excessive self-centring of the sanguine and choleric.³

The relative permanence of the temperament in the individual is not inconsistent with some gradual change over long periods of time, although there is no doubt that the temperament is that part of our mental and physical endowment which requires greatest effort or most violent and prolonged change of circumstances to modify. It has been thought that broadly the different stages of individual development and of racial evolution are marked by differences of temperament. Childhood is sanguine, youth sentimental or nervous, mature age choleric, and old age phlegmatic. The temperaments of primitive races are less obvious, but they seem to move from the phlegmatic and choleric (Negroes, Malaysians) to the melancholic and sanguine (Mongolian, Caucasian); in Europe we have the sanguine Frenchman, the choleric Spaniard or Italian, the phlegmatic Teuton, and the nervous Briton. Women on the whole are sanguine or nervous, men choleric or phlegmatic.⁴ These are of course mere rough general impressions. It has also been remarked that there has been a change of fashion in temperaments, or in what has been regarded as the ideal temperament: at one time the sanguine, it became the dark and melancholic (in the days of Byron), later the phlegmatic or indifferent, to-day perhaps the choleric—the man of energy.⁵ Character in the highest sense of the word is something very different from temperament; the latter has to do with the form and manner, the quantity and degree of mental life, character with its quality, the intellectual, moral, and aesthetic values which that life recognizes and pursues; temperament gives the foundation on which character must build—it sets the problems which the training and the making of character have to solve; whatever we may think therefore of the popular classification of the four temperaments, the individual differences themselves on which it is based—differences of sensitiveness to impressions and to feelings, of strength and quickness of reaction, of energy and endurance—are of the utmost importance. It is to such differences and their measurement that the

modern individual psychology is directing its attention; and from it we may hope in time to obtain a scientific account of temperament.

TEMPERANCE.—There is much difference of opinion among writers on moral theology as to the true relationship between the three virtues of sobriety, moderation, and temperance. Each has had its claims to be the archetypal virtue, which includes the others, advocated by representative writers; but there seem to be very strong reasons why temperance should be regarded as the inclusive virtue, the chief being that it has held a place from early times among the 'cardinal' or principal virtues. From the first, Plato seems to accept this grouping of virtues as based upon a current classification, and it passes through Aristotle and Stoics into Christian thought. The definition of temperance given by Cicero may be accepted as typical:

'Temperantia est rationis in libidine, atque in aliis non rectos impetus animi, firma et moderata dominatio. Ejus partes sunt, continentia, clementia, modestia.'¹

Plato shows a tendency to identify 'temperance' with 'continence'; in *Rep.* iv. 430 E he defines σωφροσύνη as follows:

κόσμος πού τις ἡ σωφροσύνη ἐστὶ καὶ ἡδονῶν τινῶν καὶ ἐπιθυμιῶν ἐγκράτεια.

Aristotle, however, defines the word as μεσότης περὶ ἡδονῶν and distinguishes it from ἐγκράτεια. The temperate man (σώφρων), he says, does not feel the pressure of inordinate desires; the continent (ἐγκρατής) feels it, but holds desire in restraint.² So Cicero: 'Continentia est, per quam cupiditas consilii gubernatione regitur.'³ In the NT the word σωφροσύνη occurs only in 1 Ti 2¹⁶ (σώφρων in 1 Ti 3², Tit 1⁸ 2²). ἐγκράτεια occurs in Ac 24²⁵, Gal 5²³, 2 P 1⁶; ἐγκρατεύομαι in 1 Co 7⁹ 9²⁵; ἐγκρατής in Tit 1⁸.

The general idea of temperance or moderation as an element in all virtue is peculiarly Greek, and it re-appears in Christianity.

'Temperance,' says Aquinas, 'is a cardinal virtue because that moderation which is common to all the virtues is peculiarly praiseworthy in the case of temperance.'⁴

This has been pointed out elsewhere.⁵ It is perhaps most in accordance with modern ways of thinking to take as a basis the fact of personality and to consider the Christian as standing in a threefold relationship—to God, to his neighbour, and to himself. According to Augustine, there is a virtue corresponding to each of these relationships, as is implied in Tit 2¹², ἵνα . . . σωφρόνως καὶ δικαίως καὶ εὐσεβῶς ζήσωμεν.⁶ Temperance is the form which

⁵ See art. MODERATION.

⁶ *Bern. Serm.* 2 in *comp. Res.* 11, alludes to this passage:

'Haec enim tria sunt temperationis nostrae maxime necessaria: quoniam primum debemus nobis, secundum proximo, tertium Deo.'

true self-love, duty to self, necessarily takes. It is the spirit of discipline, or rather the spirit of love consecrating itself—body, soul, and spirit—to God.

The function of temperance 'consists in restraining and moderating the desires wherewith we yearn for those things which are apt to turn us away from God's laws.'¹

Hence the virtue of temperance consists in the moderate and regulated use of those pleasures of sense, especially of touch and taste, which are most apt to draw the soul away from God, and to overthrow the supremacy of the rational faculty in man.² Temperance implies the control of appetite at those points where its demand is most importunate and difficult to resist. While 'moderation' (*modestia*) means self-control in matters of less difficulty, 'temperance' is concerned with the instincts and passions which in average human nature are the strongest and the least easy to restrain.

The following points seem to be worthy of special note.

1. The aim of the 'temperate' man is *positive*, not negative. He aims not merely at the subjugation of his lower nature, but at the cultivation of moral and spiritual power. Temperance is the virtue of the man of high ideals who strives to win a 'sovereign self-mastery.' It implies 'no monotonous restraint, but an ordered use of every gift.'³ The temperate man faces life and uses its gifts and blessings in the temper of an athlete training for a contest (1 Co 9^{25f.}) or of a soldier engaged in a campaign (2 Ti 2^{3ff.}). He exercises self-control 'not only in cutting off superfluities but in allowing himself necessities'⁴—watchful against any form of self-indulgence that may bring him under the power of the world or of his lower nature (1 Co 6¹²). He is not hindered or overpowered by circumstances, but controls them; he makes them subservient to his spiritual progress; he passes through them upwards and onwards to God.

So Augustine describes temperance as 'that action whereby the soul with the aid of God extricates itself from the love of lower (created) beauty, and wings its way to true stability and firm security in God.'⁵

2. Temperance holds a very prominent place in the earliest Christian teaching (cf. Ac 24²⁵). In the *Acts of Thecla* the substance of St. Paul's teaching is described as λόγος θεοῦ περὶ ἐγκράτειας καὶ ἀναστάσεως. In the early Christian usage of the word ἐγκράτεια was probably identified with sexual purity, and was gradually extended to include any form of world-renunciation and mortification of the body.⁶ The words ἐγκράτεια, ἐγκρατεύεσθαι occur frequently in *Hermas*, but already the tendency is to connote by them the temper of self-control or temperance in general.⁷ It includes control of appetite in the sphere of sex, food, and drink; but also the temper of moderation in expenditure, of sobriety in judgment and self-esteem, of self-restraint in matters of speech, etc. There follows a list of virtues in respect of which δεῖ μὴ ἐγκρατεύεσθαι. According to *Hermas*, ἐγκράτεια is in fact an archetypal and inclusive virtue. It is coupled with ἀπλότης in *Vis.* ii. 3.⁸ It has a saving virtue. The 'first commandment' is ἵνα φυλάξῃς τὴν πίστιν καὶ τὸν φόβον καὶ τὴν ἐγκράτειαν.⁹ Self-restraint is a fundamental duty because it is directly involved in that conflict between flesh and spirit which is the condition of our mortality

⁹ *Mand.* vi. 1.

and the occasion of moral victory or defeat. So Augustine asks:

'Cui peccato cohibendo non habemus necessariam continentiam, ne committatur? . . . Universaliter ergo continentia nobis opus est ut declinemus a malo.'¹

3. Temperance or self-control forms part of 'the fruit of the Spirit' (Gal 5²²). 'Walk in the spirit and ye shall not fulfil the lust of the flesh.' As a gift or endowment of the Spirit it was supremely manifested in our Lord.

'Where,' asks Bernard, 'is temperance to be found if not in the life of Christ? Those alone are temperate who strive to imitate *His* life, . . . whose life is the mirror of temperance.'²

It is of self-control that Augustine is speaking when he exclaims, 'Da quod jubes et jube quod vis.'³ The presence of the Spirit in man gives him liberty—the true freedom which consists not in following the impulses of the lower nature, but in fulfilling the will of God. Accordingly in Eph 5¹⁸ St. Paul seems to imply that the one infallible safeguard of temperance is the realization of the presence and action of the Holy Spirit in the soul.

4. The sin of intemperance is wrongly limited to one particular form of excess.⁴ It may include want of restraint in work, in recreation, in intellectual speculation, in the pursuit of wealth or power, in the use of the faculty of speech. On this last point much stress is laid by some Christian moralists.⁵ The fact is that the habit of loose, unrestrained speech paves the way for grave lapses from truth, purity, or good faith. It 'defiles the man' (Mt 15¹¹). It hinders or weakens that power of controlling 'the whole body' (Ja 3²) which is essential to Christian perfection. St. James implies that the 'sovereign sway of the Christian conscience' must be exercised even in what seems a small sphere, and thence gradually extended to the whole field of human nature till man becomes 'Deo solo dominante liberrimus.'⁶

LITERATURE.—Augustine, *de Mor. Eccl.*, *de Continentia*, etc.; Ambrose, *de Off. Min.* i. 43; Aquinas, *Summa*, ii. ii. qu. cxli-cxlii.; J. Taylor, *Holy Living and Holy Dying*, London, 1847, ch. 2, § 2, *Sermons*, do. 1848, no. xvi. ('The House of Feasting,' pt. 2); B. F. Westcott, *Lessons from Work*, do. 1901, p. 269 ff.; H. Rashdall, *The Theory of Good and Evil*, Oxford, 1907, bk. i. ch. vii. § 4; Stopford Brooke, *The Kingship of Love*, London, 1903, serm. x. R. L. OTTLEY.

TEMPLES.—A temple, in the original sense of the Latin word *templum*, meant a rectangular place marked out by the augur for the purpose of his observations, which were taken within a rectangular tent. An extended sense gave it the meaning of a consecrated place or building, of rectangular shape, 'inaugurated' by an augur. In this sense it was applied to the house of a god, though, strictly speaking, this meaning belonged to the *ædes*. In its primitive sense *templum* corresponds to the Gr. *τέμενος*, a place marked off as sacred to a god, in which a *ναός*, or house of the god, might be erected. As we shall see, an enclosed consecrated space often precedes an actual temple in our sense of the word, viz. the house of a god, a structure containing his image, and sometimes an altar, though not infrequently the altar stands outside the god's house (as in Greece) but within the sacred place, in the open air, as it did before any house for the god was erected. As images became more decorative and costly, it was natural to provide a house for them, though this might be done for a quite primitive image or even a fetish.⁷ Less often, however, the chamber or house of the god contained no image; it was merely a place where he might invisibly dwell or which he might visit

from time to time.¹ Where a god has his image in such a place, those of other divinities may also stand there or in subsidiary chambers connected with it. In the popular sense of the word, 'temple,' while it is connected with worship, is not usually a place within which the people worship. The priests alone enter it; the laity may worship only within the precincts, if even there. Temples vary from the simplest and smallest buildings, as they mostly were at first, to the most elaborate and vast structures.

In studying the origin of temples, no single source for all can be found, as this differs in different regions. Nomads could have no temples, though they might have tribal sacred places, or sacred tents carried in their wanderings. With the advent of a more fixed mode of life and permanent dwellings, a similar dwelling for the deity became necessary, as is seen in 2 S 7². A variety of primitive temples is known, and it could have been only in the course of a long period of time that the more elaborate buildings came into existence, while, generally speaking, the intermediate stages are not always discoverable.

I. Origin of temples.—(a) *Sacred places.*—Among savages, and probably also among most groups of primitive men,³ most of the rites of worship are carried on in the open air, sometimes because no images of divinities exist, or, where they do, they are not always enclosed within walls, and sometimes because spirits are regarded as connected with natural objects. Sacrifices are simply laid on sacred stones, or cast into the waters, or into the fire, or hung upon trees.³ Worship takes place in the open air among many of the lowest tribes (Veddās, Australians, Mūndās and other Dravidian tribes, Melanesians, Sakai, and Jakun), as well as among tribes at a higher level (some American Indians, Lapps, Buriats, etc.). This is often the result of a nomadic life, yet even nomads carry sacred images with them⁴ or have a tent for these or for other sacred things.⁵ Such open places for worship tend to become sacred and to be preserved inviolate for cult purposes, and there images are set up.

Examples of this are found among the Sakai, Jakun, Mūndās, Fjort, and Indians of California.⁶

This is obviously necessary where a sacred tree or stone stands in such a place. Sometimes sacred places are associated with the traditional appearances of spirits, gods, or ancestors, and must therefore be holy for all time. The mere fact that a religious gathering takes place in a certain spot once is enough to give it sanctity, and the gathering becomes recurrent there. Such sacred places will usually be marked by images or symbols, or by boundary-stones forming an enclosure.⁷ Single graves, often with a structure over them, and places of sepulture also become recognized places of cult.

The same preference for open-air worship in a recognized sacred place is found among the Chinese—*e.g.*, in the cult of the Altar of Heaven, which dates back to early times when the *genius loci* was worshipped at an altar under a tree.⁸ The practice is also found in the primitive cult of the Indo-European races, as a result of their conceptions of deity, not dissimilar from those of savages. The sacred stone, the sacred tree or grove, the sacred spring, were places of cult and usually

possessed an altar. The limits of the *τέμενος* were marked by boundary-stones, and within these stood an altar and a stone or post in which the deity resided. In early Indian worship there were no temples nor indeed permanent sacred places for cult—probably a result of earlier nomadic conditions prevailing after the people had become settled—and to some extent this is the case even now when temples have existed for centuries. So in early Rome there were holy places but no temples; and in ancient Persian religion there were neither images nor temples.¹ The custom and method of building temples were borrowed by the Romans first from the Etruscans and then from the Greeks. Teutons and Celts also worshipped first in the open air, and in their case the earlier cult is especially associated with the sacred tree or grove, though a spirit or god might be worshipped also on a mountain top, in a cave, or at a spring.² For the Gauls the evidence of Lucan is interesting in the passage where he describes a sacred grove near Massilia. The grove was tabu to the people; even the priest feared to walk there at midday or midnight, lest he should meet its sacred guardian. The trees were stained with sacrificial blood, but there were also altars, and the images of the gods were misshapen trunks of trees. The marvels of the grove are of a mythical kind.³

While sacred groves were general over the Celtic area, temples had begun to be built in both Cisalpine and Transalpine Gaul. The Boii had a temple in which were stored the spoils of war, and the Isubri (Isombri) had a similar temple.⁴ Plutarch speaks of the temple where the Arverni hung Caesar's sword, and Diodorus of 'temples and sacred places.'⁵ The temple of the Namnite (Saunite) women, unroofed and re-roofed in a day, must have been a simple building.⁶ In Gallo-Roman times elaborate temples were built after Roman models, as well as smaller shrines at sacred springs.⁷

Similar sacred groves existed among the Teutons, as many passages of Tacitus show.⁸ What we figure to ourselves as a built and walled house, resolves itself, the farther back we go, into a holy place untouched by human hand, embowered and shut in by self-grown trees.⁹

The use of the sacred grove continued during many centuries. But in these groves simple temples also stood, and are referred to by Tacitus, while sagas and later ecclesiastical writings speak of them, and the latter show that, when they were destroyed, a Christian church was often built on the site.¹⁰

The Latin names used for these are *fanum*, *casula*, and *templum*. The first was probably a mere hut in which stood the sacred image; the others were more elaborate buildings, whether of wood or of stone.¹¹

The grove is thus a primitive holy place, which may have as an accessory a small structure for the image which later becomes a more elaborate temple. This worship in groves, which might become the seat of a temple, is also found among lower races.

The village shrine among the Dravidian tribes of India is an example. Under a sacred tree or grove stands a heap of stones or a mound; this may be replaced by a mud platform or a mud hut with a thatched roof, or by a small building of masonry with a domed roof and platform. These form an abode for the deity and are thus a primitive kind of temple.¹²

The early Semitic sanctuary was a sacred place associated with a theophany or with the continued presence of a spirit or divinity. This might be at a tree, a stone, on a hill, or in a cave.

These holy places were sacred territory enclosed by boundary stones or walls, with altar and *ashērāh*, or sacred pole. The 'high place,' or *bāmāh*, as its name denotes, was on a height, and in the enclosed space or court there were the altar, the *ashērāh*, and the *massēbhāh* (*q. v.*) the abode of the divinity, while connected with these were 'houses,' probably of the priests, which sometimes contained images (2 K 17²³), though these were also enclosed in tents (2 K 23⁷, Ezk 16¹⁶).¹³ These houses or tents represent a primitive temple within the *bāmāh*, and, though no clear traces of actual temples have been met with in excavations, these may have been the origin of actual Canaanite temples such as those at El Berith and Gaza (Jg 9^{46f}).

⁸ See art. ALTAR (Chinese).

1629), probably consisting of an outer hall and an inner sanctuary for the image. The tents referred to resemble that provided for the Ark by David (2 S 67), though it had previously been kept in some kind of building (1 S 35-16; cf. 2 S 78). Just as there were family or tribal houses of a god (3g 175; 1s18: 30f). Remains of simple Phœnician temples suggest Egyptian influence; they are little more than a *cella*, rectangular, but open in front.¹

Examples of 'high places' among other races are found among the Aleuts and Bhils,² while they existed also in primitive Greek religion, and indeed wherever a cult was carried on on hilltops.

(b) *Shrines at graves.*—The grave as a sacred place may be another point of departure for the temple, when it is associated with a structure—though it be no more than an enclosing wooden fence with shrubs, as among the Tami of New Guinea³—where a cult is carried on. Sometimes an altar is placed over a grave, as with the Mayans and possibly the Nicaraguans,⁴ and by the Chinese for the half-yearly sacrifice to the spirits of the dead.⁵ Sometimes a series of memorial stones is erected, not always, however, over a grave, like the menhirs and dolmen-like structures of the Khâsis,⁶ the stone circles with a rectangular niche in their circumference found in Algeria, the rectangular, elliptical, or circular groups of stones in Syria,⁷ and the stone circles in Britain, varying in size and elaboration up to that at Stonehenge.⁸

These circles, long regarded without evidence as 'Druidical temples,' were probably connected with a cult of the dead in pre-Celtic times, and so were a kind of temple, like the Fijian *nanga* presently to be referred to. Some have regarded such a circle as that of Stonehenge as a temple dedicated to the sun or other heavenly bodies.⁹

Akin to these are the sacred stone enclosures, or *nanga*, of the Fiji islanders, now existing only as ruins.

These formerly presented the form of a rough parallelogram enclosed by flat upright stones, divided into three compartments by cross walls called respectively the little, great, and sacred *nanga*, the last enclosing the sacred *kava* bowl. Trees stood round the enclosure, and outside, beyond the sacred *nanga*, was the *vale tambu* ('sacred house'), a bell-roofed hut. Here the foresters of youths circumscribed on behalf of a sick parent were offered to ancestral gods with prayers for the patient's recovery. In the *nanga* the ancestral spirits are to be found by their worshippers, and thither offerings are taken on all occasions when their aid is to be invoked,¹⁰ and here firstfruits are presented to them. They were also used in the elaborate initiation ceremonies, the object of which was the introduction of the candidates to the ancestral spirits.¹⁰

Where large chambered tombs exist, as they do in many parts of the world, they have been used for worship of the dead, either at the time of the burial or at stated intervals thereafter. To this extent, therefore, they form temples, and sometimes they contain a conventional image of the dead like the human figures roughly sculptured on the walls of rock-hewn tombs in France.¹¹ The structures built over graves may be no more than large huts, of logs and thatch, like those built over the graves of kings and chiefs among the Banyoro and Baganda, but these are regarded as temples, with priests and attendants, where the spirits of the dead are consulted.¹²

In Fiji certain temples of a primitive kind are associated with graves and with the cult of the *kalouayo*, or ancestor-gods.¹³ Not unlike these are the huts of reed and grass built over the

graves of chiefs in pre-historic Egypt, where offerings were made. They gave place to mud houses, and these again to structures of stone. Of the latter the *mashtabu* had a chamber for the statue of the deceased and a tablet for offerings. Funerary chapels were part of the tomb-structure, but, where pyramids were built, this chapel or temple was erected outside the pyramid, and in it gifts and offerings were made. Sometimes they developed into large temples, which, like the smaller funerary chapels, had lands attached to them for their maintenance.¹

(c) *Caves and temples.*—Caves occasionally served as scenes of a cult, and by their shape and enclosed space may have suggested the structural temple. The caverns of mid-Magdalenian times, which contained elaborate paintings of animals or even of human figures, have been regarded as the scene of religious or magical rites, but of this there is no direct evidence.² Where cave-dwellers used part of the cave as a shrine for an image or fetish, it might easily through conservatism still be regarded as the dwelling of a god, when men no longer used it for a dwelling. It might become a temple or be associated with a temple built above it. Caves used for burial purposes would doubtless also acquire a sacred character and be used for commemorative rites.

Thus some of the Canaanite 'high places' are associated with caves, which may have been abodes of the living or burial-places, and which, it has been conjectured, were used for oracular purposes or regarded as sanctuaries of a god.³ Natural or artificial grottoes also constituted the earliest Phœnician temples.⁴ An example of gods incarnate in animal shape inhabiting a cavern which served as a temple occurs in Fiji in the case of the gods Ndengei and Ratu-Mai-Mbulu, to whom prayers and offerings were made there.⁵ Names of divinities worshipped in caves among the ancient Berbers are known, as well as the caves themselves with inscriptions to them. Sacrifices were probably offered in front of the entrance; within the cave niches contained sacred objects.⁶ Rock temples are known in early Egypt and in N. Arabia, but they are most elaborate in India and Ceylon, where they are both hewn out of solid rock and sculptured in caverns. Some originated in Buddhist times, and many still exist as examples of striking architectural skill—e.g., at Elephanta and Ellora.⁷ Their prototypes are caves used as shrines and for the cult of Hindu gods in N. India.⁸ Among the Caribs two caves were the places where sun and moon emerged and fertilized the earth. They were places of pilgrimage, were adorned with paintings, and contained images. Spirits were supposed to guard them.⁹

Another reason for caves becoming associated with worship is the belief that men first came out of them from their subterranean home. Examples of this are found in ancient Peru and other parts of America.¹⁰

Caves may also be the depositories of sacred or cult objects or of images of gods, and thus serve a purpose to which temples are also put.

The Arunta *ernatunhuga* is a rock crevice and sacred store-house containing *churinga* and their indwelling spirits. They are visited ceremonially and are highly sacred.¹¹ The Veddas keep their sacred arrows in caves to prevent them from being contaminated, especially by women.¹² The Ilopi use clefts in the rock in which to place the *bahos*, or prayer-sticks, in honour of their deities, and the Coras and Huichols deposit ceremonial arrows and images in sacred caves.¹³ The Ostyaks keep their images or stones representing the gods in sanctuaries in the hills guarded by a shaman.¹⁴

(d) *The village-house, men's house, etc., as temple.*—In many regions where separate temples are unknown, the men's house, council-house, village-house, or the *kiva*, to some extent serves the purpose of a temple among its many other uses, and corresponds to the *prytaneum* of the Greeks and the *curia* of the Romans.

Religious dances or sacred dramatic plays are held in the 'village-house' among the Aleuts or in the 'assembly-house' of the Californian tribes, which may consist of a circular domed-shaped structure or a mere brushwood enclosure.¹ To the latter corresponds the bough *wurley* used in the fire-ceremony of the Warranunga tribe, in which certain men maintain for hours a continuous singing to the accompaniment of beating boomerangs.² Among many American Indian tribes, especially in the south-west, religious rites are associated with a 'sacred house,' as with the Hupa, which does not differ in construction from other houses in the village. Here sacred dances take place, and traditions are connected with it.³ With the Pueblo tribes the *kiva* serves at once as sacred council-house, medicine-lodge, and temple of the members of a mystery society. In some districts *kivas* of ancient date are circular; more generally they are square and often below the surface of the ground. The pre-historic *kivas* of Colorado and Utah are of similar type. Women might not enter the *kiva* except to give food to husband or sons. *Kivas* are often very large, but the well openings are small, and entrance is gained by a ladder up to the roof, whence by another ladder descent is made to the interior from a hole in the roof. The walls are often decorated with symbolic paintings and are surrounded by a bench. At one end is an altar on which the symbolic objects of the society are placed, and before it is a dry sand 'painting,' representing gods and forces of nature.⁴ Corresponding to these are the sacred lodges and club-houses of Melanesia and Papua, which are generally the nearest approach to temples in those regions. Examples are found in the 'sacred houses' of the Solomon Islands;⁵ in the *torou* of New Britain, etc.—a sacred enclosure with a large room where the dresses and masks were prepared and members of the society met, whence the spirit-personators of the ceremonies emerged, and which no woman or uninitiated male might approach;⁶ in the *marawot* of the Bismarck Archipelago, a similar construction to the *torou*, but with a special part containing images and visited by the *tena*, or magician, alone;⁷ and in the house used in the *asa*-cult at Astrolabe Bay, where an ancestor-cult is practised.⁸ The structure consisted mainly of wood and thatch. The 'men's house' in the same regions has often a sacred significance, and contains skulls and heads, effigies of the dead, and symbols associated with ancestor-worship, and sometimes masks, drums, and flutes connected with the mysteries and concealed from the uninitiated. These houses are often used for the worship of ancestors.⁹

(e) *The house-shrine as temple.*—Still another aspect of the primitive temple, sometimes suggesting a point of departure for more exclusive temple structures, is the hut or house a corner of which is set apart as a place or shrine for an image or sacred objects. This custom is well-nigh universal, and only a few examples need be noted.

Among the Banyankole in each hut is a special place for fetiches, consisting of a mound of earth a foot high, beaten hard, with grass laid upon it.¹⁰ With Gold Coast tribes the *sutman* containing a spirit has an honoured place in a corner of the hut, where offerings are made to it, or, as with the Yoruba, the house-god *Olarosa*, represented in human form, is set up at the door, and huts have a recess in the wall for the fetish.¹¹ Here and there in Melanesia and Papua images of ancestors are kept in houses, or, as in certain islands off the western end of New Guinea, in a separate room of the house in which miniature wooden houses are placed for the souls to reside in. Offerings are made to them. In the chief's house are shrines for the souls of all who have died in the community. 'Such a house might almost be described as a temple of the dead.'¹² Among the Klemantans images are kept in the huts,

or, as also with the Kayans, stand before them.¹ The Votiaiks set their *vorsud*, or clan-god, on a shelf in the out-house.² In higher religions the household shrine is well known. Most Buddhist houses have their shelf with an image of Gautama. Shintōists treasure objects of private cult on a house-altar. In ancient Egypt each house had its domestic shrine, usually a recess or a cupboard with the figure of a household god.

In certain regions the temple seems to have arisen out of the private sanctuary of the king. In Mycenaean houses, especially the king's palace, had chapels as part of the structure, and the palace later became the temple. With the Phœnicians the temple was at first an annexe of the palace, like Solomon's temple at Jerusalem. Where a cult of the hearth-divinities, with libations thrown into the fire, existed—*e.g.*, in Roman houses—the house itself was a temple with the hearth as altar.

2. *Actual temples in the lower culture.*—We have seen that, while in many savage religions actual temples are unknown, many approaches to temples exist. Yet even savages are not devoid of temples of a primitive kind, for it was natural to suppose that, as the worshipper had a house, the god or spirit also should have one, either as the permanent shelter of his image or as the place whither he might resort and be approached by men in worship.

(a) The most primitive temples are probably those found in Africa, both Negro and Bantu. While frequently the 'place of praying' is a mere clearing under the tree in the village courtyard,³ thus conforming to what was found in early Indo-European worship, sometimes an actual hut is provided for a god, not differing much from the ordinary hut.

On the Lower Niger the temples contain images standing on mud platforms, and the *ju-ju* house in the bush is secret to all but the priests, and contains images, while the walls are decorated with plates.⁴ Similar temples exist among the Ewe, and that of the rain-god is painted with the colours of the rainbow.⁵ The celebrated serpent-temple at Whydah was merely a circular hut, thatched with grass—a privilege allowed only to shrines and temples—standing in an oblong enclosure. In it the sacred snakes were kept.⁶ In Dahomey temples are circular huts, so low that a man must bend double to enter one. Images stand in them on a platform of clay, before which are earthen pots and vessels smeared with blood, eggs, and oil. Some temples are elaborately decorated, and they as well as sacred groves are distinguished by calico streamers fluttering from poles or trees.⁷ Among the Yoruba—*e.g.*, at Benin—the *ju-ju* temple consisted of a space of ground 150 yards by 60, surrounded by a high wall, and covered with short grass. At one end a long shed extended across the breadth, and under it stood the altar, made of three steps the whole length of the shed. This was slightly raised in the centre, and on it stood ivory tusks on bronze heads. In the centre of the enclosure were a kind of candelabra with hooks, and a well for the reception of the bodies of victims.⁸ Among the Baganda temples resembled the king's house. They were conical structures with an elaborate reed thatch coming nearly to the ground, and supported on posts, with hide curtains for the doorway. They had also a sort of pinnacle composed of layers of reeds bound together and fastened to the top of the roof. The floor was strewn with a carpet of scented grass, dried, and cut to uniform length. These temples took some time to build, and their structure was frequently renewed. Some had also a court surrounding them, and in the case of the more important gods only the priests and mediums could enter it. In others the temple attendants had their huts in the court. Temples without courtyards could be approached and even entered by the people. The temple of the god of war was surrounded on three sides by a thick forest sacred to him. Each temple had its priests and mediums who lived in huts near by, where their vestments, worn on entering the temple, were kept. Young girls tended the sacred fire always burning in the temples, save in those which might not be entered by a woman. The larger temples had estates attached to them for their upkeep. Temples of gods had no images, for images were unknown, but they had a dais on which the invisible deity was supposed to sit, or on which his relics were kept. Sacred drums were stored in certain temples. Fetiches had also temples with priests and mediums, and there were special temples for the king's jaw-bone and umbilical cord,

and others for his ghost.¹ Similar temples for divinities and for the royal jaw-bone existed among the Busoga, Banyoro, etc., but with these and the Baganda the creator-god had no temple.²

(b) In Melanesia temples are not common, but in the Admiralty Islands wooden, thatched huts of a beehive shape, with carved door-posts representing male and female figures, serve as temples. The doorway is closed by a hurdle. Skulls of pigs and turtles are attached to the rafters, as well as balls of human hair. A mystery was always made about the principal temple, which contained images, and was sometimes open, sometimes closed.³ In Fiji each village had one or more temples (*bure*), built on a mound faced with stone rubble-work. The roof was high-pitched, with a projecting ridge-pole, and the height of the structure was twice its breadth. Each *bure* had two doors and a fire-place, and contained images, jars, boxes, mats, etc. From the roof hung a long piece of bark cloth reaching to the floor at one of the corner-posts, and marking the holy place which none but the priest approached to be inspired by the god, who descended by this cloth. The dead were sometimes buried in the *bure*, but the building was only used for worship on special occasions and often became ruinous in the interval. It served also as a council-house and chiefs' club-house. *Bures* were also erected in memory of the dead, and had an altar for offerings.⁴ In the district of Tumleo, New Guinea, *paraks*, or temples, built of wood and standing on piles, are found. They consist of two storeys and have high gables, and are approached by ladders with hand-rails carved in the form of crocodiles and ape-like figures. Nothing but drums and flutes is found in the *paraks*, and these, played by men, signify the presence of the spirits, for whose worship the temples exist. A certain degree of mystery attaches to the *paraks*; no woman or child may enter them or loiter in their vicinity.⁵

(c) In certain parts of Polynesia—Society and Sandwich Islands—the temples, or *maræ*, were enclosures open to the sky and they were of three classes: national, local, and domestic.

The national temples, called *tabu-tabu-a-tea*, perhaps because of their wide-spread sacredness, were depositories of the chief images and the places where great festivals were held. Each of them was composed of several *maræ*, some with inner courts for the images, altars, and sacred dormitories for the chief divinities, all enclosed by stone walls on two sides. In front was a fence, and at the back a pyramidal structure often of large size, with images and altars before it. At Atchura this structure was 270 ft. long, 94 broad, and 70 high. Steps led to the top, which had a surface area of 150 by 6 ft. Within the enclosure were the priests' houses, and trees grew both within and around it, forming a dark grove. Offerings were placed in the *maræ*. Men alone usually took part in the festivals, but on the completion of the year women and children also attended, but were not allowed to enter the sacred enclosure. Local *maræ* were those belonging to the different districts; the domestic *maræ* were for the family gods. In both of these, as well as in the royal *maræ*, the dead were deposited, and were there under the guardianship of the gods.⁶ In other districts—e.g., Samoa—temples resembled the beehive thatched huts, or, again, the village house where the chiefs met served as a temple. In some cases groves as well as temples were used as places of sacrifice.⁷

(d) Among the coast Veddas temple structures exist. One is 12 ft. by 10, roofed, and facing eastwards, with the roof carried forward beyond the front wall and door. Outside this structure are a

long pole, a well, and a tree with a platform, and just outside the door stands an altar. The interior is decorated with cloths and branches on the occasion of a ceremonial dance, and ceremonial garments are kept within it. Some of the village Veddas have temples of bark or of mud resembling their own huts. In these the shaman dances, and symbols of the spirits are kept.¹

(e) With the Todas, worshippers of the sacred buffalo, the dairy forms the temple or sacred place, with its ceremonial vessels and other things, which are preserved there; and precautions are taken to prevent their contamination by the touch or look of unauthorized persons. Relics of heroes are also stored in them. These temple-dairies have usually two rooms, and are of the same form as the native huts.²

(f) As an example of various stages in the evolution of temples from simple to highly elaborate, over a large area, we may cite those known in N. and S. America. Most of the lower tribes, and some of the more advanced (Hurons, Iroquois³), had no temples. But usually there were sacred spots or shrines where ceremonies were performed, sacrifices offered, and images set up.⁴

Among the Hopi such places were called *pahoki*, 'prayer-house,' and often had nothing to mark them but prayer-sticks—sticks with feathers attached. Others were denoted by circles of stones—e.g., the sun shrine with an opening to the direction of sunrise at the summer solstice—by a single stone, or by some natural mark on a rock.⁵ To these correspond the sites on which are erected bowers or lodges for the public performances of mystery societies in other tribes, often containing an altar with sacred objects.⁶ More elaborate shrines also exist among the Hopis and will be described later. In S. America corresponding to such shrines is the secret spot where the *botuto*, or sacred trumpet, of the Orinoco tribes is kept, so that women and children may not see it. With other tribes the insignia of a *piá* are *tabu* and are kept in a special shed or hut, which is also used as a place where he may be consulted. It is called a 'spirit-house' and is *tabu*.⁷ Here also may be mentioned the special 'medicine-lodge' of many tribes, erected for the performances of the shaman, corresponding to that found among the Ural-Altai tribes of N. Asia.⁸

With other tribes—e.g., the Omaha—the sacred structure consisted of three sacred tents, or *típis*, which were carried from place to place, like the Hebrew 'tent of meeting.' They consisted of poles tied together at the top, arranged in a circle, and covered with bison skins. They sheltered the three sacred objects—the sacred pole, the sacred buffalo-cow skin, and the sacred bag.⁹ The household tent as a shrine containing an altar is also sporadically found—e.g., among the Siksika, with whom each tent has an altar, a mere hole in the ground, in which sweet gum is burned.¹⁰

With the Apaches, Sioux, and others, sacred caves took the place of temples, where religious rites (*tabu* to women) were performed, or which were used as resorts for prayer.¹¹ In Florida the Apalachians had a cave-temple on the sun-mountain, Olaimi, 200 ft. long, and containing an altar and images. Images also stood at the entrance, which faced eastwards, so that the earliest beams of the sun fell upon it.¹² More elaborate still was a cave-temple of the Wiyataos, which had been used to celebrate rites by the followers of a culture-hero Wixipecocha, but was later turned into a structure with galleries, halls, and apartments. Into it the priests descended to perform sacrifices and ceremonies hid from the vulgar eye.¹³

Among the Chibchas the temples, each of which was dedicated to a god, were mere huts with clay walls, containing small stools on which idols were set. The floor was covered with grass, and mats hung on the walls. Those of greater importance had the distinction of having their chief posts set on the body of a sacrificed slave. Small shrines also existed

throughout this region, on hills or by lakes.¹ Among some Californian tribes structural temples, or *vanquicks*, in honour of the god Chingichinich, consisted of an oval enclosure, four or five yards in circumference, with interior divisions formed by branches, stakes of wood, and mats, and containing a hurdle supporting an image.² The temples of the Natchez, one in each village, which stood on mounds, were huts about 30 ft. square and of a somewhat elaborate structure. They contained the sacred fire as well as a division in which sacred objects were kept. On a platform rested the remains of the 'sun-chiefs,' with sacred images, and in an innermost sanctuary was the holy image of the sun-god or hero. This temple was the object of great reverence.³ Such sun-temples existed over a wide region in Florida, Arkansas, and Virginia, and were no more than large wigwags with thick mud walls and a domed-shaped roof with figures of eagles. Images stood in them, and women were excluded from them.⁴ No more elaborate were the temples described by travellers among Virginian tribes, in the Mississippi region, among the Fox Indians, or in S. America with the Tupinambas.⁵ Among the Huichols are temples (*tokpia*), 'god-houses,' and sacred caves, though the difference between the first two is not clear. The temples are larger than but otherwise resemble the houses, which are circular, stone-built, and roofed with thatch, and which possess a low entrance to the east. The roof is supported by upright beams. In the centre is a fireplace—a circular basin of clay. Niches in the interior walls contain ceremonial objects, and each of them is devoted to a god, and in charge of an officer of the temple. Flowers are offered with prayer in these niches. In front of the temple is a square open space for the 'god-houses,' in which the officers live who watch the temple. They are rectangular, of stone and mud, with a thatched gable-roof. The interior contains symbolic objects to please the gods. The people meet in the temples for shamanistic ceremonies. Chairs are placed for the deities invisibly present. Images are kept in sacred caves in the mountains, sometimes set in miniature temples there.⁶ In the Pueblo region the more elaborate shrines were of the nature of temples. They consisted of sealed stone enclosures, sometimes with symbols painted on them, and they contained images and symbolic representations of supernatural beings. Among the Hopi the shrine of the earth-goddess is a sealed chamber in which is her image, seated. Every November at the 'new fire' ceremony a slab is removed, and offerings are placed in the shrine, while every four years the image is carried in procession. In all Pueblo shrines are placed permanent objects (images, stones, carved slabs, etc.) and temporary objects (prayer-meal, pollen, sticks, bowls of water, clay images).⁷

The council-house, men's house, the *kiva*, etc., as serving *inter alia* all the purposes of a temple, have been already referred to.⁸ In the case of a *kiva*, or lodge of a mystery society, this is particularly marked. None but priests or the initiated may enter the sacred place; in it are made the sacred objects used in the ritual; and here prayers are said, smoke offerings presented, and other ceremonies—*e.g.*, purificatory rites—are carried on.

The rude stone structures just described form a primitive aspect of the more elaborate stone temples of barbaric peoples in N. and S. America. It was also natural that, where wooden temples existed, they should be replaced by temples of stone, as soon as more elaborate architectural methods were attained. Intermediate stages between these simple structures and the massive and elaborate temples—the ruins of which still command respect—are seldom met with, but Peter Martyr describes one in Hayti, and Schoolcraft another at Cayambe—a circle of sunburnt bricks 48 ft. in diameter and 13½ ft. high, with a small door, open to the sky.⁹ Probably many of the Peruvian temples were of such a simple character, and even the great temple of the sun at Cuzco, comprising many buildings and apartments, though it was richly adorned with gold plates, cornices, and studs, and was provided with gardens and fields, had no great architectural character—mere squares and parallelograms of one storey, roofless or thatched.¹⁰ Previous to the Inca

rule, the temple was strictly a lofty altar with a chapel for the image. Under the Incas the chapel increased in size, encircling the altar, and was made elaborate by the addition of other buildings.¹ Certain remains of temples in Peru, however, show a greater architectural complexity than those described by early Spanish travellers.

The Mexican temples, *teocalli*, 'abode of the gods,' may be described as gigantic altars on which stood chapels for the images. There were many temples in each city, varying much in dignity.

The larger *teocalli* had a great outer court capable of holding a crowd of people. Within this space stood priests' houses, oratories, and chapels for lesser gods. There arose from it a pyramidal structure of earth faced with brick or stone, rising in stages, three to nine in number, each with a platform, to a height of 80 to 100 feet. Stairways, differently arranged, rose from the base to each platform, and thence to the top. Sometimes the stairway rose directly from base to summit up one of the faces of the pyramid; or it ascended at one of the angles to the first platform, at another angle to the second, and so to the top, in order that a religious procession in ascending might make a circuit of the structure. The platforms had palisades on which were stuck the heads of human victims. On the summit stood a tower or chapel, or sometimes two, containing the image of the god or gods to whom the temple was dedicated. In front of them stood the great stone of sacrifice and altars on which perpetual fire burned. The great procession of priests at the numerous religious services was visible to all who directed their eyes to the *teocalli*, as it made the ascent.²

The practice of placing temples on pyramidal structures is also found among the Mayans and throughout the whole area of Central America, but here the buildings were of a more ambitious kind, with elaborate architecture and sculpture.³

The mounds of the Mississippi region were thought to be of Mexican or Mayan origin, but it is now accepted that they were the work of Indian tribes—Cherokees, Shawnees, Delawares, Choctaws. Nor is it proved that every mound was crowned by a temple or altar. 'Whether these were sacred enclosures, sacrificial and temple mounds, are questions to be settled, if possible, by investigation and legitimate deductions.' Houses were built on some of the mounds, but occasionally travellers speak of a temple on a mound. In such a case the mound was of no great height, and the temple was a simple structure like that of the Natchez.⁴

3. **Miniature temples.**—Among many African tribes there is a custom of making a small hut for the spirits, about 2 ft. high. This stands in the village or outside, and offerings are made at it. It is supposed to contain 'an uncanny something,' and is a kind of temple of the dead, whose spirits are supposed to visit it.

In Uganda the hut is a veritable sanctuary, with a sort of altar for offerings.⁵ In New Guinea some of the tribes set up little houses in the forest for the use of ancestral spirits, or place these within inner rooms of their own dwellings; others place the skull of the dead man in such a hut in the forest.⁶ Similar miniature structures for ancestral ghosts are found in Indo-China and among the Gilyaks.⁷

4. **Temples in the higher culture.**—In higher civilizations the temple usually has a prominent place in religious life, and is architecturally of great importance. But here also it was evolved from simple structures, though these as well as the intermediate stages cannot always be traced in archaeological sequence or from historical evidence. The series of articles on ARCHITECTURE deal with the structure of such temples in the greater religions, and it is unnecessary here to do more than offer a few general remarks.

(a) The great temples of ancient Egypt were preceded in pre-historic times by a simple structure of dried mud or a hut of wicker-work, not differing much from human dwellings and probably

resembling African native temples. The hut was sometimes square, sometimes domed, and stood on a platform of earth to save it from inundation. Within it was the image of the god, and the only opening for light was the doorway or portico, with a mast at each side. In front was a court fenced with a palisade.
